**Return** number of arguments found (`argc`)

#### Parameters

- `line`: pointer to buffer to parse; it is modified in place
- `argv`: array where the pointers to arguments are written
- `argv_size`: number of elements in `argv_array` (max. number of arguments)

`void esp_console_get_completion (const char *buf, linenoiseCompletions *lc)`

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

#### Parameters

- `buf`: the string typed by the user
- `lc`: `linenoiseCompletions` to be filled in

`const char *esp_console_get_hint (const char *buf, int *color, int *bold)`

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because `linenoiseHintsCallback` is defined as returning a `char*` instead of `const char*`.

**Return** string containing the hint text. This string is persistent and should not be freed (i.e. `linenoiseSetFreeHintsCallback` should not be used).

#### Parameters

- `buf`: line typed by the user
- `[out] color`: ANSI color code to be used when displaying the hint
- `[out] bold`: set to 1 if hint has to be displayed in bold

*esp\_err\_t* **esp\_console\_register\_help\_command** (void)

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE, if esp\_console\_init wasn’t called

*esp\_err\_t* **esp\_console\_new\_repl\_uart** (const *esp\_console\_dev\_uart\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL environment over UART driver.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF\_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp\_console functions.

**Return**

- ESP\_OK on success
- ESP\_FAIL Parameter error

**Parameters**

- [in] dev\_config: UART device configuration
- [in] repl\_config: REPL configuration
- [out] ret\_repl: return REPL handle after initialization succeed, return NULL otherwise

*esp\_err\_t* **esp\_console\_new\_repl\_usb\_cdc** (const *esp\_console\_dev\_usb\_cdc\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL environment over USB CDC.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp\_console functions.

**Return**

- ESP\_OK on success
- ESP\_FAIL Parameter error

**Parameters**

- [in] dev\_config: USB CDC configuration
- [in] repl\_config: REPL configuration
- [out] ret\_repl: return REPL handle after initialization succeed, return NULL otherwise

*esp\_err\_t* **esp\_console\_start\_repl** (*esp\_console\_repl\_t* \*repl)

Start REPL environment.

**Note** Once the REPL got started, it won’t be stopped until user call repl->del(repl) to destroy the REPL environment.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE, if repl has started already

**Parameters**

- [in] repl: REPL handle returned from esp\_console\_new\_repl\_XXX

**Structures**

**struct esp\_console\_config\_t**

Parameters for console initialization.

**Public Members**

`size_t max_cmdline_length`  
length of command line buffer, in bytes

`size_t max_cmdline_args`  
maximum number of command line arguments to parse

`int hint_color`  
ASCII color code of hint text.

`int hint_bold`  
Set to 1 to print hint text in bold.

`struct esp_console_repl_config_t`  
Parameters for console REPL (Read Eval Print Loop)

**Public Members**

`uint32_t max_history_len`  
maximum length for the history

`const char *history_save_path`  
file path used to save history commands, set to NULL won't save to file system

`uint32_t task_stack_size`  
repl task stack size

`uint32_t task_priority`  
repl task priority

`const char *prompt`  
prompt (NULL represents default: "esp> ")

`struct esp_console_dev_uart_config_t`  
Parameters for console device: UART.

**Public Members**

`int channel`  
UART channel number (count from zero)

`int baud_rate`  
Communication baud rate.

`int tx_gpio_num`  
GPIO number for TX path, -1 means using default one.

`int rx_gpio_num`  
GPIO number for RX path, -1 means using default one.

`struct esp_console_dev_usb_cdc_config_t`  
Parameters for console device: USB CDC.

**Note** It's an empty structure for now, reserved for future

`struct esp_console_cmd_t`  
Console command description.

**Public Members**

`const char *command`  
Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

**const char \*help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp\_console\_deinit. If not set, the command will not be listed in ‘help’ output.

**const char \*hint**

Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

**esp\_console\_cmd\_func\_t func**

Pointer to a function which implements the command.

**void \*argtable**

Array or structure of pointers to arg\_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg\_end. Only used for the duration of esp\_console\_cmd\_register call.

**struct esp\_console\_repl\_s**

Console REPL base structure.

### Public Members

**esp\_err\_t (\*del)(esp\_console\_repl\_t \*repl)**

Delete console REPL environment.

#### Return

- ESP\_OK on success
- ESP\_FAIL on errors

#### Parameters

- [in] repl: REPL handle returned from esp\_console\_new\_repl\_xxx

### Macros

**ESP\_CONSOLE\_CONFIG\_DEFAULT()**

Default console configuration value.

**ESP\_CONSOLE\_REPL\_CONFIG\_DEFAULT()**

Default console repl configuration value.

**ESP\_CONSOLE\_DEV\_UART\_CONFIG\_DEFAULT()**

**ESP\_CONSOLE\_DEV\_CDC\_CONFIG\_DEFAULT()**

### Type Definitions

**typedef struct linenoiseCompletions linenoiseCompletions**

**typedef int (\*esp\_console\_cmd\_func\_t)(int argc, char \*\*argv)**

Console command main function.

**Return** console command return code, 0 indicates “success”

#### Parameters

- argc: number of arguments
- argv: array with argc entries, each pointing to a zero-terminated string argument

**typedef struct esp\_console\_repl\_s esp\_console\_repl\_t**

Type defined for console REPL.

## 2.7.6 eFuse Manager

### Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

## Hardware description

The ESP32-C3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE\_BLK0).

For more details, see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]. Some eFuse bits are available for user applications.

ESP32-C3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE\_BLK0 is used entirely for system purposes;
- EFUSE\_BLK1 is used entirely for system purposes;
- EFUSE\_BLK2 is used entirely for system purposes;
- EFUSE\_BLK3 or EFUSE\_BLK\_USER\_DATA can be used for user purposes;
- EFUSE\_BLK4 or EFUSE\_BLK\_KEY0 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK5 or EFUSE\_BLK\_KEY1 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK6 or EFUSE\_BLK\_KEY2 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK7 or EFUSE\_BLK\_KEY3 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK8 or EFUSE\_BLK\_KEY4 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK9 or EFUSE\_BLK\_KEY5 can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK10 or EFUSE\_BLK\_SYS\_DATA\_PART2 is reserved for system purposes.

Each block is divided into 8 32-bits registers.

## eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool *efuse\_table\_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility will check with the *common* CSV file.

CSV files:

- common (*esp\_efuse\_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse_common_table`). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse_custom_table`.

## Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_
↪count(1..256), comment
```

Individual params in CSV file the following meanings:

**field\_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table).

**efuse\_block** Block number. It determines where the eFuse bits will be placed for this field. Available `EFUSE_BLK0..EFUSE_BLK10`.

**bit\_start** Start bit number (0..255). The `bit_start` field can be omitted. In this case, it will be set to `bit_start + bit_count` from the previous record, if it has the same `efuse_block`. Otherwise (if `efuse_block` is different, or this is the first entry), an error will be generated.

**bit\_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field will available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

### efuse\_table\_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (`esp_efuse_table.csv`). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a *common* files, use the following command `idf.py efuse_common_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32c3/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32c3` create:

- `esp_efuse_table.c` file.
- In *include* folder `esp_efuse_table.c` file.

To generate a *custom* files, use the following command `idf.py efuse_custom_table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32c3/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_
↳custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In *include* folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

## Supported coding scheme

Coding schemes are used to protect against data corruption. ESP32-C3 supports two coding schemes:

- None. EFUSE\_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE\_BLK0 can be written many times.
- RS. EFUSE\_BLK1 - EFUSE\_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software will encode the 32-byte EFUSE\_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE\_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use the `batch writing` mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

## eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1” .
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1” .
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

## eFuse API for keys

EFUSE\_BLK\_KEY0 - EFUSE\_BLK\_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an `ESP_EFUSE_KEY_PURPOSE_x` field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like `ESP_EFUSE_KEY_PURPOSE_XTS_AES...` are used for flash encryption.

The purposes like `ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST...` are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- `esp_efuse_get_purpose_field()` - Returns a pointer to a key purpose for an eFuse key block.
- `esp_efuse_get_key()` - Returns a pointer to a key block.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.

- `esp_efuse_set_key_purpose()` - Sets a key purpose for an eFuse key block.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block.
- `esp_efuse_set_keypurpose_dis_write()` - Sets a write protection of the key purpose field for an eFuse key block.
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_find_unused_key_block()` - Search for an unused key block and return the first one found.
- `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.
- `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks

### How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```
$ ./efuse_table_gen.py esp32c3/esp_efuse_table.csv --info
eFuse coding scheme: NONE
#      field_name                efuse_block    bit_start    bit_count
1      WR_DIS_FLASH_CRYPT_CNT     EFUSE_BLK0    2            1
2      WR_DIS_BLK1                 EFUSE_BLK0    7            1
3      WR_DIS_BLK2                 EFUSE_BLK0    8            1
4      WR_DIS_BLK3                 EFUSE_BLK0    9            1
5      RD_DIS_BLK1                 EFUSE_BLK0    16           1
6      RD_DIS_BLK2                 EFUSE_BLK0    17           1
7      RD_DIS_BLK3                 EFUSE_BLK0    18           1
8      FLASH_CRYPT_CNT            EFUSE_BLK0    20           7
9      MAC_FACTORY                 EFUSE_BLK0    32           8
10     MAC_FACTORY                 EFUSE_BLK0    40           8
11     MAC_FACTORY                 EFUSE_BLK0    48           8
12     MAC_FACTORY                 EFUSE_BLK0    56           8
13     MAC_FACTORY                 EFUSE_BLK0    64           8
14     MAC_FACTORY                 EFUSE_BLK0    72           8
15     MAC_FACTORY_CRC             EFUSE_BLK0    80           8
16     CHIP_VER_DIS_APP_CPU        EFUSE_BLK0    96           1
17     CHIP_VER_DIS_BT             EFUSE_BLK0    97           1
18     CHIP_VER_PKG                 EFUSE_BLK0    105          3
19     CHIP_CPU_FREQ_LOW           EFUSE_BLK0    108          1
20     CHIP_CPU_FREQ_RATED         EFUSE_BLK0    109          1
21     CHIP_VER_REV1               EFUSE_BLK0    111          1
22     ADC_VREF_AND_SDIO_DREF      EFUSE_BLK0    136          6
23     XPD_SDIO_REG                EFUSE_BLK0    142          1
24     SDIO_TIEH                   EFUSE_BLK0    143          1
25     SDIO_FORCE                   EFUSE_BLK0    144          1
26     ENCRYPT_CONFIG               EFUSE_BLK0    188          4
27     CONSOLE_DEBUG_DISABLE       EFUSE_BLK0    194          1
28     ABS_DONE_0                  EFUSE_BLK0    196          1
29     DISABLE_JTAG                 EFUSE_BLK0    198          1
30     DISABLE_DL_ENCRYPT           EFUSE_BLK0    199          1
31     DISABLE_DL_DECRYPT           EFUSE_BLK0    200          1
```

(continues on next page)

(continued from previous page)

32	DISABLE_DL_CACHE	EFUSE_BLK0	201	1
33	ENCRYPT_FLASH_KEY	EFUSE_BLK1	0	256
34	SECURE_BOOT_KEY	EFUSE_BLK2	0	256
35	MAC_CUSTOM_CRC	EFUSE_BLK3	0	8
36	MAC_CUSTOM	EFUSE_BLK3	8	48

Used bits in eFuse table:

EFUSE\_BLK0  
 [2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188-  
 ↪191] [194 194] [196 196] [198 201]

EFUSE\_BLK1  
 [0 255]

EFUSE\_BLK2  
 [0 255]

EFUSE\_BLK3  
 [0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE\_BLK0 are reserved for ↪  
 ↪Espressif)

Parsing eFuse CSV input file \$IDF\_PATH/components/efuse/esp32c3/esp\_efuse\_table.  
 ↪csv ...  
 Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE\_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field\_name, efuse\_block, bit\_start, bit\_count, comment.
3. Run a show\_efuse\_table command to check eFuse table. To generate source files run efuse\_common\_table or efuse\_custom\_table command.

## Debug eFuse & Unit tests

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests.

**espefuse.py** esptool includes a useful tool for reading/writing ESP32-C3 eFuse bits - `espefuse.py`.

## Header File

- [efuse/include/esp\\_efuse.h](#)

## Functions

*esp\_err\_t* **esp\_efuse\_read\_field\_blob**(const *esp\_efuse\_desc\_t* \*field[], void \*dst, size\_t dst\_size\_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst\_size\_bits” required size. Use “esp\_efuse\_get\_field\_size()” function to determine the length of the field.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

### Return

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

**Parameters**

- [in] `field`: A pointer to the structure describing the fields of efuse.
- [out] `dst`: A pointer to array that will contain the result of reading.
- [in] `dst_size_bits`: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

bool **esp\_efuse\_read\_field\_bit** (const *esp\_efuse\_desc\_t* \*`field`[])

Read a single bit eFuse field as a boolean value.

**Note** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

**Note** If assertions are enabled and the parameter is invalid, execution will abort

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

**Parameters**

- [in] `field`: A pointer to the structure describing the fields of efuse.

*esp\_err\_t* **esp\_efuse\_read\_field\_cnt** (const *esp\_efuse\_desc\_t* \*`field`[], *size\_t* \*`out_cnt`)

Reads bits from EFUSE field and returns number of bits programmed as “1” .

If the bits are set not sequentially, they will still be counted.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

**Parameters**

- [in] `field`: A pointer to the structure describing the fields of efuse.
- [out] `out_cnt`: A pointer that will contain the number of programmed as “1” bits.

*esp\_err\_t* **esp\_efuse\_write\_field\_blob** (const *esp\_efuse\_desc\_t* \*`field`[], const void \*`src`, *size\_t* `src_size_bits`)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src\_size\_bits” required size. Use “`esp_efuse_get_field_size()`” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] `field`: A pointer to the structure describing the fields of efuse.
- [in] `src`: A pointer to array that contains the data for writing.
- [in] `src_size_bits`: The number of bits required to write.

*esp\_err\_t* **esp\_efuse\_write\_field\_cnt** (const *esp\_efuse\_desc\_t* \*`field`[], *size\_t* `cnt`)

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1” , ESP\_ERR\_EFUSE\_CNT\_IS\_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_CNT\_IS\_FULL: Not all requested cnt bits is set.

**Parameters**

- [in] `field`: A pointer to the structure describing the fields of efuse.

- [in] cnt: Required number of programmed as “1” bits.

*esp\_err\_t* **esp\_efuse\_write\_field\_bit** (const *esp\_efuse\_desc\_t* \*field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling `esp_efuse_write_field_cnt()` with the `cnt` parameter equal to 1, except that it will return `ESP_OK` if the field is already set to 1.

#### Return

- `ESP_OK`: The operation was successfully completed, or the bit was already set to value 1.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments, including if the efuse field is not 1 bit wide.

#### Parameters

- [in] field: Pointer to the structure describing the efuse field.

*esp\_err\_t* **esp\_efuse\_set\_write\_protect** (*esp\_efuse\_block\_t* blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

#### Return

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

#### Parameters

- [in] blk: Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

*esp\_err\_t* **esp\_efuse\_set\_read\_protect** (*esp\_efuse\_block\_t* blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

#### Return

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

#### Parameters

- [in] blk: Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

int **esp\_efuse\_get\_field\_size** (const *esp\_efuse\_desc\_t* \*field[])

Returns the number of bits used by field.

**Return** Returns the number of bits used by field.

#### Parameters

- [in] field: A pointer to the structure describing the fields of efuse.

uint32\_t **esp\_efuse\_read\_reg** (*esp\_efuse\_block\_t* blk, unsigned int num\_reg)

Returns value of efuse register.

This is a thread-safe implementation. Example: `EFUSE_BLK2_RDATA3_REG` where (blk=2, num\_reg=3)

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return** Value of register

#### Parameters

- [in] blk: Block number of eFuse.
- [in] num\_reg: The register number in the block.

*esp\_err\_t* **esp\_efuse\_write\_reg** (*esp\_efuse\_block\_t* blk, unsigned int num\_reg, uint32\_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: `EFUSE_BLK3_WDATA0_REG` where (blk=3, num\_reg=0)

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**

- [in] blk: Block number of eFuse.
- [in] num\_reg: The register number in the block.
- [in] val: Value to write.

esp\_efuse\_coding\_scheme\_t **esp\_efuse\_get\_coding\_scheme** (esp\_efuse\_block\_t blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return** Return efuse coding scheme for blocks

**Parameters**

- [in] blk: Block number of eFuse.

esp\_err\_t **esp\_efuse\_read\_block** (esp\_efuse\_block\_t blk, void \*dst\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Read key to efuse block starting at the offset and the required size.

Note Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] blk: Block number of eFuse.
- [in] dst\_key: A pointer to array that will contain the result of reading.
- [in] offset\_in\_bits: Start bit in block.
- [in] size\_bits: The number of bits required to read.

esp\_err\_t **esp\_efuse\_write\_block** (esp\_efuse\_block\_t blk, const void \*src\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Write key to efuse block starting at the offset and the required size.

**Return**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits

**Parameters**

- [in] blk: Block number of eFuse.
- [in] src\_key: A pointer to array that contains the key for writing.
- [in] offset\_in\_bits: Start bit in block.
- [in] size\_bits: The number of bits required to write.

uint32\_t **esp\_efuse\_get\_pkg\_ver** (void)

Returns chip package from efuse.

**Return** chip package

void **esp\_efuse\_burn\_new\_values** (void)

Permanently update values written to the efuse write registers.

After updating EFUSE\_BLKx\_WDATAx\_REG registers with new values to write, call this function to permanently write them to efuse.

After burning new efuses, the read registers are updated to match the new efuse values.

**Note** Setting bits in efuse is permanent, they cannot be unset.

**Note** Due to this restriction you don't need to copy values to Efuse write registers from the matching read registers, bits which are set in the read register but unset in the matching write register will be unchanged when new values are burned.

**Note** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

void **esp\_efuse\_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

*esp\_err\_t* **esp\_efuse\_disable\_rom\_download\_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Return**

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_NOT\_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP\_ERR\_INVALID\_STATE (ESP32 only) This eFuse is write protected and cannot be written

*esp\_err\_t* **esp\_efuse\_enable\_rom\_secure\_download\_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

**Note** If Secure Download mode is already enabled, this function does nothing and returns success.

**Note** Disabling the ROM Download Mode also disables Secure Download Mode.

**Return**

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_INVALID\_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

void **esp\_efuse\_write\_random\_key** (uint32\_t *blk\_wdata0\_reg*)

Write random data to efuse key block write registers.

**Note** Caller is responsible for ensuring efuse block is empty and not write protected, before calling.

**Note** Behaviour depends on coding scheme: a 256-bit key is generated and written for Coding Scheme "None", a 192-bit key is generated, extended to 256-bits by the Coding Scheme, and then written for 3/4 Coding Scheme.

**Note** This function does not burn the new values, caller should call `esp_efuse_burn_new_values()` when ready to do this.

**Parameters**

- *blk\_wdata0\_reg*: Address of the first data write register in the block

uint32\_t **esp\_efuse\_read\_secure\_version** (void)

Return `secure_version` from efuse field.

**Return** Secure version from efuse field

bool **esp\_efuse\_check\_secure\_version** (uint32\_t *secure\_version*)

Check `secure_version` from app and `secure_version` and from efuse field.

**Return**

- True: If version of app is equal or more then `secure_version` from efuse.

**Parameters**

- `secure_version`: Secure version from app.

*esp\_err\_t* **esp\_efuse\_update\_secure\_version** (uint32\_t *secure\_version*)

Write efuse field by `secure_version` value.

Update the `secure_version` value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

#### Return

- `ESP_OK`: Successful.
- `ESP_FAIL`: secure version of app cannot be set to efuse field.
- `ESP_ERR_NOT_SUPPORTED`: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

#### Parameters

- [in] `secure_version`: Secure version from app.

void **esp\_efuse\_init** (uint32\_t *offset*, uint32\_t *size*)

Initializes variables: `offset` and `size` to simulate the work of an eFuse.

Note: To simulate the work of an eFuse need to set `CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE` option and to add in the `partition.csv` file a line `efuse_em, data, efuse, , 0x2000,.`

#### Parameters

- [in] `offset`: The starting address of the partition where the eFuse data will be located.
- [in] `size`: The size of the partition.

*esp\_err\_t* **esp\_efuse\_batch\_write\_begin** (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call `begin()` then perform as usually the necessary operations read and write and at the end call `commit()` to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last `commit()` function. The number of `begin()` functions should be equal to the number of `commit()` functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE...);
esp_efuse_write_field_cnt(ESP_EFUSE...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().
...
```

(continues on next page)

```
// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

**Return**

- ESP\_OK: Successful.

*esp\_err\_t* **esp\_efuse\_batch\_write\_cancel** (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The batch mode was not set.

*esp\_err\_t* **esp\_efuse\_batch\_write\_commit** (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The deferred writing mode was not set.

**const** *esp\_efuse\_desc\_t* \*\***esp\_efuse\_get\_purpose\_field** (esp\_efuse\_block\_t *block*)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use `esp_efuse_read_field_blob()` or `esp_efuse_get_key_purpose()`.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**Return** Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

**const** *esp\_efuse\_desc\_t* \*\***esp\_efuse\_get\_key** (esp\_efuse\_block\_t *block*)

Returns a pointer to a key block.

**Return** Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**bool** **esp\_efuse\_get\_key\_dis\_read** (esp\_efuse\_block\_t *block*)

Returns a read protection for the key block.

**Return** True: The key block is read protected False: The key block is readable.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_read** (esp\_efuse\_block\_t *block*)

Sets a read protection for the key block.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**bool** **esp\_efuse\_get\_key\_dis\_write** (esp\_efuse\_block\_t *block*)

Returns a write protection for the key block.

**Return** True: The key block is write protected False: The key block is writeable.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_write** (*esp\_efuse\_block\_t block*)

Sets a write protection for the key block.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

*esp\_efuse\_purpose\_t* **esp\_efuse\_get\_key\_purpose** (*esp\_efuse\_block\_t block*)

Returns the current purpose set for an efuse key block.

**Return**

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP\_EFUSE\_KEY\_PURPOSE\_MAX: Otherwise.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

*esp\_err\_t* **esp\_efuse\_set\_key\_purpose** (*esp\_efuse\_block\_t block*, *esp\_efuse\_purpose\_t purpose*)

Sets a key purpose for an efuse key block.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- [in] *purpose*: Key purpose.

bool **esp\_efuse\_get\_keypurpose\_dis\_write** (*esp\_efuse\_block\_t block*)

Returns a write protection of the key purpose field for an efuse key block.

**Return** True: The key purpose is write protected. False: The key purpose is writeable.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

*esp\_err\_t* **esp\_efuse\_set\_keypurpose\_dis\_write** (*esp\_efuse\_block\_t block*)

Sets a write protection of the key purpose field for an efuse key block.

**Return**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

**Parameters**

- [in] *block*: A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

bool **esp\_efuse\_find\_purpose** (*esp\_efuse\_purpose\_t purpose*, *esp\_efuse\_block\_t \*block*)

Find a key block with the particular purpose set.

**Return**

- True: If found,
- False: If not found (value at block pointer is unchanged).

**Parameters**

- [in] `purpose`: Purpose to search for.
- [out] `block`: Pointer in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX` which will be set to the key block if found. Can be `NULL`, if only need to test the key block exists.

`esp_efuse_block_t esp_efuse_find_unused_key_block` (void)

Search for an unused key block and return the first one found.

See `esp_efuse_key_block_unused` for a description of an unused key block.

**Return** First unused key block, or `EFUSE_BLK_KEY_MAX` if no unused key block is found.

unsigned `esp_efuse_count_unused_key_blocks` (void)

Return the number of unused efuse key blocks in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`.

bool `esp_efuse_key_block_unused` (`esp_efuse_block_t block`)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (`ESP_EFUSE_KEY_PURPOSE_USER`)

**Return**

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

**Parameters**

- `block`: key block to check.

bool `esp_efuse_get_digest_revoke` (unsigned `num_digest`)

Returns the status of the Secure Boot public key digest revocation bit.

**Return**

- True: If key digest is revoked,
- False: If key digest is not revoked.

**Parameters**

- [in] `num_digest`: The number of digest in range 0..2

*esp\_err\_t* `esp_efuse_set_digest_revoke` (unsigned `num_digest`)

Sets the Secure Boot public key digest revocation bit.

**Return**

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

**Parameters**

- [in] `num_digest`: The number of digest in range 0..2

bool `esp_efuse_get_write_protect_of_digest_revoke` (unsigned `num_digest`)

Returns a write protection of the Secure Boot public key digest revocation bit.

**Return** True: The revocation bit is write protected. False: The revocation bit is writeable.

**Parameters**

- [in] `num_digest`: The number of digest in range 0..2

*esp\_err\_t* `esp_efuse_set_write_protect_of_digest_revoke` (unsigned `num_digest`)

Sets a write protection of the Secure Boot public key digest revocation bit.

**Return**

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

**Parameters**

- [in] `num_digest`: The number of digest in range 0..2

***esp\_err\_t* esp\_efuse\_write\_key** (*esp\_efuse\_block\_t* block, *esp\_efuse\_purpose\_t* purpose, **const** void \*key, *size\_t* key\_size\_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

#### Return

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

#### Parameters

- [in] block: Block to read purpose for. Must be in range EFUSE\_BLK\_KEY0 to EFUSE\_BLK\_KEY\_MAX. Key block must be unused (esp\_efuse\_key\_block\_unused).
- [in] purpose: Purpose to set for this key. Purpose must be already unset.
- [in] key: Pointer to data to write.
- [in] key\_size\_bytes: Bytes length of data to write.

***esp\_err\_t* esp\_efuse\_write\_keys** (*esp\_efuse\_purpose\_t* purposes[], *uint8\_t* keys[][32], unsigned number\_of\_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

#### Return

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS: Error not enough unused key blocks available
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

#### Parameters

- [in] purposes: Array of purposes (purpose[number\_of\_keys]).
- [in] keys: Array of keys (uint8\_t keys[number\_of\_keys][32]). Each key is 32 bytes long.
- [in] number\_of\_keys: The number of keys to write (up to 6 keys).

***esp\_err\_t* esp\_efuse\_check\_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE\_ERR\_RST\_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP\_FAIL, which should be treated as esp\_restart.

**Note** Refers to ESP32-C3 only.

#### Return

- ESP\_OK: No errors in BLOCK0.
- ESP\_FAIL: Error in BLOCK0 requiring reboot.

## Structures

**struct** esp\_efuse\_desc\_t

Type definition for an eFuse field.

## Public Members

*esp\_efuse\_block\_t* **efuse\_block** : 8  
Block of eFuse

`uint8_t bit_start`  
Start bit [0..255]

`uint16_t bit_count`  
Length of bit field [1..-]

### Macros

**ESP\_ERR\_EFUSE**  
Base error code for efuse api.

**ESP\_OK\_EFUSE\_CNT**  
OK the required number of bits is set.

**ESP\_ERR\_EFUSE\_CNT\_IS\_FULL**  
Error field is full.

**ESP\_ERR\_EFUSE\_REPEATED\_PROG**  
Error repeated programming of programmed bits is strictly forbidden.

**ESP\_ERR\_CODING**  
Error while a encoding operation.

**ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS**  
Error not enough unused key blocks available

### Enumerations

**enum esp\_efuse\_purpose\_t**  
Type of key purpose.

*Values:*

**ESP\_EFUSE\_KEY\_PURPOSE\_USER** = 0

**ESP\_EFUSE\_KEY\_PURPOSE\_RESERVED** = 1

**ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_256\_KEY\_1** = 2

**ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_256\_KEY\_2** = 3

**ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES\_128\_KEY** = 4

**ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_ALL** = 5

**ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_JTAG** = 6

**ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_DOWN\_DIGITAL\_SIGNATURE** = 7

**ESP\_EFUSE\_KEY\_PURPOSE\_HMAC\_UP** = 8

**ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST0** = 9

**ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST1** = 10

**ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST2** = 11

**ESP\_EFUSE\_KEY\_PURPOSE\_MAX**

## 2.7.7 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see [Error Handling](#).

For the full list of error codes defined in ESP-IDF, see [Error Code Reference](#).

## API Reference

### Header File

- [esp\\_common/include/esp\\_err.h](#)

### Functions

**const** char \***esp\_err\_to\_name** (*esp\_err\_t code*)

Returns string for esp\_err\_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**Return** string error message

#### Parameters

- code: esp\_err\_t error code

**const** char \***esp\_err\_to\_name\_r** (*esp\_err\_t code*, char \*buf, size\_t buflen)

Returns string for esp\_err\_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp\_err\_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**Return** buf containing the string error message

#### Parameters

- code: esp\_err\_t error code
- [out] buf: buffer where the error message should be written
- buflen: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

### Macros

#### ESP\_OK

esp\_err\_t value indicating success (no error)

#### ESP\_FAIL

Generic esp\_err\_t code indicating failure

#### ESP\_ERR\_NO\_MEM

Out of memory

#### ESP\_ERR\_INVALID\_ARG

Invalid argument

#### ESP\_ERR\_INVALID\_STATE

Invalid state

#### ESP\_ERR\_INVALID\_SIZE

Invalid size

#### ESP\_ERR\_NOT\_FOUND

Requested resource not found

#### ESP\_ERR\_NOT\_SUPPORTED

Operation or feature not supported

#### ESP\_ERR\_TIMEOUT

Operation timed out

#### ESP\_ERR\_INVALID\_RESPONSE

Received response was invalid

**ESP\_ERR\_INVALID\_CRC**

CRC or checksum was invalid

**ESP\_ERR\_INVALID\_VERSION**

Version was invalid

**ESP\_ERR\_INVALID\_MAC**

MAC address was invalid

**ESP\_ERR\_WIFI\_BASE**

Starting number of WiFi error codes

**ESP\_ERR\_MESH\_BASE**

Starting number of MESH error codes

**ESP\_ERR\_FLASH\_BASE**

Starting number of flash error codes

**ESP\_ERR\_HW\_CRYPTO\_BASE**

Starting number of HW cryptography module error codes

**ESP\_ERROR\_CHECK (x)**

Macro which can be used to check the error code, and terminate the program in case the code is not ESP\_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

**ESP\_ERROR\_CHECK\_WITHOUT\_ABORT (x)**

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP\_ERROR\_CHECK(), this prints the same error message but isn't terminating the program.

**Type Definitions**

```
typedef int esp_err_t
```

## 2.7.8 ESP HTTPS OTA

**Overview**

esp\_https\_ota provides simplified APIs to perform firmware upgrades over HTTPS. It's an abstraction layer over existing OTA APIs.

**Application Example**

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

## Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer [Secure OTA Updates Without Secure boot](#)

## API Reference

### Header File

- [esp\\_https\\_ota/include/esp\\_https\\_ota.h](#)

### Functions

*esp\_err\_t* **esp\_https\_ota** (**const** *esp\_http\_client\_config\_t* \**config*)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

#### Return

- ESP\_OK: OTA data updated, next reboot will use specified partition.
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: Invalid app image
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for OTA operation.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's `app_update` component.

#### Parameters

- [in] `config`: pointer to *esp\_http\_client\_config\_t* structure.

*esp\_err\_t* **esp\_https\_ota\_begin** (*esp\_https\_ota\_config\_t* \**ota\_config*, *esp\_https\_ota\_handle\_t* \**handle*)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

#### Return

- ESP\_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `app_update` component and `esp_http_client` component in esp-idf.

#### Parameters

- [in] `ota_config`: pointer to *esp\_https\_ota\_config\_t* structure
- [out] `handle`: pointer to an allocated data of type *esp\_https\_ota\_handle\_t* which will be initialised in this function

*esp\_err\_t* **esp\_https\_ota\_perform** (*esp\_https\_ota\_handle\_t* *https\_ota\_handle*)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

#### Return

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's `app_update` component.

#### Parameters

- `[in] https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

bool **`esp_https_ota_is_complete_data_received`** (*`esp_https_ota_handle_t https_ota_handle`*)

Checks if complete data was received or not.

**Note** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

#### Return

- false
- true

#### Parameters

- `[in] https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

*`esp_err_t`* **`esp_https_ota_finish`** (*`esp_https_ota_handle_t https_ota_handle`*)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note** If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`

#### Return

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

#### Parameters

- `[in] https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

*`esp_err_t`* **`esp_https_ota_abort`** (*`esp_https_ota_handle_t https_ota_handle`*)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note** `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`

#### Return

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

#### Parameters

- `[in] https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

*`esp_err_t`* **`esp_https_ota_get_img_desc`** (*`esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info`*)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note** This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

**Return**

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_FAIL`: Failed to read image descriptor
- `ESP_OK`: Successfully read image descriptor

**Parameters**

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure
- [out] `new_app_info`: pointer to an allocated `esp_app_desc_t` structure

int `esp_https_ota_get_image_len_read` (`esp_https_ota_handle_t` `https_ota_handle`)

This function returns OTA image data read so far.

**Note** This API should be called only if `esp_https_ota_perform()` has been called atleast once or if `esp_https_ota_get_img_desc` has been called before.

**Return**

- -1 On failure
- total bytes read so far

**Parameters**

- [in] `https_ota_handle`: pointer to `esp_https_ota_handle_t` structure

**Structures**

**struct** `esp_https_ota_config_t`

ESP HTTPS OTA configuration.

**Public Members**

**const** `esp_http_client_config_t` \*`http_config`

ESP HTTP client configuration

`http_client_init_cb_t` `http_client_init_cb`

Callback after ESP HTTP client is initialised

bool `bulk_flash_erase`

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

**Macros**

`ESP_ERR_HTTPS_OTA_BASE`

`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

**Type Definitions**

**typedef** void \*`esp_https_ota_handle_t`

**typedef** `esp_err_t` (\*`http_client_init_cb_t`) (`esp_http_client_handle_t`)

## 2.7.9 ESP-pthread

**Overview**

This module offers Espressif specific extensions to the pthread library that can be used to influence the behaviour of pthreads. Currently the following configuration can be tuned:

- Stack size of the pthreads
- Priority of the created pthreads
- Inheriting this configuration across threads
- Thread name
- Core affinity / core pinning.

Example to tune the stack size of the pthread:

```
void * thread_func(void * p)
{
    printf("In thread_func\n");
    return NULL;
}

void app_main(void)
{
    pthread_t t1;

    esp_pthread_cfg_t cfg = esp_create_default_pthread_config();
    cfg.stack_size = (4 * 1024);
    esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, thread_func);
}
```

The API can also be used for inheriting the settings across threads. For example:

```
void * my_thread2(void * p)
{
    /* This thread will inherit the stack size of 4K */
    printf("In my_thread2\n");

    return NULL;
}

void * my_thread1(void * p)
{
    printf("In my_thread1\n");
    pthread_t t2;
    pthread_create(&t2, NULL, my_thread2);

    return NULL;
}

void app_main(void)
{
    pthread_t t1;

    esp_pthread_cfg_t cfg = esp_create_default_pthread_config();
    cfg.stack_size = (4 * 1024);
    cfg.inherit_cfg = true;
    esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, my_thread1);
}
```

## API Reference

### Header File

- [pthread/include/esp\\_pthread.h](#)

### Functions

[esp\\_pthread\\_cfg\\_t esp\\_pthread\\_get\\_default\\_config](#) (void)

Creates a default pthread configuration based on the values set via menuconfig.

**Return** A default configuration structure.

*esp\_err\_t* **esp\_thread\_set\_cfg** (const *esp\_thread\_cfg\_t* \*cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread\_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

**Note** Passing non-NULL attributes to pthread\_create() will override the stack\_size parameter set using this API

#### Return

- ESP\_OK if configuration was successfully set
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_ARG if stack\_size is less than PTHREAD\_STACK\_MIN

#### Parameters

- cfg: The pthread config parameters

*esp\_err\_t* **esp\_thread\_get\_cfg** (*esp\_thread\_cfg\_t* \*p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

#### Return

- ESP\_OK if the configuration was available
- ESP\_ERR\_NOT\_FOUND if a configuration wasn't previously set

#### Parameters

- p: Pointer to the pthread config structure that will be updated with the currently configured parameters

*esp\_err\_t* **esp\_thread\_init** (void)

Initialize pthread library.

### Structures

**struct esp\_thread\_cfg\_t**

pthread configuration structure that influences pthread creation

#### Public Members

size\_t **stack\_size**

The stack size of the pthread.

size\_t **prio**

The thread's priority.

bool **inherit\_cfg**

Inherit this configuration further.

const char \***thread\_name**

The thread name.

int **pin\_to\_core**

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

### Macros

**PTHREAD\_STACK\_MIN**

## 2.7.10 Event Loop Library

### Overview

The event loop library allows components to declare events to which other components can register handlers –code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

### Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more [here](#). Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed [here](#).
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that [here](#).
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*_
↳event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to_
↳specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is_
↳needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);
```

(continues on next page)

(continued from previous page)

```

// 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID_
↳ specifies a hypothetical
// event that handler run_on_event should execute on when it gets posted to_
↳ the loop.
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳ on_event, ...);

...

// 4. Post events to the loop. This queues the event on the event loop. At_
↳ some point in time
// the event loop executes the event handler registered to the posted event,_
↳ in this case run_on_event.
// For simplicity sake this example calls esp_event_post_to from app_main, but_
↳ posting can be done from
// any other tasks (which is the more interesting use case).
esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

...

// 5. Unregistering an unneeded handler
esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳ on_event);

...

// 6. Deleting an unneeded event loop
esp_event_loop_delete(loop_handle);
}

```

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with `_EVENT`. For example, the base for wifi events is declared and defined as `WIFI_EVENT`, the ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID's, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

### Default Event Loop

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
<a href="#"><i>esp_event_loop_create()</i></a>	<a href="#"><i>esp_event_loop_create_default()</i></a>
<a href="#"><i>esp_event_loop_delete()</i></a>	<a href="#"><i>esp_event_loop_delete_default()</i></a>
<a href="#"><i>esp_event_handler_register_with()</i></a>	<a href="#"><i>esp_event_handler_register()</i></a>
<a href="#"><i>esp_event_handler_unregister_with()</i></a>	<a href="#"><i>esp_event_handler_unregister()</i></a>
<a href="#"><i>esp_event_post_to()</i></a>	<a href="#"><i>esp_event_post()</i></a>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

### Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to [\*esp\\_event\\_handler\\_register\\_with\(\)\*](#). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for [\*esp\\_event\\_handler\\_register\\_with\(\)\*](#).

Therefore, the valid arguments to [\*esp\\_event\\_handler\\_register\\_with\(\)\*](#) are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, `ESP_EVENT_ANY_ID` - handler executes when any event with base <event base> gets posted to the loop
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE`, `MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also gets executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

### Event loop profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

### Application Example

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- [NMEA Parser](#) , which will decode the statements received from GPS.

## API Reference

### Header File

- [esp\\_event/include/esp\\_event.h](#)

### Functions

`esp_err_t esp_event_loop_create` (`const` [esp\\_event\\_loop\\_args\\_t](#) `*event_loop_args`,  
[esp\\_event\\_loop\\_handle\\_t](#) `*event_loop`)

Create a new event loop.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: `event_loop_args` or `event_loop` was `NULL`
- `ESP_ERR_NO_MEM`: Cannot allocate memory for event loops list
- `ESP_FAIL`: Failed to create task loop
- Others: Fail

#### Parameters

- [in] `event_loop_args`: configuration structure for the event loop to create
- [out] `event_loop`: handle to the created event loop

`esp_err_t esp_event_loop_delete` ([esp\\_event\\_loop\\_handle\\_t](#) `event_loop`)

Delete an existing event loop.

#### Return

- ESP\_OK: Success
- Others: Fail

**Parameters**

- [in] `event_loop`: event loop to delete, must not be NULL

*esp\_err\_t* **esp\_event\_loop\_create\_default** (void)

Create default event loop.

**Return**

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- ESP\_FAIL: Failed to create task loop
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_delete\_default** (void)

Delete the default event loop.

**Return**

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_run** (*esp\_event\_loop\_handle\_t* `event_loop`, TickType\_t `ticks_to_run`)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e task name was set to NULL in `event_loop_args` argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, ESP\_OK is returned and not ESP\_ERR\_TIMEOUT, since it is normal behavior.

**Note** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Return**

- ESP\_OK: Success
- Others: Fail

**Parameters**

- [in] `event_loop`: event loop to dispatch posted events from, must not be NULL
- [in] `ticks_to_run`: number of ticks to run the loop

*esp\_err\_t* **esp\_event\_handler\_register** (*esp\_event\_base\_t* `event_base`, int32\_t `event_id`,  
*esp\_event\_handler\_t* `event_handler`, void  
*\*event\_handler\_arg*)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use ESP\_EVENT\_ANY\_ID as the `event_id`
- all events known by the loop: use ESP\_EVENT\_ANY\_BASE for `event_base` and ESP\_EVENT\_ANY\_ID as the `event_id`

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous

registrations to be overwritten.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- `[in] event_base`: the base id of the event to register the handler for
- `[in] event_id`: the id of the event to register the handler for
- `[in] event_handler`: the handler function which gets called when the event is dispatched
- `[in] event_handler_arg`: data, aside from event data, that is passed to the handler when it is called

```
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop,
                                         esp_event_base_t event_base, int32_t event_id,
                                         esp_event_handler_t event_handler, void
                                         *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- `[in] event_loop`: the event loop to register this handler function to, must not be NULL
- `[in] event_base`: the base id of the event to register the handler for
- `[in] event_id`: the id of the event to register the handler for
- `[in] event_handler`: the handler function which gets called when the event is dispatched
- `[in] event_handler_arg`: data, aside from event data, that is passed to the handler when it is called

```
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t
                                                  event_loop, esp_event_base_t
                                                  event_base, int32_t event_id,
                                                  esp_event_handler_t event_handler,
                                                  void *event_handler_arg,
                                                  esp_event_handler_instance_t
                                                  *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id or instance is NULL
- Others: Fail

**Parameters**

- `[in] event_loop`: the event loop to register this handler function to, must not be NULL
- `[in] event_base`: the base id of the event to register the handler for
- `[in] event_id`: the id of the event to register the handler for
- `[in] event_handler`: the handler function which gets called when the event is dispatched
- `[in] event_handler_arg`: data, aside from event data, that is passed to the handler when it is called
- `[out] instance`: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t
                                             event_id,          esp_event_handler_t
                                             event_handler, void *event_handler_arg,
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Return**

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id or instance is NULL
- Others: Fail

**Parameters**

- `[in] event_base`: the base id of the event to register the handler for
- `[in] event_id`: the id of the event to register the handler for
- `[in] event_handler`: the handler function which gets called when the event is dispatched
- `[in] event_handler_arg`: data, aside from event data, that is passed to the handler when it is called
- `[out] instance`: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

```
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id,
                                       esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler so it will no longer be called during dispatch. Handlers can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handlers that were registered with the same wildcard arguments.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister()` instead.

**Note** When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**Return** `ESP_OK` success

**Return** `ESP_ERR_INVALID_ARG` invalid combination of event base and event id

**Return** others fail

#### Parameters

- [in] `event_base`: the base of the event with which to unregister the handler
- [in] `event_id`: the id of the event with which to unregister the handler
- [in] `event_handler`: the handler to unregister

```
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop,
                                           esp_event_base_t event_base, int32_t event_id,
                                           esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister_with()` instead.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

#### Parameters

- [in] `event_loop`: the event loop with which to unregister this handler function, must not be NULL
- [in] `event_base`: the base of the event with which to unregister the handler
- [in] `event_id`: the id of the event with which to unregister the handler
- [in] `event_handler`: the handler to unregister

```
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t
                                                    event_loop, esp_event_base_t
                                                    event_base, int32_t event_id,
                                                    esp_event_handler_instance_t
                                                    instance)
```

Unregister a handler instance from a specific event loop.

Unregisters a handler instance so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

**Note** When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

#### Parameters

- [in] `event_loop`: the event loop with which to unregister this handler function, must not be NULL

- [in] `event_base`: the base of the event with which to unregister the handler
- [in] `event_id`: the id of the event with which to unregister the handler
- [in] `instance`: the instance object of the registration to be unregistered

`esp_err_t esp_event_handler_instance_unregister` (*esp\_event\_base\_t* `event_base`, *int32\_t* `event_id`, *esp\_event\_handler\_instance\_t* `instance`)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

#### Parameters

- [in] `event_base`: the base of the event with which to unregister the handler
- [in] `event_id`: the id of the event with which to unregister the handler
- [in] `instance`: the instance object of the registration to be unregistered

`esp_err_t esp_event_post` (*esp\_event\_base\_t* `event_base`, *int32\_t* `event_id`, *void \*event\_data*, *size\_t* `event_data_size`, *TickType\_t* `ticks_to_wait`)

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

#### Parameters

- [in] `event_base`: the event base that identifies the event
- [in] `event_id`: the event id that identifies the event
- [in] `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- [in] `event_data_size`: the size of the event data
- [in] `ticks_to_wait`: number of ticks to block on a full event queue

`esp_err_t esp_event_post_to` (*esp\_event\_loop\_handle\_t* `event_loop`, *esp\_event\_base\_t* `event_base`, *int32\_t* `event_id`, *void \*event\_data*, *size\_t* `event_data_size`, *TickType\_t* `ticks_to_wait`)

Posts an event to the specified event loop. The event loop library keeps a copy of `event_data` and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as `esp_event_post_to`, except the additional specification of the event loop to post the event to.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

#### Parameters

- [in] `event_loop`: the event loop to post to, must not be NULL
- [in] `event_base`: the event base that identifies the event
- [in] `event_id`: the event id that identifies the event
- [in] `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- [in] `event_data_size`: the size of the event data
- [in] `ticks_to_wait`: number of ticks to block on a full event queue

*esp\_err\_t* **esp\_event\_isr\_post** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, BaseType\_t \*task\_unblocked)

Special variant of esp\_event\_post for posting events from interrupt handlers.

**Note** this function is only available when CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR is enabled

**Note** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

#### Return

- ESP\_OK: Success
- ESP\_FAIL: Event queue for the default event loop full
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

#### Parameters

- [in] event\_base: the event base that identifies the event
- [in] event\_id: the event id that identifies the event
- [in] event\_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event\_data\_size: the size of the event data; max is 4 bytes
- [out] task\_unblocked: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

*esp\_err\_t* **esp\_event\_isr\_post\_to** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, BaseType\_t \*task\_unblocked)

Special variant of esp\_event\_post\_to for posting events from interrupt handlers.

**Note** this function is only available when CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR is enabled

**Note** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

#### Return

- ESP\_OK: Success
- ESP\_FAIL: Event queue for the loop full
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

#### Parameters

- [in] event\_loop: the event loop to post to, must not be NULL
- [in] event\_base: the event base that identifies the event
- [in] event\_id: the event id that identifies the event
- [in] event\_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event\_data\_size: the size of the event data
- [out] task\_unblocked: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

*esp\_err\_t* **esp\_event\_dump** (FILE \*file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler
  ...

where:
```

(continues on next page)

```

event loop
    format: address,name rx:total_recieved dr:total_dropped
    where:
        address - memory address of the event loop
        name - name of the event loop, 'none' if no dedicated task
        total_recieved - number of successfully posted events
        total_dropped - number of events unsuccessfully posted due to queue.
↳being full

handler
    format: address ev:base,id inv:total_invoked run:total_runtime
    where:
        address - address of the handler function
        base,id - the event specified by event base and id this handler.
↳executes
        total_invoked - number of times this handler has been invoked
        total_runtime - total amount of time used for invoking this handler

```

**Note** this function is a noop when CONFIG\_ESP\_EVENT\_LOOP\_PROFILING is disabled

#### Return

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- Others: Fail

#### Parameters

- [in] file: the file stream to output to

### Structures

**struct esp\_event\_loop\_args\_t**

Configuration for creating event loops.

#### Public Members

**int32\_t queue\_size**

size of the event loop queue

**const char \*task\_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

**UBaseType\_t task\_priority**

priority of the event loop task, ignored if task name is NULL

**uint32\_t task\_stack\_size**

stack size of the event loop task, ignored if task name is NULL

**BaseType\_t task\_core\_id**

core to which the event loop task is pinned to, ignored if task name is NULL

### Header File

- [esp\\_event/include/esp\\_event\\_base.h](#)

### Macros

**ESP\_EVENT\_DECLARE\_BASE** (id)

**ESP\_EVENT\_DEFINE\_BASE** (id)

**ESP\_EVENT\_ANY\_BASE**

register handler for any event base

**ESP\_EVENT\_ANY\_ID**

register handler for any event id

**Type Definitions**

**typedef** const char \***esp\_event\_base\_t**

unique pointer to a subsystem that exposes events

**typedef** void \***esp\_event\_loop\_handle\_t**

a number that identifies an event with respect to a base

**typedef** void (\***esp\_event\_handler\_t**) (void \*event\_handler\_arg, *esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data)

function called when an event is posted to the queue

**typedef** void \***esp\_event\_handler\_instance\_t**

context identifying an instance of a registered event handler

**Related Documents****Legacy event loop****API Reference****Header File**

- [esp\\_event/include/esp\\_event\\_legacy.h](#)

**Functions**

*esp\_err\_t* **esp\_event\_send** (*system\_event\_t* \*event)

Send a event to event task.

Other task/modules, such as the tcpip\_adapter, can call this API to send an event to event task

**Note** This API is part of the legacy event system. New code should use event library API in esp\_event.h

**Return** ESP\_OK : succeed

**Return** others : fail

**Parameters**

- event: Event to send

*esp\_err\_t* **esp\_event\_send\_internal** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Send a event to event task.

Other task/modules, such as the tcpip\_adapter, can call this API to send an event to event task

**Note** This API is used by WiFi Driver only.

**Return** ESP\_OK : succeed

**Return** others : fail

**Parameters**

- [in] event\_base: the event base that identifies the event
- [in] event\_id: the event id that identifies the event
- [in] event\_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event\_data\_size: the size of the event data
- [in] ticks\_to\_wait: number of ticks to block on a full event queue

*esp\_err\_t* **esp\_event\_process\_default** (*system\_event\_t* \*event)

Default event handler for system events.

This function performs default handling of system events. When using esp\_event\_loop APIs, it is called automatically before invoking the user-provided callback function.

**Note** This API is part of the legacy event system. New code should use event library API in `esp_event.h`. Applications which implement a custom event loop must call this function as part of event processing.

**Return** ESP\_OK if an event was handled successfully

**Parameters**

- `event`: pointer to event to be handled

void **esp\_event\_set\_default\_eth\_handlers** (void)

Install default event handlers for Ethernet interface.

**Note** This API is part of the legacy event system. New code should use event library API in `esp_event.h`.

void **esp\_event\_set\_default\_wifi\_handlers** (void)

Install default event handlers for Wi-Fi interfaces (station and AP)

**Note** This API is part of the legacy event system. New code should use event library API in `esp_event.h`.

*esp\_err\_t* **esp\_event\_loop\_init** (*system\_event\_cb\_t* cb, void \*ctx)

Initialize event loop.

Create the event handler and task

**Note** This API is part of the legacy event system. New code should use event library API in `esp_event.h`.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- `cb`: application specified event callback, it can be modified by call `esp_event_set_cb`
- `ctx`: reserved for user

*system\_event\_cb\_t* **esp\_event\_loop\_set\_cb** (*system\_event\_cb\_t* cb, void \*ctx)

Set application specified event callback function.

**Note** This API is part of the legacy event system. New code should use event library API in `esp_event.h`.

**Attention** 1. If `cb` is NULL, means application don't need to handle. If `cb` is not NULL, it will be call when an event is received, after the default event callback is completed

**Return** old callback

**Parameters**

- `cb`: application callback function
- `ctx`: argument to be passed to callback

## Unions

**union system\_event\_info\_t**

*#include <esp\_event\_legacy.h>* Union of all possible system\_event argument structures

### Public Members

*system\_event\_sta\_connected\_t* **connected**

ESP32 station connected to AP

*system\_event\_sta\_disconnected\_t* **disconnected**

ESP32 station disconnected to AP

*system\_event\_sta\_scan\_done\_t* **scan\_done**

ESP32 station scan (APs) done

*system\_event\_sta\_authmode\_change\_t* **auth\_change**

the auth mode of AP ESP32 station connected to changed

*system\_event\_sta\_got\_ip\_t* **got\_ip**

ESP32 station got IP, first time got IP or when IP is changed

*system\_event\_sta\_wps\_er\_pin\_t* **sta\_er\_pin**  
ESP32 station WPS enrollee mode PIN code received

*system\_event\_sta\_wps\_fail\_reason\_t* **sta\_er\_fail\_reason**  
ESP32 station WPS enrollee mode failed reason code received

*system\_event\_sta\_wps\_er\_success\_t* **sta\_er\_success**  
ESP32 station WPS enrollee success

*system\_event\_ap\_staconnected\_t* **sta\_connected**  
a station connected to ESP32 soft-AP

*system\_event\_ap\_stadisconnected\_t* **sta\_disconnected**  
a station disconnected to ESP32 soft-AP

*system\_event\_ap\_probe\_req\_rx\_t* **ap\_probereqrecved**  
ESP32 soft-AP receive probe request packet

*system\_event\_ftm\_report\_t* **ftm\_report**  
Report of FTM procedure

*system\_event\_ap\_staipassigned\_t* **ap\_staipassigned**  
ESP32 soft-AP assign an IP to the station

*system\_event\_got\_ip6\_t* **got\_ip6**  
ESP32 station or ap or ethernet ipv6 addr state change to preferred

### Structures

**struct system\_event\_t**  
Event, as a tagged enum

### Public Members

Argument structure of event

**typedef** *wifi\_event\_ftm\_report\_t* **system\_event\_ftm\_report\_t**  
Argument structure of SYSTEM\_EVENT\_FTM\_REPORT event

**typedef** *ip\_event\_ap\_staassigned\_t* **system\_event\_ap\_staassigned\_t**  
Argument structure of event

**typedef** *ip\_event\_got\_ip\_t* **system\_event\_sta\_got\_ip\_t**  
Argument structure of event

**typedef** *ip\_event\_got\_ip6\_t* **system\_event\_got\_ip6\_t**  
Argument structure of event

**typedef** *esp\_err\_t* (\***system\_event\_handler\_t**) (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Event handler function type

**typedef** *esp\_err\_t* (\***system\_event\_cb\_t**) (void \*ctx, *system\_event\_t* \*event)  
Application specified event callback function.

**Note** This API is part of the legacy event system. New code should use event library API in esp\_event.h

#### Return

- ESP\_OK: succeed
- others: fail

#### Parameters

- ctx: reserved for user
- event: event type defined in this file

### Enumerations

**enum** **system\_event\_id\_t**  
System event types enumeration

*Values:*

**SYSTEM\_EVENT\_WIFI\_READY** = 0  
ESP32 WiFi ready

**SYSTEM\_EVENT\_SCAN\_DONE**  
ESP32 finish scanning AP

**SYSTEM\_EVENT\_STA\_START**  
ESP32 station start

**SYSTEM\_EVENT\_STA\_STOP**  
ESP32 station stop

**SYSTEM\_EVENT\_STA\_CONNECTED**  
ESP32 station connected to AP

**SYSTEM\_EVENT\_STA\_DISCONNECTED**  
ESP32 station disconnected from AP

**SYSTEM\_EVENT\_STA\_AUTHMODE\_CHANGE**  
the auth mode of AP connected by ESP32 station changed

**SYSTEM\_EVENT\_STA\_GOT\_IP**  
ESP32 station got IP from connected AP

**SYSTEM\_EVENT\_STA\_LOST\_IP**  
ESP32 station lost IP and the IP is reset to 0

**SYSTEM\_EVENT\_STA\_BSS\_RSSI\_LOW**  
ESP32 station connected BSS rssi goes below threshold

**SYSTEM\_EVENT\_STA\_WPS\_ER\_SUCCESS**  
ESP32 station wps succeeds in enrollee mode

**SYSTEM\_EVENT\_STA\_WPS\_ER\_FAILED**  
ESP32 station wps fails in enrollee mode

**SYSTEM\_EVENT\_STA\_WPS\_ER\_TIMEOUT**  
ESP32 station wps timeout in enrollee mode

**SYSTEM\_EVENT\_STA\_WPS\_ER\_PIN**  
ESP32 station wps pin code in enrollee mode

**SYSTEM\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**  
ESP32 station wps overlap in enrollee mode

**SYSTEM\_EVENT\_AP\_START**  
ESP32 soft-AP start

**SYSTEM\_EVENT\_AP\_STOP**  
ESP32 soft-AP stop

**SYSTEM\_EVENT\_AP\_STA\_CONNECTED**  
a station connected to ESP32 soft-AP

**SYSTEM\_EVENT\_AP\_STA\_DISCONNECTED**  
a station disconnected from ESP32 soft-AP

**SYSTEM\_EVENT\_AP\_STA\_IP\_ASSIGNED**  
ESP32 soft-AP assign an IP to a connected station

**SYSTEM\_EVENT\_AP\_PROBREQ\_RECV**  
Receive probe request packet in soft-AP interface

**SYSTEM\_EVENT\_ACTION\_TX\_STATUS**  
Receive status of Action frame transmitted

**SYSTEM\_EVENT\_ROC\_DONE**  
Indicates the completion of Remain-on-Channel operation status

**SYSTEM\_EVENT\_STA\_BEACON\_TIMEOUT**  
ESP32 station beacon timeout

**SYSTEM\_EVENT\_FTM\_REPORT**  
Receive report of FTM procedure

**SYSTEM\_EVENT\_GOT\_IP6**  
ESP32 station or ap or ethernet interface v6IP addr is preferred

**SYSTEM\_EVENT\_ETH\_START**  
ESP32 ethernet start

**SYSTEM\_EVENT\_ETH\_STOP**  
ESP32 ethernet stop

**SYSTEM\_EVENT\_ETH\_CONNECTED**  
ESP32 ethernet phy link up

**SYSTEM\_EVENT\_ETH\_DISCONNECTED**  
ESP32 ethernet phy link down

**SYSTEM\_EVENT\_ETH\_GOT\_IP**  
ESP32 ethernet got IP from connected AP

**SYSTEM\_EVENT\_MAX**

Number of members in this enum

## 2.7.11 FreeRTOS

### Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

---

**Note:** ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0,

---

For more information about FreeRTOS features specific to ESP-IDF, see [ESP-IDF FreeRTOS SMP Changes](#) and [ESP-IDF FreeRTOS Additions](#).

### Task API

#### Header File

- [freertos/include/freertos/task.h](#)

#### Functions

`BaseType_t xTaskCreatePinnedToCore (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)`

Create a new task with a specified affinity.

This function is similar to `xTaskCreate`, but allows setting task affinity in SMP system.

**Return** `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

#### Parameters

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- `usStackDepth`: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters`: Pointer that will be used as the parameter for the task being created.
- `uxPriority`: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- `pvCreatedTask`: Used to pass back a handle by which the created task can be referenced.
- `xCoreID`: If the value is `tskNO_AFFINITY`, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than `(portNUM_PROCESSORS - 1)` will cause the function to fail.

`static BaseType_t xTaskCreate (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask)`

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()`

function. (see <http://www.freertos.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter
    ↪ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared
    ↪static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have
    ↪been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    ↪PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

**Return** `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

**Note** If program uses thread local variables (ones specified with “`__thread`” keyword) then storage for them will be allocated on the task’s stack.

#### Parameters

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- `usStackDepth`: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters`: Pointer that will be used as the parameter for the task being created.
- `uxPriority`: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `( 2 | portPRIVILEGE_BIT )`.
- `pvCreatedTask`: Used to pass back a handle by which the created task can be referenced.

*TaskHandle\_t* **xTaskCreateStaticPinnedToCore** (TaskFunction\_t *pvTaskCode*, **const** char \***const** *pcName*, **const** uint32\_t *ulStackDepth*, void \***const** *pvParameters*, UBaseType\_t *uxPriority*, StackType\_t \***const** *pxStackBuffer*, StaticTask\_t \***const** *pxTaskBuffer*, **const** BaseType\_t *xCoreID*)

Create a new task with a specified affinity.

This function is similar to `xTaskCreateStatic`, but allows specifying task affinity in an SMP system.

**Return** If neither `pxStackBuffer` or `pxTaskBuffer` are NULL, then the task will be created and `pdPASS` is returned. If either `pxStackBuffer` or `pxTaskBuffer` are NULL then the task will not be created and `errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY` is returned.

#### Parameters

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by `configMAX_TASK_NAME_LEN` in `FreeRTOSConfig.h`.
- `ulStackDepth`: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters`: Pointer that will be used as the parameter for the task being created.
- `uxPriority`: The priority at which the task will run.
- `pxStackBuffer`: Must point to a `StackType_t` array that has at least `ulStackDepth` indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- `pxTaskBuffer`: Must point to a variable of type `StaticTask_t`, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.
- `xCoreID`: If the value is `tskNO_AFFINITY`, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than `(portNUM_PROCESSORS - 1)` will cause the function to fail.

**static** *TaskHandle\_t* **xTaskCreateStatic** (TaskFunction\_t *pvTaskCode*, **const** char \***const** *pcName*, **const** uint32\_t *ulStackDepth*, void \***const** *pvParameters*, UBaseType\_t *uxPriority*, StackType\_t \***const** *pxStackBuffer*, StaticTask\_t \***const** *pxTaskBuffer*)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <http://www.freertos.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];
```

(continues on next page)

```

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,           // Function that implements the task.
        "NAME",             // Text name for the task.
        STACK_SIZE,        // Stack size in bytes, not words.
        ( void * ) 1,       // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,             // Array to use as the task's stack.
        &xTaskBuffer );     // Variable to hold the task's data_
↪structure.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

```

**Return** If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD\_NOT\_ALLOCATE\_REQUIRED\_MEMORY is returned.

**Note** If program uses thread local variables (ones specified with “\_\_thread” keyword) then storage for them will be allocated on the task’s stack.

#### Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX\_TASK\_NAME\_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType\_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask\_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

void **vTaskAllocateMPURegions** (TaskHandle\_t xTask, const MemoryRegion\_t \*const pxRegions)

void **vTaskDelete** (TaskHandle\_t xTaskToDelete)

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

`INCLUDE_vTaskDelete` must be defined as 1 for this function to be available. See the configuration section for more information.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to `vTaskDelete ()`. Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file `death.c` for sample code that utilises `vTaskDelete ()`.

Example usage:

```
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &
    ↪xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

### Parameters

- `xTaskToDelete`: The handle of the task to be deleted. Passing `NULL` will cause the calling task to be deleted.

void **vTaskDelay** (const TickType\_t *xTicksToDelay*)

Delay a task for a given number of ticks.

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant `portTICK_PERIOD_MS` can be used to calculate real time from the tick rate - with the resolution of one tick period.

`INCLUDE_vTaskDelay` must be defined as 1 for this function to be available. See the configuration section for more information.

`vTaskDelay()` specifies a time at which the task wishes to unblock relative to the time at which `vTaskDelay()` is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after `vTaskDelay()` is called. `vTaskDelay()` does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which `vTaskDelay()` gets called and therefore the time at which the task next executes. See `vTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for ( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

### Parameters

- `xTicksToDelay`: The amount of time, in tick periods, that the calling task should block.

void **vTaskDelayUntil** (TickType\_t \*const *pxPreviousWakeTime*, const TickType\_t *xTimeIncrement*)

Delay a task until a specified time.

INCLUDE\_vTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay () in one important aspect: vTaskDelay () will cause a task to block for the specified number of ticks from the time vTaskDelay () is called. It is therefore difficult to use vTaskDelay () by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay () may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay () specifies a wake time relative to the time at which the function is called, vTaskDelayUntil () specifies the absolute (exact) time at which it wishes to unblock.

The constant portTICK\_PERIOD\_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

Example usage:

```
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for ( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here.
    }
}
```

### Parameters

- *pxPreviousWakeTime*: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within vTaskDelayUntil ().
- *xTimeIncrement*: The cycle time period. The task will be unblocked at time \**pxPreviousWakeTime* + *xTimeIncrement*. Calling vTaskDelayUntil with the same *xTimeIncrement* parameter value will cause the task to execute with a fixed interface period.

BaseType\_t **xTaskAbortDelay** (*TaskHandle\_t xTask*)

UBaseType\_t **uxTaskPriorityGet** (const *TaskHandle\_t xTask*)

Obtain the priority of any task.

INCLUDE\_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
↪ );
```

(continues on next page)

(continued from previous page)

```

// ...

// Use the handle to obtain the priority of the created task.
// It was created with tskIDLE_PRIORITY, but may have changed
// it itself.
if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
{
    // The task has changed it's priority.
}

// ...

// Is our priority higher than the created task?
if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
{
    // Our priority (obtained using NULL handle) is higher.
}
}

```

**Return** The priority of xTask.

**Parameters**

- xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

UBaseType\_t **uxTaskPriorityGetFromISR**(const *TaskHandle\_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

*eTaskState* **eTaskGetState**(*TaskHandle\_t* xTask)

Obtain the state of any task.

States are encoded by the eTaskState enumerated type.

INCLUDE\_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

**Return** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

**Parameters**

- xTask: Handle of the task to be queried.

void **vTaskGetInfo**(*TaskHandle\_t* xTask, TaskStatus\_t \*pxTaskStatus, BaseType\_t xGetFreeStackSize, *eTaskState* eState)

Populates a TaskStatus\_t structure with information about a task.

configUSE\_TRACE\_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```

void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,

```

(continues on next page)

(continued from previous page)

```

    &xTaskDetails,
    pdTRUE, // Include the high water mark in xTaskDetails.
    eInvalid ); // Include the task state in xTaskDetails.
}

```

**Parameters**

- **xTask**: Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus**: A pointer to the TaskStatus\_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace**: The TaskStatus\_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus\_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState**: The TaskStatus\_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus\_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus\_t structure.

void **vTaskPrioritySet** (*TaskHandle\_t* xTask, UBaseType\_t uxNewPriority)

Set the priority of any task.

INCLUDE\_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```

void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪ );

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}

```

**Parameters**

- **xTask**: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority**: The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle\_t* xTaskToSuspend)

Suspend a task.

INCLUDE\_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend ()` twice on the same task still only requires one call to `vTaskResume ()` to ready the suspended task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪ );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

#### Parameters

- `xTaskToSuspend`: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume** (*TaskHandle\_t xTaskToResume*)

Resumes a suspended task.

`INCLUDE_vTaskSuspend` must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to `vTaskSuspend ()` will be made available for running again by a single call to `vTaskResume ()`.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪ );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );
```

(continues on next page)

(continued from previous page)

```

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Resume the suspended task ourselves.
vTaskResume( xHandle );

// The created task will once again get microcontroller processing
// time in accordance with its priority within the system.
}

```

**Parameters**

- xTaskToResume: Handle to the task being readied.

BaseType\_t **xTaskResumeFromISR** (*TaskHandle\_t* xTaskToResume)

An implementation of vTaskResume() that can be called from within an ISR.

INCLUDE\_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Return** pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

**Parameters**

- xTaskToResume: Handle to the task being readied.

void **vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts.

Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.

```

(continues on next page)

(continued from previous page)

```

vTaskSuspendAll ();

// Perform the operation here. There is no need to use critical
// sections as we have all the microcontroller processing time.
// During this time interrupts will still operate and the kernel
// tick count will be maintained.

// ...

// The operation is complete. Restart the kernel.
xTaskResumeAll ();
}
}

```

 **BaseType\_t xTaskResumeAll (void)**

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}

```

**Return** If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned. **TickType\_t xTaskGetTickCount (void)**

Get tick count

**Return** The count of ticks since vTaskStartScheduler was called.

TickType\_t **xTaskGetTickCountFromISR** (void)

Get tick count from ISR

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType\_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

**Return** The count of ticks since vTaskStartScheduler was called.

UBaseType\_t **uxTaskGetNumberOfTasks** (void)

Get current number of tasks

**Return** The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char \***pcTaskGetName** (*TaskHandle\_t* xTaskToQuery)

Get task name

**Return** The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

*TaskHandle\_t* **xTaskGetHandle** (const char \*pcNameToQuery)

**Note** This function takes a relatively long time to complete and should be used sparingly.

**Return** The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE\_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType\_t **uxTaskGetStackHighWaterMark** (*TaskHandle\_t* xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE\_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK\_DEPTH\_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Return** The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

#### Parameters

- xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

configSTACK\_DEPTH\_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle\_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE\_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK\_DEPTH\_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Return** The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

**Parameters**

- `xTask`: Handle of the task associated with the stack to be checked. Set `xTask` to `NULL` to check the stack of the calling task.

`uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)`

Returns the start of the stack associated with `xTask`.

`INCLUDE_pxTaskGetStackStart` must be set to 1 in `FreeRTOSConfig.h` for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

**Return** A pointer to the start of the stack.

**Parameters**

- `xTask`: Handle of the task associated with the stack returned. Set `xTask` to `NULL` to return the stack of the calling task.

void `vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)`

Sets `pxHookFunction` to be the task hook function used by the task `xTask`.

**Parameters**

- `xTask`: Handle of the task to set the hook function for. Passing `xTask` as `NULL` has the effect of setting the calling task's hook function.
- `pxHookFunction`: Pointer to the hook function.

`TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)`

Returns the `pxHookFunction` value assigned to the task `xTask`. Do not call from an interrupt service routine - call `xTaskGetApplicationTaskTagFromISR()` instead.

`TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)`

Returns the `pxHookFunction` value assigned to the task `xTask`. Can be called from an interrupt service routine.

void `vTaskSetThreadLocalStoragePointer (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)`

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the `configNUM_THREAD_LOCAL_STORAGE_POINTERS` setting in `FreeRTOSConfig.h`. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

**Parameters**

- `xTaskToSet`: Task to set thread local storage pointer for
- `xIndex`: The index of the pointer to set, from 0 to `configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1`.
- `pvValue`: Pointer value to set.

void `*pvTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)`

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the `configNUM_THREAD_LOCAL_STORAGE_POINTERS` setting in `FreeRTOSConfig.h`. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

**Return** Pointer value

**Parameters**

- `xTaskToQuery`: Task to get thread local storage pointer for
- `xIndex`: The index of the pointer to get, from 0 to `configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1`.

void `vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)`

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the `configNUM_THREAD_LOCAL_STORAGE_POINTERS` setting in `FreeRTOSConfig.h`. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to `vTaskSetThreadLocalStoragePointer`, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

#### Parameters

- `xTaskToSet`: Task to set thread local storage pointer for
- `xIndex`: The index of the pointer to set, from 0 to `configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1`.
- `pvValue`: Pointer value to set.
- `pvDelCallback`: Function to call to dispose of the local storage pointer when the task is deleted.

`BaseType_t` **`xTaskCallApplicationTaskHook`** (*TaskHandle\_t* `xTask`, void *\*pvParameter*)

Calls the hook function associated with `xTask`. Passing `xTask` as `NULL` has the effect of calling the Running tasks (the calling task) hook function.

#### Parameters

- `xTask`: Handle of the task to call the hook for.
- `pvParameter`: Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

*TaskHandle\_t* **`xTaskGetIdleTaskHandle`** (void)

`xTaskGetIdleTaskHandle()` is only available if `INCLUDE_xTaskGetIdleTaskHandle` is set to 1 in `FreeRTOSConfig.h`.

Simply returns the handle of the idle task. It is not valid to call `xTaskGetIdleTaskHandle()` before the scheduler has been started.

`UBaseType_t` **`uxTaskGetSystemState`** (`TaskStatus_t` *\*const* `pxTaskStatusArray`, `const` `UBaseType_t` *uxArraySize*, `uint32_t` *\*const* `pulTotalRunTime`)

`configUSE_TRACE_FACILITY` must be defined as 1 in `FreeRTOSConfig.h` for `uxTaskGetSystemState()` to be available.

`uxTaskGetSystemState()` populates an `TaskStatus_t` structure for each task in the system. `TaskStatus_t` structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the `TaskStatus_t` structure definition in this file for the full member list.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );
```

(continues on next page)

(continued from previous page)

```

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
↳ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter /↳
↳ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",↳
↳pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,↳
↳ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%%\r\n",↳
↳pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }

            pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
        }
    }

    // The array is no longer needed, free the memory it consumes.
    vPortFree( pxTaskStatusArray );
}
}

```

**Note** This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

**Return** The number of `TaskStatus_t` structures that were populated by `uxTaskGetSystemState()`. This should equal the number returned by the `uxTaskGetNumberOfTasks()` API function, but will be zero if the value passed in the `uxArraySize` parameter was too small.

#### Parameters

- `pxTaskStatusArray`: A pointer to an array of `TaskStatus_t` structures. The array must contain at least one `TaskStatus_t` structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the `uxTaskGetNumberOfTasks()` API function.
- `uxArraySize`: The size of the array pointed to by the `pxTaskStatusArray` parameter. The size is specified as the number of indexes in the array, or the number of `TaskStatus_t` structures contained in the array, not by the number of bytes in the array.
- `pulTotalRunTime`: If `configGENERATE_RUN_TIME_STATS` is set to 1 in `FreeRTOSConfig.h` then `*pulTotalRunTime` is set by `uxTaskGetSystemState()` to the total run time (as defined

by the run time stats clock, see <http://www.freertos.org/rtos-run-time-stats.html>) since the target booted. `pulTotalRunTime` can be set to `NULL` to omit the total run time information.

void **vTaskList** (char \**pcWriteBuffer*)

List all the current tasks.

`configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

Lists all the current tasks, along with their current state and stack usage high water mark.

**Note** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Tasks are reported as blocked ( 'B' ), ready ( 'R' ), deleted ( 'D' ) or suspended ( 'S' ).

`vTaskList()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays task names, states and stack usage.

**Note** This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskList()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskList()`.

#### Parameters

- `pcWriteBuffer`: A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **vTaskGetRunTimeStats** (char \**pcWriteBuffer*)

Get the state of running tasks as a string

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. Calling `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**Note** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

`vTaskGetRunTimeStats()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

**Note** This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskGetRunTimeStats()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

#### Parameters

- `pcWriteBuffer`: A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

`uint32_t ulTaskGetIdleRunTimeCounter` (void)

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. While `uxTaskGetSystemState()` and `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, `ulTaskGetIdleRunTimeCounter()` returns the total execution time of just the idle task.

**Return** The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`BaseType_t xTaskGenericNotify` (*TaskHandle\_t xTaskToNotify*, `uint32_t ulValue`, *eNotifyAction eAction*, `uint32_t *pulPreviousNotificationValue`)

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (`uint32_t`).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWait()` or `ulTaskNotifyTake()`. If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWait()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTake()` to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`eSetBits` - The task’s notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

#### Parameters

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- `ulValue`: Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- `eAction`: Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:

**eIncrement** - The task's notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithOverwrite** - The task's notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending then the task's notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.

**eNoAction** - The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**Return** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

#### Parameters

- `pulPreviousNotificationValue`: Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

`BaseType_t xTaskGenericNotifyFromISR (TaskHandle_t xTaskToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)`

Send task notification from an ISR.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private "notification value", which is a 32-bit unsigned integer (`uint32_t`).

A version of `xTaskNotify()` that can be used from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task's notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWait()` or `ulTaskNotifyTake()`. If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWait()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTake()` to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

**eSetBits** - The task's notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

#### Parameters

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- `ulValue`: Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- `eAction`: Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:

**eIncrement** - The task's notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithOverwrite** - The task's notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending then the task's notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.

**eNoAction** - The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**Return** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

#### Parameters

- `pulPreviousNotificationValue`: Can be used to pass out the subject task's notification value before any bits are modified by the notify function.
- `pxHigherPriorityTaskWoken`: `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType\_t **xTaskNotifyWait** (uint32\_t *ulBitsToClearOnEntry*, uint32\_t *ulBitsToClearOnExit*, uint32\_t *\*pulNotificationValue*, TickType\_t *xTicksToWait*)

Wait for task notification

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private "notification value", which is a 32-bit unsigned integer (uint32\_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task's notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWait()` or `ulTaskNotifyTake()`. If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWait()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTake()` to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

**Return** If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

#### Parameters

- `ulBitsToClearOnEntry`: Bits that are set in `ulBitsToClearOnEntry` value will be cleared in the calling task's notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting `ulBitsToClearOnEntry` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0. Setting `ulBitsToClearOnEntry` to 0 will leave the task's notification value unchanged.
- `ulBitsToClearOnExit`: If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task's notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task's notification value (note `*pulNotificationValue` is

set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task's notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task's notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task's notification value).

- `pulNotificationValue`: Used to pass the task's notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- `xTicksToWait`: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS( value_in_ms )` can be used to convert a time specified in milliseconds to a time specified in ticks.

```
void vTaskNotifyGiveFromISR (TaskHandle_t xTaskToNotify, BaseType_t
                             *pxHigherPriorityTaskWoken)
```

Simplified macro for sending task notification from ISR.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (`uint32_t`).

A version of `xTaskNotifyGive()` that can be called from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task's notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTake()` API function rather than the `xTaskNotifyWait()` API function.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

#### Parameters

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- `pxHigherPriorityTaskWoken`: `vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```
uint32_t ulTaskNotifyTake (BaseType_t xClearCountOnExit, TickType_t xTicksToWait)
```

Simplified macro for receiving task notification.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (`uint32_t`).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the

need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task's notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTake() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTake().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGive() macro, or xTaskNotify() function with the eAction parameter set to eIncrement.

ulTaskNotifyTake() can either clear the task's notification value to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the task's notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTake() to [optionally] block to wait for a the task's notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWait() will return when a notification is pending, ulTaskNotifyTake() will return when the task's notification value is not zero.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

**Return** The task's notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

#### Parameters

- **xClearCountOnExit**: if xClearCountOnExit is pdFALSE then the task's notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS\_TO\_TICKS( value\_in\_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

BaseType\_t **xTaskNotifyStateClear** (*TaskHandle\_t xTask*)

If the notification state of the task referenced by the handle xTask is eNotified, then set the task's notification state to eNotWaitingNotification. The task's notification value is not altered. Set xTask to NULL to clear the notification state of the calling task.

**Return** pdTRUE if the task's notification state was set to eNotWaitingNotification, otherwise pdFALSE.

#### Macros

**tskKERNEL\_VERSION\_NUMBER**

**tskKERNEL\_VERSION\_MAJOR**

**tskKERNEL\_VERSION\_MINOR**

**tskKERNEL\_VERSION\_BUILD**

**tskMPU\_REGION\_READ\_ONLY**

**tskMPU\_REGION\_READ\_WRITE**

**tskMPU\_REGION\_EXECUTE\_NEVER**

**tskMPU\_REGION\_NORMAL\_MEMORY**

**tskMPU\_REGION\_DEVICE\_MEMORY**

**tskNO\_AFFINITY**

**taskIDLE\_PRIORITY**

Defines the priority used by the idle task. This must not be modified.

**taskYIELD ()**

Macro for forcing a context switch.

**taskENTER\_CRITICAL (x)**

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

**Note** This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER\_CRITICAL\_FROM\_ISR ()****taskENTER\_CRITICAL\_ISR (mux)****taskEXIT\_CRITICAL (x)**

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

**Note** This may alter the stack (depending on the portable implementation) so must be used with care!

**taskEXIT\_CRITICAL\_FROM\_ISR (x)****taskEXIT\_CRITICAL\_ISR (mux)****taskDISABLE\_INTERRUPTS ()**

Macro to disable all maskable interrupts.

**taskENABLE\_INTERRUPTS ()**

Macro to enable microcontroller interrupts.

**taskSCHEDULER\_SUSPENDED****taskSCHEDULER\_NOT\_STARTED****taskSCHEDULER\_RUNNING****xTaskNotify (xTaskToNotify, ulValue, eAction)****xTaskNotifyAndQuery (xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)****xTaskNotifyFromISR (xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)****xTaskNotifyAndQueryFromISR (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)****xTaskNotifyGive (xTaskToNotify)**

Simplified macro for sending task notification.

configUSE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

When configUSE\_TASK\_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32\_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGive() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGive().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTake() API function rather than the xTaskNotifyWait() API function.

See <http://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

**Return** `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

#### Parameters

- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.

#### Type Definitions

```
typedef void *TaskHandle_t
```

```
typedef BaseType_t (*TaskHookFunction_t) (void *)
```

Defines the prototype to which the application task hook function must conform.

```
typedef void (*TlsDeleteCallbackFunction_t) (int, void *)
```

Prototype of local storage pointer deletion callback.

#### Enumerations

```
enum eTaskState
```

Task states returned by `eTaskGetState`.

*Values:*

```
eRunning = 0
```

```
eReady
```

```
eBlocked
```

```
eSuspended
```

```
eDeleted
```

```
eInvalid
```

```
enum eNotifyAction
```

*Values:*

```
eNoAction = 0
```

```
eSetBits
```

```
eIncrement
```

```
eSetValueWithOverwrite
```

```
eSetValueWithoutOverwrite
```

```
enum eSleepModeStatus
```

Possible return values for `eTaskConfirmSleepModeStatus()`.

*Values:*

```
eAbortSleep = 0
```

```
eStandardSleep
```

```
eNoTasksWaitingTimeout
```

#### Queue API

##### Header File

- [freertos/include/freertos/queue.h](#)

## Functions

BaseType\_t **xQueueGenericSendFromISR** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, BaseType\_t \*const pxHigherPriorityTaskWoken, const BaseType\_t xCopyPosition)

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWokenByPost;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWokenByPost = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post each byte.
xQueueGenericSendFromISR( xRxQueue, &cIn, &
↪xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that ↪
↪the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
taskYIELD_YIELD_FROM_ISR();
}
}
```

**Return** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE\_FULL.

### Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueGenericSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- xCopyPosition: Can take the value queueSEND\_TO\_BACK to place the item at the back of the queue, or queueSEND\_TO\_FRONT to place the item at the front of the queue (for high priority messages).

BaseType\_t **xQueueGiveFromISR** (*QueueHandle\_t* xQueue, BaseType\_t \*const pxHigherPriorityTaskWoken)

BaseType\_t **xQueueGenericSend** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, TickType\_t xTicksToWait, const BaseType\_t xCopyPosition)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in

place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR ()` for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, ←
→queueSEND_TO_BACK ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, ←
→queueSEND_TO_BACK );
}

// ... Rest of task code.
}

```

**Return** `pdTRUE` if the item was successfully posted, otherwise `errQUEUE_FULL`.

#### Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.
- `xCopyPosition`: Can take the value `queueSEND_TO_BACK` to place the item at the back of

the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

`BaseType_t xQueuePeek ( QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait )`

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

This macro must not be used in an interrupt service routine. See `xQueuePeekFromISR()` for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
struct AMessage *pxMessage;

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
// Failed to create the queue.
}

// ...

// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxdMessage;

if( xQueue != 0 )
{
// Peek a message on the created queue. Block for 10 ticks if a
// message is not immediately available.
if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
// pxRxdMessage now points to the struct AMessage variable posted
// by vATask, but the item still remains on the queue.
}
}
}

```

(continues on next page)

(continued from previous page)

```
// ... Rest of task code.
}
```

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**

- `xQueue`: The handle to the queue from which the item is to be received.
- `pvBuffer`: Pointer to the buffer into which the received item will be copied.
- `xTicksToWait`: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required. `xQueuePeek()` will return immediately if `xTicksToWait` is 0 and the queue is empty.

BaseType\_t **xQueuePeekFromISR** (*QueueHandle\_t* `xQueue`, void \***const** `pvBuffer`)

A version of `xQueuePeek()` that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**

- `xQueue`: The handle to the queue from which the item is to be received.
- `pvBuffer`: Pointer to the buffer into which the received item will be copied.

BaseType\_t **xQueueReceive** (*QueueHandle\_t* `xQueue`, void \***const** `pvBuffer`, TickType\_t `xTicksToWait`)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See `xQueueReceiveFromISR` for an alternative that can.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
```

(continues on next page)

(continued from previous page)

```

// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
struct AMessage *pxRxdMessage;

if( xQueue != 0 )
{
// Receive a message on the created queue. Block for 10 ticks if a
// message is not immediately available.
if( xQueueReceive( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
// pxRxdMessage now points to the struct AMessage variable posted
// by vATask.
}
}

// ... Rest of task code.
}

```

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**

- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

UBaseType\_t **uxQueueMessagesWaiting**( const *QueueHandle\_t* xQueue )

Return the number of messages stored in a queue.

**Return** The number of messages available in the queue.

**Parameters**

- xQueue: A handle to the queue being queried.

UBaseType\_t **uxQueueSpacesAvailable**( const *QueueHandle\_t* xQueue )

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**Return** The number of spaces available in the queue.

**Parameters**

- xQueue: A handle to the queue being queried.

void **vQueueDelete**( *QueueHandle\_t* xQueue )

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters**

- xQueue: A handle to the queue to be deleted.

BaseType\_t **xQueueReceiveFromISR**( *QueueHandle\_t* xQueue, void \*const pvBuffer, BaseType\_t \*const pxHigherPriorityTaskWoken )

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
char cValueToPost;
const TickType_t xTicksToWait = ( TickType_t )0xff;

// Create a queue capable of containing 10 characters.
xQueue = xQueueCreate( 10, sizeof( char ) );
if( xQueue == 0 )
{
// Failed to create the queue.
}

// ...

// Post some characters that will be used within an ISR. If the queue
// is full then this task will block for xTicksToWait ticks.
cValueToPost = 'a';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue
// becomes full.

cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
BaseType_t xTaskWokenByReceive = pdFALSE;
char cRxdChar;

while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
↪xTaskWokenByReceive) )
{
// A character was received. Output the character now.
vOutputCharacter( cRxdChar );

// If removing the character from the queue woke the task that was
// posting onto the queue cTaskWokenByReceive will have been set to
// pdTRUE. No matter how many times this loop iterates only one
// task will be woken.
}

if( cTaskWokenByPost != ( char ) pdFALSE;
{
taskYIELD ();
}
}
}

```

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**

- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- [out] pxHigherPriorityTaskWoken: A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock \*pxTaskWoken will get set to pdTRUE, otherwise \*pxTaskWoken will remain unchanged.

BaseType\_t **xQueueIsQueueEmptyFromISR** (const *QueueHandle\_t* xQueue)

BaseType\_t **xQueueIsQueueFullFromISR** (const *QueueHandle\_t* xQueue)

UBaseType\_t **uxQueueMessagesWaitingFromISR** (const *QueueHandle\_t* xQueue)

void **vQueueAddToRegistry** (*QueueHandle\_t* xQueue, const char \*pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE\_REGISTRY\_SIZE defines the maximum number of handles the registry can hold. configQUEUE\_REGISTRY\_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

#### Parameters

- xQueue: The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- pcQueueName: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle\_t* xQueue)

lint !e971 Unqualified char types are allowed for strings and single characters only. The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

#### Parameters

- xQueue: The handle of the queue being removed from the registry.

const char \***pcQueueGetName** (*QueueHandle\_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue's handle.

**Return** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

#### Parameters

- xQueue: The handle of the queue the name of which will be returned.

*QueueHandle\_t* **xQueueGenericCreate** (const UBaseType\_t uxQueueLength, const UBaseType\_t uxItemSize, const uint8\_t ucQueueType)

lint !e971 Unqualified char types are allowed for strings and single characters only. Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

*QueueHandle\_t* **xQueueGenericCreateStatic** (const UBaseType\_t uxQueueLength, const UBaseType\_t uxItemSize, uint8\_t \*pucQueueStorage, StaticQueue\_t \*pxStaticQueue, const uint8\_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

*QueueSetHandle\_t* **xQueueCreateSet** (const UBaseType\_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet().

`xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <http://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Return** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

#### Parameters

- `uxEventQueueLength`: Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
  - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to  $(5 + 12 + 1)$ , or 18.
  - If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to  $(1 + 1 + 1)$ , or 3.
  - If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to  $(5 + 3)$ , or 8.

BaseType\_t **xQueueAddToSet** (*QueueSetMemberHandle\_t* *xQueueOrSemaphore*, *QueueSetHandle\_t* *xQueueSet*)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Return** If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

#### Parameters

- `xQueueOrSemaphore`: The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet`: The handle of the queue set to which the queue or semaphore is being added.

BaseType\_t **xQueueRemoveFromSet** (*QueueSetMemberHandle\_t* *xQueueOrSemaphore*, *QueueSetHandle\_t* *xQueueSet*)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Return** If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

#### Parameters

- `xQueueOrSemaphore`: The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet`: The handle of the queue set in which the queue or semaphore is included.

*QueueSetMemberHandle\_t* **xQueueSelectFromSet** (*QueueSetHandle\_t* xQueueSet, **const** TickType\_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on <http://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Return** xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle\_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle\_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before the specified block time expires.

#### Parameters

- xQueueSet: The queue set on which the task will (potentially) block.
- xTicksToWait: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

*QueueSetMemberHandle\_t* **xQueueSelectFromSetFromISR** (*QueueSetHandle\_t* xQueueSet)

A version of xQueueSelectFromSet() that can be used from an ISR.

## Macros

**xQueueCreate** (uxQueueLength, uxItemSize)

Creates a new queue instance. This allocates the storage required by the new queue and returns a handle for the queue.

Example usage:

```
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }
}
```

(continues on next page)

(continued from previous page)

```

}

// ... Rest of task code.
}

```

**Return** If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

#### Parameters

- `uxQueueLength`: The maximum number of items that the queue can contain.
- `uxItemSize`: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**xQueueCreateStatic** (`uxQueueLength`, `uxItemSize`, `pucQueueStorage`, `pxQueueBuffer`)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using `xQueueCreate()` then both blocks of memory are automatically dynamically allocated inside the `xQueueCreate()` function. (see <http://www.freertos.org/a00111.html>). If a queue is created using `xQueueCreateStatic()` then the application writer must provide the memory that will get used by the queue. `xQueueCreateStatic()` therefore allows a queue to be created without using any dynamic memory allocation.

<http://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                            ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                            &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                            &xQueueBuffer ); // The buffer that will hold the
    →queue structure.

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}

```

**Return** If the queue is created then a handle to the created queue is returned. If `pxQueueBuffer` is NULL

then NULL is returned.

#### Parameters

- `uxQueueLength`: The maximum number of items that the queue can contain.
- `uxItemSize`: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- `pucQueueStorage`: If `uxItemSize` is not zero then `pucQueueStorageBuffer` must point to a `uint8_t` array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is  $(uxQueueLength * uxItemSize)$  bytes. If `uxItemSize` is zero then `pucQueueStorageBuffer` can be NULL.
- `pxQueueBuffer`: Must point to a variable of type `StaticQueue_t`, which will be used to hold the queue's data structure.

#### **xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.

```

(continues on next page)

(continued from previous page)

}

**Return** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

**Parameters**

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

**xQueueSendToBack** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
}

```

(continues on next page)

(continued from previous page)

```

}

// ... Rest of task code.
}

```

**Return** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

#### Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

#### **xQueueSend** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
char ucMessageID;
char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the

```

(continues on next page)

(continued from previous page)

```

// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

**Return** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

#### Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

#### **xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

Example usage:

```

void vFunction( void *pvParameters )
{
QueueHandle_t xQueue;
uint32_t ulVarToSend, ulValReceived;

// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwrite() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

// Write the value 10 to the queue using xQueueOverwrite().
ulVarToSend = 10;
xQueueOverwrite( xQueue, &ulVarToSend );

// Peeking the queue should now return 10, but leave the value 10 in
// the queue. A block time of zero is used as it is known that the
// queue holds a value.
ulValReceived = 0;
xQueuePeek( xQueue, &ulValReceived, 0 );

if( ulValReceived != 10 )
{
// Error unless the item was removed by a different task.
}

// The queue is still full. Use xQueueOverwrite() to overwrite the
// value held in the queue with 100.
ulVarToSend = 100;
xQueueOverwrite( xQueue, &ulVarToSend );
}

```

(continues on next page)

(continued from previous page)

```

// This time read from the queue, leaving the queue empty once more.
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if( ulValReceived != 100 )
{
    // Error!
}

// ...
}

```

**Return** `xQueueOverwrite()` is a macro that calls `xQueueGenericSend()`, and therefore has the same return values as `xQueueSendToFront()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwrite()` will write to the queue even when the queue is already full.

#### Parameters

- `xQueue`: The handle of the queue to which the data is being sent.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

**`xQueueSendToFrontFromISR`** (`xQueue`, `pvItemToQueue`, `pxHigherPriorityTaskWoken`)

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}

```

**Return** `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

#### Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.

- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: `xQueueSendToFrontFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToFrontFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

#### **xQueueSendToBackFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```

**Return** `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

#### **Parameters**

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: `xQueueSendToBackFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToBackFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

#### **xQueueOverwriteFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of `xQueueOverwrite()` that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```

QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.

    // ...

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a
        ↪context
        // switch so this interrupt returns directly to the unblocked task.
        ↪port.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the
    }
}

```

**Return** xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

#### Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueOverwriteFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

#### xQueueSendFromISR( xQueue, pvItemToQueue, pxHigherPriorityTaskWoken )

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR ();
    }
}
```

**Return** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE\_FULL.

#### Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xQueueReset** (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

#### Type Definitions

**typedef struct** QueueDefinition \***QueueHandle\_t**

**typedef struct** QueueDefinition \***QueueSetHandle\_t**

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

**typedef struct** QueueDefinition \***QueueSetMemberHandle\_t**

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle\_t is defined as a type to be used where a parameter or return value can be either an QueueHandle\_t or an SemaphoreHandle\_t.

#### Semaphore API

#### Header File

- [freertos/include/freertos/semphr.h](#)

### Macros

**semBINARY\_SEMAPHORE\_QUEUE\_LENGTH**

**semSEMAPHORE\_QUEUE\_ITEM\_LENGTH**

**semGIVE\_BLOCK\_TIME**

### **xSemaphoreCreateBinary()**

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <http://www.freertos.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <http://www.freertos.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old `vSemaphoreCreateBinary()` macro is now deprecated in favour of this `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

### **xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <http://www.freertos.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function.

(see <http://www.freertos.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
    // xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

**Return** If the semaphore is created then a handle to the created semaphore is returned. If `pxSemaphoreBuffer` is NULL then NULL is returned.

#### Parameters

- `pxStaticSemaphore`: Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

#### **xSemaphoreTake** (xSemaphore, xBlockTime)

*Macro* to obtain a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not
        ↪available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
```

(continues on next page)

(continued from previous page)

```

        // We were able to obtain the semaphore and can now access the
        // shared resource.

        // ...

        // We have finished accessing the shared resource. Release the
        // semaphore.
        xSemaphoreGive( xSemaphore );
    }
    else
    {
        // We could not obtain the semaphore and can therefore not access
        // the shared resource safely.
    }
}
}

```

**Return** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

#### Parameters

- **xSemaphore**: A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime**: The time in ticks to wait for the semaphore to become available. The macro portTICK\_PERIOD\_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX\_DELAY can be used to block indefinitely (provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

#### **xSemaphoreTakeRecursive** (xMutex, xBlockTime)

*Macro* to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE\_RECURSIVE\_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the

```

(continues on next page)

(continued from previous page)

```

        // shared resource.

        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, but instead buried in a more complex
        // call structure. This is just for illustrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}
}

```

**Return** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

#### Parameters

- **xMutex**: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- **xBlockTime**: The time in ticks to wait for the semaphore to become available. The macro portTICK\_PERIOD\_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlockTime.

#### **xSemaphoreGive** (xSemaphore)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {

```

(continues on next page)

(continued from previous page)

```

if( xSemaphoreGive( xSemaphore ) != pdTRUE )
{
    // We would expect this call to fail because we cannot give
    // a semaphore without first "taking" it!
}

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
{
    // We now have the semaphore and can access the shared resource.

    // ...

    // We have finished accessing the shared resource so can free the
    // semaphore.
    if( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
        // We would not expect this call to fail because we must have
        // obtained the semaphore to get here.
    }
}
}
}

```

**Return** pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

**Parameters**

- **xSemaphore**: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

**xSemaphoreGiveRecursive** (xMutex)

semphr. h

*Macro* to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE\_RECURSIVE\_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
}

```

(continues on next page)

(continued from previous page)

```

if( xMutex != NULL )
{
    // See if we can obtain the mutex.  If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.

        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex.  In real
        // code these would not be just sequential calls as this would make
        // no sense.  Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times.  Again it is unlikely that real code would have
        // these calls sequentially, it would be more likely that the calls
        // to xSemaphoreGiveRecursive() would be called as a call stack
        // unwound.  This is just for demonstrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}
}

```

**Return** pdTRUE if the semaphore was given.

#### Parameters

- xMutex: A handle to the mutex being released, or 'given' . This is the handle returned by xSemaphoreCreateMutex();

#### **xSemaphoreGiveFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```

#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{

```

(continues on next page)

(continued from previous page)

```

for( ;; )
{
    // We want this task to run every 10 ticks of a timer.  The semaphore
    // was created before this task was started.

    // Block waiting for the semaphore to become available.
    if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
    {
        // It is time to execute.

        // ...

        // We have finished our task.  Return to the top of the loop where
        // we will block on the semaphore until it is time to execute
        // again.  Note when using the semaphore for synchronisation with an
        // ISR in this manner there is no need to 'give' the semaphore back.
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here.  Context switching from an
        // ISR uses port specific syntax.  Check the demo task for your port
        // to find the syntax required.
    }
}

```

**Return** pdTRUE if the semaphore was successfully given, otherwise errQUEUE\_FULL.

**Parameters**

- xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- pxHigherPriorityTaskWoken: xSemaphoreGiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to

xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Return** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**Parameters**

- xSemaphore: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- [out] pxHigherPriorityTaskWoken: xSemaphoreTakeFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreCreateMutex()**

Macro that implements a mutex semaphore by using the existing queue mechanism.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <http://www.freertos.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

**xSemaphoreCreateMutexStatic( pxMutexBuffer)**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is

automatically dynamically allocated inside the `xSemaphoreCreateMutex()` function. (see <http://www.freertos.org/a00111.html>). If a mutex is created using `xSemaphoreCreateMutexStatic()` then the application writer must provide the memory. `xSemaphoreCreateMutexStatic()` therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the `xSemaphoreTake()` and `xSemaphoreGive()` macros. The `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Return** If the mutex was successfully created then a handle to the created mutex is returned. If `pxMutexBuffer` was NULL then NULL is returned.

#### Parameters

- `pxMutexBuffer`: Must point to a variable of type `StaticSemaphore_t`, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

#### **xSemaphoreCreateRecursiveMutex()**

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <http://www.freertos.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `vSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** xSemaphore Handle to the created mutex semaphore. Should be of type `SemaphoreHandle_t`.

#### **xSemaphoreCreateRecursiveMutexStatic** (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see <http://www.freertos.org/a00111.html>). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore **MUST ALWAYS** ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
}
```

(continues on next page)

(continued from previous page)

```

xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

// As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
// so there is no need to check it.
}

```

**Return** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Parameters**

- pxStaticSemaphore: Must point to a variable of type StaticSemaphore\_t, which will then be used to hold the recursive mutex's data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreCreateCounting** (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <http://www.freertos.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see <http://www.freertos.org/a00111.html>). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

## 1) Counting events.

In this usage scenario an event handler will 'give' a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will 'take' a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

## 2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it 'gives' the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
    }
}

```

(continues on next page)

(continued from previous page)

```

    // The semaphore can now be used.
}
}

```

**Return** Handle to the created semaphore. Null if the semaphore could not be created.

**Parameters**

- **uxMaxCount**: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount**: The count value assigned to the semaphore when it is created.

**xSemaphoreCreateCountingStatic** (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <http://www.freertos.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <http://www.freertos.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}

```

**Return** If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If `pxSemaphoreBuffer` was NULL then NULL is returned.

**Parameters**

- `uxMaxCount`: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount`: The count value assigned to the semaphore when it is created.
- `pxSemaphoreBuffer`: Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**vSemaphoreDelete** (`xSemaphore`)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

**Parameters**

- `xSemaphore`: A handle to the semaphore to be deleted.

**xSemaphoreGetMutexHolder** (`xSemaphore`)

If `xMutex` is indeed a mutex type semaphore, return the current mutex holder. If `xMutex` is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

**xSemaphoreGetMutexHolderFromISR** (`xSemaphore`)

If `xMutex` is indeed a mutex type semaphore, return the current mutex holder. If `xMutex` is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

**uxSemaphoreGetCount** (`xSemaphore`)

`semphr.h`

If the semaphore is a counting semaphore then `uxSemaphoreGetCount()` returns its current count value. If the semaphore is a binary semaphore then `uxSemaphoreGetCount()` returns 1 if the semaphore is available, and 0 if the semaphore is not available.

## Type Definitions

```
typedef QueueHandle\_t SemaphoreHandle_t
```

## Timer API

### Header File

- `freertos/include/freertos/timers.h`

### Functions

`TimerHandle_t` **xTimerCreate** (`const` char \*`const` *pcTimerName*, `const` `TickType_t` *xTimerPeriod*, `const` `UBaseType_t` *uxAutoReload*, void \*`const` *pvTimerID*, `TimerCallbackFunction_t` *pxCallbackFunction*)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see <http://www.freertos.org/a00111.html>). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[ NUM_TIMERS ];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback( TimerHandle_t pxTimer )
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT( pxTimer );

    // Which timer expired?
    lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[ lArrayIndex ] += 1;

    // If the timer has expired 10 times then stop it from running.
    if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop( pxTimer, 0 );
    }
}

void main( void )
{
    int32_t x;

    // Create then start some timers. Starting the timers before the scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
        ↪not used by the kernel.
                                   ( 100 * x ), // The timer period in
        ↪ticks.
                                   pdTRUE, // The timers will auto-
        ↪reload themselves when they expire.
                                   ( void * ) x, // Assign each timer a
        ↪unique id equal to its array index.
                                   vTimerCallback // Each timer calls the
        ↪same callback when it expires.
                                   );

        if( xTimers[ x ] == NULL )
```

(continues on next page)

(continued from previous page)

```

    {
        // The timer was not created.
    }
    else
    {
        // Start the timer. No block time is specified, and even if one
→was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
        {
            // The timer could not be set into the Active state.
        }
    }
}

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timers running as they have
→already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );
}

```

**Return** If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

#### Parameters

- `pcTimerName`: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- `xTimerPeriodInTicks`: The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to `( 500 / portTICK_PERIOD_MS )` provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `uxAutoReload`: If `uxAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `uxAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- `pvTimerID`: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- `pxCallbackFunction`: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “void vCallbackFunction( TimerHandle\_t xTimer );” .

**TimerHandle\_t xTimerCreateStatic**(const char \*const pcTimerName, const TickType\_t xTimerPeriodInTicks, const UBaseType\_t uxAutoReload, void \*const pvTimerID, TimerCallbackFunction\_t pxCallbackFunction, StaticTimer\_t \*pxTimerBuffer)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see <http://www.freertos.org/a00111.html>). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the

memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
// The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

// A variable that will be incremented by the software timer's callback
// function.
UBaseType_t uxVariableToIncrement = 0;

// A software timer callback function that increments a variable passed to
// it when the software timer was created. After the 5th increment the
// callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID( xExpiredTimer );

    // Increment the variable to show the timer callback has executed.
    ( *puxVariableToIncrement )++;

    // If this callback has executed the required number of times, stop the
    // timer.
    if( *puxVariableToIncrement == 5 )
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }
}

void main( void )
{
    // Create the software time. xTimerCreateStatic() has an extra parameter
    // than the normal xTimerCreate() API function. The parameter is a pointer
    // to the StaticTimer_t structure that will hold the software timer
    // structure. If the parameter is passed as NULL then the structure will
    // be
    // allocated dynamically, just as if xTimerCreate() had been called.
    xTimer = xTimerCreateStatic( "T1", // Text name for the task.
    // Helps debugging only. Not used by FreeRTOS.
    xTimerPeriod, // The period of the timer
    // in ticks.
    pdTRUE, // This is an auto-reload
    // timer.
    ( void * ) &uxVariableToIncrement, // A
    // variable incremented by the software timer's callback function
    prvTimerCallback, // The function to execute
    // when the timer expires.
    &xTimerBuffer ); // The buffer that will
    // hold the software timer structure.

    // The scheduler has not started yet so a block time is not used.
```

(continues on next page)

```

xReturned = xTimerStart( xTimer, 0 );

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timers running as they have
↳already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );
}

```

**Return** If the timer is created then a handle to the created timer is returned. If `pxTimerBuffer` was `NULL` then `NULL` is returned.

#### Parameters

- `pcTimerName`: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- `xTimerPeriodInTicks`: The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xTimerPeriodInTicks` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xPeriod` can be set to  $( 500 / \text{portTICK\_PERIOD\_MS} )$  provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `uxAutoReload`: If `uxAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `uxAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.
- `pvTimerID`: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- `pxCallbackFunction`: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “void vCallbackFunction( TimerHandle\_t xTimer);” .
- `pxTimerBuffer`: Must point to a variable of type `StaticTimer_t`, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

```

void *pvTimerGetTimerID( const TimerHandle_t xTimer )
void *pvTimerGetTimerID( TimerHandle_t xTimer );

```

Returns the ID assigned to the timer.

IDs are assigned to timers using the `pvTimerID` parameter of the call to `xTimerCreated()` that was used to create the timer, and by calling the `vTimerSetTimerID()` API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

**Return** The ID assigned to the timer being queried.

#### Parameters

- `xTimer`: The timer being queried.

See the `xTimerCreate()` API function example usage scenario.

```

void vTimerSetTimerID( TimerHandle_t xTimer, void *pvNewID )
void vTimerSetTimerID( TimerHandle_t xTimer, void *pvNewID );

```

Sets the ID assigned to the timer.

IDs are assigned to timers using the `pvTimerID` parameter of the call to `xTimerCreated()` that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

#### Parameters

- `xTimer`: The timer being updated.
- `pvNewID`: The ID to assign to the timer.

See the `xTimerCreate()` API function example usage scenario.

```
BaseType_t xTimerIsTimerActive (TimerHandle_t xTimer)
BaseType_t xTimerIsTimerActive( TimerHandle_t xTimer );
```

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
// This function assumes xTimer has already been created.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
    →equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is active, do something.
    }
    else
    {
        // xTimer is not active, do something else.
    }
}
```

**Return** `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

#### Parameters

- `xTimer`: The timer being queried.

```
TaskHandle_t xTimerGetTimerDaemonTaskHandle (void)
```

`xTimerGetTimerDaemonTaskHandle()` is only available if `INCLUDE_xTimerGetTimerDaemonTaskHandle` is set to 1 in `FreeRTOSConfig.h`.

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

```
BaseType_t xTimerPendFunctionCallFromISR (PendedFunction_t xFunctionToPend, void
                                           *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)
```

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with 'Timer').

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
// The callback function that will execute in the context of the daemon task.
// Note callback functions must all use this same prototype.
void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
{
    BaseType_t xInterfaceToService;

    // The interface that requires servicing is passed in the second
    // parameter. The first parameter is not used in this case.
    xInterfaceToService = ( BaseType_t ) ulParameter2;

    // ...Perform the processing here...
}

// An ISR that receives data packets from multiple interfaces
void vAnISR( void )
{
    BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;

    // Query the hardware to determine which interface needs processing.
    xInterfaceToService = prvCheckInterfaces();

    // The actual processing is to be deferred to a task. Request the
    // vProcessInterface() callback function is executed, passing in the
    // number of the interface that needs processing. The interface to
    // service is passed in the second parameter. The first parameter is
    // not used in this case.
    xHigherPriorityTaskWoken = pdFALSE;
    xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )_
    ↪xInterfaceToService, &xHigherPriorityTaskWoken );

    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and will
    // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
    // the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
}
```

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

#### Parameters

- xFunctionToPend: The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction\_t prototype.
- pvParameter1: The value of the callback function's first parameter. The parameter has a void \* type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void \*, or the void \* can be used to point to a structure.
- ulParameter2: The value of the callback function's second parameter.
- pxHigherPriorityTaskWoken: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER\_TASK\_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then \*pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason \*pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

BaseType\_t xTimerPendFunctionCall (PendedFunction\_t xFunctionToPend, void \*pvParameter1, uint32\_t ulParameter2, TickType\_t xTicksToWait)

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with 'Timer' ).

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise

pdFALSE is returned.

#### Parameters

- `xFunctionToPend`: The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- `pvParameter1`: The value of the callback function's first parameter. The parameter has a void \* type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void \*, or the void \* can be used to point to a structure.
- `ulParameter2`: The value of the callback function's second parameter.
- `xTicksToWait`: Calling this function will result in a message being sent to the timer daemon task on a queue. `xTicksToWait` is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

```
const char *pcTimerGetName (TimerHandle_t xTimer)
const char * const pcTimerGetName( TimerHandle_t xTimer );
```

Returns the name that was assigned to a timer when the timer was created.

**Return** The name assigned to the timer specified by the `xTimer` parameter.

#### Parameters

- `xTimer`: The handle of the timer being queried.

```
void vTimerSetReloadMode (TimerHandle_t xTimer, const UBaseType_t uxAutoReload)
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );
```

Updates a timer to be either an autoreload timer, in which case the timer automatically resets itself each time it expires, or a one shot timer, in which case the timer will only expire once unless it is manually restarted.

#### Parameters

- `xTimer`: The handle of the timer being updated.
- `uxAutoReload`: If `uxAutoReload` is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer's period (see the `xTimerPeriodInTicks` parameter of the `xTimerCreate()` API function). If `uxAutoReload` is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```
TickType_t xTimerGetPeriod (TimerHandle_t xTimer)
TickType_t xTimerGetPeriod( TimerHandle_t xTimer );
```

Returns the period of a timer.

**Return** The period of the timer in ticks.

#### Parameters

- `xTimer`: The handle of the timer being queried.

```
TickType_t xTimerGetExpiryTime (TimerHandle_t xTimer)
TickType_t xTimerGetExpiryTime( TimerHandle_t xTimer );
```

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Return** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

#### Parameters

- `xTimer`: The handle of the timer being queried.

#### Macros

```
tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR
tmrCOMMAND_EXECUTE_CALLBACK

tmrCOMMAND_START_DONT_TRACE

tmrCOMMAND_START

tmrCOMMAND_RESET
```

`tmrCOMMAND_STOP`

`tmrCOMMAND_CHANGE_PERIOD`

`tmrCOMMAND_DELETE`

`tmrFIRST_FROM_ISR_COMMAND`

`tmrCOMMAND_START_FROM_ISR`

`tmrCOMMAND_RESET_FROM_ISR`

`tmrCOMMAND_STOP_FROM_ISR`

`tmrCOMMAND_CHANGE_PERIOD_FROM_ISR`

**xTimerStart** (xTimer, xTicksToWait)

BaseType\_t xTimerStart( TimerHandle\_t xTimer, TickType\_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStart()` starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerStart()` has equivalent functionality to the `xTimerReset()` API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after `xTimerStart()` was called, where 'n' is the timers defined period.

It is valid to call `xTimerStart()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerStart()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStart()` to be available.

Example usage:

**Return** `pdFAIL` will be returned if the start command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

#### Parameters

- `xTimer`: The handle of the timer being started/restarted.
- `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStart()` was called. `xTicksToWait` is ignored if `xTimerStart()` is called before the scheduler is started.

See the `xTimerCreate()` API function example usage scenario.

**xTimerStop** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

Example usage:

**Return** pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- xTimer: The handle of the timer being stopped.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

#### xTimerChangePeriod (xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```
// This function assumes xTimer has already been created. If the timer
// referenced by xTimer is already active when it is called, then the timer
// is deleted. If the timer referenced by xTimer is not active when it is
// called, then the period of the timer is set to 500ms and the timer is
// started.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
    ↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    }
    else
    {
        // xTimer is not active, change its period to 500ms. This will also
        // cause the timer to start. Block for a maximum of 100 ticks if the
        // change period command cannot immediately be sent to the timer
        // command queue.
        if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==
        ↪pdPASS )
        {
            // The command was successfully sent.
        }
        else
        {
            // The command could not be sent, even after waiting for 100 ticks
            // to pass. Take appropriate action here.
        }
    }
}
```

**Return** pdFAIL will be returned if the change period command could not be sent to the timer command queue

even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**Parameters**

- `xTimer`: The handle of the timer that is having its period changed.
- `xNewPeriod`: The new period for `xTimer`. Timer periods are specified in tick periods, so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then `xNewPeriod` should be set to 100. Alternatively, if the timer must expire after 500ms, then `xNewPeriod` can be set to  $( 500 / \text{portTICK\_PERIOD\_MS} )$  provided `configTICK_RATE_HZ` is less than or equal to 1000.
- `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when `xTimerChangePeriod()` was called. `xTicksToWait` is ignored if `xTimerChangePeriod()` is called before the scheduler is started.

**xTimerDelete** (`xTimer`, `xTicksToWait`)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerDelete()` deletes a timer that was previously created using the `xTimerCreate()` API function.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerDelete()` to be available.

Example usage:

**Return** `pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**Parameters**

- `xTimer`: The handle of the timer being deleted.
- `xTicksToWait`: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

See the `xTimerChangePeriod()` API function example usage scenario.

**xTimerReset** (`xTimer`, `xTicksToWait`)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after `xTimerReset()` was called, where 'n' is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerReset()` to be available.

Example usage:

```

// When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer.

TimerHandle_t xBacklightTimer = NULL;

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press event handler.
void vKeyPressEventHandler( char cKey )
{
    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. Wait 10 ticks for the command to be successfully sent
    // if it cannot be sent immediately.
    vSetBacklightState( BACKLIGHT_ON );
    if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate
        // action here.
    }

    // Perform the rest of the key processing here.
}

void main( void )
{
    int32_t x;

    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a text_
    ↪name, not used by the kernel. ( 5000 / portTICK_PERIOD_MS), // The timer_
    ↪period in ticks. pdFALSE, // The timer_
    ↪is a one-shot timer. 0, // The id is_
    ↪not used by the callback so can take any value. vBacklightTimerCallback // The_
    ↪callback function that switches the LCD back-light off. );

    if( xBacklightTimer == NULL )
    {
        // The timer was not created.
    }
    else
    {
        // Start the timer. No block time is specified, and even if one was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
        {
            // The timer could not be set into the Active state.
        }
    }
}

```

(continues on next page)

(continued from previous page)

```

    }
}

// ...
// Create tasks here.
// ...

// Starting the scheduler will start the timer running as it has already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );
}

```

**Return** pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- xTimer: The handle of the timer being reset/started/restarted.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

#### xTimerStartFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```

// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then restart the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. This is an interrupt service routine so can only
    // call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here

```

(continues on next page)

(continued from previous page)

```

// as both cause the timer to re-calculate its expiry time.
// xHigherPriorityTaskWoken was initialised to pdFALSE when it was
// declared (in this function).
if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
{
    // The start command was not executed successfully. Take appropriate
    // action here.
}

// Perform the rest of the key processing here.

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).
}
}

```

**Return** pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- xTimer: The handle of the timer being started/restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

#### xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```

// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the timer should be simply stopped.

// The interrupt service routine that stops the timer.
void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - simply stop the timer.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )

```

(continues on next page)

(continued from previous page)

```

{
    // The stop command was not executed successfully. Take appropriate
    // action here.
}

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).
}
}

```

**Return** pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- xTimer: The handle of the timer being stopped.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**xTimerChangePeriodFromISR** (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```

// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the period of xTimer should be changed to 500ms.

// The interrupt service routine that changes the period of xTimer.
void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - change the period of xTimer to 500ms.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
    ↪pdPASS )
    {
        // The command to change the timers period was not executed
        // successfully. Take appropriate action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch

```

(continues on next page)

(continued from previous page)

```

// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).
}
}

```

**Return** pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- xTimer: The handle of the timer that is having its period changed.
- xNewPeriod: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

#### **xTimerResetFromISR** (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```

// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of

```

(continues on next page)

(continued from previous page)

```

// key inactivity. This is an interrupt service routine so can only
// call FreeRTOS API functions that end in "FromISR".
vSetBacklightState( BACKLIGHT_ON );

// xTimerStartFromISR() or xTimerResetFromISR() could be called here
// as both cause the timer to re-calculate its expiry time.
// xHigherPriorityTaskWoken was initialised to pdFALSE when it was
// declared (in this function).
if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
{
    // The reset command was not executed successfully. Take appropriate
    // action here.
}

// Perform the rest of the key processing here.

// If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
// should be performed. The syntax required to perform a context switch
// from inside an ISR varies from port to port, and from compiler to
// compiler. Inspect the demos for the port you are using to find the
// actual syntax required.
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // Call the interrupt safe yield function here (actual function
    // depends on the FreeRTOS port being used).
}
}

```

**Return** pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### Parameters

- **xTimer**: The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken**: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

#### Type Definitions

```

typedef void *TimerHandle_t
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
typedef void (*PendedFunction_t)(void *, uint32_t)

```

#### Event Group API

##### Header File

- [freertos/include/freertos/event\\_groups.h](#)

## Functions

### *EventGroupHandle\_t* **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event group is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <http://www.freertos.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

**Return** If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See <http://www.freertos.org/a00111.html>

### *EventGroupHandle\_t* **xEventGroupCreateStatic** (StaticEventGroup\_t \*pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event group is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <http://www.freertos.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
```

(continues on next page)

(continued from previous page)

```

// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );

```

**Return** If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

#### Parameters

- pxEventGroupBuffer: pxEventGroupBuffer must point to a variable of type StaticEventGroup\_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

*EventBits\_t* **xEventGroupWaitBits** (*EventGroupHandle\_t* xEventGroup, **const** *EventBits\_t* uxBitsToWaitFor, **const** BaseType\_t xClearOnExit, **const** BaseType\_t xWaitForAllBits, TickType\_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```

#define BIT_0    ( 1 << 0 )
#define BIT_4    ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
EventBits_t uxBits;
const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup,    // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait
        ←for.
        pdTRUE,         // BIT_0 and BIT_4 should be cleared before
        ←returning.
        pdFALSE,       // Don't wait for both bits, either bit will
        ←do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to
        ←be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}

```

`{c}`

**Return** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

**Parameters**

- `xEventGroup`: The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- `uxBitsToWaitFor`: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- `xClearOnExit`: If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- `xWaitForAllBits`: If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- `xTicksToWait`: The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set.

*EventBits\_t* **xEventGroupClearBits** (*EventGroupHandle\_t* `xEventGroup`, **const** *EventBits\_t* `uxBitsToClear`)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0    ( 1 << 0 )
#define BIT_4    ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
        // called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
}
```

(continues on next page)

```

    }
}

```

**Return** The value of the event group before the specified bits were cleared.

**Parameters**

- `xEventGroup`: The event group in which the bits are to be cleared.
- `uxBitsToClear`: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

*EventBits\_t* **xEventGroupSetBits** (*EventGroupHandle\_t* `xEventGroup`, **const** *EventBits\_t* `uxBitsToSet`)

Set bits within an event group. This function cannot be called from an interrupt. `xEventGroupSetBitsFromISR()` is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```

#define BIT_0    ( 1 << 0 )
#define BIT_4    ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
                xEventGroup, // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set. It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}

```

{c}

**Return** The value of the event group at the time the call to `xEventGroupSetBits()` returns. There are two reasons why the returned value might have the bits specified by the `uxBitsToSet` parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the `xClearBitOnExit` parameter of `xEventGroupWaitBits()`). Sec-

and, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called `xEventGroupSetBits()` will execute and may change the event group value before the call to `xEventGroupSetBits()` returns.

#### Parameters

- `xEventGroup`: The event group in which the bits are to be set.
- `uxBitsToSet`: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to `0x08`. To set bit 3 and bit 0 set `uxBitsToSet` to `0x09`.

`EventBits_t xEventGroupSync` (`EventGroupHandle_t xEventGroup`, `const EventBits_t uxBitsToSet`, `const EventBits_t uxBitsToWaitFor`, `TickType_t xTicksToWait`)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the `uxBitsToWait` parameter are set, or become set within that time. In this case all the bits specified by `uxBitsToWait` will be automatically cleared before the function returns.

Example usage:

```
// Bits used by the three tasks.
#define TASK_0_BIT    ( 1 << 0 )
#define TASK_1_BIT    ( 1 << 1 )
#define TASK_2_BIT    ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
        // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
        ↪xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call
            // to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.
```

(continues on next page)

(continued from previous page)

```

// Set bit 1 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

```

**Return** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

#### Parameters

- `xEventGroup`: The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- `uxBitsToSet`: The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.
- `uxBitsToWaitFor`: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to 0x05. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to 0x07. Etc.
- `xTicksToWait`: The maximum amount of time (specified in 'ticks') to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

#### *EventBits\_t* `xEventGroupGetBitsFromISR` (*EventGroupHandle\_t* `xEventGroup`)

A version of `xEventGroupGetBits()` that can be called from an ISR.

**Return** The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

#### Parameters

- `xEventGroup`: The event group being queried.

#### `void` `vEventGroupDelete` (*EventGroupHandle\_t* `xEventGroup`)

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

#### Parameters

- `xEventGroup`: The event group being deleted.

## Macros

### `xEventGroupClearBitsFromISR` (`xEventGroup`, `uxBitsToClear`)

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0    ( 1 << 0 )
#define BIT_4    ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
                xEventGroup, // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

**Return** If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

#### Parameters

- `xEventGroup`: The event group in which the bits are to be cleared.
- `uxBitsToClear`: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

### `xEventGroupSetBitsFromISR` (`xEventGroup`, `uxBitsToSet`, `pxHigherPriorityTaskWoken`)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```
#define BIT_0    ( 1 << 0 )
#define BIT_4    ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
```

(continues on next page)

(continued from previous page)

```

BaseType_t xHigherPriorityTaskWoken, xResult;

// xHigherPriorityTaskWoken must be initialised to pdFALSE.
xHigherPriorityTaskWoken = pdFALSE;

// Set bit 0 and bit 4 in xEventGroup.
xResult = xEventGroupSetBitsFromISR(
    xEventGroup, // The event group being updated.
    BIT_0 | BIT_4 // The bits being set.
    &xHigherPriorityTaskWoken );

// Was the message posted successfully?
if( xResult == pdPASS )
{
    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and
    // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
    // refer to the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
}

```

**Return** If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

#### Parameters

- `xEventGroup`: The event group in which the bits are to be set.
- `uxBitsToSet`: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to `0x08`. To set bit 3 and bit 0 set `uxBitsToSet` to `0x09`.
- `pxHigherPriorityTaskWoken`: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then `*pxHigherPriorityTaskWoken` will be set to `pdTRUE` by `xEventGroupSetBitsFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `*pxHigherPriorityTaskWoken` must be initialised to `pdFALSE`. See the example code below.

#### **xEventGroupGetBits** (`xEventGroup`)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

**Return** The event group bits at the time `xEventGroupGetBits()` was called.

#### Parameters

- `xEventGroup`: The event group being queried.

### Type Definitions

```

typedef void *EventGroupHandle_t
typedef TickType_t EventBits_t

```

### Stream Buffer API

#### Header File

- [freertos/include/freertos/stream\\_buffer.h](#)

#### Functions

```

size_t xStreamBufferSend( StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t
    xDataLengthBytes, TickType_t xTicksToWait )

```

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task

or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is
    ↪ not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

**Return** The number of bytes written to the stream buffer. If a task times out before it can write all `xDataLengthBytes` into the buffer it will still write as many bytes as possible.

#### Parameters

- `xStreamBuffer`: The handle of the stream buffer to which a stream is being sent.
- `pvTxData`: A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- `xDataLengthBytes`: The maximum number of bytes to copy from `pvTxData` into the stream buffer.
- `xTicksToWait`: The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another `xDataLengthBytes` bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. If a task times out before it can write all `xDataLengthBytes` into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

size\_t **xStreamBufferSendFromISR** (*StreamBufferHandle\_t* xStreamBuffer, const void \*pvTxData, size\_t xDataLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferRead()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
//A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Return** The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

#### Parameters

- xStreamBuffer: The handle of the stream buffer to which a stream is being sent.
- pvTxData: A pointer to the data that is to be copied into the stream buffer.
- xDataLengthBytes: The maximum number of bytes to copy from pvTxData into the stream buffer.
- pxHigherPriorityTaskWoken: It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the cur-

rently executing task (the task that was interrupted), then, internally, `xStreamBufferSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE`. If `xStreamBufferSendFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `*pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the example code below for an example.

`size_t xStreamBufferReceive` (*StreamBufferHandle\_t* `xStreamBuffer`, *void \*pvRxData*, *size\_t xBufferLengthBytes*, *TickType\_t xTicksToWait*)

Receives bytes from a stream buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferReceive()` to read from a stream buffer from a task. Use `xStreamBufferReceiveFromISR()` to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                          ( void * ) ucRxData,
                                          sizeof( ucRxData ),
                                          xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains another xReceivedBytes bytes of data, which can
        // be processed here....
    }
}
```

**Return** The number of bytes actually read from the stream buffer, which will be less than `xBufferLengthBytes` if the call to `xStreamBufferReceive()` timed out before `xBufferLengthBytes` were available.

#### Parameters

- `xStreamBuffer`: The handle of the stream buffer from which bytes are to be received.
- `pvRxData`: A pointer to the buffer into which the received bytes will be copied.
- `xBufferLengthBytes`: The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum number of bytes to receive in one call. `xStreamBufferReceive` will return as many bytes as possible up to a maximum set by `xBufferLengthBytes`.
- `xTicksToWait`: The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. `xStreamBufferReceive()` will return immediately if `xTicksToWait` is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided IN-

CLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

size\_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle\_t* xStreamBuffer, void \*pvRxData, size\_t xBufferLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                                ( void * ) ucRxData,
                                                sizeof( ucRxData ),
                                                &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Return** The number of bytes read from the stream buffer, if any.

#### Parameters

- **xStreamBuffer**: The handle of the stream buffer from which a stream is being received.
- **pvRxData**: A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes**: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken**: It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

void **xStreamBufferDelete** (*StreamBufferHandle\_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

#### Parameters

- xStreamBuffer: The handle of the stream buffer to be deleted.

BaseType\_t **xStreamBufferIsFull** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

**Return** If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

#### Parameters

- xStreamBuffer: The handle of the stream buffer being queried.

BaseType\_t **xStreamBufferIsEmpty** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

**Return** If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

#### Parameters

- xStreamBuffer: The handle of the stream buffer being queried.

BaseType\_t **xStreamBufferReset** (*StreamBufferHandle\_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

**Return** If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

#### Parameters

- xStreamBuffer: The handle of the stream buffer being reset.

size\_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

size\_t **xStreamBufferBytesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

BaseType\_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle\_t* xStreamBuffer, size\_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Return** If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

#### Parameters

- xStreamBuffer: The handle of the stream buffer being updated.
- xTriggerLevel: The new trigger level for the stream buffer.

BaseType\_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle\_t* xStreamBuffer, BaseType\_t \*pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND\_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND\_COMPLETED() macro sends a notification to the task to remove it from

the Blocked state. `xStreamBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbSEND_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

**Return** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

#### Parameters

- `xStreamBuffer`: The handle of the stream buffer to which data was written.
- `pxHigherPriorityTaskWoken`: `*pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into `xStreamBufferSendCompletedFromISR()`. If calling `xStreamBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

```
BaseType_t xStreamBufferReceiveCompletedFromISR (StreamBufferHandle_t
                                                xStreamBuffer,           BaseType_t
                                                *pxHigherPriorityTaskWoken)
```

For advanced users only.

The `sbRECEIVE_COMPLETED()` macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbRECEIVE_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xStreamBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbRECEIVE_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

**Return** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

#### Parameters

- `xStreamBuffer`: The handle of the stream buffer from which data was read.
- `pxHigherPriorityTaskWoken`: `*pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into `xStreamBufferReceiveCompletedFromISR()`. If calling `xStreamBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

## Macros

**xStreamBufferCreate** (`xBufferSizeBytes`, `xTriggerLevelBytes`)

Creates a new stream buffer using dynamically allocated memory. See `xStreamBufferCreateStatic()` for a version that uses statically allocated memory (memory that is allocated at compile time).

`configSUPPORT_DYNAMIC_ALLOCATION` must be set to 1 or left undefined in `FreeRTOSConfig.h` for `xStreamBufferCreate()` to be available.

Example use:

```
void vAFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

    // Create a stream buffer that can hold 100 bytes. The memory used to
    →hold
    // both the stream buffer structure and the data in the stream buffer
    →is
    // allocated dynamically.
    xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes,
    →xTriggerLevel );
```

(continues on next page)

(continued from previous page)

```

    if( xStreamBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // stream buffer.
    }
    else
    {
        // The stream buffer was created successfully and can now be used.
    }
}

```

**Return** If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

#### Parameters

- **xBufferSizeBytes**: The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes**: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

**xStreamBufferCreateStatic** (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT\_STATIC\_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```

// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                              xTriggerLevel,
                                              ucBufferStorage,
                                              &xStreamBufferStruct );
}

```

(continues on next page)

(continued from previous page)

```

// As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
// parameters were NULL, xStreamBuffer will not be NULL, and can be used to
// reference the created stream buffer in other stream buffer API calls.

// Other code that uses the stream buffer can go here.
}

```

**Return** If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticStreamBuffer are NULL then NULL is returned.

#### Parameters

- **xBufferSizeBytes**: The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes**: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea**: Must point to a uint8\_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer**: Must point to a variable of type StaticStreamBuffer\_t, which will be used to hold the stream buffer's data structure.

#### Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

#### Message Buffer API

##### Header File

- [freertos/include/freertos/message\\_buffer.h](#)

##### Macros

#### **xMessageBufferCreate** (xBufferSizeBytes)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT\_DYNAMIC\_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```

void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );
}

```

(continues on next page)

(continued from previous page)

```

if( xMessageBuffer == NULL )
{
    // There was not enough heap memory space available to create the
    // message buffer.
}
else
{
    // The message buffer was created successfully and can now be used.
}

```

**Return** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

#### Parameters

- `xBufferSizeBytes`: The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

**xMessageBufferCreateStatic** (`xBufferSizeBytes`, `pucMessageBufferStorageArea`, `pxStaticMessageBuffer`)

Creates a new message buffer using statically allocated memory. See `xMessageBufferCreate()` for a version that uses dynamically allocated memory.

Example use:

```

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                                ucBufferStorage,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}

```

**Return** If the message buffer is created successfully then a handle to the created message buffer is returned. If either `pucMessageBufferStorageArea` or `pxStaticmessageBuffer` are NULL then NULL is returned.

#### Parameters

- `xBufferSizeBytes`: The size, in bytes, of the buffer pointed to by the `pucMessageBufferStorageArea` parameter. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message

buffer space. The maximum number of bytes that can be stored in the message buffer is actually (`xBufferSizeBytes - 1`).

- `pucMessageBufferStorageArea`: Must point to a `uint8_t` array that is at least `xBufferSizeBytes + 1` big. This is the array to which messages are copied when they are written to the message buffer.
- `pxStaticMessageBuffer`: Must point to a variable of type `StaticMessageBuffer_t`, which will be used to hold the message buffer's data structure.

#### **xMessageBufferSend** (`xMessageBuffer`, `pvTxData`, `xDataLengthBytes`, `xTicksToWait`)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferSend()` to write to a message buffer from a task. Use `xMessageBufferSendFromISR()` to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

**Return** The number of bytes written to the message buffer. If the call to `xMessageBufferSend()` times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then `xDataLengthBytes` is returned.

#### **Parameters**

- `xMessageBuffer`: The handle of the message buffer to which a message is being sent.
- `pvTxData`: A pointer to the message that is to be copied into the message buffer.

- `xDataLengthBytes`: The length of the message. That is, the number of bytes to copy from `pvTxData` into the message buffer. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting `xDataLengthBytes` to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- `xTicksToWait`: The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when `xMessageBufferSend()` is called. The calling task will never block if `xTicksToWait` is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. Tasks do not use any CPU time when they are in the Blocked state.

**xMessageBufferSendFromISR** (`xMessageBuffer`, `pvTxData`, `xDataLengthBytes`, `pxHigherPriorityTaskWoken`)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferSend()` to write to a message buffer from a task. Use `xMessageBufferSendFromISR()` to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
```

(continues on next page)

(continued from previous page)

```

// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**Return** The number of bytes actually written to the message buffer. If the message buffer didn't have enough free space for the message to be stored then 0 is returned, otherwise `xDataLengthBytes` is returned.

#### Parameters

- `xMessageBuffer`: The handle of the message buffer to which a message is being sent.
- `pvTxData`: A pointer to the message that is to be copied into the message buffer.
- `xDataLengthBytes`: The length of the message. That is, the number of bytes to copy from `pvTxData` into the message buffer. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message's length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting `xDataLengthBytes` to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- `pxHigherPriorityTaskWoken`: It is possible that a message buffer will have a task blocked on it waiting for data. Calling `xMessageBufferSendFromISR()` can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling `xMessageBufferSendFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xMessageBufferSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE`. If `xMessageBufferSendFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `*pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the code example below for an example.

#### **xMessageBufferReceive** (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferReceive()` to read from a message buffer from a task. Use `xMessageBufferReceiveFromISR()` to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive the next message from the message buffer. Wait in the Blocked
// state (so not using any CPU processing time) for a maximum of 100ms for
// a message to become available.
xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );
}

```

(continues on next page)

(continued from previous page)

```

if( xReceivedBytes > 0 )
{
    // A ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
}
}

```

**Return** The length, in bytes, of the message read from the message buffer, if any. If `xMessageBufferReceive()` times out before a message became available then zero is returned. If the length of the message is greater than `xBufferLengthBytes` then the message will be left in the message buffer and zero is returned.

#### Parameters

- `xMessageBuffer`: The handle of the message buffer from which a message is being received.
- `pvRxData`: A pointer to the buffer into which the received message is to be copied.
- `xBufferLengthBytes`: The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum length of the message that can be received. If `xBufferLengthBytes` is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- `xTicksToWait`: The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. `xMessageBufferReceive()` will return immediately if `xTicksToWait` is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. Tasks do not use any CPU time when they are in the Blocked state.

#### **xMessageBufferReceiveFromISR** (`xMessageBuffer`, `pvRxData`, `xBufferLengthBytes`, `pxHigherPriorityTaskWoken`)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()`) inside a critical section and set the receive block time to 0.

Use `xMessageBufferReceive()` to read from a message buffer from a task. Use `xMessageBufferReceiveFromISR()` to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );
}

```

(continues on next page)

(continued from previous page)

```

if( xReceivedBytes > 0 )
{
    // A ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**Return** The length, in bytes, of the message read from the message buffer, if any.

#### Parameters

- **xMessageBuffer**: The handle of the message buffer from which a message is being received.
- **pvRxData**: A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes**: The length of the buffer pointed to by the **pvRxData** parameter. This sets the maximum length of the message that can be received. If **xBufferLengthBytes** is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken**: It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling **xMessageBufferReceiveFromISR()** can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling **xMessageBufferReceiveFromISR()** causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, **xMessageBufferReceiveFromISR()** will set **\*pxHigherPriorityTaskWoken** to **pdTRUE**. If **xMessageBufferReceiveFromISR()** sets this value to **pdTRUE**, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. **\*pxHigherPriorityTaskWoken** should be set to **pdFALSE** before it is passed into the function. See the code example below for an example.

#### **vMessageBufferDelete** (xMessageBuffer)

Deletes a message buffer that was previously created using a call to **xMessageBufferCreate()** or **xMessageBufferCreateStatic()**. If the message buffer was created using dynamic memory (that is, by **xMessageBufferCreate()**), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

#### Parameters

- **xMessageBuffer**: The handle of the message buffer to be deleted.

#### **xMessageBufferIsFull** (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

**Return** If the message buffer referenced by **xMessageBuffer** is full then **pdTRUE** is returned. Otherwise **pdFALSE** is returned.

#### Parameters

- **xMessageBuffer**: The handle of the message buffer being queried.

#### **xMessageBufferIsEmpty** (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

**Return** If the message buffer referenced by **xMessageBuffer** is empty then **pdTRUE** is returned. Otherwise **pdFALSE** is returned.

#### Parameters

- **xMessageBuffer**: The handle of the message buffer being queried.

**xMessageBufferReset** (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Return** If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

**Parameters**

- xMessageBuffer: The handle of the message buffer being reset.

**xMessageBufferSpaceAvailable** (xMessageBuffer)

Returns the number of bytes of free space in the message buffer.

**Return** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message's length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**Parameters**

- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferSpacesAvailable** (xMessageBuffer)**xMessageBufferNextLengthBytes** (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

**Return** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**Parameters**

- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferSendCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND\_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND\_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**

- xMessageBuffer: The handle of the stream buffer to which data was written.
- pxHigherPriorityTaskWoken: \*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**xMessageBufferReceiveCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE\_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE\_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**

- `xMessageBuffer`: The handle of the stream buffer from which data was read.
- `pxHigherPriorityTaskWoken`: `*pxHigherPriorityTaskWoken` should be initialised to pdFALSE before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

### Type Definitions

**typedef** void \***MessageBufferHandle\_t**

Type by which message buffers are referenced. For example, a call to `xMessageBufferCreate()` returns an `MessageBufferHandle_t` variable that can then be used as a parameter to `xMessageBufferSend()`, `xMessageBufferReceive()`, etc.

## 2.7.12 FreeRTOS Additions

### Overview

ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However various features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

*Ring Buffers*: Ring buffers were added to provide a form of buffer that could accept entries of arbitrary lengths.

*Hooks*: ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric amongst both CPUs.

*Component Specific Properties*: Currently added only one component specific property `ORIG_INCLUDE_PATH`.

### Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items *must also be returned* to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

**No-Split** buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use no-split buffers when items must occupy contiguous memory. *Only this buffer type allows you getting the data item address and writing to the item by yourself.*

**Allow-Split** buffers will allow an item to be split when wrapping around if doing so will allow the item to be stored. Allow-split buffers are more memory efficient than no-split buffers but can return an item in two parts when retrieving.

**Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes and be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

---

**Note:** No-split/allow-split buffers will always store items at 32-bit aligned addresses. Therefore when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

---

**Note:** Each item stored in no-split/allow-split buffers will **require an additional 8 bytes for a header**. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of no-split/allow-split buffers will also be rounded up when created.

**Usage** The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer then send an item to it.

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↳TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to apply for the memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This way adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))

...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when
↳copy
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
```

(continues on next page)

(continued from previous page)

```

//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates retrieving and returning an item from a **no-split ring buffer** using `xRingbufferReceive()` and `vRingbufferReturnItem()`

```

...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from an **allow-split ring buffer** using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

```

...

//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
 BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↳*)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from a **byte buffer** using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```

...

//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`

**Note:** Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between no-split/allow-split buffers and byte buffers with regards to sending items/data. The diagrams assume that three items of sizes **18, 3, and 27 bytes** are sent respectively to a **buffer of 128 bytes**.

Fig. 21: Sending items to no-split/allow-split ring buffers

For no-split/allow-split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

**Using SendAcquire and SendComplete** Items in no-split buffers are acquired (by `SendAcquire`) in strict FIFO order and must be sent to the buffer by `SendComplete` for the data to be accessible by the consumer. Multiple items

Fig. 22: Sending items to byte buffers

can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However the receiving of data items must occur in FIFO order, therefore not calling SendComplete the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire/SendComplete don't happen in the same order. At the beginning, there is already an data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

Fig. 23: SendAcquire/SendComplete items in no-split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Due to the usage if 20 bytes item is not complete, it's not available, nor the following data items.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-split/byte buffers do not allow using SendAcquire/SendComplete since acquired buffers are required to be complete (not wrapped).

**Wrap around** The following diagrams illustrate the differences between no-split, allow-split, and byte buffers when a sent item requires a wrap around. The diagrams assumes a buffer of **128 bytes** with **56 bytes of free space that wraps around** and a sent item of **28 bytes**.

Fig. 24: Wrap around in no-split buffers

No-split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Fig. 25: Wrap around in allow-split buffers

Allow-split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Note:** Allow-split buffers treats the both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

Fig. 26: Wrap around in byte buffers

Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each part continuous will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrates the differences between no-split/allow-split and byte buffers in retrieving and returning data.

Items in no-split/allow-split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Fig. 27: Retrieving/Returning items in no-split/allow-split ring buffers

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However the items are not returned in they were retrieved (20, 8, 16). As such, the space is not freed until the first item (16 byte) is returned.

Fig. 28: Retrieving/Returning data in byte buffers

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets** Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);
```

(continues on next page)

(continued from previous page)

```

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}

...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_
↪TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //Handle item
    ...
} else {
    ...
}

```

**Ring Buffers with Static Allocation** The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer's data structure of type `StaticRingbuffer_t`
- The ring buffer's storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for no-split/allow-split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```

#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

```

## Ring Buffer API Reference

**Note:** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the **highest priority task will always be serviced first**. However due to the usage of binary semaphores in the ring buffer's underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However in between iterations of acquiring the semaphore, there is a **gap in the critical section** which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the **semaphore being acquired by the second highest priority task** waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

### Header File

- `esp_ringbuf/include/freertos/ringbuf.h`

### Functions

*RingbufHandle\_t* **xRingbufferCreate** (*size\_t xBufferSize*, *RingbufferType\_t xBufferType*)

Create a ring buffer.

**Note** *xBufferSize* of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

**Return** A handle to the created ring buffer, or NULL in case of error.

#### Parameters

- [*in*] *xBufferSize*: Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers
- [*in*] *xBufferType*: Type of ring buffer, see documentation.

*RingbufHandle\_t* **xRingbufferCreateNoSplit** (*size\_t xItemSize*, *size\_t xItemNum*)

Create a ring buffer of type RINGBUF\_TYPE\_NOSPLIT for a fixed *item\_size*.

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

**Return** A *RingbufHandle\_t* handle to the created ring buffer, or NULL in case of error.

#### Parameters

- [*in*] *xItemSize*: Size of each item to be put into the ring buffer
- [*in*] *xItemNum*: Maximum number of items the buffer needs to hold simultaneously

*RingbufHandle\_t* **xRingbufferCreateStatic** (*size\_t* *xBufferSize*, *RingbufferType\_t* *xBufferType*,  
*uint8\_t* \**pucRingbufferStorage*, *StaticRingbuffer\_t*  
\**pxStaticRingbuffer*)

Create a ring buffer but manually provide the required memory.

**Note** *xBufferSize* of no-split/allow-split buffers MUST be 32-bit aligned.

**Return** A handle to the created ring buffer

**Parameters**

- [in] *xBufferSize*: Size of the buffer in bytes.
- [in] *xBufferType*: Type of ring buffer, see documentation
- [in] *pucRingbufferStorage*: Pointer to the ring buffer's storage area. Storage area must of the same size as specified by *xBufferSize*
- [in] *pxStaticRingbuffer*: Pointed to a struct of type *StaticRingbuffer\_t* which will be used to hold the ring buffer's data structure

*BaseType\_t* **xRingbufferSend** (*RingbufHandle\_t* *xRingbuffer*, **const** void \**pvItem*, *size\_t* *xItemSize*,  
*TickType\_t* *xTicksToWait*)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**

- *pdTRUE* if succeeded
- *pdFALSE* on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**

- [in] *xRingbuffer*: Ring buffer to insert the item into
- [in] *pvItem*: Pointer to data to insert. NULL is allowed if *xItemSize* is 0.
- [in] *xItemSize*: Size of data to insert.
- [in] *xTicksToWait*: Ticks to wait for room in the ring buffer.

*BaseType\_t* **xRingbufferSendFromISR** (*RingbufHandle\_t* *xRingbuffer*, **const** void \**pvItem*, *size\_t*  
*xItemSize*, *BaseType\_t* \**pxHigherPriorityTaskWoken*)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**

- *pdTRUE* if succeeded
- *pdFALSE* when the ring buffer does not have space.

**Parameters**

- [in] *xRingbuffer*: Ring buffer to insert the item into
- [in] *pvItem*: Pointer to data to insert. NULL is allowed if *xItemSize* is 0.
- [in] *xItemSize*: Size of data to insert.
- [out] *pxHigherPriorityTaskWoken*: Value pointed to will be set to *pdTRUE* if the function woke up a higher priority task.

*BaseType\_t* **xRingbufferSendAcquire** (*RingbufHandle\_t* *xRingbuffer*, void \*\**ppvItem*, *size\_t* *xItem-*  
*Size*, *TickType\_t* *xTicksToWait*)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items *SendAcquire* or *Send* after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

**Note** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**

- [in] xRingbuffer: Ring buffer to allocate the memory
- [out] ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
- [in] xItemSize: Size of item to acquire.
- [in] xTicksToWait: Ticks to wait for room in the ring buffer.

BaseType\_t **xRingbufferSendComplete** (*RingbufHandle\_t* xRingbuffer, void \*pvItem)

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

**Note** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

**Return**

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

**Parameters**

- [in] xRingbuffer: Ring buffer to insert the item into
- [in] pvItem: Pointer to item in allocated memory to insert.

void \***xRingbufferReceive** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, TickType\_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Return**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL on timeout, \*pxItemSize is untouched in that case.

**Parameters**

- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- [in] xTicksToWait: Ticks to wait for items in the ring buffer.

void \***xRingbufferReceiveFromISR** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

**Note** A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Note** Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

**Return**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, \*pxItemSize is untouched in that case.

**Parameters**

- [in] xRingbuffer: Ring buffer to retrieve the item from
- [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.

BaseType\_t **xRingbufferReceiveSplit** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvHeadItem, void \*\*ppvTailItem, size\_t \*pxHeadItemSize, size\_t \*pxTailItemSize, TickType\_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is

retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

**Note** Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers

**Return**

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `ppvHeadItem`: Double pointer to first part (set to NULL if no items were retrieved)
- [out] `ppvTailItem`: Double pointer to second part (set to NULL if item is not split)
- [out] `pxHeadItemSize`: Pointer to size of first part (unmodified if no items were retrieved)
- [out] `pxTailItemSize`: Pointer to size of second part (unmodified if item is not split)
- [in] `xTicksToWait`: Ticks to wait for items in the ring buffer.

BaseType\_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle\_t* `xRingbuffer`, void  
\*\**ppvHeadItem*, void \*\**ppvTailItem*, size\_t  
\**pxHeadItemSize*, size\_t \**pxTailItemSize*)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

**Note** Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers

**Return**

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `ppvHeadItem`: Double pointer to first part (set to NULL if no items were retrieved)
- [out] `ppvTailItem`: Double pointer to second part (set to NULL if item is not split)
- [out] `pxHeadItemSize`: Pointer to size of first part (unmodified if no items were retrieved)
- [out] `pxTailItemSize`: Pointer to size of second part (unmodified if item is not split)

void \***xRingbufferReceiveUpTo** (*RingbufHandle\_t* `xRingbuffer`, size\_t \**pxItemSize*, TickType\_t *xTicksToWait*, size\_t *xMaxSize*)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

**Note** A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

**Note** This function should only be called on byte buffers

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Note** Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

**Return**

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
- [in] `xTicksToWait`: Ticks to wait for items in the ring buffer.
- [in] `xMaxSize`: Maximum number of bytes to return.

void \***xRingbufferReceiveUpToFromISR** (*RingbufHandle\_t* `xRingbuffer`, size\_t \**pxItemSize*, size\_t  
*xMaxSize*)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

**Note** A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

**Note** This function should only be called on byte buffers

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Return**

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
- [in] `xMaxSize`: Maximum number of bytes to return.

void **vRingbufferReturnItem** (*RingbufHandle\_t* `xRingbuffer`, void `*pvItem`)

Return a previously-retrieved item to the ring buffer.

**Note** If a split item is retrieved, both parts should be returned by calling this function twice

**Parameters**

- [in] `xRingbuffer`: Ring buffer the item was retrieved from
- [in] `pvItem`: Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle\_t* `xRingbuffer`, void `*pvItem`, BaseType\_t `*pxHigherPriorityTaskWoken`)

Return a previously-retrieved item to the ring buffer from an ISR.

**Note** If a split item is retrieved, both parts should be returned by calling this function twice

**Parameters**

- [in] `xRingbuffer`: Ring buffer the item was retrieved from
- [in] `pvItem`: Item that was received earlier
- [out] `pxHigherPriorityTaskWoken`: Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

void **vRingbufferDelete** (*RingbufHandle\_t* `xRingbuffer`)

Delete a ring buffer.

**Note** This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to delete

size\_t **xRingbufferGetMaxItemSize** (*RingbufHandle\_t* `xRingbuffer`)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

**Note** The max item size for a no-split buffer is limited to  $((\text{buffer\_size}/2) - \text{header\_size})$ . This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

**Return** Maximum size, in bytes, of an item that can be placed in a ring buffer.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to query

size\_t **xRingbufferGetCurFreeSize** (*RingbufHandle\_t* `xRingbuffer`)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

**Warning** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent `Send`

**Note** An empty no-split buffer has a max current free size for an item that is limited to  $((\text{buffer\_size}/2) - \text{header\_size})$ . See API reference for `xRingbufferGetMaxItemSize()`.

**Return** Current free size, in bytes, available for an entry

**Parameters**

- [in] `xRingbuffer`: Ring buffer to query

BaseType\_t **xRingbufferAddToQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Add the ring buffer's read semaphore to a queue set.

The ring buffer's read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer's read semaphore to a queue set.

**Return**

- pdTRUE on success, pdFALSE otherwise

**Parameters**

- [in] xRingbuffer: Ring buffer to add to the queue set
- [in] xQueueSet: Queue set to add the ring buffer's read semaphore to

BaseType\_t **xRingbufferCanRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetMemberHandle\_t* xMember)

Check if the selected queue set member is the ring buffer's read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

**Return**

- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

**Parameters**

- [in] xRingbuffer: Ring buffer which should be checked
- [in] xMember: Member returned from xQueueSelectFromSet

BaseType\_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Remove the ring buffer's read semaphore from a queue set.

This specifically removes a ring buffer's read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

**Return**

- pdTRUE on success
- pdFALSE otherwise

**Parameters**

- [in] xRingbuffer: Ring buffer to remove from the queue set
- [in] xQueueSet: Queue set to remove the ring buffer's read semaphore from

void **vRingbufferGetInfo** (*RingbufHandle\_t* xRingbuffer, UBaseType\_t \*uxFree, UBaseType\_t \*uxRead, UBaseType\_t \*uxWrite, UBaseType\_t \*uxAcquire, UBaseType\_t \*uxItemsWaiting)

Get information about ring buffer status.

Get information of the a ring buffer's current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**

- [in] xRingbuffer: Ring buffer to remove from the queue set
- [out] uxFree: Pointer use to store free pointer position
- [out] uxRead: Pointer use to store read pointer position
- [out] uxWrite: Pointer use to store write pointer position
- [out] uxAcquire: Pointer use to store acquire pointer position
- [out] uxItemsWaiting: Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle\_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

**Parameters**

- xRingbuffer: Ring buffer to show

## Structures

### **struct xSTATIC\_RINGBUFFER**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

## Type Definitions

### **typedef void \*RingbufHandle\_t**

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

### **typedef struct xSTATIC\_RINGBUFFER StaticRingbuffer\_t**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

## Enumerations

### **enum RingbufferType\_t**

*Values:*

#### **RINGBUF\_TYPE\_NOSPLIT = 0**

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

#### **RINGBUF\_TYPE\_ALLOWSPPLIT**

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

#### **RINGBUF\_TYPE\_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

#### **RINGBUF\_TYPE\_MAX**

## Hooks

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by Vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

**Vanilla FreeRTOS Hooks** Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as **Legacy Hooks** in ESP-IDF FreeRTOS. To enable legacy hooks, [\*CONFIG\\_FREERTOS\\_LEGACY\\_HOOKS\*](#) should be enabled in *project configuration menu*.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32 is dual core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

In a dual core system, `vApplicationTickHook()` must be located in IRAM (for example by adding the `IRAM_ATTR` attribute).

**ESP-IDF Idle and Tick Hooks** Due to the the dual core nature of the ESP32, it may be necessary for some applications to have separate hooks for each core. Furthermore, it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time. Therefore the ESP-IDF provides it's own hooks API in addition to the legacy hooks provided by Vanilla FreeRTOS.

The ESP-IDF tick/idle hooks are registered at run time, and each tick/idle hook must be registered to a specific CPU. When the idle task runs/tick Interrupt occurs on a particular CPU, the CPU will run each of its registered idle/tick hooks in turn.

## Hooks API Reference

### Header File

- [esp\\_common/include/esp\\_freertos\\_hooks.h](#)

### Functions

*esp\_err\_t* **esp\_register\_freertos\_idle\_hook\_for\_cpu** (*esp\_freertos\_idle\_cb\_t* *new\_idle\_cb*,  
UBaseType\_t *cpuid*)

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

#### Return

- ESP\_OK: Callback registered to the specified core's idle hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core's idle hook to register callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

#### Parameters

- [in] *new\_idle\_cb*: Callback to be called
- [in] *cpuid*: id of the core

*esp\_err\_t* **esp\_register\_freertos\_idle\_hook** (*esp\_freertos\_idle\_cb\_t* *new\_idle\_cb*)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

#### Return

- ESP\_OK: Callback registered to the calling core's idle hook
- ESP\_ERR\_NO\_MEM: No more space on the calling core's idle hook to register callback

#### Parameters

- [in] *new\_idle\_cb*: Callback to be called

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook\_for\_cpu** (*esp\_freertos\_tick\_cb\_t* *new\_tick\_cb*,  
UBaseType\_t *cpuid*)

Register a callback to be called from the specified core's tick hook.

#### Return

- ESP\_OK: Callback registered to specified core's tick hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core's tick hook to register the callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

#### Parameters

- [in] *new\_tick\_cb*: Callback to be called
- [in] *cpuid*: id of the core

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook** (*esp\_freertos\_tick\_cb\_t* *new\_tick\_cb*)

Register a callback to be called from the calling core's tick hook.

#### Return

- ESP\_OK: Callback registered to the calling core's tick hook

- `ESP_ERR_NO_MEM`: No more space on the calling core's tick hook to register the callback

#### Parameters

- `[in]` `new_tick_cb`: Callback to be called

void `esp_deregister_freertos_idle_hook_for_cpu` (`esp_freertos_idle_cb_t` `old_idle_cb`,  
`UBaseType_t cpuid`)

Unregister an idle callback from the idle hook of the specified core.

#### Parameters

- `[in]` `old_idle_cb`: Callback to be unregistered
- `[in]` `cpuid`: id of the core

void `esp_deregister_freertos_idle_hook` (`esp_freertos_idle_cb_t` `old_idle_cb`)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

#### Parameters

- `[in]` `old_idle_cb`: Callback to be unregistered

void `esp_deregister_freertos_tick_hook_for_cpu` (`esp_freertos_tick_cb_t` `old_tick_cb`,  
`UBaseType_t cpuid`)

Unregister a tick callback from the tick hook of the specified core.

#### Parameters

- `[in]` `old_tick_cb`: Callback to be unregistered
- `[in]` `cpuid`: id of the core

void `esp_deregister_freertos_tick_hook` (`esp_freertos_tick_cb_t` `old_tick_cb`)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

#### Parameters

- `[in]` `old_tick_cb`: Callback to be unregistered

### Type Definitions

```
typedef bool (*esp_freertos_idle_cb_t) (void)
```

```
typedef void (*esp_freertos_tick_cb_t) (void)
```

### Component Specific Properties

Besides standard component variables that could be gotten with basic cmake build properties FreeRTOS component also provides an arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

## 2.7.13 Heap Memory Allocation

### Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32-C3 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, *DMA-Capable Memory* or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

## Memory Capabilities

The ESP32-C3 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be *32-bit aligned*.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see *Memory Types*.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

## Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

---

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

---

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code.

The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32-C3 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

**Heap Sizes** At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

**Finding available heap** See *Heap Information*.

## Special Capabilities

**DMA-Capable Memory** Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

**32-Bit Accessible Memory** If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can't do for a normal `malloc()` call. This can help to use all the available memory in the ESP32-C3.

Memory allocated with `MALLOC_CAP_32BIT` can *only* be accessed via 32-bit reads and writes, any other type of access will generate a fatal `LoadStoreError` exception.

## API Reference - Heap Allocation

### Header File

- [heap/include/esp\\_heap\\_caps.h](#)

### Functions

`esp_err_t heap_caps_register_failed_alloc_callback(esp_alloc_failed_hook_t callback)`  
registers a callback function to be invoked if a memory allocation operation fails

**Return** `ESP_OK` if callback was registered.

#### Parameters

- `callback`: caller defined callback to be invoked

void \*`heap_caps_malloc(size_t size, uint32_t caps)`

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to `libc malloc()`, for capability-aware memory.

In IDF, `malloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

**Return** A pointer to the memory allocated on success, `NULL` on failure

#### Parameters

- `size`: Size, in bytes, of the amount of memory to allocate
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void `heap_caps_free(void *ptr)`

Free memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc free()`, for capability-aware memory.

In IDF, `free(p)` is equivalent to `heap_caps_free(p)`.

#### Parameters

- `ptr`: Pointer to memory previously returned from `heap_caps_malloc()` or `heap_caps_realloc()`. Can be `NULL`.

void \*`heap_caps_realloc(void *ptr, size_t size, uint32_t caps)`

Reallocate memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc realloc()`, for capability-aware memory.

In IDF, `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.

'`caps`' parameter can be different to the capabilities that any original '`ptr`' was allocated with. In this way, `realloc` can be used to "move" a buffer if necessary to ensure it meets a new set of capabilities.

**Return** Pointer to a new buffer of size '`size`' with capabilities '`caps`', or `NULL` if allocation failed.

#### Parameters

- `ptr`: Pointer to previously allocated memory, or `NULL` for a new allocation.
- `size`: Size of the new buffer requested, or 0 to free the buffer.

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory desired for the new allocation.

void **heap\_caps\_aligned\_alloc** (*size\_t alignment, size\_t size, uint32\_t caps*)

Allocate a aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc `aligned_alloc()`, for capability-aware memory.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- `alignment`: How the pointer received needs to be aligned must be a power of two
- `size`: Size, in bytes, of the amount of memory to allocate
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void **heap\_caps\_aligned\_free** (*void \*ptr*)

Used to deallocate memory previously allocated with `heap_caps_aligned_alloc`.

**Note** This function is deprecated, please consider using `heap_caps_free()` instead

**Parameters**

- `ptr`: Pointer to the memory allocated

void **heap\_caps\_aligned\_calloc** (*size\_t alignment, size\_t n, size\_t size, uint32\_t caps*)

Allocate a aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- `alignment`: How the pointer received needs to be aligned must be a power of two
- `n`: Number of continuing chunks of memory to allocate
- `size`: Size, in bytes, of a chunk of memory to allocate
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

void **heap\_caps\_calloc** (*size\_t n, size\_t size, uint32\_t caps*)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc `calloc()`, for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_calloc(p, MALLOC_CAP_8BIT)`.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- `n`: Number of continuing chunks of memory to allocate
- `size`: Size, in bytes, of a chunk of memory to allocate
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

size\_t **heap\_caps\_get\_total\_size** (*uint32\_t caps*)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**Return** total size in bytes

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

size\_t **heap\_caps\_get\_free\_size** (*uint32\_t caps*)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

**Return** Amount of free bytes in the regions

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`size_t heap_caps_get_minimum_free_size (uint32_t caps)`

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities.

Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

**Return** Amount of free bytes in the regions

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`size_t heap_caps_get_largest_free_block (uint32_t caps)`

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

**Return** Size of largest free block in bytes.

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`void heap_caps_get_info (multi_heap_info_t *info, uint32_t caps)`

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**

- `info`: Pointer to a structure which will be filled with relevant heap metadata.
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`void heap_caps_print_heap_info (uint32_t caps)`

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

`bool heap_caps_check_integrity_all (bool print_errors)`

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**

- `print_errors`: Print specific errors if heap corruption is found.

`bool heap_caps_check_integrity (uint32_t caps, bool print_errors)`

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory
- `print_errors`: Print specific errors if heap corruption is found.

bool **heap\_caps\_check\_integrity\_addr** (intptr\_t *addr*, bool *print\_errors*)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

**Note** The entire heap region around the address is checked, not only the adjacent heap blocks.

**Return** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

**Parameters**

- *addr*: Address in memory. Check for corruption in region containing this address.
- *print\_errors*: Print specific errors if heap corruption is found.

void **heap\_caps\_malloc\_extmem\_enable** (size\_t *limit*)

Enable `malloc()` in external memory and set limit below which `malloc()` attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**

- *limit*: Limit, in bytes.

void \***heap\_caps\_malloc\_prefer** (size\_t *size*, size\_t *num*, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory.

This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- *size*: Size, in bytes, of the amount of memory to allocate
- *num*: Number of variable paramters

void \***heap\_caps\_realloc\_prefer** (void \**ptr*, size\_t *size*, size\_t *num*, ...)

Allocate a chunk of memory as preference in decreasing order.

**Return** Pointer to a new buffer of size '*size*', or NULL if allocation failed.

**Parameters**

- *ptr*: Pointer to previously allocated memory, or NULL for a new allocation.
- *size*: Size of the new buffer requested, or 0 to free the buffer.
- *num*: Number of variable paramters

void \***heap\_caps\_calloc\_prefer** (size\_t *n*, size\_t *size*, size\_t *num*, ...)

Allocate a chunk of memory as preference in decreasing order.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- *n*: Number of continuing chunks of memory to allocate
- *size*: Size, in bytes, of a chunk of memory to allocate
- *num*: Number of variable paramters

void **heap\_caps\_dump** (uint32\_t *caps*)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses `stdout/stderr`). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by `malloc` is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).

- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

**Parameters**

- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

void **heap\_caps\_dump\_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for `heap_caps_dump`.

size\_t **heap\_caps\_get\_allocated\_size** (void \**ptr*)

Return the size that a particular pointer was allocated with.

**Note** The app will crash with an assertion failure if the pointer is not valid.

**Return** Size of the memory allocated at this block.

**Parameters**

- `ptr`: Pointer to currently allocated heap memory. Must be a pointer value previously returned by `heap_caps_malloc`, `malloc`, `calloc`, etc. and not yet freed.

**Macros****MALLOC\_CAP\_EXEC**

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

**MALLOC\_CAP\_32BIT**

Memory must allow for aligned 32-bit data accesses.

**MALLOC\_CAP\_8BIT**

Memory must allow for 8/16/...-bit data accesses.

**MALLOC\_CAP\_DMA**

Memory must be able to accessed by DMA.

**MALLOC\_CAP\_PID2**

Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID3**

Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID4**

Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID5**

Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID6**

Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID7**

Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC\_CAP\_SPIRAM**

Memory must be in SPI RAM.

**MALLOC\_CAP\_INTERNAL**

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC\_CAP\_DEFAULT**

Memory can be returned in a non-capability-specific memory allocation (e.g. `malloc()`, `calloc()`) call.

**MALLOC\_CAP\_IRAM\_8BIT**

Memory must be in IRAM and allow unaligned access.

**MALLOC\_CAP\_RETENTION****MALLOC\_CAP\_INVALID**

Memory can't be used / list end marker.

**Type Definitions**

```
typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
        callback called when a allocation operation fails, if registered
```

**Parameters**

- `size`: in bytes of failed allocation
- `caps`: capabilities requested of failed allocation
- `function_name`: function which generated the failure

**Thread Safety** Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context (see [Calling heap related functions from ISR](#)). However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

**Calling heap related functions from ISR**

The following functions from the heap component can be called from interrupt handler (ISR):

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`
- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

Note however this practice is strongly discouraged.

**Heap Tracing & Debugging**

The following features are documented on the [Heap Memory Debugging](#) page:

- [Heap Information](#) (free space, etc.)
- [Heap Corruption Detection](#)
- [Heap Tracing](#) (memory leak detection, monitoring, etc.)

**API Reference - Initialisation****Header File**

- `heap/include/esp_heap_caps_init.h`

## Functions

void **heap\_caps\_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap\_caps\_enable\_nonos\_stack\_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

*esp\_err\_t* **heap\_caps\_add\_region** (intptr\_t *start*, intptr\_t *end*)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by `start` & `end` parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

**Return** `ESP_OK` on success, `ESP_ERR_INVALID_ARG` if a parameter is invalid, `ESP_ERR_NOT_FOUND` if the specified start address doesn't reside in a known region, or any error returned by `heap_caps_add_region_with_caps()`.

### Parameters

- `start`: Start address of new region.
- `end`: End address of new region.

*esp\_err\_t* **heap\_caps\_add\_region\_with\_caps** (const uint32\_t *caps*[], intptr\_t *start*, intptr\_t *end*)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if a parameter is invalid
- `ESP_ERR_NO_MEM` if no memory to register new heap.
- `ESP_ERR_INVALID_SIZE` if the memory region is too small to fit a heap
- `ESP_FAIL` if region overlaps the start and/or end of an existing region

### Parameters

- `caps`: Ordered array of capability masks for the new region, in order of priority. Must have length `SOC_MEMORY_TYPE_NO_PRIOS`. Does not need to remain valid after the call returns.
- `start`: Start address of new region.
- `end`: End address of new region.

## Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region's capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the [multi\\_heap](#) functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region's use) and then calling `multi_heap_malloc()` or `multi_heap_calloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular `multi_heap` instance.

## API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

### Header File

- [heap/include/multi\\_heap.h](#)

### Functions

void **multi\_heap\_aligned\_alloc** (*multi\_heap\_handle\_t heap*, *size\_t size*, *size\_t alignment*)  
allocate a chunk of memory with specific alignment

**Return** pointer to the memory allocated, NULL on failure

#### Parameters

- `heap`: Handle to a registered heap.
- `size`: size in bytes of memory chunk
- `alignment`: how the memory must be aligned

void **multi\_heap\_malloc** (*multi\_heap\_handle\_t heap*, *size\_t size*)  
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

**Return** Pointer to new memory, or NULL if allocation fails.

#### Parameters

- `heap`: Handle to a registered heap.
- `size`: Size of desired buffer.

void **multi\_heap\_aligned\_free** (*multi\_heap\_handle\_t heap*, void *\*p*)  
free() a buffer aligned in a given heap.

**Note** This function is deprecated, consider using `multi_heap_free()` instead

#### Parameters

- `heap`: Handle to a registered heap.
- `p`: NULL, or a pointer previously returned from `multi_heap_aligned_alloc()` for the same heap.

void **multi\_heap\_free** (*multi\_heap\_handle\_t heap*, void *\*p*)  
free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument 'p' must be NULL or have been allocated in the specified heap.

#### Parameters

- `heap`: Handle to a registered heap.
- `p`: NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

void **multi\_heap\_realloc** (*multi\_heap\_handle\_t heap*, void *\*p*, *size\_t size*)  
realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument 'p' must be NULL or have been allocated in the specified heap.

**Return** New buffer of 'size' containing contents of 'p', or NULL if reallocation failed.

**Parameters**

- `heap`: Handle to a registered heap.
- `p`: NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- `size`: Desired new size for buffer.

`size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)`

Return the size that a particular pointer was allocated with.

**Return** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

**Parameters**

- `heap`: Handle to a registered heap.
- `p`: Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

`multi_heap_handle_t multi_heap_register (void *start, size_t size)`

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Return** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

**Parameters**

- `start`: Start address of the memory to use for a new heap.
- `size`: Size (in bytes) of the new heap.

`void multi_heap_set_lock (multi_heap_handle_t heap, void *lock)`

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

**Parameters**

- `heap`: Handle to a registered heap.
- `lock`: Optional pointer to a locking structure to associate with this heap.

`void multi_heap_dump (multi_heap_handle_t heap)`

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters**

- `heap`: Handle to a registered heap.

`bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)`

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

**Return** true if heap is valid, false otherwise.

**Parameters**

- `heap`: Handle to a registered heap.
- `print_errors`: If true, errors will be printed to stderr.

`size_t multi_heap_free_size (multi_heap_handle_t heap)`

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

**Return** Number of free bytes.

**Parameters**

- `heap`: Handle to a registered heap.

`size_t` **multi\_heap\_minimum\_free\_size** (*multi\_heap\_handle\_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime “low water mark” of possible values returned from `multi_free_heap_size()`, for the specified heap.

**Return** Number of free bytes.

**Parameters**

- `heap`: Handle to a registered heap.

`void` **multi\_heap\_get\_info** (*multi\_heap\_handle\_t* heap, *multi\_heap\_info\_t* \*info)

Return metadata about a given heap.

Fills a *multi\_heap\_info\_t* structure with information about the specified heap.

**Parameters**

- `heap`: Handle to a registered heap.
- `info`: Pointer to a structure to fill with heap metadata.

## Structures

**struct multi\_heap\_info\_t**

Structure to access heap metadata via `multi_heap_get_info`.

## Public Members

`size_t` **total\_free\_bytes**

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

`size_t` **total\_allocated\_bytes**

Total bytes allocated to data in the heap.

`size_t` **largest\_free\_block**

Size of largest free block in the heap. This is the largest `malloc`-able size.

`size_t` **minimum\_free\_bytes**

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

`size_t` **allocated\_blocks**

Number of (variable size) blocks allocated in the heap.

`size_t` **free\_blocks**

Number of (variable size) free blocks in the heap.

`size_t` **total\_blocks**

Total number of (variable size) blocks in the heap.

## Type Definitions

**typedef struct** multi\_heap\_info \***multi\_heap\_handle\_t**

Opaque handle to a registered heap.

## 2.7.14 Heap Memory Debugging

### Overview

ESP-IDF integrates tools for requesting *heap information*, *detecting heap corruption*, and *tracing memory leaks*. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the [Heap Memory Allocation](#) page.

### Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

### Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,

**Assertions** The heap implementation (`multi_heap.c`, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under `Compiler options` -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It's also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

**Memory Allocation Failed Hook** Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time a allocation operation fails.

Additionally user can enable a generation of a system abort if allocation operation fails by following the steps below: - In the project configuration menu, navigate to `Component config` -> `Heap Memory Debugging` and select `Abort if memory allocation fails` option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below show how to register a allocation failure callback:

```

#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_
↳*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↳", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↳failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}

```

**Finding Heap Corruption** Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a `CORRUPT_HEAP` message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging [Configuration](#) level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use [JTAG debugging](#) to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. For example `esp_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, [heap tracing](#) in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See [Heap Tracing To Find Heap Corruption](#) for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under `Component config` there is a menu `Heap memory debugging`. The setting `CONFIG_HEAP_CORRUPTION_DETECTION` can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use `calloc()` (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug” .) The application should be changed to not access heap memory after it has been freed.

If a call to `malloc()` or `realloc()` causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

**Manual Heap Checks in Comprehensive Mode** Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for *Light Impact* mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

## Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in [system/heap\\_task\\_tracking](#)

## Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- **Standalone.** In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- **Host-based.** This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using `app_trace` library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- **Leak checking:** find memory which is allocated and never freed.
- **Heap use analysis:** show all functions that are allocating/freeing memory while the trace is running.

**How To Diagnose Memory Leaks** If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or [related functions](#) to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

**Standalone Mode** Once you've identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see [CONFIG\\_HEAP\\_TRACING\\_DEST](#)).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in
↳ internal RAM

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
}
```

(continues on next page)

(continued from previous page)

```

do_something_you_suspect_is_leaking();

ESP_ERROR_CHECK( heap_trace_stop() );
heap_trace_dump();
...
}

```

The output from the heap trace will look something like this:

```

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

```

(Above example output is using *IDF Monitor* to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

- `XX bytes` is number of bytes allocated
- `@ 0x...` is the heap address returned from `malloc/calloc`.
- `CPU x` is the CPU (0 or 1) running when the allocation was made.
- `ccount 0x...` is the `CCOUNT` (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

**Host-Based Mode** Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> `CONFIG_HEAP_TRACING_DEST` and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> `CONFIG_APPTRACE_DESTINATION` and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```

#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
}

```

(continues on next page)

(continued from previous page)

```

    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}

```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in [Getting Started Guide](#).
2. Run OpenOCD (see [JTAG Debugging](#)).

---

**Note:** In order to use this feature you need OpenOCD version *v0.10.0-esp32-20181105* or later.

---

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special gdbinit file:

```

target remote :3333

mon reset halt
flushregs

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c

```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at [heap\\_trace\\_start\(\)](#). Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at [heap\\_trace\\_stop\(\)](#).

4. Run GDB using the following command `riscv32-esp-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at [heap\\_trace\\_stop\(\)](#). Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:

```

Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '['/tmp/heap.svdat']'...

**Heap Tracing To Find Heap Corruption** Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

**Performance Impact** Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

**False-Positive Memory Leaks** Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it's quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.

- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

## API Reference - Heap Tracing

### Header File

- [heap/include/esp\\_heap\\_trace.h](#)

### Functions

*esp\_err\_t* **heap\_trace\_init\_standalone** (*heap\_trace\_record\_t* \*record\_buffer, size\_t num\_records)

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

#### Return

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

#### Parameters

- `record_buffer`: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- `num_records`: Size of the heap trace buffer, as number of record structures.

*esp\_err\_t* **heap\_trace\_init\_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

#### Return

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

*esp\_err\_t* **heap\_trace\_start** (*heap\_trace\_mode\_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

**Note** `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

**Note** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

#### Return

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- `ESP_OK` Tracing is started.

#### Parameters

- `mode`: Mode for tracing.
  - `HEAP_TRACE_ALL` means all heap allocations and frees are traced.
  - `HEAP_TRACE_LEAKS` means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

*esp\_err\_t* **heap\_trace\_stop** (void)

Stop heap tracing.

#### Return

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.

- ESP\_ERR\_INVALID\_STATE Heap tracing was not in progress.
- ESP\_OK Heap tracing stopped..

*esp\_err\_t* **heap\_trace\_resume** (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

#### Return

- ESP\_ERR\_NOT\_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP\_ERR\_INVALID\_STATE Heap tracing was already started.
- ESP\_OK Heap tracing resumed.

size\_t **heap\_trace\_get\_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

*esp\_err\_t* **heap\_trace\_get** (size\_t *index*, *heap\_trace\_record\_t* \**record*)

Return a raw record from the heap trace buffer.

**Note** It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode record indexing may skip entries unless heap tracing is stopped first.

#### Return

- ESP\_ERR\_NOT\_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP\_ERR\_INVALID\_STATE Heap tracing was not initialised.
- ESP\_ERR\_INVALID\_ARG Index is out of bounds for current heap trace record count.
- ESP\_OK Record returned successfully.

#### Parameters

- *index*: Index (zero-based) of the record to return.
- [out] *record*: Record where the heap trace record will be copied.

void **heap\_trace\_dump** (void)

Dump heap trace record data to stdout.

**Note** It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode the dump may skip entries unless heap tracing is stopped first.

## Structures

**struct heap\_trace\_record\_t**

Trace record data type. Stores information about an allocated region of memory.

### Public Members

uint32\_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void \***address**

Address which was allocated.

size\_t **size**

Size of the allocation.

void \***allocated\_by**[CONFIG\_HEAP\_TRACING\_STACK\_DEPTH]

Call stack of the caller which allocated the memory.

void \***freed\_by**[CONFIG\_HEAP\_TRACING\_STACK\_DEPTH]

Call stack of the caller which freed the memory (all zero if not freed.)

## Macros

`CONFIG_HEAP_TRACING_STACK_DEPTH`

## Enumerations

`enum heap_trace_mode_t`

Values:

`HEAP_TRACE_ALL`

`HEAP_TRACE_LEAKS`

## 2.7.15 High Resolution Timer

### Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

`esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, `esp_timer` uses a 64-bit hardware timer, where the implementation depends on `CONFIG_ESP_TIMER_IMPL`. Available options are:

- SYSTIMER

`ESP_TIMER_TASK`. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

### Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

### esp\_timer during the light sleep

During light sleep, the `esp_timer` counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the `esp_timer` counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

### Handling callbacks

`esp_timer` is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

### Obtaining Current Time

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

### Application Example

The following example illustrates usage of `esp_timer` APIs: [system/esp\\_timer](#).

### API Reference

#### Header File

- [esp\\_timer/include/esp\\_timer.h](#)

#### Functions

`esp_err_t esp_timer_early_init` (void)  
Minimal initialization of `esp_timer`.

This function can be called very early in startup process, after this call only `esp_timer_get_time` function can be used.

**Note** This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

**Return**

- ESP\_OK on success

*esp\_err\_t* **esp\_timer\_init** (void)

Initialize esp\_timer library.

**Note** This function is called from startup code. Applications do not need to call this function before using other esp\_timer APIs. Before calling this function, esp\_timer\_early\_init must be called by the startup code.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized
- other errors from interrupt allocator

*esp\_err\_t* **esp\_timer\_deinit** (void)

De-initialize esp\_timer library.

**Note** Normally this function should not be called from applications

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not yet initialized

*esp\_err\_t* **esp\_timer\_create** (const *esp\_timer\_create\_args\_t* \*create\_args, *esp\_timer\_handle\_t* \*out\_handle)

Create an esp\_timer instance.

**Note** When done using the timer, delete it with esp\_timer\_delete function.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if some of the create\_args are not valid
- ESP\_ERR\_INVALID\_STATE if esp\_timer library is not initialized yet
- ESP\_ERR\_NO\_MEM if memory allocation fails

**Parameters**

- create\_args: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- [out] out\_handle: Output, pointer to esp\_timer\_handle\_t variable which will hold the created timer handle.

*esp\_err\_t* **esp\_timer\_start\_once** (*esp\_timer\_handle\_t* timer, uint64\_t timeout\_us)

Start one-shot timer.

Timer should not be running when this function is called.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

**Parameters**

- timer: timer handle created using esp\_timer\_create
- timeout\_us: timer timeout, in microseconds relative to the current moment

*esp\_err\_t* **esp\_timer\_start\_periodic** (*esp\_timer\_handle\_t* timer, uint64\_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every 'period' microseconds.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

**Parameters**

- timer: timer handle created using esp\_timer\_create
- period: timer period, in microseconds

*esp\_err\_t* **esp\_timer\_stop** (*esp\_timer\_handle\_t* timer)

Stop the timer.

This function stops the timer previously started using `esp_timer_start_once` or `esp_timer_start_periodic`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if the timer is not running

**Parameters**

- timer: timer handle created using `esp_timer_create`

*esp\_err\_t* **esp\_timer\_delete** (*esp\_timer\_handle\_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if the timer is running

**Parameters**

- timer: timer handle allocated using `esp_timer_create`

*int64\_t* **esp\_timer\_get\_time** (void)

Get time in microseconds since boot.

**Return** number of microseconds since underlying timer has been started

*int64\_t* **esp\_timer\_get\_next\_alarm** (void)

Get the timestamp when the next timeout is expected to occur.

**Return** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

*esp\_err\_t* **esp\_timer\_dump** (FILE \*stream)

Dump the list of timers to a stream.

If `CONFIG_ESP_TIMER_PROFILING` option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

```
name period alarm times_armed times_triggered total_callback_run_time
```

where:

name —timer name (if `CONFIG_ESP_TIMER_PROFILING` is defined), or timer pointer period —period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if `CONFIG_ESP_TIMER_PROFILING` is defined:

times\_armed —number of times the timer was armed via `esp_timer_start_X` times\_triggered - number of times the callback was called total\_callback\_run\_time - total time taken by callback to execute, across all calls

**Return**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if can not allocate temporary buffer for the output

**Parameters**

- stream: stream (such as stdout) to dump the information to

bool **esp\_timer\_is\_active** (*esp\_timer\_handle\_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Return**

- 1 if timer is still active
- 0 if timer is not active.

**Parameters**

- `timer`: timer handle created using `esp_timer_create`

### Structures

**struct esp\_timer\_create\_args\_t**

Timer configuration passed to `esp_timer_create`.

### Public Members

*esp\_timer\_cb\_t* **callback**

Function to call when timer expires.

void **\*arg**

Argument to pass to the callback.

*esp\_timer\_dispatch\_t* **dispatch\_method**

Call the callback from task or from ISR.

const char **\*name**

Timer name, used in `esp_timer_dump` function.

bool **skip\_unhandled\_events**

Skip unhandled events for periodic timers.

### Type Definitions

**typedef struct esp\_timer \*esp\_timer\_handle\_t**

Opaque type representing a single `esp_timer`.

**typedef void (\*esp\_timer\_cb\_t)(void \*arg)**

Timer callback function type.

### Parameters

- `arg`: pointer to opaque user-specific data

### Enumerations

**enum esp\_timer\_dispatch\_t**

Method for dispatching timer callback.

*Values:*

**ESP\_TIMER\_TASK**

Callback is called from timer task.

## 2.7.16 Call function with external stack

### Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter

### Usage

`esp_execute_shared_stack_function()` takes four arguments, a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack, a pointer to the top of stack used to that function, the size in bytes of stack and, a pointer to a user function where the shared stack space will reside, after calling the function, the user defined function will be deferred as a callback where functions can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                     shared_stack,
                                     8192,
                                     external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

## API Reference

### Header File

- [esp\\_common/include/esp\\_expression\\_with\\_stack.h](#)

### Functions

void **esp\_execute\_shared\_stack\_function** (*SemaphoreHandle\_t lock*, void \**stack*, size\_t *stack\_size*, *shared\_stack\_function function*)

Calls user defined shared stack space function.

**Note** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

#### Parameters

- *lock*: Mutex object to protect in case of shared stack
- *stack*: Pointer to user allocated stack
- *stack\_size*: Size of current stack in bytes
- *function*: pointer to the shared stack function to be executed

### Macros

**ESP\_EXECUTE\_EXPRESSION\_WITH\_STACK** (*lock*, *stack*, *stack\_size*, *expression*)

### Type Definitions

**typedef** void (\**shared\_stack\_function*) (void)

## 2.7.17 Interrupt allocation

### Overview

The ESP32-C3 has one core, with 31 interrupts. Each interrupt has a programmable priority level.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The `esp_intr_alloc()` abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling `esp_intr_alloc()` (or `esp_intr_alloc_intrstatus()`). It can use the flags passed to this function to set the type of interrupt allocated, specifying a specific level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code has two different types of interrupts it handles differently: Shared interrupts and non-shared interrupts. The simplest of the two are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering it, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to see if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts (because of the chance of missed interrupts when edge interrupts are used.) (The logic behind this: DevA and DevB share an int. DevB signals an int. Int line goes high. ISR handler calls code for DevA -> does nothing. ISR handler calls code for DevB, but while doing that, DevA signals an int. ISR DevB is done, clears int for DevB, exits interrupt code. Now an interrupt for DevA is still pending, but because the int line never went low (DevA kept it high even when the int for DevB was cleared) the interrupt is never serviced.)

### IRAM-Safe Interrupt Handlers

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the [SPI flash API documentation](#) for more details.

### Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They'll be all allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it *very carefully*. There usually exist 2 ways to stop a interrupt from being triggered: *disable the source* or *mask peripheral interrupt status*. IDF only handles the enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits should always be masked before the handler responsible for it is disabled, or the status should be handled in other enabled interrupt properly.** You may leave some status bits unhandled if you just disable one of all the handlers without masking the status bits, which causes the interrupt to trigger infinitely resulting in a system crash.

## API Reference

### Header File

- `esp_system/include/esp_intr_alloc.h`

## Functions

*esp\_err\_t* **esp\_intr\_mark\_shared** (int *intno*, int *cpu*, bool *is\_in\_iram*)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Return** ESP\_ERR\_INVALID\_ARG if *cpu* or *intno* is invalid ESP\_OK otherwise

### Parameters

- *intno*: The number of the interrupt (0-31)
- *cpu*: CPU on which the interrupt should be marked as shared (0 or 1)
- *is\_in\_iram*: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

*esp\_err\_t* **esp\_intr\_reserve** (int *intno*, int *cpu*)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Return** ESP\_ERR\_INVALID\_ARG if *cpu* or *intno* is invalid ESP\_OK otherwise

### Parameters

- *intno*: The number of the interrupt (0-31)
- *cpu*: CPU on which the interrupt should be marked as shared (0 or 1)

*esp\_err\_t* **esp\_intr\_alloc** (int *source*, int *flags*, *intr\_handler\_t* *handler*, void *\*arg*, *intr\_handle\_t* *\*ret\_handle*)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the *flags* parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP\_INTR\_FLAG\_IRAM flag is used, and handler address is not in IRAM or RTC\_FAST\_MEM, then ESP\_ERR\_INVALID\_ARG is returned.

**Return** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags ESP\_OK otherwise

### Parameters

- *source*: The interrupt source. One of the ETS\_\*\_INTR\_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS\_INTERNAL\_\*\_INTR\_SOURCE sources as defined in this header.
- *flags*: An ORred mask of the ESP\_INTR\_FLAG\_\* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP\_INTR\_FLAG\_SHARED, it will allocate a shared interrupt of level 1. Setting ESP\_INTR\_FLAG\_INTRDISABLED will return from this function with the interrupt disabled.
- *handler*: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- *arg*: Optional argument for passed to the interrupt handler
- *ret\_handle*: Pointer to an *intr\_handle\_t* to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

*esp\_err\_t* **esp\_intr\_alloc\_intrstatus** (int *source*, int *flags*, uint32\_t *intrstatusreg*, uint32\_t *intrstatusmask*, *intr\_handler\_t* *handler*, void *\*arg*, *intr\_handle\_t* *\*ret\_handle*)

Allocate an interrupt with the given parameters.

This essentially does the same as *esp\_intr\_alloc*, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

**Return** `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags `ESP_OK` otherwise

**Parameters**

- `source`: The interrupt source. One of the `ETS_*_INTR_SOURCE` interrupt mux sources, as defined in `soc/soc.h`, or one of the internal `ETS_INTERNAL_*_INTR_SOURCE` sources as defined in this header.
- `flags`: An ORred mask of the `ESP_INTR_FLAG_*` defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is `ESP_INTR_FLAG_SHARED`, it will allocate a shared interrupt of level 1. Setting `ESP_INTR_FLAG_INTRDISABLED` will return from this function with the interrupt disabled.
- `intrstatusreg`: The address of an interrupt status register
- `intrstatusmask`: A mask. If a read of address `intrstatusreg` has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- `handler`: The interrupt handler. Must be `NULL` when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- `arg`: Optional argument for passed to the interrupt handler
- `ret_handle`: Pointer to an `intr_handle_t` to store a handle that can later be used to request details or free the interrupt. Can be `NULL` if no handle is required.

*esp\_err\_t* `esp_intr_free` (*intr\_handle\_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note** When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

**Return** `ESP_ERR_INVALID_ARG` the handle is `NULL` `ESP_FAIL` failed to release this handle `ESP_OK` otherwise

**Parameters**

- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

int `esp_intr_get_cpu` (*intr\_handle\_t* handle)

Get CPU number an interrupt is tied to.

**Return** The core number where the interrupt is allocated

**Parameters**

- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

int `esp_intr_get_intno` (*intr\_handle\_t* handle)

Get the allocated interrupt for a certain handle.

**Return** The interrupt number

**Parameters**

- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

*esp\_err\_t* `esp_intr_disable` (*intr\_handle\_t* handle)

Disable the interrupt associated with the handle.

**Note**

1. For local interrupts (`ESP_INTERNAL_*` sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**Return** `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

**Parameters**

- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

*esp\_err\_t* **esp\_intr\_enable** (*intr\_handle\_t* handle)

Enable the interrupt associated with the handle.

**Note** For local interrupts (ESP\_INTERNAL\_\* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**Return** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_OK otherwise

**Parameters**

- handle: The handle, as obtained by esp\_intr\_alloc or esp\_intr\_alloc\_intrstatus

*esp\_err\_t* **esp\_intr\_set\_in\_iram** (*intr\_handle\_t* handle, bool is\_in\_iram)

Set the “in IRAM” status of the handler.

**Note** Does not work on shared interrupts.

**Return** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid. ESP\_OK otherwise

**Parameters**

- handle: The handle, as obtained by esp\_intr\_alloc or esp\_intr\_alloc\_intrstatus
- is\_in\_iram: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

void **esp\_intr\_noniram\_disable** (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void **esp\_intr\_noniram\_enable** (void)

Re-enable interrupts disabled by esp\_intr\_noniram\_disable.

void **esp\_intr\_enable\_source** (int inum)

enable the interrupt source based on its number

**Parameters**

- inum: interrupt number from 0 to 31

void **esp\_intr\_disable\_source** (int inum)

disable the interrupt source based on its number

**Parameters**

- inum: interrupt number from 0 to 31

static int **esp\_intr\_flags\_to\_level** (int flags)

Get the lowest interrupt level from the flags.

**Parameters**

- flags: The same flags that pass to esp\_intr\_alloc\_intrstatus API

## Macros

**ESP\_INTR\_FLAG\_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp\_intr\_alloc\* needs. Accept a Level 1 interrupt vector (lowest priority)

**ESP\_INTR\_FLAG\_LEVEL2**

Accept a Level 2 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL3**

Accept a Level 3 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL4**

Accept a Level 4 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL5**

Accept a Level 5 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL6**

Accept a Level 6 interrupt vector.

**ESP\_INTR\_FLAG\_NMI**

Accept a Level 7 interrupt vector (highest priority)

**ESP\_INTR\_FLAG\_SHARED**

Interrupt can be shared between ISRs.

**ESP\_INTR\_FLAG\_EDGE**

Edge-triggered interrupt.

**ESP\_INTR\_FLAG\_IRAM**

ISR can be called if cache is disabled.

**ESP\_INTR\_FLAG\_INTRDISABLED**

Return with this interrupt disabled.

**ESP\_INTR\_FLAG\_LOWMED**

Low and medium prio interrupts. These can be handled in C.

**ESP\_INTR\_FLAG\_HIGH**

High level interrupts. Need to be handled in assembly.

**ESP\_INTR\_FLAG\_LEVELMASK**

Mask for all level flags.

**ETS\_INTERNAL\_TIMER0\_INTR\_SOURCE**

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS\_INTERNAL\_TIMER1\_INTR\_SOURCE**

Platform timer 1 interrupt source.

**ETS\_INTERNAL\_TIMER2\_INTR\_SOURCE**

Platform timer 2 interrupt source.

**ETS\_INTERNAL\_SW0\_INTR\_SOURCE**

Software int source 1.

**ETS\_INTERNAL\_SW1\_INTR\_SOURCE**

Software int source 2.

**ETS\_INTERNAL\_PROFILING\_INTR\_SOURCE**

Int source for profiling.

**ETS\_INTERNAL\_INTR\_SOURCE\_OFF**

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

**ESP\_INTR\_ENABLE** (inum)

Enable interrupt by interrupt number

**ESP\_INTR\_DISABLE** (inum)

Disable interrupt by interrupt number

**Type Definitions**

```
typedef void (*intr_handler_t) (void *arg)
```

Function prototype for interrupt handler function

```
typedef struct intr_handle_data_t intr_handle_data_t
```

Interrupt handler associated data structure

```
typedef intr_handle_data_t*intr_handle_t
```

Handle to an interrupt handler

**2.7.18 Logging library**

## Overview

The logging library provides two ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. All logging statements for verbosity levels higher than `CONFIG_LOG_DEFAULT_LEVEL` will be removed by the preprocessor.
- **At runtime:** all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

---

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_DEFAULT_LEVEL`. To increase log level for a specific file at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

---

## How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_
↳* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g., `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
CFLAGS += -D LOG_LOCAL_LEVEL=ESP_LOG_DEBUG
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```

esp_log_level_set ("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set ("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set ("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client

```

**Logging to Host via JTAG** By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section [Logging to Host](#).

### Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF's [examples](#) directory. The most relevant examples that deal with logging are the following:

- [system/ota](#)
- [storage/sd\\_card](#)
- [protocols/https\\_request](#)

## API Reference

### Header File

- [log/include/esp\\_log.h](#)

### Functions

void **esp\_log\_level\_set** (const char \*tag, esp\_log\_level\_t level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function can not raise log level above the level set using `CONFIG_LOG_DEFAULT_LEVEL` setting in `menuconfig`.

To raise log level above the default one for a given file, define `LOG_LOCAL_LEVEL` to one of the `ESP_LOG_*` values, before including `esp_log.h` in this file.

#### Parameters

- `tag`: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value `"*"` resets log level for all tags to the given value.
- `level`: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

*vprintf\_like\_t* **esp\_log\_set\_vprintf** (*vprintf\_like\_t func*)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Return** func old Function used for output.

#### Parameters

- `func`: new Function used for output. Must have same signature as `vprintf`.

uint32\_t **esp\_log\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of `ESP_LOGx` macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Return** timestamp, in milliseconds

char \***esp\_log\_system\_timestamp** (void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP\_LOGx macros to print the system time as “HH:MM:SS.sss” . The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will still print the RTOS tick time.

**Return** timestamp, in “HH:MM:SS.sss”

uint32\_t **esp\_log\_early\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

**Return** timestamp, in milliseconds

void **esp\_log\_write** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP\_LOGE, ESP\_LOGW, ESP\_LOGI, ESP\_LOGD, ESP\_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp\_log\_writev** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, va\_list args)

Write message into the log, va\_list variant.

This function is provided to ease integration toward other logging framework, so that esp\_log can be used as a log sink.

**See** esp\_log\_write()

## Macros

**ESP\_LOG\_BUFFER\_HEX\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

### Parameters

- tag: description tag
- buffer: Pointer to the buffer array
- buff\_len: length of buffer in bytes
- level: level of the log

**ESP\_LOG\_BUFFER\_CHAR\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

### Parameters

- tag: description tag
- buffer: Pointer to the buffer array
- buff\_len: length of buffer in bytes
- level: level of the log

**ESP\_LOG\_BUFFER\_HEXDUMP** (tag, buffer, buff\_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```

W (195) log_example: 0x3ffb4280  45 53 50 33 32 20 69 73  20 67 72 65 61 74_
↪2c 20 |ESP32 is great, |
W (195) log_example: 0x3ffb4290  77 6f 72 6b 69 6e 67 20  61 6c 6f 6e 67 20_
↪77 69 |working along wi|
W (205) log_example: 0x3ffb42a0  74 68 20 74 68 65 20 49  44 46 2e 00      _
↪      |th the IDF..|

```

It is highly recommend to use terminals with over 102 text width.

**Parameters**

- tag: description tag
- buffer: Pointer to the buffer array
- buff\_len: length of buffer in bytes
- level: level of the log

**ESP\_LOG\_BUFFER\_HEX** (tag, buffer, buff\_len)

Log a buffer of hex bytes at Info level.

See `esp_log_buffer_hex_level`

**Parameters**

- tag: description tag
- buffer: Pointer to the buffer array
- buff\_len: length of buffer in bytes

**ESP\_LOG\_BUFFER\_CHAR** (tag, buffer, buff\_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See `esp_log_buffer_char_level`

**Parameters**

- tag: description tag
- buffer: Pointer to the buffer array
- buff\_len: length of buffer in bytes

**ESP\_EARLY\_LOGE** (tag, format, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. log at `ESP_LOG_ERROR` level.

See `printf,ESP_LOGE`

**ESP\_EARLY\_LOGW** (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_WARN` level.

See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP\_EARLY\_LOGI** (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_INFO` level.

See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP\_EARLY\_LOGD** (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_DEBUG` level.

See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP\_EARLY\_LOGV** (tag, format, ...)

macro to output logs in startup code at `ESP_LOG_VERBOSE` level.

See `ESP_EARLY_LOGE,ESP_LOGE,printf`

**ESP\_LOG\_EARLY\_IMPL** (tag, format, log\_level, log\_tag\_letter, ...)

**ESP\_LOGE** (tag, format, ...)

**ESP\_LOGW** (tag, format, ...)

**ESP\_LOGI** (tag, format, ...)

**ESP\_LOGD** (tag, format, ...)

**ESP\_LOGV** (tag, format, ...)

**ESP\_LOG\_LEVEL** (level, tag, format, ...)

runtime macro to output logs at a specified level.

See `printf`

**Parameters**

- `tag`: tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- `level`: level of the output log.
- `format`: format of the output log. see `printf`
- `...`: variables to be replaced into the log. see `printf`

**ESP\_LOG\_LEVEL\_LOCAL** (level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`.

See `printf`, `ESP_LOG_LEVEL`

**ESP\_DRAM\_LOGE** (tag, format, ...)

Macro to output logs when the cache is disabled. log at `ESP_LOG_ERROR` level.

Similar to `ESP_EARLY_LOGE`, the log level cannot be changed by `esp_log_level_set`.

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`, where `TAG` is a `char*` that points to a str in the DRAM.

**Note** Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

See `esp_rom_printf`, `ESP_LOGE`

**ESP\_DRAM\_LOGW** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_WARN` level.

See `ESP_DRAM_LOGW`, `ESP_LOGW`, `esp_rom_printf`

**ESP\_DRAM\_LOGI** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_INFO` level.

See `ESP_DRAM_LOGI`, `ESP_LOGI`, `esp_rom_printf`

**ESP\_DRAM\_LOGD** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_DEBUG` level.

See `ESP_DRAM_LOGD`, `ESP_LOGD`, `esp_rom_printf`

**ESP\_DRAM\_LOGV** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_VERBOSE` level.

See `ESP_DRAM_LOGV`, `ESP_LOGV`, `esp_rom_printf`

## Type Definitions

**typedef** int (**\*vprintf\_like\_t**) (const char \*, va\_list)

## Enumerations

**enum** `esp_log_level_t`

Log level.

*Values:*

**ESP\_LOG\_NONE**

No log output

**ESP\_LOG\_ERROR**

Critical errors, software module can not recover on its own

**ESP\_LOG\_WARN**

Error conditions from which recovery measures have been taken

**ESP\_LOG\_INFO**

Information messages which describe normal flow of events

**ESP\_LOG\_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

**ESP\_LOG\_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

## 2.7.19 Miscellaneous System APIs

### Software reset

To perform software reset of the chip, `esp_restart()` function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, `esp_register_shutdown_handler()` function is provided to register a routine which needs to be called prior to restart (when done by `esp_restart()`). This is similar to the functionality of `atexit` POSIX function.

### Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.

### Heap memory

Two heap memory related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using `malloc` family of functions. For further information about heap memory see [Heap Memory Allocation](#).

### Random number generation

ESP32-C3 contains a hardware random number generator, values from it can be obtained using `esp_random()`.

When Wi-Fi or Bluetooth are enabled, numbers returned by hardware random number generator (RNG) can be considered true random numbers. Without Wi-Fi or Bluetooth enabled, hardware RNG is a pseudo-random number generator. At startup, ESP-IDF bootloader seeds the hardware RNG with entropy, but care must be taken when reading random values between the start of `app_main` and initialization of Wi-Fi or Bluetooth drivers.

### MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

In ESP-IDF these addresses are calculated from *Base MAC address*. Base MAC address can be initialized with factory-programmed value from internal eFuse, or with a user-defined value. In addition to setting the base MAC address, applications can specify the way in which MAC addresses are allocated to devices. See [Number of universally administered MAC address](#) section for more details.

**Base MAC address** To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), you can simply use `esp_read_mac()` function.

By default, this function takes the eFuse value burned at a pre-defined block (e.g. BLK0 for ESP32, BLK1 for ESP32-S2) as the base MAC address. Per-interface MAC addresses will be calculated according to the table above.

Applications who want to customize base MAC address (not the one provided by Espressif) should call `esp_base_mac_addr_set()` before `esp_read_mac()`. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).

Note that, calls to `esp_base_mac_addr_set()` should take place before the initialization of network stack, for example, early in `app_main`.

**Custom MAC address in eFuse** To facilitate the usage of custom MAC addresses, ESP-IDF provides `esp_efuse_mac_get_custom()` function, which loads MAC address from internal pre-defined eFuse block (e.g. BLK3 for ESP32). This function assumes that custom MAC address is stored in the following format:

Field	# of bits	Range of bits	Notes
Version	8	191:184	0: invalid, others —valid
Reserved	128	183:56	
MAC address	48	55:8	
MAC address CRC	8	7:0	CRC-8-CCITT, polynomial 0x07

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Number of universally administered MAC address** Several MAC addresses (universally administered by IEEE) are uniquely assigned to the networking interfaces (Wi-Fi/BT/Ethernet). The final octet of each universally administered MAC address increases by one. Only the first one of them (which is called base MAC address) is stored in eFuse or external storage, the others are generated from it. Here, ‘generate’ means adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the universally administered MAC addresses are not enough for all of the networking interfaces, locally administered MAC addresses which are derived from universally administered MAC addresses are assigned to the rest of networking interfaces.

See [this article](#) for the definition of local and universally administered MAC addresses.

### Chip version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

### SDK version

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
#endif
```

## App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set `PROJECT_VER` variable in your project CMakeLists.txt/Makefile:

- In application CMakeLists.txt put `set(PROJECT_VER "0.1.0.1")` before including `project.cmake`.

(For legacy GNU Make build system: in application Makefile put `PROJECT_VER = "0.1.0.1"` before including `project.mk`.)

If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise if `PROJECT_VER` variable is not set in the project then it will be retrieved from either `$(PROJECT_PATH)/version.txt` file (if present) else using git command `git describe`. If neither is available then `PROJECT_VER` will be set to "1". Application can make use of this by calling `esp_ota_get_app_description()` or `esp_ota_get_partition_description()` functions.

## API Reference

### Header File

- `esp_system/include/esp_system.h`

### Functions

`esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the handler has already been registered
- `ESP_ERR_NO_MEM` if no more shutdown handler slots are available

#### Parameters

- `handle`: function to execute on restart

`esp_err_t esp_unregister_shutdown_handler(shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the given handler hasn't been registered before

void `esp_restart` (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be `SW_CPU_RESET`. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

*esp\_reset\_reason\_t* **esp\_reset\_reason** (void)

Get reason of last reset.

**Return** See description of `esp_reset_reason_t` for explanation of each value.

uint32\_t **esp\_get\_free\_heap\_size** (void)

Get the size of available heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available heap size, in bytes.

uint32\_t **esp\_get\_free\_internal\_heap\_size** (void)

Get the size of available internal heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available internal heap size, in bytes.

uint32\_t **esp\_get\_minimum\_free\_heap\_size** (void)

Get the minimum heap that has ever been available.

**Return** Minimum free heap ever available

uint32\_t **esp\_random** (void)

Get one random 32-bit word from hardware RNG.

The hardware RNG is fully functional whenever an RF subsystem is running (ie Bluetooth or WiFi is enabled). For random values, call this function after WiFi or Bluetooth are started.

If the RF subsystem is not used by the program, the function `bootloader_random_enable()` can be called to enable an entropy source. `bootloader_random_disable()` must be called before RF subsystem or I2S peripheral are used. See these functions' documentation for more details.

Any time the app is running without an RF subsystem (or `bootloader_random`) enabled, RNG hardware should be considered a PRNG. A very small amount of entropy is available due to pre-seeding while the IDF bootloader is running, but this should not be relied upon for any use.

**Return** Random value between 0 and `UINT32_MAX`

void **esp\_fill\_random** (void \*buf, size\_t len)

Fill a buffer with random bytes from hardware RNG.

**Note** This function has the same restrictions regarding available entropy as `esp_random()`

**Parameters**

- `buf`: Pointer to buffer to fill with random numbers.
- `len`: Length of buffer in bytes

*esp\_err\_t* **esp\_base\_mac\_addr\_set** (const uint8\_t \*mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. If using base MAC address stored in BLK3 of EFUSE or external storage, call this API to set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage before initializing WiFi/BT/Ethernet.

**Note** Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

**Note** If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_ARG` If `mac` is `NULL` or is not a unicast MAC

**Parameters**

- `mac`: base MAC address, length: 6 bytes.

*esp\_err\_t* **esp\_base\_mac\_addr\_get** (uint8\_t \*mac)

Return base MAC address which is set using `esp_base_mac_addr_set`.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_MAC` base MAC address has not been set

**Parameters**

- `mac`: base MAC address, length: 6 bytes.

*esp\_err\_t* **esp\_efuse\_mac\_get\_custom** (uint8\_t \**mac*)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to BLK3 of EFUSE. Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see `esp_base_mac_addr_set()` for details.

**Return** ESP\_OK on success ESP\_ERR\_INVALID\_VERSION An invalid MAC version field was read from BLK3 of EFUSE ESP\_ERR\_INVALID\_CRC An invalid MAC CRC was read from BLK3 of EFUSE

**Parameters**

- *mac*: base MAC address, length: 6 bytes.

*esp\_err\_t* **esp\_efuse\_mac\_get\_default** (uint8\_t \**mac*)

Return base MAC address which is factory-programmed by Espressif in BLK0 of EFUSE.

**Return** ESP\_OK on success

**Parameters**

- *mac*: base MAC address, length: 6 bytes.

*esp\_err\_t* **esp\_read\_mac** (uint8\_t \**mac*, *esp\_mac\_type\_t* *type*)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using `esp_base_mac_addr_get` or reads base MAC address from BLK0 of EFUSE. Then set the MAC address of the interface including wifi station, wifi softap, bluetooth and ethernet.

**Return** ESP\_OK on success

**Parameters**

- *mac*: MAC address of the interface, length: 6 bytes.
- *type*: type of MAC address, 0:wifi station, 1:wifi softap, 2:bluetooth, 3:ethernet.

*esp\_err\_t* **esp\_derive\_local\_mac** (uint8\_t \**local\_mac*, **const** uint8\_t \**universal\_mac*)

Derive local MAC address from universal MAC address.

This function derives a local MAC address from an universal MAC address. A definition of local vs universal MAC address can be found on Wikipedia <>. In ESP32, universal MAC address is generated from base MAC address in EFUSE or other external storage. Local MAC address is derived from the universal MAC address.

**Return** ESP\_OK on success

**Parameters**

- *local\_mac*: Derived local MAC address, length: 6 bytes.
- *universal\_mac*: Source universal MAC address, length: 6 bytes.

void **esp\_system\_abort** (**const** char \**details*)

Trigger a software abort.

**Parameters**

- *details*: Details that will be displayed during panic handling.

void **esp\_chip\_info** (*esp\_chip\_info\_t* \**out\_info*)

Fill an *esp\_chip\_info\_t* structure with information about the chip.

**Parameters**

- [out] *out\_info*: structure to be filled

## Structures

**struct esp\_chip\_info\_t**

The structure represents information about the chip.

### Public Members

`esp_chip_model_t model`

chip model, one of `esp_chip_model_t`

`uint32_t features`

bit mask of `CHIP_FEATURE_x` feature flags

`uint16_t full_revision`

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

`uint8_t cores`

number of CPU cores

`uint8_t revision`

chip revision number

### Macros

`CHIP_FEATURE_EMB_FLASH`

Chip has embedded flash memory.

`CHIP_FEATURE_WIFI_BGN`

Chip has 2.4GHz WiFi.

`CHIP_FEATURE_BLE`

Chip has Bluetooth LE.

`CHIP_FEATURE_BT`

Chip has Bluetooth Classic.

### Type Definitions

`typedef void (*shutdown_handler_t) (void)`

Shutdown handler type

### Enumerations

`enum esp_mac_type_t`

Values:

`ESP_MAC_WIFI_STA`

`ESP_MAC_WIFI_SOFTAP`

`ESP_MAC_BT`

`ESP_MAC_ETH`

`enum esp_reset_reason_t`

Reset reasons.

Values:

`ESP_RST_UNKNOWN`

Reset reason can not be determined.

`ESP_RST_POWERON`

Reset due to power-on event.

`ESP_RST_EXT`

Reset by external pin (not applicable for ESP32)

`ESP_RST_SW`

Software reset via `esp_restart`.

`ESP_RST_PANIC`

Software reset due to exception/panic.

**ESP\_RST\_INT\_WDT**

Reset (software or hardware) due to interrupt watchdog.

**ESP\_RST\_TASK\_WDT**

Reset due to task watchdog.

**ESP\_RST\_WDT**

Reset due to other watchdogs.

**ESP\_RST\_DEEPSLEEP**

Reset after exiting deep sleep mode.

**ESP\_RST\_BROWNOUT**

Brownout reset (software or hardware)

**ESP\_RST\_SDIO**

Reset over SDIO.

**enum esp\_chip\_model\_t**

Chip models.

*Values:*

**CHIP\_ESP32 = 1**

ESP32.

**CHIP\_ESP32S2 = 2**

ESP32-S2.

**CHIP\_ESP32S3 = 4**

ESP32-S3.

**CHIP\_ESP32C3 = 5**

ESP32-C3.

**Header File**

- [esp\\_common/include/esp\\_idf\\_version.h](#)

**Functions**

**const char \*esp\_get\_idf\_version** (void)

Return full IDF version string, same as ‘git describe’ output.

**Note** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

**Return** constant string from IDF\_VER

**Macros**

**ESP\_IDF\_VERSION\_MAJOR**

Major version number (X.x.x)

**ESP\_IDF\_VERSION\_MINOR**

Minor version number (x.X.x)

**ESP\_IDF\_VERSION\_PATCH**

Patch version number (x.x.X)

**ESP\_IDF\_VERSION\_VAL** (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

**ESP\_IDF\_VERSION**

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

## 2.7.20 Over The Air Updates (OTA)

### OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the *Partition Table* of the device with at least two “OTA app slot” partitions (i.e. `ota_0` and `ota_1`) and an “OTA Data Partition” .

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

### OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the *Partition Table* of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually `ota_0`) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

### App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application it is written to the `otadata` partition. The partition contains a `ota_seq` counter which is a pointer to the slot (`ota_0`, `ota_1`, ...) from which the application will be selected for boot.

**App OTA State** States control the process of selecting a boot app:

States	Restriction of selecting a boot app in bootloader
ESP_OTA_IMG_VALID	Not the restriction. Will be selected.
ESP_OTA_IMG_PENDING_VERIFY	Not the restriction. Will be selected.
ESP_OTA_IMG_INVALID	Will not be selected.
ESP_OTA_IMG_ABORTED	Will not be selected.
ESP_OTA_IMG_NEW	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.
ESP_OTA_IMG_PENDING_VERIFY	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected and the state will change to ESP_OTA_IMG_ABORTED.

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and ESP\_OTA\_IMG\_NEW and ESP\_OTA\_IMG\_PENDING\_VERIFY states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

**Rollback Process** The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state ESP\_OTA\_IMG\_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the ESP\_OTA\_IMG\_PENDING\_VERIFY state if it is set, then it will be written to ESP\_OTA\_IMG\_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP\_OTA\_IMG\_INVALID or ESP\_OTA\_IMG\_ABORTED.
- The bootloader checks the selected application for ESP\_OTA\_IMG\_NEW state if it is set, then it will be written to ESP\_OTA\_IMG\_PENDING\_VERIFY. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to ESP\_OTA\_IMG\_ABORTED (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP\_OTA\_IMG\_PENDING\_VERIFY state).
- If the self-test fails then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP\_OTA\_IMG\_INVALID state.
- If the application has not been confirmed, the state remains ESP\_OTA\_IMG\_PENDING\_VERIFY, and the next boot it will be changed to ESP\_OTA\_IMG\_ABORTED. That will prevent re-boot of this application. There will be a rollback to the previous working application.

**Unexpected Reset** If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

**Booting invalid/aborted apps** Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the `otadata`.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

**Where the states are set** A brief description of where the states are set:

- `ESP_OTA_IMG_VALID` state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- `ESP_OTA_IMG_UNDEFINED` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- `ESP_OTA_IMG_NEW` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- `ESP_OTA_IMG_INVALID` state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- `ESP_OTA_IMG_ABORTED` state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- `ESP_OTA_IMG_PENDING_VERIFY` state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has `ESP_OTA_IMG_NEW` state.

## Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

## A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If `otadata` is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of eFuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the `ESP_OTA_IMG_VALID` state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen due to the device may not have any bootable apps then it will return `ESP_ERR_OTA_ROLLBACK_FAILED` error and stay in the `ESP_OTA_IMG_PENDING_VERIFY` state.
- The next update of app is possible if a running app is in the `ESP_OTA_IMG_VALID` state.

**Recommendation:**

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than running app, you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```

....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) ==_
↪false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a_
↪secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }

                image_header_was_checked = true;

                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
    }
}
....

```

**Restrictions:**

- The number of bits in the `secure_version` field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option.
- Anti-rollback only works if the encoding scheme for efuse is set to NONE.
- The partition table should not have a factory partition, only two of the app.

**security\_version:**

- In application image it is stored in `esp_app_desc` structure. The number is set `CONFIG_BOOTLOADER_APP_SECURE_VERSION`.

**Secure OTA Updates Without Secure boot**

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` and `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

**OTA Tool (otatool.py)**

The component `app_update` provides a tool `otatool.py` for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (`read_otadata`)
- erase otadata partition, effectively resetting device to factory app (`erase_otadata`)

- switch OTA partitions (switch\_ota\_partition)
- erasing OTA partition (erase\_ota\_partition)
- write to OTA partition (write\_ota\_partition)
- read contents of OTA partition (read\_ota\_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool's Python API and command-line interface, respectively.

**Python API** Before anything else, make sure that the *otatool* module is imported.

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py_
↳ lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir) # this enables Python to find otatool module
from otatool import * # import all names inside otatool module
```

The starting point for using the tool's Python API to do is create a *OtatoolTarget* object:

```
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

**Command-line Interface** The command-line interface of *otatool.py* has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - these are arguments that are needed for executing the main_
↳ command (parttool.py), mostly pertaining to the target device
- subcommand - this is the operation to be performed
- subcommand-args - these are arguments that are specific to the chosen operation
```

```
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
```

(continues on next page)

(continued from previous page)

```
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `-help` as argument:

```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

### Application Example

End-to-end example of OTA firmware update workflow: [system/ota](#).

## API Reference

### Header File

- `app_update/include/esp_ota_ops.h`

### Functions

**const** `esp_app_desc_t` \***esp\_ota\_get\_app\_description** (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

**Return** Pointer to `esp_app_desc` structure.

**int** **esp\_ota\_get\_app\_elf\_sha256** (char \**dst*, size\_t *size*)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

**Return** Number of bytes written to *dst* (including null terminator)

#### Parameters

- *dst*: Destination buffer
- *size*: Size of the buffer

`esp_err_t` **esp\_ota\_begin** (**const** `esp_partition_t` \**partition*, size\_t *image\_size*, `esp_ota_handle_t` \**out\_handle*)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass `OTA_SIZE_UNKNOWN` which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until `esp_ota_end()` is called with the returned handle.

Note: If the rollback option is enabled and the running application has the `ESP_OTA_IMG_PENDING_VERIFY` state then it will lead to the

ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE error. Confirm the running app before to run download a new app, use `esp_ota_mark_app_valid_cancel_rollback()` function for it (this should be done as early as possible when you first download a new application).

#### Return

- ESP\_OK: OTA operation commenced successfully.
- ESP\_ERR\_INVALID\_ARG: partition or out\_handle arguments were NULL, or partition doesn't point to an OTA app partition.
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for OTA operation.
- ESP\_ERR\_OTA\_PARTITION\_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP\_ERR\_NOT\_FOUND: Partition argument not found in partition table.
- ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID: The OTA data partition contains invalid data.
- ESP\_ERR\_INVALID\_SIZE: Partition doesn't fit in configured flash size.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.

#### Parameters

- `partition`: Pointer to info for partition which will receive the OTA update. Required.
- `image_size`: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA\_SIZE\_UNKNOWN, the entire partition is erased.
- `out_handle`: On success, returns a handle which should be used for subsequent `esp_ota_write()` and `esp_ota_end()` calls.

*esp\_err\_t* **esp\_ota\_write** (*esp\_ota\_handle\_t* handle, **const** void \*data, size\_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

#### Return

- ESP\_OK: Data was written to flash successfully.
- ESP\_ERR\_INVALID\_ARG: handle is invalid.
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: First byte of image contains invalid app image magic byte.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID: OTA data partition has invalid contents

#### Parameters

- `handle`: Handle obtained from `esp_ota_begin`
- `data`: Data buffer to write
- `size`: Size of data buffer in bytes.

*esp\_err\_t* **esp\_ota\_write\_with\_offset** (*esp\_ota\_handle\_t* handle, **const** void \*data, size\_t size, uint32\_t offset)

Write OTA update data to partition.

This function can write data in non contiguous manner. If flash encryption is enabled, data should be 16 byte aligned.

**Note** While performing OTA, if the packets arrive out of order, `esp_ota_write_with_offset()` can be used to write data in non contiguous manner. Use of `esp_ota_write_with_offset()` in combination with `esp_ota_write()` is not recommended.

#### Return

- ESP\_OK: Data was written to flash successfully.
- ESP\_ERR\_INVALID\_ARG: handle is invalid.
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: First byte of image contains invalid app image magic byte.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID: OTA data partition has invalid contents

#### Parameters

- `handle`: Handle obtained from `esp_ota_begin`
- `data`: Data buffer to write
- `size`: Size of data buffer in bytes
- `offset`: Offset in flash partition

*esp\_err\_t* **esp\_ota\_end** (*esp\_ota\_handle\_t* handle)

Finish OTA update and validate newly written app image.

**Note** After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**

- `handle`: Handle obtained from `esp_ota_begin()`.

*esp\_err\_t* **esp\_ota\_abort** (*esp\_ota\_handle\_t* handle)

Abort OTA update, free the handle and memory associated with it.

**Return**

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

**Parameters**

- `handle`: obtained from `esp_ota_begin()`.

*esp\_err\_t* **esp\_ota\_set\_boot\_partition** (**const** *esp\_partition\_t* \*partition)

Configure OTA data for a new boot partition.

**Note** If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

**Return**

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was `NULL` or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

**Parameters**

- `partition`: Pointer to info for partition containing app image to boot.

**const** *esp\_partition\_t* \***esp\_ota\_get\_boot\_partition** (void)

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

**Return** Pointer to info for partition structure, or `NULL` if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

**const** *esp\_partition\_t* \***esp\_ota\_get\_running\_partition** (void)

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition

information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Return** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t
                                                    *start_from)
```

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

**Return** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

#### Parameters

- `start_from`: If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

```
esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition,
                                             esp_app_desc_t *app_desc)
```

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

#### Return

- `ESP_OK` Successful.
- `ESP_ERR_NOT_FOUND` `app_desc` structure is not found. Magic word is incorrect.
- `ESP_ERR_NOT_SUPPORTED` Partition is not application.
- `ESP_ERR_INVALID_ARG` Arguments is NULL or if partition's offset exceeds partition size.
- `ESP_ERR_INVALID_SIZE` Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

#### Parameters

- [in] `partition`: Pointer to app partition. (only app partition)
- [out] `app_desc`: Structure of info about app.

```
esp_err_t esp_ota_mark_app_valid_cancel_rollback (void)
```

This function is called to indicate that the running app is working well.

#### Return

- `ESP_OK`: if successful.

```
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot (void)
```

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

#### Return

- `ESP_FAIL`: if not successful.
- `ESP_ERR_OTA_ROLLBACK_FAILED`: The rollback is not possible due to flash does not have any apps.

```
const esp_partition_t *esp_ota_get_last_invalid_partition (void)
```

Returns last partition with invalid state (`ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED`).

**Return** partition.

```
esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t
                                       *ota_state)
```

Returns state for given partition.

#### Return

- **ESP\_OK**: Successful.
- **ESP\_ERR\_INVALID\_ARG**: partition or ota\_state arguments were NULL.
- **ESP\_ERR\_NOT\_SUPPORTED**: partition is not ota.
- **ESP\_ERR\_NOT\_FOUND**: Partition table does not have otadata or state was not found for given partition.

**Parameters**

- [in] `partition`: Pointer to partition.
- [out] `ota_state`: state of partition (if this partition has a record in otadata).

*esp\_err\_t* **esp\_ota\_erase\_last\_boot\_app\_partition** (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

**Return**

- **ESP\_OK**: Successful, otherwise **ESP\_ERR**.

bool **esp\_ota\_check\_rollback\_is\_possible** (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure\_version of app >= secure\_version of efuse (if anti-rollback is enabled).

**Return**

- **True**: Returns true if the slots have at least one app (except the running app).
- **False**: The rollback is not possible.

*esp\_err\_t* **esp\_ota\_revoke\_secure\_boot\_public\_key** (*esp\_ota\_secure\_boot\_public\_key\_index\_t* *index*)

Revokes the old signature digest. To be called in the application after the rollback logic.

Relevant for Secure boot v2 on targets where upto 3 key digests can be stored (Key N-1, Key N, Key N+1). When key N-1 used to sign an app is invalidated, an OTA update is to be sent with an app signed with key N-1 & Key N. After successfully booting the OTA app should call this function to revoke Key N-1.

**Return**

- **ESP\_OK**: If revocation is successful.
- **ESP\_ERR\_INVALID\_ARG**: If the index of the public key to be revoked is incorrect.
- **ESP\_FAIL**: If secure boot v2 has not been enabled.

**Parameters**

- `index`: - The index of the signature block to be revoked

**Macros****OTA\_SIZE\_UNKNOWN**

Used for `esp_ota_begin()` if new image size is unknown

**OTA\_WITH\_SEQUENTIAL\_WRITES**

Used for `esp_ota_begin()` if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

**ESP\_ERR\_OTA\_BASE**

Base error code for ota\_ops api

**ESP\_ERR\_OTA\_PARTITION\_CONFLICT**

Error if request was to write or erase the current running partition

**ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**

Error if OTA data partition contains invalid content

**ESP\_ERR\_OTA\_VALIDATE\_FAILED**

Error if OTA app image is invalid

**ESP\_ERR\_OTA\_SMALL\_SEC\_VER**

Error if the firmware has a secure version less than the running firmware.

**ESP\_ERR\_OTA\_ROLLBACK\_FAILED**

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE**

Error if current active firmware is still marked in pending validation state (ESP\_OTA\_IMG\_PENDING\_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**Type Definitions**

```
typedef uint32_t esp_ota_handle_t
```

Opaque handle for an application OTA update.

esp\_ota\_begin() returns a handle which is then used for subsequent calls to esp\_ota\_write() and esp\_ota\_end().

**Enumerations**

```
enum esp_ota_secure_boot_public_key_index_t
```

Secure Boot V2 public key indexes.

*Values:*

```
SECURE_BOOT_PUBLIC_KEY_INDEX_0
```

Points to the 0th index of the Secure Boot v2 public key

```
SECURE_BOOT_PUBLIC_KEY_INDEX_1
```

Points to the 1st index of the Secure Boot v2 public key

```
SECURE_BOOT_PUBLIC_KEY_INDEX_2
```

Points to the 2nd index of the Secure Boot v2 public key

## 2.7.21 Power Management

**Overview**

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

**Configuration**

Power management can be enabled at compile time, using the option [\*CONFIG\\_PM\\_ENABLE\*](#).

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32c3_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default `REF_TICK` clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (`true/false`).  
Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32C3_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

---

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

---

---

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the [Sleep Modes](#) documentation can be used to trigger wakeup from the light sleep state.

---

### Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32-C3 supports three types of locks described in the table below.

Lock	Description
<code>ESP_PM_CPU_FREQ_MAX</code>	Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code> . For ESP32-C3, this value can be set to 80 MHz, 160 MHz, or 240 MHz.
<code>ESP_PM_APB_FREQ_MAX</code>	Requests the APB frequency to be at the maximum supported value. For ESP32-C3, this is 80 MHz.
<code>ESP_PM_NO_LIGHT_SLEEP</code>	Disables automatic switching to light sleep.

### ESP32-C3 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP32C3_DEFAULT_CPU_FREQ_MHZ`.

Max CPU Frequency Set	Lock Acquisition	CPU and APB Frequencies
240	ESP_PM_CPU_FREQ_MAX acquired	CPU: 240 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>
160	ESP_PM_CPU_FREQ_MAX acquired	CPU: 160 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>
80	Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with *High resolution timer* APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

### Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the work of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART:** if REF\_TICK is used as a clock source. See `use_ref_tick` member of `uart_config_t`.
- **LEDC:** if REF\_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT:** if REF\_TICK or XTAL is used as a clock source. See `flags` member of `rmt_config_t` and macro `RMT_CHANNEL_FLAGS_AWARE_DFS`.

Currently, the following peripheral drivers are aware of DFS and will use the ESP\_PM\_APB\_FREQ\_MAX lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APLL clock is used, then it will use the ESP\_PM\_NO\_LIGHT\_SLEEP lock)
- SDMMC

The following drivers will hold the ESP\_PM\_APB\_FREQ\_MAX lock while the driver is enabled:

- **SPI slave:** between calls to `spi_slave_initialize()` and `spi_slave_free()`.
- **Ethernet:** between calls to `esp_eth_driver_install()` and `esp_eth_driver_uninstall()`.
- **WiFi:** between calls to `esp_wifi_start()` and `esp_wifi_stop()`. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **TWAI:** between calls to `twai_driver_install()` and `twai_driver_uninstall()`.
- **Bluetooth:** between calls to `esp_bt_controller_enable()` and `esp_bt_controller_disable()`. If Bluetooth modem sleep is enabled, the ESP\_PM\_APB\_FREQ\_MAX lock will be released for the periods of time when radio is disabled. However the ESP\_PM\_NO\_LIGHT\_SLEEP lock will still be held.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- Timer group

## API Reference

### Header File

- `esp_pm/include/esp_pm.h`

### Functions

`esp_err_t esp_pm_configure(const void *config)`

Set implementation-specific power management configuration.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the configuration values are not correct
- ESP\_ERR\_NOT\_SUPPORTED if certain combination of values is not supported, or if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

#### Parameters

- `config`: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

`esp_err_t esp_pm_get_configuration(void *config)`

Get implementation-specific power management configuration.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the pointer is null

#### Parameters

- `config`: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

`esp_err_t esp_pm_lock_create(esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)`

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if the lock structure can not be allocated
- ESP\_ERR\_INVALID\_ARG if `out_handle` is NULL or type argument is not valid

- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- `lock_type`: Power management constraint which the lock should control
- `arg`: argument, value depends on `lock_type`, see `esp_pm_lock_type_t`
- `name`: arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the `esp_pm_dump_locks` function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- `[out] out_handle`: handle returned from this function. Use this handle when calling `esp_pm_lock_delete`, `esp_pm_lock_acquire`, `esp_pm_lock_release`. Must not be NULL.

*esp\_err\_t* **esp\_pm\_lock\_acquire** (*esp\_pm\_lock\_handle\_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to `esp_pm_lock_create`, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- `handle`: handle obtained from `esp_pm_lock_create` function

*esp\_err\_t* **esp\_pm\_lock\_release** (*esp\_pm\_lock\_handle\_t* handle)

Release the lock taken using `esp_pm_lock_acquire`.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if lock is not acquired
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- `handle`: handle obtained from `esp_pm_lock_create` function

*esp\_err\_t* **esp\_pm\_lock\_delete** (*esp\_pm\_lock\_handle\_t* handle)

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle argument is NULL
- ESP\_ERR\_INVALID\_STATE if the lock is still acquired
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

**Parameters**

- `handle`: handle obtained from `esp_pm_lock_create` function

*esp\_err\_t* **esp\_pm\_dump\_locks** (FILE \*stream)

Dump the list of all locks to stderr

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

**Return**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

**Parameters**

- `stream`: stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

**Type Definitions**

```
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```

Opaque handle to the power management lock.

**Enumerations**

```
enum esp_pm_lock_type_t
```

Power management constraints.

*Values:*

**ESP\_PM\_CPU\_FREQ\_MAX**

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

**ESP\_PM\_APB\_FREQ\_MAX**

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

**ESP\_PM\_NO\_LIGHT\_SLEEP**

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

**Header File**

- [esp\\_pm/include/esp32c3/pm.h](#)

**Structures**

```
struct esp_pm_config_esp32c3_t
```

Power management config for ESP32C3.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

**Public Members**

int **max\_freq\_mhz**  
Maximum CPU frequency, in MHz

int **min\_freq\_mhz**  
Minimum CPU frequency to use when no locks are taken, in MHz

bool **light\_sleep\_enable**  
Enter light sleep when no locks are taken

## 2.7.22 Sleep Modes

**Overview**

ESP32-C3 is capable of light sleep and deep sleep power saving modes.

In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from APB\_CLK are powered off. The only parts of the chip which can still be powered on are:

- RTC controller
- RTC peripherals
- RTC fast memory

Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see [Power Management APIs](#)). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

### WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (`esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

### Wakeup sources

**Timer** RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW\_CLK.

This wakeup mode doesn't require RTC peripherals or RTC memories to be powered on during sleep.

`esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

**UART wakeup (light sleep only)** When ESP32-C3 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32-C3 to trigger wakeup, before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

### Power-down of RTC peripherals and memories

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

In ESP32-C3 there is only RTC fast memory, so if some variables in the program are marked by `RTC_DATA_ATTR`, `RTC_SLOW_ATTR` or `RTC_FAST_ATTR` attributes, all of them go to RTC fast memory. It will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

### Entering light sleep

`esp_light_sleep_start()` function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

### Entering deep sleep

`esp_deep_sleep_start()` function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

### Configuring IOs

Some ESP32-C3 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```
rtc_gpio_isolate(GPIO_NUM_12);
```

### UART output handling

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

### Checking sleep wakeup cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

### Disable sleep wakeup source

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

### Application Example

Implementation of basic functionality of deep sleep is shown in [protocols/sntp](#) example, where ESP module is periodically waken up to retrieve time from NTP server.

An example in [system/deep\\_sleep](#) illustrates usage of deep sleep wakeup triggered by timer.

## API Reference

### Header File

- [esp\\_system/include/esp\\_sleep.h](#)

### Functions

*esp\_err\_t* **esp\_sleep\_disable\_wakeup\_source** (*esp\_sleep\_source\_t* source)

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in `esp_sleep_start` function.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if trigger was not active

#### Parameters

- source: - number of source to disable of type `esp_sleep_source_t`

*esp\_err\_t* **esp\_sleep\_enable\_timer\_wakeup** (*uint64\_t* time\_in\_us)

Enable wakeup by timer.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if value is out of range (TBD)

#### Parameters

- time\_in\_us: time before wakeup, in microseconds

bool **esp\_sleep\_is\_valid\_wakeup\_gpio** (*gpio\_num\_t* gpio\_num)

Returns true if a GPIO number is valid for use as wakeup source.

**Note** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Return** True if this GPIO number will be accepted as a sleep wakeup source.

#### Parameters

- gpio\_num: Number of the GPIO to test for wakeup source capability

*esp\_err\_t* **esp\_deep\_sleep\_enable\_gpio\_wakeup** (*uint64\_t* *gpio\_pin\_mask*, *esp\_deepsleep\_gpio\_wake\_up\_mode\_t* mode)

Enable wakeup using specific gpio pins.

This function enables an IO pin to wake the chip from deep sleep

**Note** This function does not modify pin configuration. The pins are configured in `esp_sleep_start`, immediately before entering sleep mode.

**Note** You don't need to care to pull-up or pull-down before using this function, because this will be done in `esp_sleep_start` based on param mask you give. BTW, when you use low level to wake up the chip, we strongly recommend you to add external registers(pull-up).

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio num is more than 5 or mode is invalid,

#### Parameters

- gpio\_pin\_mask: Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which are have RTC functionality can be used in this bit map.
- mode: Select logic function used to determine wakeup condition:
  - ESP\_GPIO\_WAKEUP\_GPIO\_LOW: wake up when the gpio turn to low.
  - ESP\_GPIO\_WAKEUP\_GPIO\_HIGH: wake up when the gpio turn to high.

*esp\_err\_t* **esp\_sleep\_enable\_gpio\_wakeup** (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

**Note** In revisions 0 and 1 of the ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if wakeup triggers conflict

*esp\_err\_t* **esp\_sleep\_enable\_uart\_wakeup** (int *uart\_num*)

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note** ESP32 does not support wakeup from UART2.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if wakeup from given UART is not supported

**Parameters**

- *uart\_num*: UART port to wake up from

*esp\_err\_t* **esp\_sleep\_enable\_wifi\_wakeup** (void)

Enable wakeup by WiFi MAC.

**Return**

- ESP\_OK on success

*esp\_err\_t* **esp\_sleep\_disable\_wifi\_wakeup** (void)

Disable wakeup by WiFi MAC.

**Return**

- ESP\_OK on success

uint64\_t **esp\_sleep\_get\_ext1\_wakeup\_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

**Return** bit mask, if GPIO<sub>n</sub> caused wakeup, BIT(n) will be set

uint64\_t **esp\_sleep\_get\_gpio\_wakeup\_status** (void)

Get the bit mask of GPIOs which caused wakeup (gpio)

If wakeup was caused by another source, this function will return 0.

**Return** bit mask, if GPIO<sub>n</sub> caused wakeup, BIT(n) will be set

*esp\_err\_t* **esp\_sleep\_pd\_config** (*esp\_sleep\_pd\_domain\_t* *domain*, *esp\_sleep\_pd\_option\_t* *option*)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP\_PD\_OPTION\_AUTO.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if either of the arguments is out of range

**Parameters**

- *domain*: power domain to configure
- *option*: power down option (ESP\_PD\_OPTION\_OFF, ESP\_PD\_OPTION\_ON, or ESP\_PD\_OPTION\_AUTO)

void **esp\_deep\_sleep\_start** (void)  
Enter deep sleep with the configured wakeup options.

This function does not return.

*esp\_err\_t* **esp\_light\_sleep\_start** (void)  
Enter light sleep with the configured wakeup options.

**Return**

- ESP\_OK on success (returned after wakeup)
- ESP\_ERR\_SLEEP\_REJECT sleep request is rejected(wakeup source set before the sleep request)
- ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

void **esp\_deep\_sleep** (uint64\_t *time\_in\_us*)  
Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

`esp_deep_sleep` does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- `esp_bluedroid_disable`
- `esp_bt_controller_disable`
- `esp_wifi_stop`

This function does not return.

**Note** The device will wake up immediately if the deep-sleep time is set to 0

**Parameters**

- *time\_in\_us*: deep-sleep time, unit: microsecond

*esp\_sleep\_wakeup\_cause\_t* **esp\_sleep\_get\_wakeup\_cause** (void)  
Get the wakeup source which caused wakeup from sleep.

**Return** cause of wake up from last sleep (deep sleep or light sleep)

void **esp\_wake\_deep\_sleep** (void)  
Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp\_set\_deep\_sleep\_wake\_stub** (*esp\_deep\_sleep\_wake\_stub\_fn\_t* *new\_stub*)  
Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

*esp\_deep\_sleep\_wake\_stub\_fn\_t* **esp\_get\_deep\_sleep\_wake\_stub** (void)  
Get current wake from deep sleep stub.

**Return** Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp\_default\_wake\_deep\_sleep** (void)  
The default esp-idf-provided esp\_wake\_deep\_sleep() stub.  
See docs/deep-sleep-stub.rst for details.

void **esp\_deep\_sleep\_disable\_rom\_logging** (void)  
Disable logging from the ROM code after deep sleep.  
Using LSB of RTC\_STORE4.

void **esp\_sleep\_config\_gpio\_isolate** (void)  
Configure to isolate all GPIO pins in sleep state.

void **esp\_sleep\_enable\_gpio\_switch** (bool *enable*)  
Enable or disable GPIO pins status switching between slept status and waked status.

#### Parameters

- *enable*: decide whether to switch status or not

#### Type Definitions

```
typedef esp_sleep_source_t esp_sleep_wakeup_cause_t  
typedef void (*esp_deep_sleep_wake_stub_fn_t) (void)  
Function type for stub to run on wake from sleep.
```

#### Enumerations

```
enum esp_sleep_ext1_wakeup_mode_t  
Logic function used for EXT1 wakeup mode.
```

*Values:*

```
ESP_EXT1_WAKEUP_ALL_LOW = 0  
Wake the chip when all selected GPIOs go low.
```

```
ESP_EXT1_WAKEUP_ANY_HIGH = 1  
Wake the chip when any of the selected GPIOs go high.
```

```
enum esp_deepsleep_gpio_wake_up_mode_t
```

*Values:*

```
ESP_GPIO_WAKEUP_GPIO_LOW = 0
```

```
ESP_GPIO_WAKEUP_GPIO_HIGH = 1
```

```
enum esp_sleep_pd_domain_t  
Power domains which can be powered down in sleep mode.
```

*Values:*

```
ESP_PD_DOMAIN_RTC_PERIPH  
RTC IO, sensors and ULP co-processor.
```

```
ESP_PD_DOMAIN_RTC_SLOW_MEM  
RTC slow memory.
```

```
ESP_PD_DOMAIN_RTC_FAST_MEM  
RTC fast memory.
```

```
ESP_PD_DOMAIN_XTAL  
XTAL oscillator.
```

```
ESP_PD_DOMAIN_CPU  
CPU core.
```

```
ESP_PD_DOMAIN_RTC8M  
Internal 8M oscillator.
```

```
ESP_PD_DOMAIN_VDDSDIO  
VDD_SDIO.
```

**ESP\_PD\_DOMAIN\_MAX**

Number of domains.

**enum esp\_sleep\_pd\_option\_t**

Power down options.

*Values:*

**ESP\_PD\_OPTION\_OFF**

Power down the power domain in sleep mode.

**ESP\_PD\_OPTION\_ON**

Keep power domain enabled during sleep mode.

**ESP\_PD\_OPTION\_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

**enum esp\_sleep\_source\_t**

Sleep wakeup cause.

*Values:*

**ESP\_SLEEP\_WAKEUP\_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

**ESP\_SLEEP\_WAKEUP\_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

**ESP\_SLEEP\_WAKEUP\_EXT0**

Wakeup caused by external signal using `RTC_IO`.

**ESP\_SLEEP\_WAKEUP\_EXT1**

Wakeup caused by external signal using `RTC_CNTL`.

**ESP\_SLEEP\_WAKEUP\_TIMER**

Wakeup caused by timer.

**ESP\_SLEEP\_WAKEUP\_TOUCHPAD**

Wakeup caused by touchpad.

**ESP\_SLEEP\_WAKEUP\_ULP**

Wakeup caused by ULP program.

**ESP\_SLEEP\_WAKEUP\_GPIO**

Wakeup caused by GPIO (light sleep only)

**ESP\_SLEEP\_WAKEUP\_UART**

Wakeup caused by UART (light sleep only)

**ESP\_SLEEP\_WAKEUP\_WIFI**

Wakeup caused by WIFI (light sleep only)

**ESP\_SLEEP\_WAKEUP\_COCPU**

Wakeup caused by COCPU int.

**ESP\_SLEEP\_WAKEUP\_COCPU\_TRAP\_TRIG**

Wakeup caused by COCPU crash.

**ESP\_SLEEP\_WAKEUP\_BT**

Wakeup caused by BT (light sleep only)

**enum [anonymous]**

*Values:*

**ESP\_ERR\_SLEEP\_REJECT = ESP\_ERR\_INVALID\_STATE**

**ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION = ESP\_ERR\_INVALID\_ARG**

## 2.7.23 Watchdogs

### Overview

The ESP-IDF has support for two types of watchdogs: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using [Project Configuration Menu](#), however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

**Interrupt watchdog** The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn't blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can't get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as "Interrupt wdt timeout on CPU0" or "Interrupt wdt timeout on CPU1" (as applicable).

**Configuration** The interrupt watchdog is enabled by default via the [CONFIG\\_ESP\\_INT\\_WDT](#) configuration flag. The timeout is configured by setting [CONFIG\\_ESP\\_INT\\_WDT\\_TIMEOUT\\_MS](#). The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see [CONFIG\\_FREERTOS\\_HZ](#)).

**Tuning** If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it's possible to increase the [CONFIG\\_ESP\\_INT\\_WDT\\_TIMEOUT\\_MS](#) setting instead.

**Task Watchdog Timer** The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle task, however any task can subscribe to be watched by the TWDT. Each watched task must 'reset' the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function [esp\\_task\\_wdt\\_isr\\_user\\_handler](#) in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling [esp\\_task\\_wdt\\_init\(\)](#) which will configure the hardware timer. A task can then subscribe to the TWDT using [esp\\_task\\_wdt\\_add\(\)](#) in order to be watched. Each subscribed task must periodically call [esp\\_task\\_wdt\\_reset\(\)](#) to reset the TWDT. Failure by any subscribed tasks to periodically call

`esp_task_wdt_reset()` indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using `esp_task_wdt_delete()`. A task that has been unsubscribed should no longer call `esp_task_wdt_reset()`. Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling `esp_task_wdt_deinit()`.

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolise the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_add()` at any time.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenale them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-C3 is connected to OpenOCD via JTAG.

## Interrupt Watchdog API Reference

### Header File

- `esp_common/include/esp_int_wdt.h`

### Functions

void `esp_int_wdt_init` (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

## Task Watchdog API Reference

A full example using the Task Watchdog is available in esp-idf: [system/task\\_watchdog](#)

### Header File

- `esp_common/include/esp_task_wdt.h`

### Functions

`esp_err_t esp_task_wdt_init` (uint32\_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT's timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add()`.

#### Return

- `ESP_OK`: Initialization was successful
- `ESP_ERR_NO_MEM`: Initialization failed due to lack of memory

**Note** `esp_task_wdt_init()` must only be called after the scheduler started

**Parameters**

- [in] `timeout`: Timeout period of TWDT in seconds
- [in] `panic`: Flag that controls whether the panic handler will be executed when the TWDT times out

*esp\_err\_t* `esp_task_wdt_deinit` (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Return**

- `ESP_OK`: TWDT successfully deinitialized
- `ESP_ERR_INVALID_STATE`: Error, tasks are still subscribed to the TWDT
- `ESP_ERR_NOT_FOUND`: Error, TWDT has already been deinitialized

*esp\_err\_t* `esp_task_wdt_add` (*TaskHandle\_t* handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to be called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

**Return**

- `ESP_OK`: Successfully subscribed the task to the TWDT
- `ESP_ERR_INVALID_ARG`: Error, the task is already subscribed
- `ESP_ERR_NO_MEM`: Error, could not subscribe the task due to lack of memory
- `ESP_ERR_INVALID_STATE`: Error, the TWDT has not been initialized yet

**Parameters**

- [in] `handle`: Handle of the task. Input NULL to subscribe the current running task to the TWDT

*esp\_err\_t* `esp_task_wdt_reset` (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

**Return**

- `ESP_OK`: Successfully reset the TWDT on behalf of the currently running task
- `ESP_ERR_NOT_FOUND`: Error, the current running task has not subscribed to the TWDT
- `ESP_ERR_INVALID_STATE`: Error, the TWDT has not been initialized yet

*esp\_err\_t* `esp_task_wdt_delete` (*TaskHandle\_t* handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`. If the task is an IDLE task, this function will automatically disable the calling of `esp_task_wdt_reset()` from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

**Return**

- `ESP_OK`: Successfully unsubscribed the task from the TWDT
- `ESP_ERR_INVALID_ARG`: Error, the task is already unsubscribed
- `ESP_ERR_INVALID_STATE`: Error, the TWDT has not been initialized yet

**Parameters**

- [in] `handle`: Handle of the task. Input NULL to unsubscribe the current running task.

`esp_err_t esp_task_wdt_status (TaskHandle_t handle)`

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**Return :**

- **ESP\_OK:** The task is currently subscribed to the TWDT
- **ESP\_ERR\_NOT\_FOUND:** The task is currently not subscribed to the TWDT
- **ESP\_ERR\_INVALID\_STATE:** The TWDT is not initialized, therefore no tasks can be subscribed

**Parameters**

- `[in] handle`: Handle of the task. Input NULL to query the current running task.

## 2.7.24 System Time

### Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer:** Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an *RTC Clock Source* and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.
- **High-resolution timer:** Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the APB\_CLK clock source (typically 80 MHz), which has a frequency deviation of less than  $\pm 10$  ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32C3_TIME_SYSCALL` in project configuration.

### RTC Clock Source

The RTC timer has the following clock sources:

- **Internal 150kHz RC oscillator (default):** Features lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- **External 32kHz crystal:** Requires a 32kHz crystal to be connected to the 32K\_XP and 32K\_XN pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
- **External 32kHz oscillator at 32K\_XN pin:** Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K\_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of  $0.1 < V_{cm} < 0.5 \times V_{amp}$ , where  $V_{amp}$  is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K\_XP pin and ground. In this case, the 32K\_XP pin cannot be used as a GPIO pin.
- **Internal 8.5MHz oscillator, divided by 256 (~33kHz):** Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32C3_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K\_XN pin sources can be found in Section *Crystal Oscillator* of [ESP32 Hardware Design Guidelines](#).

### Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

\* –To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

### SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH` updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```
sntp_setoperatingmode(SNTP_OPMODE_POLL);  
sntp_setservername(0, "pool.ntp.org");  
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in `protocols/sntp` directory.

## Timezones

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the TZ environment variable to the correct value depending on the device location. The format of the time string is the same as described in the [GNU libc documentation](#) (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

## API Reference

### Header File

- `lwip/include/apps/esp_sntp.h`

### Functions

void `sntp_sync_time` (`struct timeval *tv`)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

#### Parameters

- `tv`: Time received from SNTP server.

void `sntp_set_sync_mode` (`sntp_sync_mode_t sync_mode`)

Set the sync mode.

Allowable two mode: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

#### Parameters

- `sync_mode`: Sync mode.

`sntp_sync_mode_t` `sntp_get_sync_mode` (void)

Get set sync mode.

**Return** `SNTP_SYNC_MODE_IMMED`: Update time immediately. `SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

`sntp_sync_status_t sntp_get_sync_status` (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

**Return** `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void `sntp_set_sync_status` (`sntp_sync_status_t sync_status`)

Set status of time sync.

#### Parameters

- `sync_status`: status of time sync (see `sntp_sync_status_t`)

void `sntp_set_time_sync_notification_cb` (`sntp_sync_time_cb_t callback`)

Set a callback function for time synchronization notification.

#### Parameters

- `callback`: a callback function

void `sntp_set_sync_interval` (uint32\_t `interval_ms`)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function, otherwise, it will be applied after the last interval expired.

#### Parameters

- `interval_ms`: The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32\_t `sntp_get_sync_interval` (void)

Get the sync interval of SNTP operation.

**Return** the sync interval

bool `sntp_restart` (void)

Restart SNTP.

**Return** True - Restart False - SNTP was not initialized yet

### Type Definitions

**typedef** void (`*sntp_sync_time_cb_t`) (**struct** timeval \*tv)

SNTP callback function for notifying about time sync event.

#### Parameters

- `tv`: Time received from SNTP server.

### Enumerations

**enum** `sntp_sync_mode_t`

SNTP time update mode.

*Values:*

**SNTP\_SYNC\_MODE\_IMMED**

Update system time immediately when receiving a response from the SNTP server.

**SNTP\_SYNC\_MODE\_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

**enum sntp\_sync\_status\_t**

SNTP sync status.

*Values:***SNTP\_SYNC\_STATUS\_RESET****SNTP\_SYNC\_STATUS\_COMPLETED****SNTP\_SYNC\_STATUS\_IN\_PROGRESS**

## 2.7.25 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

### API Reference

#### Header File

- [esp\\_rom/include/esp\\_rom\\_sys.h](#)

#### Functions

**int esp\_rom\_printf** (**const** char \**fmt*, ...)

Print formatted string to console device.

**Note** float and long long data are not supported!**Return** int: Total number of characters written on success; A negative number on failure.**Parameters**

- *fmt*: Format string
- . . . : Additional arguments, depending on the format string

**void esp\_rom\_delay\_us** (uint32\_t *us*)Pauses execution for *us* microseconds.**Parameters**

- *us*: Number of microseconds to pause

**void esp\_rom\_install\_channel\_putc** (int *channel*, void (\**putc*)) char *c**esp\_rom\_printf* can print message to different channels simultaneously. This function can help install the low level *putc* function for *esp\_rom\_printf*.**Parameters**

- *channel*: Channel number (starting from 1)
- *putc*: Function pointer to the *putc* implementation. Set NULL can disconnect *esp\_rom\_printf* with *putc*.

**void esp\_rom\_disable\_logging** (void)

Disable logging from the ROM code.

**void esp\_rom\_install\_uart\_printf** (void)Install UART1 as the default console channel, equivalent to `esp_rom_install_channel_putc(1, esp_rom_uart_putc)`

Code examples for this API section are provided in the [system](#) directory of ESP-IDF examples.

## 2.8 Project Configuration

### 2.8.1 Introduction

ESP-IDF uses [kconfiglib](#) which is a Python-based extension to the [Kconfig](#) system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig

files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see [Kconfig](#) and [kconfiglib extensions](#).

## 2.8.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sd-kconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with `make menuconfig`.)

## 2.8.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the `sdkconfig` file. Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see [Custom `sdkconfig.defaults`](#).

## 2.8.4 Kconfig Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the `help` of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of `conf-idf` which causes that Windows line endings are not recognized after a backslash).

### Format checker

`tools/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn't some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

## 2.8.5 Backward Compatibility of Kconfig Options

The standard **Kconfig** tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new **Kconfig** option names. Old options are replaced by new ones in the `sdkconfig` file.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.make`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. *Deprecated options and their replacements* are automatically generated by `confgen.py`.

## 2.8.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from **Kconfig** files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When **Kconfig** generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a **Kconfig** file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

### SDK tool configuration

Contains:

- `CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`
- `CONFIG_SDK_TOOLPREFIX`
- `CONFIG_SDK_PYTHON`
- `CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`

### CONFIG\_SDK\_TOOLPREFIX

Compiler toolchain path/prefix

*Found in: [SDK tool configuration](#)*

The prefix/path that is used to call the toolchain. The default setting assumes a `cross-tool-ng` gcc setup that is in your `PATH`.

**Default value:**

- “riscv32-esp-elf- “

### CONFIG\_SDK\_PYTHON

Python interpreter

*Found in: [SDK tool configuration](#)*

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)

**Default value:**

- “python”

## CONFIG\_SDK\_MAKE\_WARN\_UNDEFINED\_VARIABLES

‘make’ warns on undefined variables

*Found in: SDK tool configuration*

Adds `--warn-undefined-variables` to `MAKEFLAGS`. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.

(Note: this option is used with the legacy GNU Make build system only.)

### Default value:

- Yes (enabled)

## CONFIG\_SDK\_TOOLCHAIN\_SUPPORTS\_TIME\_WIDE\_64\_BITS

Toolchain supports `time_t` wide 64-bits

*Found in: SDK tool configuration*

Enable this option in case you have a custom toolchain which supports `time_t` wide 64-bits. This option checks `time_t` is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits `time_t`.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide `time_t`. This will change in a future major release, but currently 64-bit `time_t` requires a custom built toolchain.

### Default value:

- No (disabled)

## Build type

Contains:

- [CONFIG\\_APP\\_BUILD\\_TYPE](#)

## CONFIG\_APP\_BUILD\_TYPE

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (`data/bss`). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=  
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y  
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

**Available options:**

- Default (binary application + 2nd stage bootloader) (`APP_BUILD_TYPE_APP_2NDBOOT`)
- ELF file, loadable into RAM (EXPERIMENTAL)) (`APP_BUILD_TYPE_ELF_RAM`)

## Application manager

Contains:

- [\*CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_NAME\\_VAR\*](#)
- [\*CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_VER\\_VAR\*](#)
- [\*CONFIG\\_APP\\_PROJECT\\_VER\\_FROM\\_CONFIG\*](#)
- [\*CONFIG\\_APP\\_RETRIEVE\\_LEN\\_ELF\\_SHA\*](#)
- [\*CONFIG\\_APP\\_COMPILE\\_TIME\\_DATE\*](#)

### CONFIG\_APP\_COMPILE\_TIME\_DATE

Use time/date stamp for app

*Found in: [Application manager](#)*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

**Default value:**

- Yes (enabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR

Exclude `PROJECT_VER` from firmware image

*Found in: [Application manager](#)*

The `PROJECT_VER` variable from the build system will not affect the firmware image. This value will not be contained in the `esp_app_desc` structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR

Exclude `PROJECT_NAME` from firmware image

*Found in: [Application manager](#)*

The `PROJECT_NAME` variable from the build system will not affect the firmware image. This value will not be contained in the `esp_app_desc` structure.

**Default value:**

- No (disabled)

### **CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### **CONFIG\_APP\_PROJECT\_VER**

Project version

*Found in: Application manager > CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

### **CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 16

### **Bootloader config**

Contains:

- *CONFIG\_BOOTLOADER\_LOG\_LEVEL*
- *CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION*
- *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*
- *CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT*
- *CONFIG\_BOOTLOADER\_APP\_TEST*
- *CONFIG\_BOOTLOADER\_FACTORY\_RESET*
- *CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO*
- *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP*
- *CONFIG\_BOOTLOADER\_WDT\_ENABLE*
- *CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST*

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

*Found in: [Bootloader config](#)*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

### Available options:

- Size (-Os) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

### Available options:

- No output (BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

## CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

### Available options:

- 1.8V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

## CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input pulled low while device starts up. See settings below.

### Default value:

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a factory reset, this GPIO must be pulled low on reset. Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy\_init, …” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**

- “nvs” if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_APP\_TEST

GPIO triggers boot from test app partition

*Found in: [Bootloader config](#)*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST

Number of the GPIO input to boot TEST partition

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

**Default value:**

- 18 if `CONFIG_BOOTLOADER_APP_TEST`

### **CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: [Bootloader config](#)*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

### **CONFIG\_BOOTLOADER\_WDT\_ENABLE**

Use RTC watchdog in start code

*Found in: [Bootloader config](#)*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK clock source. After changing a frequency slow\_clk a time of WDT needs to re-set for new frequency. slow\_clk depends on ESP32\_RTC\_CLK\_SRC (INTERNAL\_RC or EXTERNAL\_CRYSTAL).

**Default value:**

- Yes (enabled)

### **CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE**

Allows RTC watchdog disable in user code

*Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_WDT_ENABLE`*

If it is set, the client must itself reset or disable rtc\_wdt in their code (app\_main()). Otherwise rtc\_wdt will be disabled before calling app\_main function. Use function rtc\_wdt\_feed() for resetting counter of rtc\_wdt. Use function rtc\_wdt\_disable() for disabling rtc\_wdt.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_WDT\_TIME\_MS**

Timeout for RTC watchdog (ms)

*Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_WDT_ENABLE`*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

Found in: [Bootloader config](#)

After updating the app, the bootloader runs a new app with the “ESP\_OTA\_IMG\_PENDING\_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER\\_APP\\_SEC\\_VER\\_SIZE\\_EFUSE\\_FIELD](#) option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

**Default value:**

- 16 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allow emulate read/write operations with efuse secure version. It allow to test anti-rollback implementation without permanent write eFuse bits. In partition table should be exist this partition `emul_efuse, data, 5, , 0x2000`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `(CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS

Skip image validation always (READ HELP FIRST)

*Found in:* `Bootloader config`

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: [Bootloader config](#)*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO\_CPU.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE**

Size in bytes for custom purposes

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

**Range:**

- from 0 to 0x10 if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### **CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON’ T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

**Default value:**

- Yes (enabled)

### **Security features**

Contains:

- [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#)
- [CONFIG\\_SECURE\\_SIGNED\\_APPS\\_SCHEME](#)
- [CONFIG\\_SECURE\\_BOOT\\_ENABLE\\_AGGRESSIVE\\_KEY\\_REVOKE](#)
- [CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED](#)
- [CONFIG\\_SECURE\\_BOOT](#)

- *Potentially insecure options*
- `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
- `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
- `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
- `CONFIG_SECURE_UART_ROM_DL_MODE`
- `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

### **CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

### **CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two options: 1. ECDSA based secure boot scheme. (Only choice for Secure Boot V1) Supported in ESP32 and ESP32-ECO3. 2. The RSA based secure boot scheme. (Only choice for Secure Boot V2) Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3.

#### **Available options:**

- ECDSA (`SECURE_SIGNED_APPS_ECDSA_SCHEME`)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.  
Refer to the documentation before enabling.
- RSA (`SECURE_SIGNED_APPS_RSA_SCHEME`)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

### **CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

#### **Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

### **CONFIG\_SECURE\_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

## CONFIG\_SECURE\_BOOT\_VERSION

Select secure boot version

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT](#)*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3 ECO3. Secure Boot V1 is the AES based secure boot scheme. Supported in ESP32 and ESP32-ECO3.

**Available options:**

- Enable Secure Boot version 1 (SECURE\_BOOT\_V1\_ENABLED)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE\_BOOT\_V2\_ENABLED)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES

Sign binaries during build

*Found in: [Security features](#)*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

## CONFIG\_SECURE\_BOOT\_SIGNING\_KEY

Secure boot private signing key

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

**Default value:**

- "secure\_boot\_signing\_key.pem" if [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)

### CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### CONFIG\_SECURE\_BOOT\_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### CONFIG\_SECURE\_FLASH\_ENC\_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

## CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows UART bootloader to perform flash encryption operations

Select Release mode only for production or manufacturing. Once enabled you can not reflash using UART bootloader

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version and [Flash Encryption](#) for details.

### Available options:

- Development(NOT SECURE) (SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT)
- Release (SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE)

### Potentially insecure options Contains:

- [CONFIG\\_SECURE\\_BOOT\\_V2\\_ALLOW\\_EFUSE\\_RD\\_DIS](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_SHORT\\_APP\\_PARTITION](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_JTAG](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_ENC](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_CACHE](#)
- [CONFIG\\_SECURE\\_FLASH\\_REQUIRE\\_ALREADY\\_ENABLED](#)

## CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

### Default value:

- No (disabled) if [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#) || [SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

## CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR\_DIS\_RD\_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE\_RD\_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK\_KEY0-BLOCK\_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is NOT possible to read/write efuses using esepfuse.py utility. However, efuse can be read/written from the application

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT

### CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using esepfuse.py.

**Default value:**

- No (disabled) if SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT

## CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

Found in: *Security features*

### Available options:

- UART ROM download mode (Permanently disabled (recommended)) (SECURE\_DISABLE\_ROM\_DL\_MODE)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE\_ENABLE\_SECURE\_ROM\_DL\_MODE)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.  
Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`
- UART ROM download mode (Enabled (not recommended)) (SECURE\_INSECURE\_ALLOW\_DL\_MODE)  
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

## Serial flasher config

Contains:

- `CONFIG_ESPTOOLPY_MONITOR_BAUD`
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_BAUD`
- `CONFIG_ESPTOOLPY_PORT`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
- `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_COMPRESSED`

## CONFIG\_ESPTOOLPY\_PORT

Default serial port

*Found in: [Serial flasher config](#)*

The serial port that's connected to the ESP chip. This can be overridden by setting the ESPPORT environment variable.

This value is ignored when using the CMake-based build system or idf.py.

**Default value:**

- “/dev/ttyUSB0”

## CONFIG\_ESPTOOLPY\_BAUD

Default baud rate

*Found in: [Serial flasher config](#)*

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the ESPBAUD variable.

This value is ignored when using the CMake-based build system or idf.py.

**Available options:**

- 115200 baud (ESPTOOLPY\_BAUD\_115200B)
- 230400 baud (ESPTOOLPY\_BAUD\_230400B)
- 921600 baud (ESPTOOLPY\_BAUD\_921600B)
- 2Mbaud (ESPTOOLPY\_BAUD\_2MB)
- Other baud rate (ESPTOOLPY\_BAUD\_OTHER)

## CONFIG\_ESPTOOLPY\_BAUD\_OTHER\_VAL

Other baud rate value

*Found in: [Serial flasher config](#)*

**Default value:**

- 115200

## CONFIG\_ESPTOOLPY\_COMPRESSED

Use compressed upload

*Found in: [Serial flasher config](#)*

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.

**Default value:**

- Yes (enabled)

## CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

*Found in: [Serial flasher config](#)*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

**Default value:**

- No (disabled)

## CONFIG\_ESPTOOLPY\_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

### Available options:

- QIO (ESPTOOLPY\_FLASHMODE\_QIO)
- QOUT (ESPTOOLPY\_FLASHMODE\_QOUT)
- DIO (ESPTOOLPY\_FLASHMODE\_DIO)
- DOUT (ESPTOOLPY\_FLASHMODE\_DOUT)

## CONFIG\_ESPTOOLPY\_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

### Available options:

- 80 MHz (ESPTOOLPY\_FLASHFREQ\_80M)
- 40 MHz (ESPTOOLPY\_FLASHFREQ\_40M)
- 26 MHz (ESPTOOLPY\_FLASHFREQ\_26M)
- 20 MHz (ESPTOOLPY\_FLASHFREQ\_20M)

## CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

### Available options:

- 1 MB (ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (ESPTOOLPY\_FLASHSIZE\_16MB)

## CONFIG\_ESPTOOLPY\_FLASHSIZE\_DETECT

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

### Default value:

- Yes (enabled)

## CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY\_BEFORE\_RESET)
- No reset (ESPTOOLPY\_BEFORE\_NORESET)

**CONFIG\_ESPTOOLPY\_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (ESPTOOLPY\_AFTER\_NORESET)

**CONFIG\_ESPTOOLPY\_MONITOR\_BAUD**

‘idf.py monitor’ baud rate

*Found in: Serial flasher config*

Baud rate to use when running ‘idf.py monitor’ or ‘make monitor’ to view serial output from a running chip.

If “Same as UART Console baud rate” is chosen then the value will follow the “UART Console baud rate” config item.

Can override by setting the MONITORBAUD environment variable.

**Available options:**

- Same as UART console baud rate (ESPTOOLPY\_MONITOR\_BAUD\_CONSOLE)
- 9600 bps (ESPTOOLPY\_MONITOR\_BAUD\_9600B)
- 57600 bps (ESPTOOLPY\_MONITOR\_BAUD\_57600B)
- 115200 bps (ESPTOOLPY\_MONITOR\_BAUD\_115200B)
- 230400 bps (ESPTOOLPY\_MONITOR\_BAUD\_230400B)
- 921600 bps (ESPTOOLPY\_MONITOR\_BAUD\_921600B)
- 2 Mbps (ESPTOOLPY\_MONITOR\_BAUD\_2MB)
- Custom baud rate (ESPTOOLPY\_MONITOR\_BAUD\_OTHER)

**CONFIG\_ESPTOOLPY\_MONITOR\_BAUD\_OTHER\_VAL**

Custom baud rate value

*Found in: Serial flasher config*

**Default value:**

- 115200

**Partition Table**

Contains:

- *CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME*
- *CONFIG\_PARTITION\_TABLE\_MD5*
- *CONFIG\_PARTITION\_TABLE\_OFFSET*
- *CONFIG\_PARTITION\_TABLE\_TYPE*

## CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

*Found in:* [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. Otherwise it's possible to create a new custom partition CSV for your application.

### Available options:

- Single factory app, no OTA (PARTITION\_TABLE\_SINGLE\_APP)
- Factory app, two OTA definitions (PARTITION\_TABLE\_TWO\_OTA)
- Custom partition table CSV (PARTITION\_TABLE\_CUSTOM)
- Single factory app, no OTA, encrypted NVS (PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)
- Factory app, two OTA definitions, encrypted NVS (PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)

## CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

*Found in:* [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

### Default value:

- "partitions.csv"

## CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in:* [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

### Default value:

- "0x8000"

## CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

*Found in:* [Partition Table](#)

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

### Default value:

- Yes (enabled) if ESP32\_COMPATIBLE\_PRE\_V3\_1\_BOOTLOADERS

## Compiler options

Contains:

- [CONFIG\\_COMPILER\\_OPTIMIZATION\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_COMPILER\\_DISABLE\\_GCC8\\_WARNINGS](#)
- [CONFIG\\_COMPILER\\_DUMP\\_RTL\\_FILES](#)
- [CONFIG\\_COMPILER\\_WARN\\_WRITE\\_STRINGS](#)
- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)
- [CONFIG\\_COMPILER\\_CXX\\_RTTI](#)
- [CONFIG\\_COMPILER\\_OPTIMIZATION](#)
- [CONFIG\\_COMPILER\\_STACK\\_CHECK\\_MODE](#)

### CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in:* [Compiler options](#)

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOT-LOADER_COMPILER_OPTIMIZATION` setting.

#### Available options:

- Debug (-Og) (`COMPILER_OPTIMIZATION_DEFAULT`)
- Optimize for size (-Os) (`COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`COMPILER_OPTIMIZATION_NONE`)

### CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in:* [Compiler options](#)

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) `-DNDEBUG` is added to `CPPFLAGS` in this case.

#### Available options:

- Enabled (`COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE`)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (`COMPILER_OPTIMIZATION_ASSERTIONS_SILENT`)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.

- Disabled (sets `-DNDEBUG`) (`COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`)  
If assertions are disabled, `-DNDEBUG` is added to `CPPFLAGS`.

### **CONFIG\_COMPILER\_CXX\_EXCEPTIONS**

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

### **CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE**

Emergency Pool Size

*Found in: [Compiler options](#) > [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)

### **CONFIG\_COMPILER\_CXX\_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### **CONFIG\_COMPILER\_STACK\_CHECK\_MODE**

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

**Available options:**

- None (COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (COMPILER\_STACK\_CHECK\_MODE\_ALL)

## CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable -Wwrite-strings warning flag

*Found in: [Compiler options](#)*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_DISABLE\_GCC8\_WARNINGS

Disable new warnings introduced in GCC 6 - 8

*Found in: [Compiler options](#)*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don't appear with GCC 5.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

## Component config

Contains:

**Application Level Tracing** Contains:

- *CONFIG\_APPTRACE\_DESTINATION*
- *FreeRTOS System View Tracing*
- *CONFIG\_APPTRACE\_GCOV\_ENABLE*
- *CONFIG\_APPTRACE\_BUF\_SIZE*
- *CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX*
- *CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH*
- *CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO*

**CONFIG\_APPTRACE\_DESTINATION**

Data Destination

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (APPTRACE\_DEST\_JTAG)
- None (APPTRACE\_DEST\_NONE)

### **CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO**

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

### **CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

### **CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

### **CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX**

Size of the pending data buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)

### **CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

### **CONFIG\_APPTRACE\_SV\_TS\_SOURCE**

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**

- CPU cycle counter (CCOUNT) (APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- Timer 0, Group 0 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_00)

- Timer 1, Group 0 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_01)
- Timer 0, Group 1 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_10)
- Timer 1, Group 1 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_11)
- esp\_timer high resolution timer (APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### **CONFIG\_APPTRACE\_SV\_MAX\_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Configures maximum supported tasks in sysview debug

### **CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### **CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Trace Buffer Overflow” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “ISR Enter” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “ISR Exit” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “ISR to Scheduler” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Start Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Stop Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Start Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Stop Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Create” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Terminate” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “System Idle” event.

**CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Enables “Timer Enter” event.

**CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Enables “Timer Exit” event.

**CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: [Component config](#) > [Application Level Tracing](#)*

Enables support for GCOV data transfer to host.

**ESP-ASIO** Contains:

- [CONFIG\\_ASIO\\_SSL\\_SUPPORT](#)

**CONFIG\_ASIO\_SSL\_SUPPORT**

Enable SSL/TLS support of ASIO

*Found in: [Component config](#) > [ESP-ASIO](#)*

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

**Default value:**

- No (disabled)

**CONFIG\_ASIO\_SSL\_LIBRARY\_CHOICE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: [Component config](#) > [ESP-ASIO](#) > [CONFIG\\_ASIO\\_SSL\\_SUPPORT](#)*

The ASIO support multiple backend TLS libraries. Currently the mbedTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- esp-openssl (ASIO\_USE\_ESP\_OPENSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO\_USE\_ESP\_WOLFSSL)

**Bluetooth** Contains:

- [Bluedroid Options](#)
- [CONFIG\\_BT\\_ENABLED](#)
- [NimBLE Options](#)

## CONFIG\_BT\_ENABLED

Bluetooth

Found in: *Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

**Bluetooth controller** Contains:

- *CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*
- *CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL*
- *CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT*
- *CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*
- *CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB*
- *CONFIG\_BT\_CTRL\_HW\_CCA\_VAL*
- *CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM*
- *CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE*
- *CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX*
- *CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN*
- *CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE*
- *CONFIG\_BT\_CTRL\_HW\_CCA*
- *MODEM\_SLEEP Options*
- *CONFIG\_BT\_CTRL\_ADV\_DUP\_FILT\_MAX*

## CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT

BLE Max Instances

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

BLE maximum activities of bluetooth controller, both of connections, scan, sync and adv(periodic adv, multi-adv).

**Range:**

- from 1 to 10 if *CONFIG\_BT\_ENABLED*

**Default value:**

- 10 if *CONFIG\_BT\_ENABLED*

## CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB

BLE static ACL TX buffer numbers

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

**Range:**

- from 0 to 12 if *CONFIG\_BT\_ENABLED*

**Default value:**

- 0 if *CONFIG\_BT\_ENABLED*

## CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE

HCI mode

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify HCI mode as VHCI or UART(H4)

**Available options:**

- VHCI (BT\_CTRL\_HCI\_MODE\_VHCI)  
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32C3, too.
- UART(H4) (BT\_CTRL\_HCI\_MODE\_UART\_H4)  
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**CONFIG\_BT\_CTRL\_ADV\_DUP\_FILT\_MAX**

The maximum number of 5.0 extend duplicate scan filter

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

The maximum number of duplicate scan filter

**Range:**

- from 1 to 500 if *CONFIG\_BT\_ENABLED*

**Default value:**

- 30 if *CONFIG\_BT\_ENABLED*

**CONFIG\_BT\_CTRL\_HW\_CCA**

HW CCA check enable

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

It enables HW CCA feature in controller

**Default value:**

- No (disabled) if *CONFIG\_BT\_ENABLED*

**CONFIG\_BT\_CTRL\_HW\_CCA\_VAL**

CCA threshold value

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

**Range:**

- from 20 to 60 if *CONFIG\_BT\_ENABLED*

**Default value:**

- 20 if *CONFIG\_BT\_ENABLED*

**CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE**

Connection event length determination method

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify connection event length determination

**Available options:**

- ORIGINAL (BT\_CTRL\_CE\_LENGTH\_TYPE\_ORIG)
- Use CE parameter for HCI command (BT\_CTRL\_CE\_LENGTH\_TYPE\_CE)
- Use Espressif self-defined method (BT\_CTRL\_CE\_LENGTH\_TYPE\_SD)

**CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX**

default Tx antenna used

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify default Tx antenna used for bluetooth

**Available options:**

- Antenna 0 (BT\_CTRL\_TX\_ANTENNA\_INDEX\_0)
- Antenna 1 (BT\_CTRL\_TX\_ANTENNA\_INDEX\_1)

**CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX**

default Rx antenna used

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#)*

Specify default Rx antenna used for bluetooth

**Available options:**

- Antenna 0 (BT\_CTRL\_RX\_ANTENNA\_INDEX\_0)
- Antenna 1 (BT\_CTRL\_RX\_ANTENNA\_INDEX\_1)

**CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL**

BLE default Tx power level

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#)*

Specify default Tx power level

**Available options:**

- -24dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N24)
- -21dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N21)
- -18dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N18)
- -15dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N15)
- -12dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N12)
- **-9dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N9)
- **-6dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N6)
- **-3dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N3)
- 0dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N0)
- **+3dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P3)
- **+6dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P6)
- **+9dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P9)
- +12dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P12)
- +15dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P15)
- +18dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P18)
- +21dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P21)

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP**

BLE adv report flow control supported

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#)*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#)

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM**

BLE adv report flow control number

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#)*

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is  $35 * 50$  bytes. Please set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_ENABLED`

### CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**

- from 1 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_ENABLED`

**Default value:**

- 20 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_ENABLED`

### CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED`

### CONFIG\_BT\_CTRL\_SCAN\_DUPL\_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- Scan Duplicate By Device Address (`BT_CTRL_SCAN_DUPL_TYPE_DEVICE`)  
This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once

- Scan Duplicate By Advertising Data (BT\_CTRL\_SCAN\_DUPL\_TYPE\_DATA)  
This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BT\_CTRL\_SCAN\_DUPL\_TYPE\_DATA\_DEVICE)  
This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

### CONFIG\_BT\_CTRL\_SCAN\_DUPL\_CACHE\_SIZE

Maximum number of devices in scan duplicate filter

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#)

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) && [CONFIG\\_BT\\_ENABLED](#)

**Default value:**

- 100 if [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) && [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_BT\_CTRL\_DUPL\_SCAN\_CACHE\_REFRESH\_PERIOD

Duplicate scan list refresh period (seconds)

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#)

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**

- from 0 to 1000 if [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) && [CONFIG\\_BT\\_ENABLED](#)

**Default value:**

- 0 if [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) && [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_BT\_CTRL\_BLE\_MESH\_SCAN\_DUPL\_EN

Special duplicate scan mechanism for BLE Mesh scan

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#)

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) && [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_BT\_CTRL\_MESH\_DUPL\_SCAN\_CACHE\_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_MESH\\_SCAN\\_DUPL\\_EN](#)

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**

- Force Enable (`BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN`)  
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (`BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS`)  
Disable the limitation on max tx/rx time for Coded-PHY connection

**MODEM\_SLEEP Options** Contains:

- `CONFIG_BT_CTRL_MODEM_SLEEP`
- `CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP`

**CONFIG\_BT\_CTRL\_MODEM\_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > MODEM\_SLEEP Options*

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

**Default value:**

- No (disabled) if `BT_CTRL_HCI_MODE_UART_H4` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_MODEM\_SLEEP\_MODE\_1**

Bluetooth Modem sleep Mode 1

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > MODEM\_SLEEP Options > CONFIG\_BT\_CTRL\_MODEM\_SLEEP*

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

**Default value:**

- Yes (enabled) if `CONFIG_BT_CTRL_MODEM_SLEEP` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_LOW\_POWER\_CLOCK**

Bluetooth low power clock

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > MODEM\_SLEEP Options > CONFIG\_BT\_CTRL\_MODEM\_SLEEP > CONFIG\_BT\_CTRL\_MODEM\_SLEEP\_MODE\_1*

Select the low power clock source for bluetooth controller

**Available options:**

- Main crystal (BT\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL)  
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (BT\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL)  
External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT\_CTRL\_LPCLK\_SEL\_RTC\_SLOW)  
Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

### CONFIG\_BT\_CTRL\_MAIN\_XTAL\_PU\_DURING\_LIGHT\_SLEEP

power up main XTAL during light sleep

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > MODEM SLEEP Options*

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

#### Default value:

- No (disabled) if (BT\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL || BT\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL) && CONFIG\_BT\_ENABLED && CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE && CONFIG\_BT\_ENABLED

### CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN

Enable HW AGC recorrect

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Enable uncoded phy AGC recorrect

#### Default value:

- No (disabled) if CONFIG\_BT\_ENABLED

### CONFIG\_BT\_CTRL\_CODED\_AGC\_RECORRECT\_EN

Enable coded phy AGC recorrect

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN*

Enable coded phy AGC recorrect

#### Default value:

- No (disabled) if CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN && CONFIG\_BT\_ENABLED

### CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX

Disable active scan backoff

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED`

**CONFIG\_BT\_HOST**

Bluetooth Host

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- **Bluedroid - Dual-mode (BT\_BLUEDROID\_ENABLED)**  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (BT\_NIMBLE\_ENABLED)**  
This option is recommended for BLE only usecases to save on memory
- **Controller Only (BT\_CONTROLLER\_ONLY)**  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**Bluedroid Options** Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTC_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT_DEBUG_LOG_LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_MULTI_CONNECTION_ENBALE`
- `CONFIG_BT_MAX_DEVICE_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`

**CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**

- 3072 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BT\_BLUEDROID\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (BT\_BLUEDROID\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 4096 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_ENABLED

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTS\_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 8 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

**Available options:**

- GATTS manually send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)  
Let Bluedroid handle the service change indication internally

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 7 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if *CONFIG\_BT\_BLE\_SMP\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### BT DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL*

### CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT\_DEBUG\_LOG\_LEVEL*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT\_LOG\_HCI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HCI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)

- VERBOSE (BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

**Available options:**

- NONE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

**Available options:**

- NONE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

**Available options:**

- NONE (BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)

- ERROR (BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

**Available options:**

- NONE (BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

**Available options:**

- NONE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

**Available options:**

- NONE (BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

**Available options:**

- NONE (BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

**Available options:**

- NONE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

**Available options:**

- NONE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

**Available options:**

- NONE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)

- DEBUG (BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

**Available options:**

- NONE (BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

**Available options:**

- NONE (BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

**Available options:**

- NONE (BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

**Available options:**

- NONE (BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Blueroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

**Available options:**

- NONE (BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Blueroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

**Available options:**

- NONE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Blueroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 4 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Blueroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && [CONFIG\\_BT\\_BLE\\_ENABLED](#) && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT

Timeout of BLE connection establishment

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP\_GATTC\_OPEN\_EVT or ESP\_GATTS\_OPEN\_EVT is triggered.

**Range:**

- from 1 to 60 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 30 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 32 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**NimBLE Options** Contains:

- [CONFIG\\_BT\\_NIMBLE\\_ACL\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_ACL\\_BUF\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_SVC\\_GAP\\_DEVICE\\_NAME](#)
- [CONFIG\\_BT\\_NIMBLE\\_HS\\_STOP\\_TIMEOUT\\_MS](#)
- [CONFIG\\_BT\\_NIMBLE\\_ROLE\\_BROADCASTER](#)
- [CONFIG\\_BT\\_NIMBLE\\_ROLE\\_CENTRAL](#)

- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_EXT_ADV`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`
- `CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- `CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS`

### **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

#### **Available options:**

- Internal memory (`BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)

Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BT\_NIMBLE\_LOG\_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config → Log output → Default log verbosity” .

**Available options:**

- No logs (BT\_NIMBLE\_LOG\_LEVEL\_NONE)
- Error logs (BT\_NIMBLE\_LOG\_LEVEL\_ERROR)
- Warning logs (BT\_NIMBLE\_LOG\_LEVEL\_WARNING)
- Info logs (BT\_NIMBLE\_LOG\_LEVEL\_INFO)
- Debug logs (BT\_NIMBLE\_LOG\_LEVEL\_DEBUG)

**CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu.

**Range:**

- from 1 to 9 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_MAX BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_MAX\_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE

The CPU core on which NimBLE host will run

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**

- Core 0 (PRO CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_NIMBLE\_TASK\_STACK\_SIZE

NimBLE Host task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL

Enable BLE Central role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL

Enable BLE Peripheral role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER

Enable BLE Broadcaster role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_NVS\_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_LEGACY

Security manager legacy pairing

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME

BLE GAP default device name

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- “nimble” if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN

Maximum length of BLE device name in octets

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU

Preferred MTU size in octets

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_COUNT

ACL Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The number of ACL data buffers.

**Default value:**

- 20 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_SIZE

ACL Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_BUF\_SIZE

HCI Event Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 70 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HCI\_EVT\_HI\_BUF\_COUNT**

High Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HCI\_EVT\_LO\_BUF\_COUNT**

Low Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MSYS1\_BLOCK\_COUNT**

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 12 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL**

Enable Host Flow control

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable Host Flow control

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL**

Host Flow control interval

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control interval in msecs

**Default value:**

- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH

Host Flow control threshold

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT

Host Flow control on disconnect

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT

RPA timeout in seconds

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**

- from 1 to 41400 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 900 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/./esp32/api-guides/esp-ble-mesh/ble-mesh-index``

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROVISIONER](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_GATT\\_PROXY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_FRIEND](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_LOW\\_POWER](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROXY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_RELAY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_DEVICE\\_NAME](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_NODE\\_COUNT](#)

### CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable proxy. This is automatically set whenever NIMBLE\_MESH\_PB\_GATT or NIMBLE\_MESH\_GATT\_PROXY is set

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER**

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MESH\_FRIEND**

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_CRYPTO\_STACK\_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS

BLE host stop timeout in msec

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HOST\_BASED\_PRIVACY

Enable host based privacy for random address.

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT

Enable connection reattempts on connection establishment error

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT

Maximum number connection reattempts

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)*

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 7 if BT\_NIMBLE\_ENABLED && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && BT\_NIMBLE\_ENABLED

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_EXT\_ADV

Enable extended advertising.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

### CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_DATA\_LEN

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Defines size of extended advertising data. Size should not increase 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS

Maximum number of periodic advertising syncs.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 1 to 8 if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BLE\_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- `BLE Mesh NET BUF DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- *BLE Mesh specific test option*
- `BLE Mesh STACK DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`

- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

Found in: *Component config* > `CONFIG_BLE_MESH`

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN**

Support Duplicate Scan in BLE Mesh

Found in: *Component config* > `CONFIG_BLE_MESH`

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data” .

**Default value:**

- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE**

Memory allocation strategy

Found in: *Component config* > `CONFIG_BLE_MESH`

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal DRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL)
- External SPIRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL)
- Default alloc mode (BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_IRAM\_8BIT)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC**

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if (ESP32\_SPIRAM\_SUPPORT || ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY) && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE**

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**

- External SPIRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_EXTERNAL)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_IRAM\_8BIT)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

**CONFIG\_BLE\_MESH\_DEINIT**

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**BLE Mesh and BLE coexistence support** Contains:

- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN*
- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support > CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

## CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

## CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB

Support receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER > CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROV**

BLE Mesh Provisioning support

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PB\_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV`

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PB\_GATT**

Provisioning support using GATT (PB-GATT)

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG\_BLE\_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_NODE* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT

Node Identity advertising timeout

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 60 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 4 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT

BLE Mesh GATT Proxy Client

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

Found in: *Component config* > *CONFIG\_BLE\_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE

How often the sequence number gets updated in storage

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PARTITION\_NAME

Name of the NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) > [CONFIG\\_BLE\\_MESH\\_SPECIFIC\\_PARTITION](#)*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- “ble\_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUBNET\_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT**

Maximum number of application keys per network

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE

Network message cache size

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT

Number of advertising buffers

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of advertising buffers available. The transport layer reserves ADV\_BUF\_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 4 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SDU\_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**

- 384 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MAX**

Maximum number of segments in outgoing messages

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE\\_MESH\\_ADV\\_BUF\\_COUNT](#)) as there are outgoing segments.

**Range:**

- from 2 to 32 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 32 if [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY**

Relay support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF**

Use separate advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#)*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT**

Number of advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#) > [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#)*

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

## CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) > [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#)

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 15 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT

Retry timeout for Friend requests

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 300 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND**

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### **CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN**

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NO\_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG\_BLE\_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH* && *CONFIG\_BLE\_MESH*

### BLE Mesh STACK DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL*

### CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL

BLE\_MESH\_STACK

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**

- NONE (BLE\_MESH\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_TRACE\_LEVEL\_VERBOSE)

### BLE Mesh NET BUF DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL*

## CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL

BLE\_MESH\_NET\_BUF

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

### Available options:

- NONE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT

Timeout(ms) for client message response

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

### Range:

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

### Default value:

- 4000 if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Foundation models** Contains:

- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*

## CONFIG\_BLE\_MESH\_CFG\_CLI

Configuration Client model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_CLI

Health Client model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_SRV

Health Server model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Server model.

### Default value:

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Client/Server models** Contains:

- *CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_SERVER*
- *CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHTING\_SERVER*
- *CONFIG\_BLE\_MESH\_SCENE\_CLI*
- *CONFIG\_BLE\_MESH\_SCHEDULER\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_CLI*

**CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Battery Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_SENSOR\_SERVER**

Sensor server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER**

Time and Scenes server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_LIGHTING\_SERVER

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### BLE Mesh specific test option

 Contains:

- *CONFIG\_BLE\_MESH\_DEBUG*
- *CONFIG\_BLE\_MESH\_SHELL*
- *CONFIG\_BLE\_MESH\_SELF\_TEST*

### CONFIG\_BLE\_MESH\_SELF\_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_SELF\_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_SELF\_TEST* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_SELF\_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_SELF\_TEST* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_DEBUG**

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPT**

Crypto debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Foundation Models debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ADV**

Advertising debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable advertising debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER**

Low Power debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Low Power debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_FRIEND**

Friend debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Friend debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROXY**

Proxy debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Proxy protocol debug logs for the BLE Mesh functionality.

**CoAP Configuration** Contains:

- [CONFIG\\_COAP\\_MBEDTLS\\_ENCRYPTION\\_MODE](#)
- [CONFIG\\_COAP\\_MBEDTLS\\_DEBUG](#)

### **CONFIG\_COAP\_MBEDTLS\_ENCRYPTION\_MODE**

CoAP Encryption method

*Found in: [Component config](#) > [CoAP Configuration](#)*

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)

- Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
- Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

**Available options:**

- Pre-Shared Keys (COAP\_MBEDTLS\_PSK)
- PKI Certificates (COAP\_MBEDTLS\_PKI)

### **CONFIG\_COAP\_MBEDTLS\_DEBUG**

Enable CoAP debugging

*Found in: [Component config](#) > [CoAP Configuration](#)*

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call `coap_set_log_level()` at runtime in order to enable CoAP debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

### **CONFIG\_COAP\_MBEDTLS\_DEBUG\_LEVEL**

Set CoAP debugging level

*Found in: [Component config](#) > [CoAP Configuration](#) > [CONFIG\\_COAP\\_MBEDTLS\\_DEBUG](#)*

Set CoAP debugging level

**Available options:**

- Emergency (COAP\_LOG\_EMERG)
- Alert (COAP\_LOG\_ALERT)
- Critical (COAP\_LOG\_CRIT)
- Error (COAP\_LOG\_ERROR)
- Warning (COAP\_LOG\_WARNING)
- Notice (COAP\_LOG\_NOTICE)
- Info (COAP\_LOG\_INFO)
- Debug (COAP\_LOG\_DEBUG)

**Driver configurations** Contains:

- [ADC configuration](#)
- [SPI configuration](#)
- [TWAI configuration](#)
- [UART configuration](#)

**ADC configuration** Contains:

- [CONFIG\\_ADC\\_DISABLE\\_DAC](#)
- [CONFIG\\_ADC\\_CONTINUOUS\\_FORCE\\_USE\\_ADC2\\_ON\\_C3\\_S3](#)
- [CONFIG\\_ADC\\_ONESHOT\\_FORCE\\_USE\\_ADC2\\_ON\\_C3](#)
- [CONFIG\\_ADC\\_FORCE\\_XPD\\_FSM](#)

### **CONFIG\_ADC\_FORCE\_XPD\_FSM**

Use the FSM to control ADC power

*Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**Default value:**

- No (disabled)

### **CONFIG\_ADC\_DISABLE\_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled)

### **CONFIG\_ADC\_CONTINUOUS\_FORCE\_USE\_ADC2\_ON\_C3\_S3**

Force use ADC2 continuous mode on ESP32C3

*Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)*

On ESP32C3, ADC2 Digital Controller is not stable. Therefore, ADC2 continuous mode is not suggested on ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

**Default value:**

- No (disabled)

### **CONFIG\_ADC\_ONESHOT\_FORCE\_USE\_ADC2\_ON\_C3**

Force use ADC2 oneshot mode on ESP32C3

*Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)*

On ESP32C3, ADC2 Digital Controller is not stable. Therefore, ADC2 oneshot mode is not suggested on ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

**Default value:**

- No (disabled)

**SPI configuration** Contains:

- [\*CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM\*](#)

### **CONFIG\_SPI\_MASTER\_IN\_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPI\_SLAVE\_IN\_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**TWAI configuration** Contains:

- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_LISTEN\\_ONLY\\_DOM](#)
- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

### **CONFIG\_TWAI\_ISR\_IN\_IRAM**

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [TWAI configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP\_INTR\_FLAG\_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI\_ALERT\_AND\_LOG flag) will have no effect.

**Default value:**

- No (disabled)

### **CONFIG\_TWAI\_ERRATA\_FIX\_LISTEN\_ONLY\_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: [Component config](#) > [Driver configurations](#) > [TWAI configuration](#)*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**

- No (disabled)

**UART configuration** Contains:

- [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#)

### **CONFIG\_UART\_ISR\_IN\_IRAM**

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [UART configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**

- No (disabled)

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### CONFIG\_EFUSE\_CUSTOM\_TABLE

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_CUSTOM\_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “main/esp\_efuse\_custom\_table.csv” if *CONFIG\_EFUSE\_CUSTOM\_TABLE*

### CONFIG\_EFUSE\_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

All read and writes operations are redirected to RAM instead of eFuse registers. If this option is set, all permanent changes (via eFuse) are disabled. Log output will state changes which would be applied, but they will not be.

**Default value:**

- No (disabled)

### ESP-TLS

 Contains:

- *CONFIG\_ESP\_TLS\_INSECURE*
- *CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE*
- *CONFIG\_ESP\_DEBUG\_WOLFSSL*
- *CONFIG\_ESP\_TLS\_SERVER*
- *CONFIG\_ESP\_TLS\_PSK\_VERIFICATION*
- *CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY*
- *CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL*

### CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS (ESP\_TLS\_USING\_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP\_TLS\_USING\_WOLFSSL)

### CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

*Found in: [Component config](#) > [ESP-TLS](#)*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_INSECURE](#)*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `crt_bundle_attach`, `use_global_ca_store` etc.). **WARNING** : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

*Found in: [Component config](#) > [ESP-TLS](#)*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if ESP\_TLS\_USING\_WOLFSSL

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable detailed debug prints for wolfSSL SSL library.

**Default value:**

- No (disabled) if ESP\_TLS\_USING\_WOLFSSL

### ESP32C3-Specific

 Contains:

- [CONFIG\\_ESP32C3\\_DEFAULT\\_CPU\\_FREQ\\_MHZ](#)
- [CONFIG\\_ESP32C3\\_BROWNOUT\\_DET](#)
- [CONFIG\\_ESP32C3\\_LIGHTSLEEP\\_GPIO\\_RESET\\_WORKAROUND](#)
- [CONFIG\\_ESP32C3\\_DEBUG\\_OCDAWARE](#)
- [CONFIG\\_ESP32C3\\_REV\\_MAX\\_FULL\\_STR](#)
- [CONFIG\\_ESP32C3\\_REV\\_MIN](#)
- [CONFIG\\_ESP32C3\\_NO\\_BLOBS](#)
- [CONFIG\\_ESP32C3\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_ESP32C3\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)
- [CONFIG\\_ESP32C3\\_DEBUG\\_STUBS\\_ENABLE](#)
- [CONFIG\\_ESP32C3\\_RTC\\_CLK\\_SRC](#)
- [CONFIG\\_ESP32C3\\_TIME\\_SYSCALL](#)

### CONFIG\_ESP32C3\_DEFAULT\_CPU\_FREQ\_MHZ

CPU frequency

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

CPU frequency to be set on application startup.

**Available options:**

- 40 MHz (ESP32C3\_DEFAULT\_CPU\_FREQ\_40)
- 80 MHz (ESP32C3\_DEFAULT\_CPU\_FREQ\_80)
- 160 MHz (ESP32C3\_DEFAULT\_CPU\_FREQ\_160)

### CONFIG\_ESP32C3\_REV\_MIN

Minimum Supported ESP32-C3 Revision

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) (ESP32C3\_REV\_MIN\_0)
- Rev v0.1 (ECO1) (ESP32C3\_REV\_MIN\_1)
- Rev v0.2 (ECO2) (ESP32C3\_REV\_MIN\_2)
- Rev v0.3 (ECO3) (ESP32C3\_REV\_MIN\_3)
- Rev v0.4 (ECO4) (ESP32C3\_REV\_MIN\_4)

### CONFIG\_ESP32C3\_REV\_MAX\_FULL\_STR

Maximum Supported ESP32-C3 Revision

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

**Available options:**

- Rev v0.99 (ESP32C3\_REV\_MAX\_FULL\_STR\_OPT)

### CONFIG\_ESP32C3\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

Configure the number of universally administered (by IEEE) MAC addresses.

During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.

If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Note that ESP32-C3 has no integrated Ethernet MAC. Although it's possible to use the `esp_read_mac()` API to return a MAC for Ethernet, this can only be used with an external MAC peripheral.

**Available options:**

- Two (ESP32C3\_UNIVERSAL\_MAC\_ADDRESSES\_TWO)
- Four (ESP32C3\_UNIVERSAL\_MAC\_ADDRESSES\_FOUR)

### CONFIG\_ESP32C3\_DEBUG\_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32C3\_DEBUG\_STUBS\_ENABLE

OpenOCD debug stubs

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging, e.g. GCOV data dump.

**Default value:**

- “COMPILER\_OPTIMIZATION\_LEVEL\_DEBUG” if ESP32C3\_TRAX

## CONFIG\_ESP32C3\_BROWNOUT\_DET

Hardware brownout detect & reset

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

The ESP32-C3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP32C3\_BROWNOUT\_DET\_LVL\_SEL

Brownout voltage level

*Found in: [Component config](#) > [ESP32C3-Specific](#) > [CONFIG\\_ESP32C3\\_BROWNOUT\\_DET](#)*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**

- 2.51V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_7)
- 2.64V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_6)
- 2.76V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_5)
- 2.92V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_4)
- 3.10V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_3)
- 3.27V (ESP32C3\_BROWNOUT\_DET\_LVL\_SEL\_2)

## CONFIG\_ESP32C3\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution (systimer) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer (systimer) is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC\_STORE registers are used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (ESP32C3\_TIME\_SYSCALL\_USE\_RTC\_SYSTIMER)

- RTC (ESP32C3\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (ESP32C3\_TIME\_SYSCALL\_USE\_SYSTIMER)
- None (ESP32C3\_TIME\_SYSCALL\_USE\_NONE)

### CONFIG\_ESP32C3\_RTC\_CLK\_SRC

RTC clock source

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

Choose which clock is used as RTC clock source.

**Available options:**

- Internal 150kHz RC oscillator (ESP32C3\_RTC\_CLK\_SRC\_INT\_RC)
- External 32kHz crystal (ESP32C3\_RTC\_CLK\_SRC\_EXT\_CRYS)
- External 32kHz oscillator at 32K\_XP pin (ESP32C3\_RTC\_CLK\_SRC\_EXT\_OSC)
- Internal 8MHz oscillator, divided by 256 (~32kHz) (ESP32C3\_RTC\_CLK\_SRC\_INT\_8MD256)

### CONFIG\_ESP32C3\_RTC\_CLK\_CAL\_CYCLES

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 125000

**Default value:**

- 3000 if ESP32C3\_RTC\_CLK\_SRC\_EXT\_CRYS || ESP32C3\_RTC\_CLK\_SRC\_EXT\_OSC || ESP32C3\_RTC\_CLK\_SRC\_INT\_8MD256
- 1024

### CONFIG\_ESP32C3\_NO\_BLOBS

No Binary Blobs

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_ESP32C3\_LIGHTSLEEP\_GPIO\_RESET\_WORKAROUND

light sleep GPIO reset workaround

*Found in: [Component config](#) > [ESP32C3-Specific](#)*

ESP32C3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**

- Yes (enabled)

## ADC-Calibration

**Common ESP-related** Contains:

- *CONFIG\_ESP\_CONSOLE\_UART*
- *CONFIG\_ESP\_CONSOLE\_SECONDARY*
- *CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP*
- *CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_TASK\_WDT*
- *CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_INT\_WDT*
- *CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY*
- *CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE*
- *CONFIG\_ESP\_PANIC\_HANDLER\_IRAM*
- *CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE*
- *CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE*
- *CONFIG\_ESP\_CONSOLE\_UART\_NUM*
- *CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO*
- *CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO*

## CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE

System event queue size

*Found in: Component config > Common ESP-related*

Config system event queue size in different application.

**Default value:**

- 32

**CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE**

Event loop task stack size

*Found in: [Component config](#) > [Common ESP-related](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

**CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE**

Main task stack size

*Found in: [Component config](#) > [Common ESP-related](#)*

Configure the “main task” stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

**CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: [Component config](#) > [Common ESP-related](#)*

Configure the IPC tasks stack size. One IPC task runs on each core (in dual core mode), and allows for cross-core function calls.

See IPC documentation for more details.

The default stack size should be enough for most common use cases. It can be shrunk if you are sure that you do not use any custom IPC functionality.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

**CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY**

IPC runs at caller’s priority

*Found in: [Component config](#) > [Common ESP-related](#)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, and hence IPC task will run at `(configMAX_PRIORITIES - 1)` priority.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE**

Minimal allowed size for shared stack

*Found in: [Component config](#) > [Common ESP-related](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

## CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [Common ESP-related](#)*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

### Available options:

- Default: UART0 (ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (ESP\_CONSOLE\_UART\_CUSTOM)
- None (ESP\_CONSOLE\_NONE)

## CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: [Component config](#) > [Common ESP-related](#)*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

### Available options:

- No secondary console (ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

## CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: [Component config](#) > [Common ESP-related](#)*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

### Available options:

- UART0 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

## CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: [Component config](#) > [Common ESP-related](#)*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 21 if ESP\_CONSOLE\_UART\_CUSTOM
- 43 if ESP\_CONSOLE\_UART\_CUSTOM

## CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [Common ESP-related](#)*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 20 if ESP\_CONSOLE\_UART\_CUSTOM
- 44 if ESP\_CONSOLE\_UART\_CUSTOM

## CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: [Component config](#) > [Common ESP-related](#)*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 4000000 if [CONFIG\\_PM\\_ENABLE](#)
- from 1200 to 1000000 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 115200

### CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [Common ESP-related](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300 if ESP32\_SPIRAM\_SUPPORT && [CONFIG\\_ESP\\_INT\\_WDT](#)
- 800 if ESP32\_SPIRAM\_SUPPORT && [CONFIG\\_ESP\\_INT\\_WDT](#)

### CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [Common ESP-related](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S

Task Watchdog timeout period (seconds)

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0

Watch CPU0 Idle Task

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1

Watch CPU1 Idle Task

*Found in: [Component config](#) > [Common ESP-related](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PANIC\_HANDLER\_IRAM

Place panic handler code in IRAM

*Found in: [Component config](#) > [Common ESP-related](#)*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code is placed in IRAM. This allows the panic handler to run without needing to re-enable cache first. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash.)

**Default value:**

- No (disabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

## CONFIG\_ETH\_USE\_SPI\_ETHERNET

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

## CONFIG\_ETH\_SPI\_ETHERNET\_DM9051

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

## CONFIG\_ETH\_SPI\_ETHERNET\_W5500

Use W5500 (MAC RAW)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

## CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: [Component config](#) > [Ethernet](#)*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_TX\\_BUFFER\\_NUM](#)

## CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_OPENETH](#)*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 4 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_OPENETH](#)*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 1 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### CONFIG\_ESP\_EVENT\_LOOP\_PROFILING

Enable event loop profiling

*Found in: [Component config](#) > [Event Loop Library](#)*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

### CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

### CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32 if [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS

Enable https

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH

Enable HTTP Basic Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

**HTTP Server** Contains:

- [CONFIG\\_HTTPD\\_PURGE\\_BUF\\_LEN](#)
- [CONFIG\\_HTTPD\\_LOG\\_PURGE\\_DATA](#)
- [CONFIG\\_HTTPD\\_MAX\\_REQ\\_HDR\\_LEN](#)
- [CONFIG\\_HTTPD\\_MAX\\_URI\\_LEN](#)
- [CONFIG\\_HTTPD\\_ERR\\_RESP\\_NO\\_DELAY](#)
- [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#)

### CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_MAX\_URI\_LEN

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

### CONFIG\_HTTPD\_PURGE\_BUF\_LEN

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

## CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

Found in: *Component config > HTTP Server*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

## ESP HTTPS OTA Contains:

- *CONFIG\_OTA\_ALLOW\_HTTP*

## CONFIG\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

## ESP HTTPS server Contains:

- *CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE*

## CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE

Enable ESP\_HTTPS\_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

## ESP NETIF Adapter Contains:

- *CONFIG\_ESP\_NETIF\_TCPIP\_ADAPTER\_COMPATIBLE\_LAYER*
- *CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL*
- *CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB*

## CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

Found in: *Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

## CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

### Available options:

- LwIP (ESP\_NETIF\_TCPIP\_LWIP)  
lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

## CONFIG\_ESP\_NETIF\_TCPIP\_ADAPTER\_COMPATIBLE\_LAYER

Enable backward compatible tcpip\_adapter interface

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Backward compatible interface to tcpip\_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

### Default value:

- Yes (enabled)

## Power Management

 Contains:

- [CONFIG\\_PM\\_SLP\\_DISABLE\\_GPIO](#)
- [CONFIG\\_PM\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_PM\\_RTOS\\_IDLE\\_OPT](#)
- [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

### Default value:

- No (disabled)

## CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT\_CPU\_FREQ\_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp\_pm\_configure function.

### Default value:

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, esp\_pm\_\* functions will keep track of the amount of time each of the power management locks has been held, and esp\_pm\_dump\_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm\_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 260B of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable [GPIO\\_ESP32\\_SUPPORT\\_SWITCH\\_SLP\\_PULL](#) at first, otherwise you will not be able to switch pullup/pulldown mode.

**ESP System Settings** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_RTC\\_EXT\\_XTAL\\_BOOTSTRAP\\_CYCLES](#)
- [CONFIG\\_ESP\\_SYSTEM\\_ALLOW\\_RTC\\_FAST\\_MEM\\_AS\\_HEAP](#)
- [CONFIG\\_ESP\\_SYSTEM\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- *Memory protection*
- [CONFIG\\_ESP\\_SYSTEM\\_PANIC](#)
- [CONFIG\\_ESP\\_SYSTEM\\_PD\\_FLASH](#)
- [CONFIG\\_ESP\\_SYSTEM\\_PM\\_POWER\\_DOWN\\_CPU](#)
- [CONFIG\\_ESP\\_SYSTEM\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)
- [RTC Clock Config](#)

**CONFIG\_ESP\_SYSTEM\_PANIC**

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

**Available options:**

- Print registers and halt ([ESP\\_SYSTEM\\_PANIC\\_PRINT\\_HALT](#))  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot ([ESP\\_SYSTEM\\_PANIC\\_PRINT\\_REBOOT](#))  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot ([ESP\\_SYSTEM\\_PANIC\\_SILENT\\_REBOOT](#))  
Just resets the processor without outputting anything
- Invoke GDBStub ([ESP\\_SYSTEM\\_PANIC\\_GDBSTUB](#))  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

**CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for [RTC\\_SLOW\\_CLK](#) calibration" (about 3000).

**CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: [Component config](#) > [ESP System Settings](#)*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_PD\_FLASH

PD flash at light sleep when there is no SPIRAM

*Found in: [Component config](#) > [ESP System Settings](#)*

If enabled, chip will try to power down flash at light sleep, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured. This option will in fact consider VDD\_SDIO auto power value (ESP\_PD\_OPTION\_AUTO) as OFF. Also, it is possible to force a power domain to stay ON during light sleep by using `esp_sleep_pd_config()` function.

**Default value:**

- Yes (enabled) if SPIRAM

### CONFIG\_ESP\_SYSTEM\_PM\_POWER\_DOWN\_CPU

Power down CPU in light sleep

*Found in: [Component config](#) > [ESP System Settings](#)*

If enabled, the CPU will be powered down in light sleep. Enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_PSRAM\_LEAKAGE\_WORKAROUND

PSRAM leakage current workaround in light sleep

*Found in: [Component config](#) > [ESP System Settings](#)*

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

### CONFIG\_ESP\_SYSTEM\_FLASH\_LEAKAGE\_WORKAROUND

Flash leakage current workaround in light sleep

*Found in: [Component config](#) > [ESP System Settings](#)*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

### RTC Clock Config

 Contains:

- [CONFIG\\_RTC\\_CLOCK\\_BBPLL\\_POWER\\_ON\\_WITH\\_USB](#)

### CONFIG\_RTC\_CLOCK\_BBPLL\_POWER\_ON\_WITH\_USB

Keep BBPLL clock always work

*Found in: [Component config](#) > [ESP System Settings](#) > [RTC Clock Config](#)*

When software switches the CPU clock source from BBPLL clock to XTAL, usually the BBPLL will be switched off. This helps to save some power consumption in sleep modes. However this may also happen during the software reset, resulting in the inactive (disconnected from host) of the USB\_SERIAL\_JTAG device during software reset.

When USB\_SERIAL\_JTAG is being used, whether to turn off the clock source during software reset and in sleep modes is determined by `RTC_CLOCK_BBPLL_POWER_ON_WITH_USB`.

- When `RTC_CLOCK_BBPLL_POWER_ON_WITH_USB` is enabled, the clock will be kept, so that the `USB_SERIAL_JTAG` will keep alive during software reset. The side-effect is the increasing of power consumption during sleep modes, even though `USB_SERIAL_JTAG` will not work in sleep modes.
- When `RTC_CLOCK_BBPLL_POWER_ON_WITH_USB` is disabled, the clock will be turned off. `USB_SERIAL_JTAG` will be inactive during software reset and in sleep modes. This saves some power consumption in sleep modes.

When `USB_SERIAL_JTAG` is not being used, software will always turn off `BBPLL` regardless of `RTC_CLOCK_BBPLL_POWER_ON_WITH_USB` is set or not.

**Default value:**

- Yes (enabled)

**Memory protection** Contains:

- [\*CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE\*](#)

**CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE**

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK**

Lock memory protection settings

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled)

**High resolution timer (esp\_timer)** Contains:

- [\*CONFIG\\_ESP\\_TIMER\\_PROFILING\*](#)
- [\*CONFIG\\_ESP\\_TIMER\\_IMPL\*](#)
- [\*CONFIG\\_ESP\\_TIMER\\_TASK\\_STACK\\_SIZE\*](#)

**CONFIG\_ESP\_TIMER\_PROFILING**

Enable `esp_timer` profiling features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

If enabled, `esp_timer_dump` will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp\_timer)*

Configure the stack size of “timer\_task” task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

**CONFIG\_ESP\_TIMER\_IMPL**

Hardware timer to use for esp\_timer

*Found in: Component config > High resolution timer (esp\_timer)*

esp\_timer APIs can be implemented using different hardware timers.

- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for non ESP32 chips.

**Available options:**

- FRC2 (legacy) timer (ESP\_TIMER\_IMPL\_FRC2)
- LAC timer of Timer Group 0 (ESP\_TIMER\_IMPL\_TG0\_LAC)
- SYSTIMER (ESP\_TIMER\_IMPL\_SYSTIMER)

**Wi-Fi** Contains:

- [CONFIG\\_ESP32\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)
- [CONFIG\\_ESP32\\_WIFI\\_SOFTAP\\_BEACON\\_MAX\\_LEN](#)
- [CONFIG\\_ESP32\\_WIFI\\_CACHE\\_TX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ESP32\\_WIFI\\_DYNAMIC\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ESP32\\_WIFI\\_DYNAMIC\\_TX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ESP32\\_WIFI\\_STATIC\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ESP32\\_WIFI\\_STATIC\\_TX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ESP\\_WIFI\\_STA\\_DISCONNECTED\\_PM\\_ENABLE](#)
- [CONFIG\\_ESP32\\_WIFI\\_SW\\_COEXIST\\_ENABLE](#)
- [CONFIG\\_ESP32\\_WIFI\\_TX\\_BUFFER](#)
- [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)
- [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)
- [CONFIG\\_ESP32\\_WIFI\\_AMSDU\\_TX\\_ENABLED](#)
- [CONFIG\\_ESP32\\_WIFI\\_CSI\\_ENABLED](#)
- [CONFIG\\_ESP32\\_WIFI\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)
- [CONFIG\\_ESP32\\_WIFI\\_IRAM\\_OPT](#)
- [CONFIG\\_ESP32\\_WIFI\\_MGMT\\_SBUF\\_NUM](#)
- [CONFIG\\_ESP32\\_WIFI\\_NVS\\_ENABLED](#)

- [CONFIG\\_ESP32\\_WIFI\\_RX\\_IRAM\\_OPT](#)
- [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)
- [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_ESP32\\_WIFI\\_TASK\\_CORE\\_ID](#)

### CONFIG\_ESP32\_WIFI\_SW\_COEXIST\_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in:* [Component config](#) > [Wi-Fi](#)

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM

Max number of WiFi static RX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 25

**Default value:**

- 10 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM

Max number of WiFi dynamic RX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 128 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 0 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

## CONFIG\_ESP32\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

### Available options:

- Static (ESP32\_WIFI\_STATIC\_TX\_BUFFER)
- Dynamic (ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER)

## CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM

Max number of WiFi static TX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

### Range:

- from 1 to 64 if ESP32\_WIFI\_STATIC\_TX\_BUFFER

### Default value:

- 16 if ESP32\_WIFI\_STATIC\_TX\_BUFFER

## CONFIG\_ESP32\_WIFI\_CACHE\_TX\_BUFFER\_NUM

Max number of WiFi cache TX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

### Range:

- from 16 to 128 if ESP32\_SPIRAM\_SUPPORT || ESP32S2\_SPIRAM\_SUPPORT || ESP32S3\_SPIRAM\_SUPPORT

### Default value:

- 32 if ESP32\_SPIRAM\_SUPPORT || ESP32S2\_SPIRAM\_SUPPORT || ESP32S3\_SPIRAM\_SUPPORT

### CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### CONFIG\_ESP32\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

### CONFIG\_ESP32\_WIFI\_AMPDU\_TX\_ENABLED

WiFi AMPDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_TX\_BA\_WIN

WiFi AMPDU TX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 32

**Default value:**

- 6

### CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED

WiFi AMPDU RX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN**

WiFi AMPDU RX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 32

**Default value:**

- 6 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)
- 16 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)

**CONFIG\_ESP32\_WIFI\_AMSDU\_TX\_ENABLED**

WiFi AMSDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if `ESP32_SPIRAM_SUPPORT` || `ESP32S2_SPIRAM_SUPPORT` || `ESP32S3_SPIRAM_SUPPORT`

**CONFIG\_ESP32\_WIFI\_NVS\_ENABLED**

WiFi NVS flash

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_TASK\_CORE\_ID**

WiFi Task Core ID

*Found in: [Component config](#) > [Wi-Fi](#)*

Pinned WiFi task to core 0 or core 1.

**Available options:**

- Core 0 (`ESP32_WIFI_TASK_PINNED_TO_CORE_0`)
- Core 1 (`ESP32_WIFI_TASK_PINNED_TO_CORE_1`)

### CONFIG\_ESP32\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN

Max length of WiFi SoftAP Beacon

Found in: [Component config](#) > [Wi-Fi](#)

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP32\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP32\_WIFI\_LOG\_DEFAULT\_LEVEL

WiFi default log level

Found in: [Component config](#) > [Wi-Fi](#)

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

Note that this setting limits which log statements are compiled into the program. So setting this to, say, “Warning” would mean that changing log level to “Debug” at runtime will not be possible.

**Available options:**

- No output (WIFI\_LOG\_DEFAULT\_LEVEL\_NONE)
- Error (WIFI\_LOG\_DEFAULT\_LEVEL\_ERROR)
- Warning (WIFI\_LOG\_DEFAULT\_LEVEL\_WARN)
- Info (WIFI\_LOG\_DEFAULT\_LEVEL\_INFO)
- Debug (WIFI\_LOG\_DEFAULT\_LEVEL\_DEBUG)
- Verbose (WIFI\_LOG\_DEFAULT\_LEVEL\_VERBOSE)

### CONFIG\_ESP32\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED` && `ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### **CONFIG\_ESP32\_WIFI\_RX\_IRAM\_OPT**

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED` && `ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### **CONFIG\_ESP32\_WIFI\_ENABLE\_WPA3\_SAE**

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP' s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT**

WiFi SLP IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by `ESP32_WIFI_IRAM_OPT` and `ESP32_WIFI_RX_IRAM_OPT`, or this one. If already enabled `ESP32_WIFI_IRAM_OPT`, the other 7.3KB IRAM memory would be taken by this option. If already enabled `ESP32_WIFI_RX_IRAM_OPT`, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

### **CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME**

Minimum active time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**

- 50 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME**

Maximum keep alive time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**CONFIG\_ESP\_WIFI\_FTM\_ENABLE**

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT**

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT**

FTM Responder support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE**

Power Management for station at disconnected

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT**

Wifi sleep optimize when beacon lost

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 3 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**PHY** Contains:

- *CONFIG\_ESP\_PHY\_ENABLE\_USB*
- *CONFIG\_ESP32\_PHY\_MAX\_WIFI\_TX\_POWER*
- *CONFIG\_ESP32\_PHY\_MAC\_BB\_PD*
- *CONFIG\_ESP32\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE*
- *CONFIG\_ESP32\_PHY\_INIT\_DATA\_IN\_PARTITION*

## CONFIG\_ESP32\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE

Store phy calibration data in NVS

*Found in: [Component config](#) > [PHY](#)*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP32\_PHY\_INIT\_DATA\_IN\_PARTITION

Use a partition to store PHY init data

*Found in: [Component config](#) > [PHY](#)*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ESP32\\_PHY\\_DEFAULT\\_INIT\\_IF\\_INVALID](#)
- [CONFIG\\_ESP32\\_SUPPORT\\_MULTIPLE\\_PHY\\_INIT\\_DATA\\_BIN](#)

## CONFIG\_ESP32\_PHY\_DEFAULT\_INIT\_IF\_INVALID

Reset default PHY init data if invalid

*Found in: [Component config](#) > [PHY](#) > [CONFIG\\_ESP32\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

**Default value:**

- No (disabled) if [CONFIG\\_ESP32\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

## CONFIG\_ESP32\_SUPPORT\_MULTIPLE\_PHY\_INIT\_DATA\_BIN

Support multiple PHY init data bin

*Found in: [Component config](#) > [PHY](#) > [CONFIG\\_ESP32\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION` && `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`

**CONFIG\_ESP32\_MULTIPLE\_PHY\_DATA\_BIN\_EMBEDDED**

Support embedded multiple phy init data bin to app bin

*Found in:* `Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN`

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if `CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN` && `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`

**CONFIG\_ESP32\_PHY\_INIT\_DATA\_ERROR**

Terminate operation when PHY init data error

*Found in:* `Component config > PHY > CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN`

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if `CONFIG_ESP32_SUPPORT_MULTIPLE_PHY_INIT_DATA_BIN` && `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`

**CONFIG\_ESP32\_PHY\_MAX\_WIFI\_TX\_POWER**

Max WiFi TX power (dBm)

*Found in:* `Component config > PHY`

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

**CONFIG\_ESP32\_PHY\_MAC\_BB\_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in:* `Component config > PHY`

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

## CONFIG\_ESP\_PHY\_ENABLE\_USB

Enable USB when phy init

Found in: *Component config* > *PHY*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

### Default value:

- Yes (enabled)
- No (disabled)

**Core dump** Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_SUMMARY\\_STACKDUMP\\_SIZE](#)

## CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

Found in: *Component config* > *Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition\_table directory.

### Available options:

- Flash (ESP\_COREDUMP\_ENABLE\_TO\_FLASH)
- UART (ESP\_COREDUMP\_ENABLE\_TO\_UART)
- None (ESP\_COREDUMP\_ENABLE\_TO\_NONE)

## CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

Found in: *Component config* > *Core dump*

Select the data format for core dump.

### Available options:

- Binary format (ESP\_COREDUMP\_DATA\_FORMAT\_BIN)
- ELF format (ESP\_COREDUMP\_DATA\_FORMAT\_ELF)

## CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

Found in: *Component config* > *Core dump*

Select the integrity check for the core dump.

### Available options:

- Use CRC32 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_SHA256)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in: [Component config](#) > [Core dump](#)*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if ESP\_COREDUMP\_ENABLE\_TO\_FLASH

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in: [Component config](#) > [Core dump](#)*

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in: [Component config](#) > [Core dump](#)*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if ESP\_COREDUMP\_ENABLE\_TO\_UART

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in: [Component config](#) > [Core dump](#)*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

### CONFIG\_ESP\_COREDUMP\_SUMMARY\_STACKDUMP\_SIZE

Size of the stack dump buffer

*Found in: [Component config](#) > [Core dump](#)*

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

**Range:**

- from 512 to 4096 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF &&  
ESP\_COREDUMP\_ENABLE\_TO\_FLASH

**Default value:**

- 1024 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF &&  
ESP\_COREDUMP\_ENABLE\_TO\_FLASH

## CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

Found in: *Component config > Core dump*

### Available options:

- Decode and show summary (info\_corefile) (ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (ESP\_COREDUMP\_DECODE\_DISABLE)

## FAT Filesystem support

 Contains:

- *CONFIG\_FATFS\_API\_ENCODING*
- *CONFIG\_FATFS\_USE\_FASTSEEK*
- *CONFIG\_FATFS\_LONG\_FILENAMES*
- *CONFIG\_FATFS\_MAX\_LFN*
- *CONFIG\_FATFS\_FS\_LOCK*
- *CONFIG\_FATFS\_CHOOSE\_CODEPAGE*
- *CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM*
- *CONFIG\_FATFS\_TIMEOUT\_MS*
- *CONFIG\_FATFS\_PER\_FILE\_CACHE*

## CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

Found in: *Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

### Available options:

- Dynamic (all code pages supported) (FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (FATFS\_CODEPAGE\_437)
- Arabic (CP720) (FATFS\_CODEPAGE\_720)
- Greek (CP737) (FATFS\_CODEPAGE\_737)
- KBL (CP771) (FATFS\_CODEPAGE\_771)
- Baltic (CP775) (FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (FATFS\_CODEPAGE\_855)
- Turkish (CP857) (FATFS\_CODEPAGE\_857)
- Portugese (CP860) (FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (FATFS\_CODEPAGE\_863)
- Arabic (CP864) (FATFS\_CODEPAGE\_864)
- Nordic (CP865) (FATFS\_CODEPAGE\_865)
- Russian (CP866) (FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (FATFS\_CODEPAGE\_932)
- Simplified Chinese (DBCS) (CP936) (FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (FATFS\_CODEPAGE\_950)

## CONFIG\_FATFS\_LONG\_FILENAMES

Long filename support

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**

- No long filenames (FATFS\_LFN\_NONE)
- Long filename buffer in heap (FATFS\_LFN\_HEAP)
- Long filename buffer on stack (FATFS\_LFN\_STACK)

### CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

**Range:**

- from 12 to 255

**Default value:**

- 255

### CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**

- API uses ANSI/OEM encoding (FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-16 encoding (FATFS\_API\_ENCODING\_UTF\_16)
- API uses UTF-8 encoding (FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### **CONFIG\_FATFS\_PER\_FILE\_CACHE**

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### **CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM**

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC` || `SPIRAM_USE_MALLOC`

### **CONFIG\_FATFS\_USE\_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

### **CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE**

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

**Modbus configuration** Contains:

- `CONFIG_FMB_COMM_MODE_ASCII_EN`
- `CONFIG_FMB_COMM_MODE_RTU_EN`
- `CONFIG_FMB_COMM_MODE_TCP_EN`
- `CONFIG_FMB_MASTER_TIMER_GROUP`
- `CONFIG_FMB_MASTER_TIMER_INDEX`
- `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE`
- `CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT`
- `CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT`
- `CONFIG_FMB_CONTROLLER_STACK_SIZE`
- `CONFIG_FMB_PORT_TASK_Prio`
- `CONFIG_FMB_PORT_TASK_STACK_SIZE`
- `CONFIG_FMB_QUEUE_LENGTH`
- `CONFIG_FMB_SERIAL_BUF_SIZE`
- `CONFIG_FMB_EVENT_QUEUE_TIMEOUT`
- `CONFIG_FMB_TIMER_PORT_ENABLED`
- `CONFIG_FMB_PORT_TASK_AFFINITY`
- `CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB`
- `CONFIG_FMB_TIMER_ISR_IN_IRAM`
- `CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS`
- `CONFIG_FMB_MASTER_DELAY_MS_CONVERT`
- `CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND`
- `CONFIG_FMB_TIMER_GROUP`
- `CONFIG_FMB_TIMER_INDEX`

### **CONFIG\_FMB\_COMM\_MODE\_TCP\_EN**

Enable Modbus stack support for TCP communication mode

*Found in: Component config > Modbus configuration*

Enable Modbus TCP option for stack.

**Default value:**

- Yes (enabled)

### **CONFIG\_FMB\_TCP\_PORT\_DEFAULT**

Modbus TCP port number

*Found in: Component config > Modbus configuration > CONFIG\_FMB\_COMM\_MODE\_TCP\_EN*

Modbus default port number used by Modbus TCP stack

**Range:**

- from 0 to 65535

**Default value:**

- 502

### **CONFIG\_FMB\_TCP\_PORT\_MAX\_CONN**

Maximum allowed connections for TCP stack

*Found in: Component config > Modbus configuration > CONFIG\_FMB\_COMM\_MODE\_TCP\_EN*

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

**Range:**

- from 1 to 6

**Default value:**

- 5

**CONFIG\_FMB\_TCP\_CONNECTION\_TOUT\_SEC**

Modbus TCP connection timeout

*Found in: [Component config](#) > [Modbus configuration](#) > [CONFIG\\_FMB\\_COMM\\_MODE\\_TCP\\_EN](#)*

Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

**Range:**

- from 1 to 3600

**Default value:**

- 20

**CONFIG\_FMB\_COMM\_MODE\_RTU\_EN**

Enable Modbus stack support for RTU mode

*Found in: [Component config](#) > [Modbus configuration](#)*

Enable RTU Modbus communication mode option for Modbus serial stack.

**Default value:**

- Yes (enabled)

**CONFIG\_FMB\_COMM\_MODE\_ASCII\_EN**

Enable Modbus stack support for ASCII mode

*Found in: [Component config](#) > [Modbus configuration](#)*

Enable ASCII Modbus communication mode option for Modbus serial stack.

**Default value:**

- Yes (enabled)

**CONFIG\_FMB\_MASTER\_TIMEOUT\_MS\_RESPOND**

Slave respond timeout (Milliseconds)

*Found in: [Component config](#) > [Modbus configuration](#)*

If master sends a frame which is not broadcast, it has to wait sometime for slave response. if slave is not respond in this time, the master will process timeout error.

**Range:**

- from 50 to 3000

**Default value:**

- 150

**CONFIG\_FMB\_MASTER\_DELAY\_MS\_CONVERT**

Slave conversion delay (Milliseconds)

*Found in: [Component config](#) > [Modbus configuration](#)*

If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**Range:**

- from 50 to 400

**Default value:**

- 200

### CONFIG\_FMB\_QUEUE\_LENGTH

Modbus serial task queue length

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**Range:**

- from 0 to 200

**Default value:**

- 20

### CONFIG\_FMB\_PORT\_TASK\_STACK\_SIZE

Modbus port task stack size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).

**Range:**

- from 2048 to 8192

**Default value:**

- 4096

### CONFIG\_FMB\_SERIAL\_BUF\_SIZE

Modbus serial task RX/TX buffer size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**Range:**

- from 0 to 2048

**Default value:**

- 256

### CONFIG\_FMB\_SERIAL\_ASCII\_BITS\_PER\_SYMB

Number of data bits per ASCII character

*Found in: [Component config](#) > [Modbus configuration](#)*

This option defines the number of data bits per ASCII character.

**Range:**

- from 7 to 8

**Default value:**

- 8

### CONFIG\_FMB\_SERIAL\_ASCII\_TIMEOUT\_RESPOND\_MS

Response timeout for ASCII communication mode (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

**Range:**

- from 300 to 2000

**Default value:**

- 1000

### CONFIG\_FMB\_PORT\_TASK\_PRIO

Modbus port task priority

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG\_FMB\_PORT\_TASK\_PRIO - 1).

**Range:**

- from 3 to 23

**Default value:**

- 10

### CONFIG\_FMB\_PORT\_TASK\_AFFINITY

Modbus task affinity

*Found in: [Component config](#) > [Modbus configuration](#)*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

**Available options:**

- No affinity (FMB\_PORT\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (FMB\_PORT\_TASK\_AFFINITY\_CPU0)
- CPU1 (FMB\_PORT\_TASK\_AFFINITY\_CPU1)

### CONFIG\_FMB\_CONTROLLER\_SLAVE\_ID\_SUPPORT

Modbus controller slave ID support

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

**Default value:**

- Yes (enabled)

### CONFIG\_FMB\_CONTROLLER\_SLAVE\_ID

Modbus controller slave ID

*Found in: [Component config](#) > [Modbus configuration](#) > [CONFIG\\_FMB\\_CONTROLLER\\_SLAVE\\_ID\\_SUPPORT](#)*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

**Range:**

- from 0 to 4294967295

**Default value:**

- “0x00112233”

### CONFIG\_FMB\_CONTROLLER\_NOTIFY\_TIMEOUT

Modbus controller notification timeout (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**Range:**

- from 0 to 200

**Default value:**

- 20

### CONFIG\_FMB\_CONTROLLER\_NOTIFY\_QUEUE\_SIZE

Modbus controller notification queue size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**Range:**

- from 0 to 200

**Default value:**

- 20

### CONFIG\_FMB\_CONTROLLER\_STACK\_SIZE

Modbus controller stack size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

**Range:**

- from 0 to 8192

**Default value:**

- 4096

### CONFIG\_FMB\_EVENT\_QUEUE\_TIMEOUT

Modbus stack event queue timeout (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

**Range:**

- from 0 to 500

**Default value:**

- 20

### CONFIG\_FMB\_TIMER\_PORT\_ENABLED

Modbus stack use timer for 3.5T symbol time measurement

*Found in: [Component config](#) > [Modbus configuration](#)*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

**Default value:**

- No (disabled)

### CONFIG\_FMB\_TIMER\_GROUP

Slave Timer group number

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus slave Timer group number that is used for timeout measurement.

**Range:**

- from 0 to 1

**Default value:**

- 0

### CONFIG\_FMB\_TIMER\_INDEX

Slave Timer index in the group

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus slave Timer Index in the group that is used for timeout measurement.

**Range:**

- from 0 to 1

**Default value:**

- 0

### CONFIG\_FMB\_MASTER\_TIMER\_GROUP

Master Timer group number

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus master Timer group number that is used for timeout measurement.

**Range:**

- from 0 to 1

**Default value:**

- 0

### CONFIG\_FMB\_MASTER\_TIMER\_INDEX

Master Timer index

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus master Timer Index in the group that is used for timeout measurement. Note: Modbus master and slave should have different timer index to be able to work simultaneously.

**Range:**

- from 0 to 1

**Default value:**

- 0

## CONFIG\_FMB\_TIMER\_ISR\_IN\_IRAM

Place timer interrupt handler into IRAM

*Found in: [Component config](#) > [Modbus configuration](#)*

This option places Modbus timer IRQ handler into IRAM. This allows to avoid delays related to processing of non-IRAM-safe interrupts during a flash write operation (NVS updating a value, or some other flash API which has to perform a read/write operation and disable CPU cache). This option has dependency with the `UART_ISR_IN_IRAM` option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

### Default value:

- No (disabled)

## FreeRTOS Contains:

- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`
- `CONFIG_FREERTOS_ASSERT`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_LEGACY_HOOKS`
- `CONFIG_FREERTOS_CORETIMER`

## CONFIG\_FREERTOS\_UNICORE

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of `tskNO_AFFINITY` in `task.h`. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) `INT_MAX`.

## CONFIG\_FREERTOS\_CORETIMER

Xtensa timer to use as the FreeRTOS tick source

Found in: [Component config > FreeRTOS](#)

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS\_CORETIMER\_0)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS\_CORETIMER\_1)  
Select this to use timer 1

## CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER

Enable FreeRTOS platform optimized scheduler

Found in: [Component config > FreeRTOS](#)

On most platforms there are instructions can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_HZ

Tick rate (Hz)

Found in: [Component config > FreeRTOS](#)

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**

- from 1 to 1000

**Default value:**

- 100

## CONFIG\_FREERTOS\_ASSERT\_ON\_UNTESTED\_FUNCTION

Halt when an SMP-untested function is called

Found in: [Component config > FreeRTOS](#)

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW

Check for stack overflow

Found in: [Component config > FreeRTOS](#)

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplicationStackOverflowHook when this happens.

**Available options:**

- No checking (FREERTOS\_CHECK\_STACKOVERFLOW\_NONE)  
Do not check for stack overflows (configCHECK\_FOR\_STACK\_OVERFLOW=0)

- Check by stack pointer value (FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK\_FOR\_STACK\_OVERFLOW=1)
- Check using canary bytes (FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK\_FOR\_STACK\_OVERFLOW=2)

### CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK

Set a debug watchpoint as a stack overflow check

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS\_CHECK\_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panicking) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: [Component config > FreeRTOS](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

Number of thread local storage pointers

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

## CONFIG\_FREERTOS\_ASSERT

FreeRTOS assertions

*Found in: [Component config](#) > [FreeRTOS](#)*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

By default these behave the same as the global project assert settings.

**Available options:**

- abort() on failed assertions (FREERTOS\_ASSERT\_FAIL\_ABORT)  
If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic handler can be configured to handle the outcome of an abort() in different ways.  
If assertions are disabled for the entire project, they are also disabled in FreeRTOS and this option is unavailable.
- Print and continue failed assertions (FREERTOS\_ASSERT\_FAIL\_PRINT\_CONTINUE)  
If a FreeRTOS assertion fails, print it out and continue.
- Disable FreeRTOS assertions (FREERTOS\_ASSERT\_DISABLE)  
FreeRTOS configASSERT() will not be compiled into the binary.

## CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

Idle Task stack size

*Found in: [Component config](#) > [FreeRTOS](#)*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

**Range:**

- from 768 to 32768

**Default value:**

- 2304

## CONFIG\_FREERTOS\_ISR\_STACKSIZE

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF
- from 1536 to 32768

**Default value:**

- 2096 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF
- 1536

## CONFIG\_FREERTOS\_LEGACY\_HOOKS

Use FreeRTOS legacy hooks

*Found in: [Component config](#) > [FreeRTOS](#)*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp\_register\_freertos\_XXX\_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can't be migrated to the esp\_register\_freertos\_XXX\_hook system.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN

Maximum task name length

*Found in: [Component config](#) > [FreeRTOS](#)*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**Range:**

- from 1 to 256

**Default value:**

- 16

## CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP

Enable static task clean up hook

*Found in: [Component config](#) > [FreeRTOS](#)*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```
void vPortCleanUpTCB ( void *pxTCB ) {  
    // place clean up code here  
}
```

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY

FreeRTOS timer task priority

*Found in: [Component config](#) > [FreeRTOS](#)*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the priority that the timer task will run at.

**Range:**

- from 1 to 25

**Default value:**

- 1

### CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH

FreeRTOS timer task stack size

*Found in: [Component config > FreeRTOS](#)*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH

FreeRTOS timer queue length

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the 'timer command queue'. The 'timer command queue' is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

**Range:**

- from 5 to 20

**Default value:**

- 10

### CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE

FreeRTOS queue registry size

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

**Range:**

- from 0 to 20

**Default value:**

- 0

### CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY

Enable FreeRTOS trace facility

*Found in: [Component config > FreeRTOS](#)*

If enabled, configUSE\_TRACE\_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

Enable FreeRTOS stats formatting functions

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)*

If enabled, configUSE\_STATS\_FORMATTING\_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)

## CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#) > [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)

## CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

Enable FreeRTOS to collect run time stats

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, configGENERATE\_RUN\_TIME\_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS and FREERTOS\_USE\_TRACE\_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**

- Use ESP TIMER for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for

(as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### **CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE**

Tickless idle support

*Found in: [Component config](#) > [FreeRTOS](#)*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### **CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### **CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

### **CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER**

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port\*\_CRITICAL calls

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, context of port\*\_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port\*\_CRITICAL from ISR context would cause assert failure

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

**Heap memory debugging** Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)

## CONFIG\_HEAP\_CORRUPTION\_DETECTION

Heap corruption detection

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**

- Basic (no poisoning) (HEAP\_POISONING\_DISABLED)
- Light impact (HEAP\_POISONING\_LIGHT)
- Comprehensive (HEAP\_POISONING\_COMPREHENSIVE)

## CONFIG\_HEAP\_TRACING\_DEST

Heap tracing

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables the heap tracing API defined in esp\_heap\_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**

- Disabled (HEAP\_TRACING\_OFF)
- Standalone (HEAP\_TRACING\_STANDALONE)
- Host-based (HEAP\_TRACING\_TOHOST)

### CONFIG\_HEAP\_TRACING\_STACK\_DEPTH

Heap tracing stack depth

*Found in: [Component config](#) > [Heap memory debugging](#)*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

**jsmn** Contains:

- [CONFIG\\_JSMN\\_PARENT\\_LINKS](#)
- [CONFIG\\_JSMN\\_STRICT](#)

### CONFIG\_JSMN\_PARENT\_LINKS

Enable parent links

*Found in: [Component config](#) > [jsmn](#)*

You can access to parent node of parsed json

**Default value:**

- No (disabled)

### CONFIG\_JSMN\_STRICT

Enable strict mode

*Found in: [Component config](#) > [jsmn](#)*

In strict mode primitives are: numbers and booleans

**Default value:**

- No (disabled)

**libsodium** Contains:

- [CONFIG\\_LIBSODIUM\\_USE\\_MBEDTLS\\_SHA](#)

## CONFIG\_LIBSODIUM\_USE\_MBEDTLS\_SHA

Use mbedTLS SHA256 & SHA512 implementations

Found in: *Component config > libsodium*

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium's API manages SHA state).

**Default value:**

- Yes (enabled)

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_COLORS](#)

## CONFIG\_LOG\_DEFAULT\_LEVEL

Default log verbosity

Found in: *Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

Note that this setting limits which log statements are compiled into the program. So setting this to, say, “Warning” would mean that changing log level to “Debug” at runtime will not be possible.

**Available options:**

- No output (LOG\_DEFAULT\_LEVEL\_NONE)
- Error (LOG\_DEFAULT\_LEVEL\_ERROR)
- Warning (LOG\_DEFAULT\_LEVEL\_WARN)
- Info (LOG\_DEFAULT\_LEVEL\_INFO)
- Debug (LOG\_DEFAULT\_LEVEL\_DEBUG)
- Verbose (LOG\_DEFAULT\_LEVEL\_VERBOSE)

## CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

Found in: *Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

## CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

Found in: *Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)

- System time is taken from POSIX time functions which use the ESP32's RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**

- Milliseconds Since Boot (LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- *Checksums*
- *CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS*
- *DHCP server*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID*
- *CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK*
- *CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP*
- *CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT*
- *CONFIG\_LWIP\_L2\_TO\_L3\_COPY*
- *CONFIG\_LWIP\_IP4\_FRAG*
- *CONFIG\_LWIP\_IP6\_FRAG*
- *CONFIG\_LWIP\_IP\_FORWARD*
- *CONFIG\_LWIP\_NETBUF\_RECVINFO*
- *CONFIG\_LWIP\_AUTOIP*
- *CONFIG\_LWIP\_IPV6*
- *CONFIG\_LWIP\_ETHARP\_TRUST\_IP\_MAC*
- *CONFIG\_LWIP\_ESP\_LWIP\_ASSERT*
- *CONFIG\_LWIP\_DEBUG*
- *CONFIG\_LWIP\_IRAM\_OPTIMIZATION*
- *CONFIG\_LWIP\_STATS*
- *CONFIG\_LWIP\_TIMERS\_ONDEMAND*
- *CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES*
- *CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_PAP\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_DEBUG\_ON*
- *CONFIG\_LWIP\_PPP\_SUPPORT*
- *CONFIG\_LWIP\_IP4\_REASSEMBLY*
- *CONFIG\_LWIP\_IP6\_REASSEMBLY*
- *CONFIG\_LWIP\_SLIP\_SUPPORT*
- *CONFIG\_LWIP\_SO\_LINGER*
- *CONFIG\_LWIP\_SO\_RCVBUF*
- *CONFIG\_LWIP\_SO\_REUSE*
- *Hooks*
- *ICMP*
- *CONFIG\_LWIP\_LOCAL\_HOSTNAME*
- *LWIP RAW API*
- *CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS*
- *CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE*
- *CONFIG\_LWIP\_MAX\_SOCKETS*
- *CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP*
- *SNTP*
- *CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT*
- *CONFIG\_LWIP\_NETIF\_LOOPBACK*
- *TCP*

- [CONFIG\\_LWIP\\_TCPIP\\_TASK\\_AFFINITY](#)
- [CONFIG\\_LWIP\\_TCPIP\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCPIP\\_RECVMBOX\\_SIZE](#)
- [UDP](#)

### CONFIG\_LWIP\_LOCAL\_HOSTNAME

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- “espressif”

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as `gethostbyname` support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TIMERS\_ONDEMAND

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Use VFS\_SUPPORT\_SELECT instead, which is the inverse of this option.

The virtual filesystem layer of select() redirects sockets to lwip\_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip\_select(), therefore, select can be used for sockets only.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1,l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_SO\_REUSE\_RXTOALL**

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_SO\_RCVBUF**

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_NETBUF\_RECVINFO**

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IP4\_FRAG**

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_IP6\_FRAG**

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ETHARP\_TRUST\_IP\_MAC

Enable LWIP ARP trust

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little

latency. The peer \*is\* in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer. - The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP**

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_GARP\_TMR\_INTERVAL**

GARP timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_GRATUITOUS\\_ARP](#)*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

### **CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE**

TCPIP task receive mail box size

*Found in: [Component config](#) > [LWIP](#)*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 64 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

### **CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID**

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: [Component config](#) > [LWIP](#)*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS**

DHCP coarse timer interval(s)

*Found in: [Component config](#) > [LWIP](#)*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- [CONFIG\\_LWIP\\_DHCPS](#)

**CONFIG\_LWIP\_DHCPS**

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

### CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

### CONFIG\_LWIP\_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_AUTOIP\\_TRIES](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_MAX\\_CONFLICTS](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_RATE\\_LIMIT\\_INTERVAL](#)

### CONFIG\_LWIP\_AUTOIP\_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 2 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS

Max IP conflicts before rate limiting

*Found in:* *Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 9 if *CONFIG\_LWIP\_AUTOIP*

### CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL

Rate limited interval (seconds)

*Found in:* *Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 20 if *CONFIG\_LWIP\_AUTOIP*

### CONFIG\_LWIP\_IPV6

Enable IPv6

*Found in:* *Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6\_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in:* *Component config > LWIP > CONFIG\_LWIP\_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

*Found in:* *Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will "loop back" and be received by this interface.

**Default value:**

- Yes (enabled)

Contains:

- *CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS*

## CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG\_LWIP\_NETIF\_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

## TCP Contains:

- *CONFIG\_LWIP\_TCP\_WND\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE*
- *CONFIG\_LWIP\_TCP\_RTO\_TIME*
- *CONFIG\_LWIP\_TCP\_KEEP\_CONNECTION\_WHEN\_IP\_CHANGES*
- *CONFIG\_LWIP\_MAX\_ACTIVE\_TCP*
- *CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT*
- *CONFIG\_LWIP\_MAX\_LISTENING\_TCP*
- *CONFIG\_LWIP\_TCP\_MAXRTX*
- *CONFIG\_LWIP\_TCP\_SYNMAXRTX*
- *CONFIG\_LWIP\_TCP\_MSL*
- *CONFIG\_LWIP\_TCP\_MSS*
- *CONFIG\_LWIP\_TCP\_OVERSIZE*
- *CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*
- *CONFIG\_LWIP\_TCP\_SACK\_OUT*
- *CONFIG\_LWIP\_WND\_SCALE*
- *CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION*
- *CONFIG\_LWIP\_TCP\_TMR\_INTERVAL*

## CONFIG\_LWIP\_MAX\_ACTIVE\_TCP

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

## CONFIG\_LWIP\_MAX\_LISTENING\_TCP

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION

TCP high speed retransmissions

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_MAXRTX

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

### CONFIG\_LWIP\_TCP\_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 6
- 12

### CONFIG\_LWIP\_TCP\_MSS

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_mSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

**CONFIG\_LWIP\_TCP\_TMR\_INTERVAL**

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

**CONFIG\_LWIP\_TCP\_MSL**

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

**CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT**

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

**CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT**

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 65535 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5744

**CONFIG\_LWIP\_TCP\_WND\_DEFAULT**

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 65535 if *CONFIG\_LWIP\_WND\_SCALE*
- from 2440 to 1024000 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 5744

**CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum *LWIP\_TCP\_RECVMBOX\_SIZE* packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is *LWIP\_TCP\_RECVMBOX\_SIZE* multiples the maximum TCP socket number. In other words, the bigger *LWIP\_TCP\_RECVMBOX\_SIZE* means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64 if *CONFIG\_LWIP\_WND\_SCALE*
- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 6

**CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_TCP\_SACK\_OUT**

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TCP\_KEEP\_CONNECTION\_WHEN\_IP\_CHANGES**

Keep TCP connections when IP changed

*Found in: Component config > LWIP > TCP*

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2

Disable this option to keep consistent with the original LWIP code behavior.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**

- MSS (LWIP\_TCP\_OVERSIZE\_MSS)
- 25% MSS (LWIP\_TCP\_OVERSIZE\_QUARTER\_MSS)
- Disabled (LWIP\_TCP\_OVERSIZE\_DISABLE)

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 3000
- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_UDP\_PCBS**

Maximum active UDP control blocks

*Found in:* [Component config](#) > [LWIP](#) > [UDP](#)

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE**

Default UDP receive mail box size

*Found in:* [Component config](#) > [LWIP](#) > [UDP](#)

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum `UDP_RECVMBOX_SIZE` packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is `UDP_RECVMBOX_SIZE` multiplies the maximum UDP socket number. In other words, the bigger `UDP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP**

Enable LWIP IP checksums

*Found in:* [Component config](#) > [LWIP](#) > [Checksums](#)

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

*Found in: [Component config](#) > [LWIP](#)*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**

- No affinity (LWIP\_TCPIP\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU0)
- CPU1 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU1)

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP stack. Now only PPP over serial is possible.

PPP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPv6 support for PPP connections (IPv6CP)

*Found in: Component config > LWIP > CONFIG\_LWIP\_PPP\_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**

- Yes (enabled) if *CONFIG\_LWIP\_PPP\_SUPPORT* && *CONFIG\_LWIP\_IPV6*

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_PPP\_PAP\_SUPPORT

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### **CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT**

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT**

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT**

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_DEBUG\_ON**

Enable PPP debug log output

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_SLIP\_SUPPORT**

Enable SLIP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_SLIP\\_DEBUG\\_ON](#)

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG\_LWIP\_SLIP\_SUPPORT*

Enable SLIP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_SLIP\_SUPPORT*

**ICMP** Contains:

- *CONFIG\_LWIP\_ICMP*
- *CONFIG\_LWIP\_BROADCAST\_PING*
- *CONFIG\_LWIP\_MULTICAST\_PING*

### CONFIG\_LWIP\_ICMP

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MULTICAST\_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_BROADCAST\_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

**LWIP RAW API** Contains:

- *CONFIG\_LWIP\_MAX\_RAW\_PCBS*

### CONFIG\_LWIP\_MAX\_RAW\_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**SNTP** Contains:

- [CONFIG\\_LWIP\\_DHCP\\_MAX\\_NTP\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)

### **CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS**

Maximum number of NTP servers

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### **CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY**

Request interval to update time (ms)

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

### **CONFIG\_LWIP\_ESP\_LWIP\_ASSERT**

Enable LWIP ASSERT checks

*Found in:* [Component config](#) > [LWIP](#)

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**

- Yes (enabled) if `COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

### **CONFIG\_LWIP\_HOOK\_TCP\_ISN**

TCP ISN Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_isn`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

**Available options:**

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_IP6\_ROUTE

IPv6 route Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM`)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in: [Component config](#) > [LWIP](#)*

**Default value:**

- No (disabled)

Contains:

- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_DHCP_DEBUG`
- `CONFIG_LWIP_DHCP_STATE_DEBUG`
- `CONFIG_LWIP_ETHARP_DEBUG`
- `CONFIG_LWIP_ICMP_DEBUG`
- `CONFIG_LWIP_ICMP6_DEBUG`
- `CONFIG_LWIP_IP_DEBUG`
- `CONFIG_LWIP_IP6_DEBUG`
- `CONFIG_LWIP_NETIF_DEBUG`
- `CONFIG_LWIP_PBUF_DEBUG`
- `CONFIG_LWIP_SOCKETS_DEBUG`
- `CONFIG_LWIP_TCP_DEBUG`
- `CONFIG_LWIP_DEBUG_ESP_LOG`

### **CONFIG\_LWIP\_DEBUG\_ESP\_LOG**

Route LWIP debugs through ESP\_LOG interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_NETIF\_DEBUG**

Enable netif debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_ICMP*

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**mbedTLS** Contains:

- *CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG\_MBEDTLS\_CHACHA20\_C*
- *CONFIG\_MBEDTLS\_ECP\_C*

- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

## **CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls\_platform\_set\_malloc\_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

### **Available options:**

- Internal memory (`MBEDTLS_INTERNAL_MEM_ALLOC`)

- External SPIRAM (MBEDTLS\_EXTERNAL\_MEM\_ALLOC)
- Default alloc mode (MBEDTLS\_DEFAULT\_MEM\_ALLOC)
- Custom alloc mode (MBEDTLS\_CUSTOM\_MEM\_ALLOC)
- Internal IRAM (MBEDTLS\_IRAM\_8BIT\_MEM\_ALLOC)  
Allows to use IRAM memory region as 8bit accessible region.  
TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN

TLS maximum message content length

*Found in: [Component config](#) > [mbedtls](#)*

Maximum TLS message length (in bytes) supported by mbedtls.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max\_fragment\_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS\_ERR\_SSL\_INVALID\_RECORD (-0x7200).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN

Asymmetric in/out fragment length

*Found in: [Component config](#) > [mbedtls](#)*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN

TLS maximum incoming fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

### CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER

Using dynamic TX/RX buffer

*Found in:* [Component config > mbedTLS](#)

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS\_SSL\_OUT\_CONTENT\_LEN” or “MBEDTLS\_SSL\_IN\_CONTENT\_LEN” , so to save more heap, users can set the options to be an appropriate value.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#) && [CONFIG\\_MBEDTLS\\_SSL\\_VARIABLE\\_BUFFER\\_LENGTH](#)

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_PEER\_CERT

Free SSL peer certificate after its usage

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

Free peer certificate after its usage in handshake process.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA

Free private key and DHM data after its usage

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT

Free SSL CA certificate after its usage

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER > CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

### CONFIG\_MBEDTLS\_DEBUG

Enable mbedTLS debugging

*Found in: [Component config](#) > [mbedTLS](#)*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp\_debug.h” and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedTLS debugging level

*Found in: [Component config](#) > [mbedTLS](#) > [CONFIG\\_MBEDTLS\\_DEBUG](#)*

Set mbedTLS debugging level

**Available options:**

- Warning (`MBEDTLS_DEBUG_LEVEL_WARN`)
- Info (`MBEDTLS_DEBUG_LEVEL_INFO`)
- Debug (`MBEDTLS_DEBUG_LEVEL_DEBUG`)
- Verbose (`MBEDTLS_DEBUG_LEVEL_VERBOSE`)

**mbedTLS v2.28.x related** Contains:

- *DTLS-based configurations*
- `CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION`
- `CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK`
- `CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE`
- `CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT`
- `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

### CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH

Variable SSL buffer length

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v2.28.x related](#)*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT

Use a backward compatible ECDH context (Experimental)

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v2.28.x related](#)*

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

### CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_PEER\\_CERT](#)

**DTLS-based configurations** Contains:

- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_SRTP](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID

Support for the DTLS Connection ID extension

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX

Maximum length of CIDs used for incoming DTLS messages

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX

Maximum length of CIDs used for outgoing DTLS messages

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY

Record plaintext padding (for DTLS 1.2)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 16 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use\_srtp extension.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

**Certificate Bundle** Contains:

- [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE

Enable trusted root certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#)

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE

Default certificate bundle options

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Available options:**

- Use the full default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_CMN)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_NONE)

### CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

### CONFIG\_MBEDTLS\_ECP\_RESTARTABLE

Enable mbedTLS ecp restartable

*Found in: [Component config > mbedTLS](#)*

Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in: [Component config > mbedTLS](#)*

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_HARDWARE\_MPI

Enable hardware MPI (bignum) acceleration

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_HARDWARE\_SHA

Enable hardware SHA acceleration

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

**CONFIG\_MBEDTLS\_ROM\_MD5**

Use MD5 implementation in ROM

*Found in: [Component config](#) > [mbedtls](#)*

Use ROM MD5 in mbedtls.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_HAVE\_TIME**

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE**

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard `time()` and `gmtime()` functions. If the certificate is not valid for the current system time then verification will fail with code `MBEDTLS_X509_BADCERT_FUTURE` or `MBEDTLS_X509_BADCERT_EXPIRED`.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SHA512\_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable `MBEDTLS_SHA512_C` adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_TLS\_MODE**

TLS Protocol Role

*Found in: [Component config](#) > [mbedtls](#)*

`mbedtls` can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

- Server & Client (`MBEDTLS_TLS_SERVER_AND_CLIENT`)
- Server (`MBEDTLS_TLS_SERVER_ONLY`)
- Client (`MBEDTLS_TLS_CLIENT_ONLY`)
- None (`MBEDTLS_TLS_DISABLED`)

### **TLS Key Exchange Methods** Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in:* [Component config](#) > [mbedtls](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_SSL3

Legacy SSL 3.0 support

*Found in:* [Component config](#) > [mbedtls](#)

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1

Support TLS 1.0 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_1

Support TLS 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_X509\_CHECK\_KEY\_USAGE

Enable verification of the keyUsage extension

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this avoids problems with mis-issued and/or misused (intermediate) CA and leaf certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_X509\_CHECK\_EXTENDED\_KEY\_USAGE

Enable verification of the extendedKeyUsage extension

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this avoids problems with mis-issued and/or misused certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### Symmetric Ciphers Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_RC4\\_MODE](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

### CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RC4\_MODE

RC4 Stream Cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

**Available options:**

- Disabled (MBEDTLS\_RC4\_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS\_RC4\_ENABLED\_NO\_DEFAULT)
- Enabled (MBEDTLS\_RC4\_ENABLED)

### CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_XTEA\_C

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CCM\_C

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_GCM\_C

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_NIST\_KW\_C

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RIPEMD160\_C

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### CONFIG\_MBEDTLS\_PEM\_PARSE\_C

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PEM\_WRITE\_C

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: Component config > mbedTLS*

**Default value:**

- Yes (enabled)

Contains:

- `CONFIG_MBEDTLS_ECDH_C`
- `CONFIG_MBEDTLS_ECJPAKE_C`
- `CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`

**CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

Enable support for SECP192R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if ([CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_SIGN](#) || [CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_VERIFY](#)) && [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

Enable support for SECP224R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if ([CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_SIGN](#) || [CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_VERIFY](#)) && [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

Enable support for SECP384R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP521R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP192K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP224K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if ([CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_SIGN](#) || [CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_VERIFY](#)) && [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if ([CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_SIGN](#) || [CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_VERIFY](#)) && [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)*

Enable support for CURVE25519 Elliptic Curve.

**Default value:**

- Yes (enabled) if ([CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_SIGN](#) || [CONFIG\\_MBEDTLS\\_ATCA\\_HW\\_ECDSA\\_VERIFY](#)) && [CONFIG\\_MBEDTLS\\_ECP\\_C](#)

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST ‘modulo p’ optimisations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECP\\_C](#)*

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CHACHA20\_C

Chacha20 stream cipher

*Found in:* [Component config > mbedtls](#)

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CHACHAPOLY\_C

ChaCha20-Poly1305 AEAD algorithm

*Found in:* [Component config > mbedtls > CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#) && [CONFIG\\_MBEDTLS\\_POLY1305\\_C](#)

### CONFIG\_MBEDTLS\_HKDF\_C

HKDF algorithm (RFC 5869)

*Found in:* [Component config > mbedtls](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_C

Enable the threading abstraction layer

*Found in:* [Component config > mbedtls](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_ALT

Enable threading alternate implementation

*Found in:* [Component config > mbedtls > CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

### CONFIG\_MBEDTLS\_THREADING\_PTHREAD

Enable threading pthread implementation

*Found in:* [Component config > mbedtls > CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_THREADING_C`

### **CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI**

Fallback to software implementation for larger MPI values

*Found in: [Component config](#) > [mbedtls](#)*

Fallback to software implementation for RSA key lengths larger than `SOC_RSA_MAX_BIT_LEN`. If this is not active then the ESP will be unable to process keys greater than `SOC_RSA_MAX_BIT_LEN`.

**Default value:**

- Yes (enabled)
- No (disabled)

### **CONFIG\_MBEDTLS\_SECURITY\_RISKS**

Show configurations with potential security risks

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_MBEDTLS\\_ALLOW\\_UNSUPPORTED\\_CRITICAL\\_EXT](#)

### **CONFIG\_MBEDTLS\_ALLOW\_UNSUPPORTED\_CRITICAL\_EXT**

X.509 CRT parsing with unsupported critical extensions

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_SECURITY\\_RISKS](#)*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SECURITY\\_RISKS](#)

**mDNS** Contains:

- [CONFIG\\_MDNS\\_MAX\\_SERVICES](#)
- [CONFIG\\_MDNS\\_SERVICE\\_ADD\\_TIMEOUT\\_MS](#)
- [CONFIG\\_MDNS\\_STRICT\\_MODE](#)
- [CONFIG\\_MDNS\\_TASK\\_AFFINITY](#)
- [CONFIG\\_MDNS\\_TASK\\_PRIORITY](#)
- [CONFIG\\_MDNS\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_MDNS\\_TIMER\\_PERIOD\\_MS](#)

### **CONFIG\_MDNS\_MAX\_SERVICES**

Max number of services

*Found in: [Component config](#) > [mDNS](#)*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

**Range:**

- from 1 to 64

**Default value:**

- 10

### CONFIG\_MDNS\_TASK\_PRIORITY

mDNS task priority

*Found in: [Component config > mDNS](#)*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

**Range:**

- from 1 to 255

**Default value:**

- 1

### CONFIG\_MDNS\_TASK\_STACK\_SIZE

mDNS task stack size

*Found in: [Component config > mDNS](#)*

Allows setting mDNS task stacksize.

**Default value:**

- 4096

### CONFIG\_MDNS\_TASK\_AFFINITY

mDNS task affinity

*Found in: [Component config > mDNS](#)*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

**Available options:**

- No affinity (MDNS\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (MDNS\_TASK\_AFFINITY\_CPU0)
- CPU1 (MDNS\_TASK\_AFFINITY\_CPU1)

### CONFIG\_MDNS\_SERVICE\_ADD\_TIMEOUT\_MS

mDNS adding service timeout (ms)

*Found in: [Component config > mDNS](#)*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

**Range:**

- from 10 to 30000

**Default value:**

- 2000

### CONFIG\_MDNS\_STRICT\_MODE

mDNS strict mode

*Found in: [Component config > mDNS](#)*

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mdns resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

**Default value:**

- No (disabled)

### **CONFIG\_MDNS\_TIMER\_PERIOD\_MS**

mDNS timer period (ms)

*Found in: [Component config](#) > [mDNS](#)*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**Range:**

- from 10 to 10000

**Default value:**

- 100

### **ESP-MQTT Configurations** Contains:

- [CONFIG\\_MQTT\\_CUSTOM\\_OUTBOX](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_311](#)
- [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)
- [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_EXPIRED\\_TIMEOUT\\_MS](#)
- [CONFIG\\_MQTT\\_REPORT\\_DELETED\\_MESSAGES](#)
- [CONFIG\\_MQTT\\_SKIP\\_PUBLISH\\_IF\\_DISCONNECTED](#)
- [CONFIG\\_MQTT\\_MSG\\_ID\\_INCREMENTAL](#)

### **CONFIG\_MQTT\_PROTOCOL\_311**

Enable MQTT protocol 3.1.1

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_SSL**

Enable MQTT over SSL

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET**

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE

Enable MQTT over Websocket Secure

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET\\_SECURE](#)

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL

Use Incremental Message Id

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket port

**Default value:**

- 80 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET\\_SECURE](#)

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

MQTT task stack size

**Default value:**

- 6144 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED

Enable MQTT task core selection

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

This will enable core selection

**Default value:**

- "false"

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION

Core to use ?

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)*

**Available options:**

- Core 0 (MQTT\_USE\_CORE\_0)
- Core 1 (MQTT\_USE\_CORE\_1)

### CONFIG\_MQTT\_CUSTOM\_OUTBOX

Enable custom outbox implementation

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar).

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS

Outbox message expired timeout[ms]

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`

### **CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING**

Line ending for UART output

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring the desired line endings sent to UART when a newline ( ‘n’ , LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn’ t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (`NEWLIB_STDOUT_LINE_ENDING_CRLF`)
- LF (`NEWLIB_STDOUT_LINE_ENDING_LF`)
- CR (`NEWLIB_STDOUT_LINE_ENDING_CR`)

### **CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING**

Line ending for UART input

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring which input sequence on UART produces a newline ( ‘n’ , LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn’ t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (`NEWLIB_STDIN_LINE_ENDING_CRLF`)
- LF (`NEWLIB_STDIN_LINE_ENDING_LF`)
- CR (`NEWLIB_STDIN_LINE_ENDING_CR`)

### **CONFIG\_NEWLIB\_NANO\_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: [Component config](#) > [Newlib](#)*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’ t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘enable-newlib-nano-formatted-io’ : <https://sourceware.org/newlib/README>

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**Default value:**

- No (disabled)

**NVS** Contains:

- [\*CONFIG\\_NVS\\_ENCRYPTION\*](#)
- [\*CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG\*](#)

**CONFIG\_NVS\_ENCRYPTION**

Enable NVS encryption

*Found in: [Component config](#) > [NVS](#)*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if [\*CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED\*](#)

**CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: [Component config](#) > [NVS](#)*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**OpenSSL** Contains:

- [\*CONFIG\\_OPENSSL\\_DEBUG\*](#)
- [\*CONFIG\\_OPENSSL\\_ERROR\\_STACK\*](#)
- [\*CONFIG\\_OPENSSL\\_LOWLEVEL\\_DEBUG\*](#)
- [\*CONFIG\\_OPENSSL\\_DEBUG\\_LEVEL\*](#)
- [\*CONFIG\\_OPENSSL\\_ASSERT\*](#)

**CONFIG\_OPENSSL\_DEBUG**

Enable OpenSSL debugging

*Found in: [Component config](#) > [OpenSSL](#)*

Enable OpenSSL debugging function.

If the option is enabled, “SSL\_DEBUG” works.

**Default value:**

- No (disabled)

### CONFIG\_OPENSSL\_ERROR\_STACK

Enable OpenSSL error structure

*Found in:* [Component config > OpenSSL](#)

Enable OpenSSL Error reporting

**Default value:**

- Yes (enabled)

### CONFIG\_OPENSSL\_DEBUG\_LEVEL

OpenSSL debugging level

*Found in:* [Component config > OpenSSL](#)

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL\_DEBUG\_LEVEL” works.

For example: If OPENSSL\_DEBUG\_LEVEL = 2, you use function “SSL\_DEBUG(1, “malloc failed”)” . Because 1 < 2, it will not print.

**Range:**

- from 0 to 255 if [CONFIG\\_OPENSSL\\_DEBUG](#)

**Default value:**

- 0 if [CONFIG\\_OPENSSL\\_DEBUG](#)

### CONFIG\_OPENSSL\_LOWLEVEL\_DEBUG

Enable OpenSSL low-level module debugging

*Found in:* [Component config > OpenSSL](#)

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.

**Default value:**

- No (disabled) if [CONFIG\\_OPENSSL\\_DEBUG](#)

### CONFIG\_OPENSSL\_ASSERT

Select OpenSSL assert function

*Found in:* [Component config > OpenSSL](#)

OpenSSL function needs “assert” function to check if input parameters are valid.

If you want to use assert debugging function, “OPENSSL\_DEBUG” should be enabled.

**Available options:**

- Do nothing (OPENSSL\_ASSERT\_DO\_NOTHING)  
Do nothing and “SSL\_ASSERT” does not work.
- Check and exit (OPENSSL\_ASSERT\_EXIT)  
Enable assert exiting, it will check and return error code.
- Show debugging message (OPENSSL\_ASSERT\_DEBUG)  
Enable assert debugging, it will check and show debugging message.
- Show debugging message and exit (OPENSSL\_ASSERT\_DEBUG\_EXIT)  
Enable assert debugging and exiting, it will check, show debugging message and return error code.
- Show debugging message and block (OPENSSL\_ASSERT\_DEBUG\_BLOCK)  
Enable assert debugging and blocking, it will check, show debugging message and block by “while (1);” .

**PThreads** Contains:

- [CONFIG\\_PTHREAD\\_TASK\\_NAME\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_CORE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_PRIO\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_STACK\\_SIZE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_STACK\\_MIN](#)

### **CONFIG\_PTHREAD\_TASK\_PRIO\_DEFAULT**

Default task priority

*Found in: [Component config](#) > [PThreads](#)*

Priority used to create new tasks with default pthread parameters.

**Range:**

- from 0 to 255

**Default value:**

- 5

### **CONFIG\_PTHREAD\_TASK\_STACK\_SIZE\_DEFAULT**

Default task stack size

*Found in: [Component config](#) > [PThreads](#)*

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

### **CONFIG\_PTHREAD\_STACK\_MIN**

Minimum allowed pthread stack size

*Found in: [Component config](#) > [PThreads](#)*

Minimum allowed pthread stack size set in attributes passed to pthread\_create

**Default value:**

- 768

### **CONFIG\_PTHREAD\_TASK\_CORE\_DEFAULT**

Default pthread core affinity

*Found in: [Component config](#) > [PThreads](#)*

The default core to which pthreads are pinned.

**Available options:**

- No affinity (PTHREAD\_DEFAULT\_CORE\_NO\_AFFINITY)
- Core 0 (PTHREAD\_DEFAULT\_CORE\_0)
- Core 1 (PTHREAD\_DEFAULT\_CORE\_1)

### **CONFIG\_PTHREAD\_TASK\_NAME\_DEFAULT**

Default name of pthreads

*Found in: [Component config](#) > [PThreads](#)*

The default name of pthreads.

**Default value:**

- “pthread”

**SPI Flash driver** Contains:

- `CONFIG_SPI_FLASH_AUTO_SUSPEND`
- *Auto-detect flash chips*
- `CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE`
- `CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE`
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH`
- `CONFIG_SPI_FLASH_YIELD_DURING_ERASE`
- `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`
- `CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE`
- `CONFIG_SPI_FLASH_SIZE_OVERRIDE`
- `CONFIG_SPI_FLASH_SHARE_SPII_BUS`
- `CONFIG_SPI_FLASH_ROM_IMPL`
- `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`
- `CONFIG_SPI_FLASH_VERIFY_WRITE`
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`

### **CONFIG\_SPI\_FLASH\_VERIFY\_WRITE**

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_FLASH\_LOG\_FAILED\_WRITE**

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**

- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

### **CONFIG\_SPI\_FLASH\_WARN\_SETTING\_ZERO\_TO\_ONE**

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**

- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

### CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS

Enable operation counters

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option enables the following APIs:

- spi\_flash\_reset\_counters
- spi\_flash\_dump\_counters
- spi\_flash\_get\_counters

These APIs may be used to collect performance data for spi\_flash APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**

- 0

### CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH

Enable SPI flash ROM driver patched functions

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_ROM\_IMPL

Use esp\_flash implementation in ROM

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI\_FLASH\_AUTO\_SUSPEND (C3, S3)

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE

Writing to dangerous flash regions

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *\*does not\** check calls to the esp\_rom\_XXX SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**

- Aborts (SPI\_FLASH\_DANGEROUS\_WRITE\_ABORTS)
- Fails (SPI\_FLASH\_DANGEROUS\_WRITE\_FAILS)
- Allowed (SPI\_FLASH\_DANGEROUS\_WRITE\_ALLOWED)

**CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL**

Use the legacy implementation before IDF v4.0

*Found in: [Component config](#) > [SPI Flash driver](#)*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

**Default value:**

- No (disabled)

**CONFIG\_SPI\_FLASH\_SHARE\_SPI1\_BUS**

Support other devices attached to SPI1 bus

*Found in: [Component config](#) > [SPI Flash driver](#)*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp\_flash driver access to the main flash chip.

If you only need to use esp\_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_USE\\_LEGACY\\_IMPL](#)

**CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE**

Bypass a block erase and always do sector erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**

- No (disabled)

**CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE**

Enables yield operation during flash erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

**Default value:**

- Yes (enabled)

**CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS**

Duration of erasing to yield CPUs (ms)

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**

- 20

**CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_TICKS**

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE*

Defines how many ticks will be before returning to continue a erasing.

**Default value:**

- 1

**CONFIG\_SPI\_FLASH\_AUTO\_SUSPEND**

Auto suspend long erase/write operations (READ DOCS FIRST)

*Found in: Component config > SPI Flash driver*

This option is default n before ESP32-C3, because it needs bootloader support.

**CAUTION:** If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

Auto-suspend feature is only supported by XMC chip. If you are using an official module, please contact Espressif Business support. Also reading auto suspend part in *SPI Flash API* document before you enable this function.

**Default value:**

- No (disabled) if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` && `CONFIG_SPI_FLASH_ROM_IMPL`

**CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE**

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**

- from 256 to 8192

**Default value:**

- 8192

**CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE**

Override flash size in bootloader header by `ESPTOOLPY_FLASHSIZE`

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest `ESPTOOLPY_FLASHSIZE` value from the app header if the size in the bootloader header is incorrect.

**Default value:**

- No (disabled)

## CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED

Flash timeout checkout disabled

*Found in:* [Component config](#) > [SPI Flash driver](#)

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_USE\\_LEGACY\\_IMPL](#)

### Auto-detect flash chips

 Contains:

- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_BOYA\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_GD\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_ISSI\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_MXIC\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_TH\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_WINBOND\\_CHIP](#)

## CONFIG\_SPI\_FLASH\_SUPPORT\_ISSI\_CHIP

ISSI

*Found in:* [Component config](#) > [SPI Flash driver](#) > [Auto-detect flash chips](#)

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

## CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_CHIP

MXIC

*Found in:* [Component config](#) > [SPI Flash driver](#) > [Auto-detect flash chips](#)

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

## CONFIG\_SPI\_FLASH\_SUPPORT\_GD\_CHIP

GigaDevice

*Found in:* [Component config](#) > [SPI Flash driver](#) > [Auto-detect flash chips](#)

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_WINBOND\_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_BOYA\_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_TH\_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**

- Yes (enabled)

### SPIFFS Configuration

 Contains:

- *Debug Configuration*
- *CONFIG\_SPIFFS\_USE\_MAGIC*
- *CONFIG\_SPIFFS\_GC\_STATS*
- *CONFIG\_SPIFFS\_PAGE\_CHECK*
- *CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS*
- *CONFIG\_SPIFFS\_MAX\_PARTITIONS*
- *CONFIG\_SPIFFS\_USE\_MTIME*
- *CONFIG\_SPIFFS\_GC\_MAX\_RUNS*
- *CONFIG\_SPIFFS\_OBJ\_NAME\_LEN*
- *CONFIG\_SPIFFS\_META\_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG\_SPIFFS\_PAGE\_SIZE*

- [CONFIG\\_SPIFFS\\_MTIME\\_WIDE\\_64\\_BITS](#)

### CONFIG\_SPIFFS\_MAX\_PARTITIONS

Maximum Number of Partitions

*Found in:* [Component config](#) > [SPIFFS Configuration](#)

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration** Contains:

- [CONFIG\\_SPIFFS\\_CACHE](#)

### CONFIG\_SPIFFS\_CACHE

Enable SPIFFS Cache

*Found in:* [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#)

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_WR

Enable SPIFFS Write Caching

*Found in:* [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_STATS

Enable SPIFFS Cache Statistics

*Found in:* [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_PAGE\_CHECK

Enable SPIFFS Page Check

*Found in:* [Component config](#) > [SPIFFS Configuration](#)

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_GC\_MAX\_RUNS

Set Maximum GC Runs

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**

- from 1 to 255

**Default value:**

- 10

### CONFIG\_SPIFFS\_GC\_STATS

Enable SPIFFS GC Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_PAGE\_SIZE

SPIFFS logical page size

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**

- from 256 to 1024

**Default value:**

- 256

### CONFIG\_SPIFFS\_OBJ\_NAME\_LEN

Set SPIFFS Maximum Name Length

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS\_OBJ\_NAME\_LEN - 1.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

### CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS

Enable symbolic links for image creation

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_USE\_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_USE\_MAGIC\_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG\\_SPIFFS\\_USE\\_MAGIC](#)*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_META\_LENGTH

Size of per-file metadata field

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

`SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH` should not exceed `SPIFFS_PAGE_SIZE - 64`.

**Default value:**

- 4

### CONFIG\_SPIFFS\_USE\_MTIME

Save file modification time

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through `stat/fstat` functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches `SPIFFS_META_LENGTH`. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support `time_t` 64 bits (see `SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`).

**Default value:**

- No (disabled) if `CONFIG_SPIFFS_META_LENGTH`  $\geq$  8

**Debug Configuration** Contains:

- `CONFIG_SPIFFS_DBG`
- `CONFIG_SPIFFS_API_DBG`
- `CONFIG_SPIFFS_CACHE_DBG`
- `CONFIG_SPIFFS_CHECK_DBG`
- `CONFIG_SPIFFS_TEST_VISUALISATION`
- `CONFIG_SPIFFS_GC_DBG`

### **CONFIG\_SPIFFS\_DBG**

Enable general SPIFFS debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_API\_DBG**

Enable SPIFFS API debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_GC\_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CACHE\_DBG**

Enable SPIFFS Cache debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CHECK\_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)

## CONFIG\_SPIFFS\_TEST\_VISUALISATION

Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS\_vis function in the API.

**Default value:**

- No (disabled)

**TCP Transport** Contains:

- *Websocket*

**Websocket** Contains:

- *CONFIG\_WS\_TRANSPORT*

## CONFIG\_WS\_TRANSPORT

Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*

Enable support for creating websocket transport.

**Default value:**

- Yes (enabled)

## CONFIG\_WS\_BUFFER\_SIZE

Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG\_WS\_TRANSPORT*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**

- 1024

## TinyUSB

**Unity unit testing library** Contains:

- *CONFIG\_UNITY\_ENABLE\_COLOR*
- *CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER*
- *CONFIG\_UNITY\_ENABLE\_FIXTURE*
- *CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL*
- *CONFIG\_UNITY\_ENABLE\_DOUBLE*
- *CONFIG\_UNITY\_ENABLE\_FLOAT*

## CONFIG\_UNITY\_ENABLE\_FLOAT

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_DOUBLE

Support for double type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on double arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_COLOR

Colorize test output

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, Unity will colorize test results using console escape sequences.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, then the following features will be available:

- TEST\_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_FIXTURE

Include Unity test fixture

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, `unity_fixture.h` header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL

Print a backtrace when a unit test fails

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as `TEST_ASSERT`, `TEST_FAIL` etc.

**Default value:**

- No (disabled)

**Virtual file system** Contains:

- [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

### CONFIG\_VFS\_SUPPORT\_IO

Provide basic I/O functions

*Found in:* [Component config](#) > [Virtual file system](#)

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SUPPORT\_DIR

Provide directory related functions

*Found in:* [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir\_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SUPPORT\_SELECT

Provide select function

*Found in:* [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**Default value:**

- Yes (enabled) if [CONFIG\\_VFS\\_SUPPORT\\_IO](#) && [CONFIG\\_LWIP\\_USE\\_ONLY\\_LWIP\\_SELECT](#)

### CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT

Suppress select() related debug outputs

*Found in:* [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**

- Yes (enabled)

### CONFIG\_VFS\_SUPPORT\_TERMIOS

Provide `termios.h` functions

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO*

Disabling this option can save memory when the support for `termios.h` is not required.

**Default value:**

- Yes (enabled)

### Host File System I/O (Semihosting) Contains:

- *CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS*
- *CONFIG\_VFS\_SEMIHOSTFS\_HOST\_PATH\_MAX\_LEN*

### CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

### CONFIG\_VFS\_SEMIHOSTFS\_HOST\_PATH\_MAX\_LEN

Host FS: Maximum path length for the host base directory

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum path length for the host base directory which is to be mounted. If host path passed to `esp_vfs_semihost_register()` is longer than this value it will be truncated.

**Default value:**

- 128

### Wear Levelling Contains:

- *CONFIG\_WL\_SECTOR\_MODE*
- *CONFIG\_WL\_SECTOR\_SIZE*

### CONFIG\_WL\_SECTOR\_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (WL\_SECTOR\_SIZE\_512)
- 4096 (WL\_SECTOR\_SIZE\_4096)

**CONFIG\_WL\_SECTOR\_MODE**

Sector store mode

*Found in: [Component config](#) > [Wear Levelling](#)*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**

- Performance (WL\_SECTOR\_MODE\_PERF)
- Safety (WL\_SECTOR\_MODE\_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- [CONFIG\\_WIFI\\_PROV\\_BLE\\_BONDING](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_SEC\\_CONN](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_FORCE\\_ENCRYPTION](#)
- [CONFIG\\_WIFI\\_PROV\\_SCAN\\_MAX\\_ENTRIES](#)
- [CONFIG\\_WIFI\\_PROV\\_AUTOSTOP\\_TIMEOUT](#)

**CONFIG\_WIFI\_PROV\_SCAN\_MAX\_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

**CONFIG\_WIFI\_PROV\_AUTOSTOP\_TIMEOUT**

Provisioning auto-stop timeout

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30

### CONFIG\_WIFI\_PROV\_BLE\_BONDING

Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

### CONFIG\_WIFI\_PROV\_BLE\_SEC\_CONN

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED

### CONFIG\_WIFI\_PROV\_BLE\_FORCE\_ENCRYPTION

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

**Supplicant** Contains:

- *CONFIG\_WPA\_TESTING\_OPTIONS*
- *CONFIG\_WPA\_11KV\_SUPPORT*
- *CONFIG\_WPA\_DPP\_SUPPORT*
- *CONFIG\_WPA\_WAPI\_PSK*
- *CONFIG\_WPA\_DEBUG\_PRINT*
- *CONFIG\_WPA\_WPS\_STRICT*
- *CONFIG\_WPA\_MBEDTLS\_CRYPTO*

### CONFIG\_WPA\_MBEDTLS\_CRYPTO

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**

- Yes (enabled)

### CONFIG\_WPA\_WAPI\_PSK

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)

### CONFIG\_WPA\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_TESTING\_OPTIONS

Add DPP testing code

*Found in: [Component config](#) > [Supplicant](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_WPS\_STRICT

Strictly validate all WPS attributes

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_11KV\_SUPPORT

Enable 802.11k, 802.11v APIs handling

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_SCAN\_CACHE

Keep scan results in cache

*Found in: [Component config](#) > [Supplicant](#) > [CONFIG\\_WPA\\_11KV\\_SUPPORT](#)*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_WPA\\_11KV\\_SUPPORT](#)

## CONFIG\_WPA\_DPP\_SUPPORT

Enable DPP support

Found in: *Component config > Supplicant*

Select this option to enable WiFi Easy Connect Support.

### Default value:

- No (disabled)

## Compatibility options

Contains:

- [CONFIG\\_LEGACY\\_INCLUDE\\_COMMON\\_HEADERS](#)

## CONFIG\_LEGACY\_INCLUDE\_COMMON\_HEADERS

Include headers across components as before IDF v4.0

Found in: *Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It's not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it's changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

### Default value:

- No (disabled)

## Deprecated options and their replacements

## 2.8.7 Customisations

Because IDF builds by default with *Warning On Undefined Variables*, when the Kconfig tool generates Makefiles (the `auto.conf` file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that `ifdef` and `ifndef` can still be used in Makefiles, because they test if a variable is defined *and has a non-empty value*.)

When generating header files for C & C++, the behaviour is not customised - so `#ifdef` can be used to test if a boolean config item is set or not.

## 2.9 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

`ESP_FAIL` (-1): Generic `esp_err_t` code indicating failure

`ESP_OK` (0): `esp_err_t` value indicating success (no error)

`ESP_ERR_NO_MEM` (0x101): Out of memory

`ESP_ERR_INVALID_ARG` (0x102): Invalid argument

`ESP_ERR_INVALID_STATE` (0x103): Invalid state

`ESP_ERR_INVALID_SIZE` (0x104): Invalid size

`ESP_ERR_NOT_FOUND` (0x105): Requested resource not found

`ESP_ERR_NOT_SUPPORTED` (0x106): Operation or feature not supported

`ESP_ERR_TIMEOUT` (0x107): Operation timed out

`ESP_ERR_INVALID_RESPONSE` (0x108): Received response was invalid

`ESP_ERR_INVALID_CRC` (0x109): CRC or checksum was invalid

`ESP_ERR_INVALID_VERSION` (0x10a): Version was invalid

`ESP_ERR_INVALID_MAC` (0x10b): MAC address was invalid

`ESP_ERR_NOT_FINISHED` (0x201)

`ESP_ERR_NVS_BASE` (0x1100): Starting number of error codes

`ESP_ERR_NVS_NOT_INITIALIZED` (0x1101): The storage driver is not initialized

`ESP_ERR_NVS_NOT_FOUND` (0x1102): Id namespace doesn’t exist yet and mode is `NVS_READONLY`

`ESP_ERR_NVS_TYPE_MISMATCH` (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

`ESP_ERR_NVS_READ_ONLY` (0x1104): Storage handle was opened as read only

`ESP_ERR_NVS_NOT_ENOUGH_SPACE` (0x1105): There is not enough space in the underlying storage to save the value

`ESP_ERR_NVS_INVALID_NAME` (0x1106): Namespace name doesn’t satisfy constraints

`ESP_ERR_NVS_INVALID_HANDLE` (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED (0x1108)*: The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG (0x1109)*: Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL (0x110a)*: Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE (0x110b)*: NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH (0x110c)*: String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES (0x110d)*: NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG (0x110e)*: String or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND (0x110f)*: Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND (0x1110)*: NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED (0x1111)*: XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED (0x1112)*: XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED (0x1113)*: XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND (0x1114)*: XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED (0x1115)*: NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED (0x1116)*: NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART (0x1117)*: NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS (0x1118)*: Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION (0x1119)*: NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE (0x1200)*: Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG (0x1201)*: Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR (0x1202)*: Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL (0x1203)*: More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL (0x1204)*: Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE (0x1205)*: Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE (0x1500)*: Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT (0x1501)*: Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID (0x1502)*: Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED (0x1503)*: Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER (0x1504)*: Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED (0x1505)*: Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE (0x1506)*: Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE (0x1600)*: Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT (0x1601)*: OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL (0x1602)*: Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG (0x1603)*: Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING (0x1604)*: Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS (0x1605)*: Error not enough unused key blocks available

*ESP\_ERR\_IMAGE\_BASE (0x2000)*

*ESP\_ERR\_IMAGE\_FLASH\_FAIL (0x2001)*

*ESP\_ERR\_IMAGE\_INVALID (0x2002)*

*ESP\_ERR\_WIFI\_BASE (0x3000)*: Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT (0x3001)*: WiFi driver was not installed by *esp\_wifi\_init*

*ESP\_ERR\_WIFI\_NOT\_STARTED (0x3002)*: WiFi driver was not started by *esp\_wifi\_start*

*ESP\_ERR\_WIFI\_NOT\_STOPPED (0x3003)*: WiFi driver was not stopped by *esp\_wifi\_stop*

*ESP\_ERR\_WIFI\_IF (0x3004)*: WiFi interface error

*ESP\_ERR\_WIFI\_MODE (0x3005)*: WiFi mode error

*ESP\_ERR\_WIFI\_STATE (0x3006)*: WiFi internal state error

*ESP\_ERR\_WIFI\_CONN (0x3007)*: WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS (0x3008)*: WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC (0x3009)*: MAC address is invalid

*ESP\_ERR\_WIFI\_SSID (0x300a)*: SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD (0x300b)*: Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT (0x300c)*: Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL (0x300d)*: WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK (0x300e)*: The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT (0x300f)*: Station still in disconnect status

*ESP\_ERR\_WIFI\_POST (0x3012)*: Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE (0x3013)*: Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE (0x3014)*: Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC (0x3015)*: The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW (0x3016)*: The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_REGISTRAR (0x3033)*: WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE (0x3034)*: WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM (0x3035)*: WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE (0x3064)*: ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT (0x3065)*: ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG (0x3066)*: Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM* (**0x3067**): Out of memory

*ESP\_ERR\_ESPNOW\_FULL* (**0x3068**): ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND* (**0x3069**): ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL* (**0x306a**): Internal error

*ESP\_ERR\_ESPNOW\_EXIST* (**0x306b**): ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF* (**0x306c**): Interface error

*ESP\_ERR\_DPP\_FAILURE* (**0x3097**): Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE* (**0x3098**): DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR* (**0x3099**): Encountered invalid DPP Attribute

*ESP\_ERR\_MESH\_BASE* (**0x4000**): Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START* (**0x4001**)

*ESP\_ERR\_MESH\_NOT\_INIT* (**0x4002**)

*ESP\_ERR\_MESH\_NOT\_CONFIG* (**0x4003**)

*ESP\_ERR\_MESH\_NOT\_START* (**0x4004**)

*ESP\_ERR\_MESH\_NOT\_SUPPORT* (**0x4005**)

*ESP\_ERR\_MESH\_NOT\_ALLOWED* (**0x4006**)

*ESP\_ERR\_MESH\_NO\_MEMORY* (**0x4007**)

*ESP\_ERR\_MESH\_ARGUMENT* (**0x4008**)

*ESP\_ERR\_MESH\_EXCEED\_MTU* (**0x4009**)

*ESP\_ERR\_MESH\_TIMEOUT* (**0x400a**)

*ESP\_ERR\_MESH\_DISCONNECTED* (**0x400b**)

*ESP\_ERR\_MESH\_QUEUE\_FAIL* (**0x400c**)

*ESP\_ERR\_MESH\_QUEUE\_FULL* (**0x400d**)

*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND* (**0x400e**)

*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND* (**0x400f**)

*ESP\_ERR\_MESH\_OPTION\_NULL* (**0x4010**)

*ESP\_ERR\_MESH\_OPTION\_UNKNOWN* (**0x4011**)

*ESP\_ERR\_MESH\_XON\_NO\_WINDOW* (**0x4012**)

*ESP\_ERR\_MESH\_INTERFACE* (**0x4013**)

*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE* (**0x4014**)

*ESP\_ERR\_MESH\_DISCARD* (**0x4015**)

*ESP\_ERR\_MESH\_VOTING* (**0x4016**)

*ESP\_ERR\_MESH\_XMIT* (**0x4017**)

*ESP\_ERR\_MESH\_QUEUE\_READ* (**0x4018**)

*ESP\_ERR\_MESH\_PS* (**0x4019**)

*ESP\_ERR\_MESH\_RECV\_RELEASE* (**0x401a**)

*ESP\_ERR\_ESP\_NETIF\_BASE* (**0x5000**)

*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS* (**0x5001**)

*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY* (**0x5002**)

`ESP_ERR_ESP_NETIF_DHCP_START_FAILED` (**0x5003**)

`ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED` (**0x5004**)

`ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED` (**0x5005**)

`ESP_ERR_ESP_NETIF_NO_MEM` (**0x5006**)

`ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED` (**0x5007**)

`ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED` (**0x5008**)

`ESP_ERR_ESP_NETIF_INIT_FAILED` (**0x5009**)

`ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED` (**0x500a**)

`ESP_ERR_ESP_NETIF_DHCP_START_FAILED` (**0x500b**)

*`ESP_ERR_FLASH_BASE` (**0x6000**):* Starting number of flash error codes

`ESP_ERR_FLASH_OP_FAIL` (**0x6001**)

`ESP_ERR_FLASH_OP_TIMEOUT` (**0x6002**)

`ESP_ERR_FLASH_NOT_INITIALISED` (**0x6003**)

`ESP_ERR_FLASH_UNSUPPORTED_HOST` (**0x6004**)

`ESP_ERR_FLASH_UNSUPPORTED_CHIP` (**0x6005**)

`ESP_ERR_FLASH_PROTECTED` (**0x6006**)

*`ESP_ERR_HTTP_BASE` (**0x7000**):* Starting number of HTTP error codes

*`ESP_ERR_HTTP_MAX_REDIRECT` (**0x7001**):* The error exceeds the number of HTTP redirects

*`ESP_ERR_HTTP_CONNECT` (**0x7002**):* Error open the HTTP connection

*`ESP_ERR_HTTP_WRITE_DATA` (**0x7003**):* Error write HTTP data

*`ESP_ERR_HTTP_FETCH_HEADER` (**0x7004**):* Error read HTTP header from server

*`ESP_ERR_HTTP_INVALID_TRANSPORT` (**0x7005**):* There are no transport support for the input scheme

*`ESP_ERR_HTTP_CONNECTING` (**0x7006**):* HTTP connection hasn't been established yet

*`ESP_ERR_HTTP_EAGAIN` (**0x7007**):* Mapping of errno EAGAIN to esp\_err\_t

*`ESP_ERR_ESP_TLS_BASE` (**0x8000**):* Starting number of ESP-TLS error codes

*`ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME` (**0x8001**):* Error if hostname couldn't be resolved upon tls connection

*`ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET` (**0x8002**):* Failed to create socket

*`ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY` (**0x8003**):* Unsupported protocol family

## Chapter 3

# ESP32-C3 Hardware Reference

### 3.1 ESP32-C3 Modules and Boards

Espressif designs and manufactures different modules and development boards to help users evaluate the potential of the ESP32-C3 family of chips.

This document provides description of modules and development boards currently available from Espressif.

---

**Note:** For description of previous versions of modules and development boards as well as for description of discontinued ones, please go to Section [Previous Versions of ESP32-C3 Modules and Boards](#).

---

#### 3.1.1 Related Documents

- [Previous Versions of ESP32-C3 Modules and Boards](#)

### 3.2 Previous Versions of ESP32-C3 Modules and Boards

This sections contains overview and links to documentation of previous version ESP32-C3 Modules and Boards that have been replaced with newer versions or discontinued. It is maintained for convenience of users as previous versions of some modules and boards are still in use and some may still be available for purchase.

#### 3.2.1 Related Documents

# Chapter 4

## API Guides

### 4.1 Application Level Tracing library

#### 4.1.1 Overview

IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32-C3 via JTAG interface with small overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behavior analysis, see [System Behavior Analysis with SEGGER SystemView](#)
4. Source code coverage, see [Gcov \(Source Code Coverage\)](#)

Tracing components when working over JTAG interface are shown in the figure below.

#### 4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode.** This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from *HW UP BUFFER* buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program's behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

**Streaming mode.** Tracing module enters this mode when host connects to ESP32-C3. In this mode before writing new data to *HW UP BUFFER* tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISRs, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option [CONFIG\\_APPTRACE\\_PENDING\\_DATA\\_SIZE\\_MAX](#). This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g. due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.

Fig. 1: Tracing Components when Working Over JTAG

### 4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see [JTAG Debugging](#) for details.
2. **Target side:** Application tracing functionality can be enabled in menuconfig. *Component config > Application Level Tracing* menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables `CONFIG_APPTRACE_ENABLE` option.

---

**Note:** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see [Optimize JTAG speed](#).

---

There are two additional menuconfig options not mentioned above:

1. *Threshold for flushing last trace data to host on panic* (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less than 512 bytes of the recent trace data, so if there is less than 512 bytes of pending data at the moment of panic they will not be flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.
2. *Timeout for flushing last trace data to host on panic* (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.

### 4.1.4 How to use this library

This library provides API for transferring arbitrary data between host and ESP32-C3. When enabled in menuconfig target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

#### Application Specific Tracing

In general user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. On target side user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
↳ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` function uses `memcpy` to copy user data to the internal buffer. In some cases it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↳*tmo in us*);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo_
↳in us*);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report_
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

Also according to his needs user may want to receive data from the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not_
↳wait*);
```

(continues on next page)

(continued from previous page)

```

if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

```

esp\_appttrace\_read() function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use esp\_appttrace\_down\_buffer\_get() and esp\_appttrace\_down\_buffer\_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```

#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_appttrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_appttrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz,
↳100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_appttrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
↳*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}

```

2. The next step is to build the program image and download it to the target as described in the [Getting Started Guide](#).
3. Run OpenOCD (see [JTAG Debugging](#)).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal telnet <oocd\_host> 4444. If telnet session is opened on the same machine which runs OpenOCD you can use localhost as <oocd\_host> in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see [OpenOCD Application Level Tracing Commands](#).
6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in \$IDF\_PATH/tools/esp\_app\_trace: appttrace\_proc.py (used for feature tests) and logtrace\_proc.py (see more details in section [Logging to Host](#)).

**OpenOCD Application Level Tracing Commands** HW UP BUFFER is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So

it is possible situation that user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions tracing module prepends all user data chunks with header which contains allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

---

**Note:** Currently OpenOCD does not provide commands to send arbitrary user data to the target.

---

Command usage:

```
esp apptrace [start <options>] | [stop] | [status] | [dump <cores_num>
<outfile>]
```

Sub-commands:

**start** Start tracing (continuous streaming).  
**stop** Stop tracing.  
**status** Get tracing status.  
**dump** Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt
[skip_size]]]]]
```

**outfile** Path to file to save data from both CPUs. This argument should have the following format: `file://path/to/file`.

**poll\_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.

**trace\_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).

**stop\_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.

**wait4halt** If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.

**skip\_size** Number of bytes to skip at the start. By default 0.

---

**Note:** If `poll_period` is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

---

Command usage examples:

1. Collect 2048 bytes of tracing data to a file “trace.log”. The file will be saved in “openocd-esp32” directory.

```
esp apptrace start file://trace.log 1 2048 5 0 0
```

The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

---

**Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of timeout. Either increase the timeout or use a function `esp_apptrace_flush()` to flush the data on specific intervals.

---

2. Retrieve tracing data indefinitely in non-blocking mode.

```
esp apptrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp apptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp apptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target's operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset use the `openocd reset halt` command.

### Logging to Host

IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host.

By default IDF's logging library uses `vprintf`-like function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of `vprintf`-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_appttrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

**Limitations** Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for `printf` arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from `.rodata` section are supported as format strings and arguments.
4. Maximum number of `printf` arguments is 256.

**How To Use It** In order to use logging via trace module user needs to perform the following steps:

1. On target side special `vprintf`-like function needs to be installed. As it was mentioned earlier this function is `esp_appttrace_vprintf`. It sends log data to the host. Example code is provided in [system/app\\_trace\\_to\\_host](#).
2. Follow instructions in items 2-5 in [Application Specific Tracing](#).
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`.

**Log Trace Processor Command Options** Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

**trace\_file** Path to log trace file**elf\_file** Path to program ELF file

Optional arguments:

**-h, --help** show this help message and exit**--no-errors, -n** Do not print errors**System Behavior Analysis with SEGGER SystemView**

Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see [SystemView](#)). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

---

**Note:** Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

---

**How To Use It** Support for this feature is enabled by *Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG\_APPTRACE\_SV\_ENABLE)* menuconfig option. There are several other options enabled under the same menu:

1. ESP32-C3 timer to use as SystemView timestamp source: (*CONFIG\_APPTRACE\_SV\_TS\_SOURCE*) selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32-C3 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In dual-core mode external timer working at 40 Mhz is used, so timestamp granularity is 25 ns.
2. Individually enabled or disabled collection of SystemView events (*CONFIG\_APPTRACE\_SV\_EVT\_XXX*):
  - Trace Buffer Overflow Event
  - ISR Enter Event
  - ISR Exit Event
  - ISR Exit to Scheduler Event
  - Task Start Execution Event
  - Task Stop Execution Event
  - Task Start Ready State Event
  - Task Stop Ready State Event
  - Task Create Event
  - Task Terminate Event
  - System Idle Event
  - Timer Enter Event
  - Timer Exit Event

IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

**OpenOCD SystemView Tracing Command Options** Command usage:

```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:

**start** Start tracing (continuous streaming).**stop** Stop tracing.**status** Get tracing status.

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

**outfile1** Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.

**outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.

**poll\_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.

**trace\_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).

**stop\_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

---

**Note:** If `poll_period` is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

---

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVdat” and “app-cpu.SVdat” . The files will be saved in “openocd-esp32” directory.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat
```

The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter `esp apptrace stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat 0 -1 -1
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.

**Data Visualization** After trace data are collected user can use special tool to visualize the results and inspect behavior of the program.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called *Impulse* which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.

Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

---

**Note:** IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping `$(SYSVIEW_INSTALL_DIR)/Description/SYSVIEW_FreeRTOS.txt` with `$(IDF_PATH)/docs/api-guides/SYSVIEW_FreeRTOS.txt`. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

---

## Gcov (Source Code Coverage)

**Basics of Gcov and Gcovr** Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program’ s runtime. **Gcov** is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The **Gcovr** tool is utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the Host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a `.gcno` notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have their own `.gcno` file of the same name (e.g., a `main.c` will generate a `main.gcno` when compiled).
2. Execute the program. During execution, the program should generate `.gda` data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a `.gda` file for each source file compiled with the `--coverage` option (e.g., `main.c` will generate a `main.gda`).
3. Gcov or Gcovr can be used generate a code coverage based on the `.gcno`, `.gda`, and source files. Gcov will generate a text based coverage report for each source file in the form of a `.gcov` file, whilst Gcovr will generate a coverage report in HTML format.

**Gcov and Gcovr in ESP-IDF** Using Gcov in ESP-IDF is complicated by the fact that the program is running remotely from the Host (i.e., on the target). The code coverage data (i.e., the `.gda` files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. [Setting Up a Project for Gcov](#)
2. [Dumping Code Coverage Data](#)
3. [Generating Coverage Report](#)

### Setting Up a Project for Gcov

**Compiler Option** In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

**To cause all source files in a component to be compiled with the `--coverage` option.**

- Add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

**To cause a select number of source files (e.g. `source1.c` and `source2.c`) in the same component to be compiled with the**

- Add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `source1.o: CFLAGS += --coverage` and `source2.o: CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

When a source file is compiled with the `--coverage` option (e.g. `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project's build directory.

**Project Configuration** Before building a project with source code coverage, ensure that the following project configuration options are enabled by running `idf.py menuconfig` (or `make menuconfig` if using the legacy Make build system).

- Enable the application tracing module by choosing *Trace Memory* for the [CONFIG\\_APPTRACE\\_DESTINATION](#) option.
- Enable Gcov to host via the [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)

**Dumping Code Coverage Data** Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the Host is known as dumping.

The dumping of coverage data is done via OpenOCD (see [JTAG Debugging](#) on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <ocd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project's build directory. For example, if `gcov_example_main.c` of the main component was compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/___idf_main.dir/gcov_example_main.c.gcda` (or `build/main/gcov_example_main.gcda` if using the legacy Make build system). Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application's life time. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application's entire lifetime.

ESP-IDF supports two methods of dumping code coverage data from the target to the host:

- Instant Run-Time Dump
- Hard-coded Dump

**Instant Run-Time Dump** An Instant Run-Time Dump is triggered by calling the `ESP32-C3 gcov OpenOCD` command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32-C3's current state and execute a builtin IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the Host. Upon completion, the ESP32-C3 will resume its current state.

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the Host must execute the `esp gcov dump` OpenOCD command (via a telnet session). The `esp gcov dump` command will cause OpenOCD to connect to the ESP32-C3, retrieve the code coverage data, then disconnect from the ESP32-C3 thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application's lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application's lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application's main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp gcov dump` automatically via the use a `gdbinit` script (see Using GDB from [Command Line](#)).

The following GDB script is will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp gcov dump` OpenOCD command.

```
b esp_gcov_dump
commands
mon esp gcov dump
end
```

---

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <oocd_command>`.

---

**Generating Coverage Report** Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both Gcov and Gcovr can be used to generate code coverage reports. Gcov is provided along with the Xtensa toolchain, whilst Gcovr may need to be installed separately. For details on how to use Gcov or Gcovr, refer to [Gcov documentation](#) and [Gcovr documentation](#).

**Adding Gcovr Build Target to Project** To make report generation more convenient, users can define additional build targets in their projects such report generation can be done with a single build command.

**CMake Build System** For the CMake build systems, add the following lines to the `CMakeLists.txt` file of your project.

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

**Make Build System** For the Make build systems, add the following lines to the Makefile of your project.

```
GCOV := $(call dequote,$(CONFIG_SDK_TOOLPREFIX))gcov
REPORT_DIR := $(BUILD_DIR_BASE)/coverage_report

gcovr-report:
    echo "Generating coverage report in: $(REPORT_DIR) "
    echo "Using gcov: $(GCOV) "
    mkdir -p $(REPORT_DIR)/html
    cd $(BUILD_DIR_BASE)
    gcovr -r $(PROJECT_PATH) --gcov-executable $(GCOV) -s --html-details $(REPORT_
↪DIR)/html/index.html

cov-data-clean:
    echo "Remove coverage data files..."
    find $(BUILD_DIR_BASE) -name "*.gcda" -exec rm {} +
    rm -rf $(REPORT_DIR)

.PHONY: gcovr-report cov-data-clean
```

The following commands can now be used:

- `make gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- `make cov-data-clean` will remove all coverage data files.

## 4.2 Application Startup Flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. *First stage bootloader* in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x0.
2. *Second stage bootloader* loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. *Application startup* executes. At this point the second CPU and RTOS scheduler are started.

This process is explained in detail in the following sections.

### 4.2.1 First stage bootloader

After SoC reset, the CPU will start running immediately to perform initialization. The reset vector code is located in the mask ROM of the ESP32-C3 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see [deep sleep](#) documentation for this.
2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32-C3 datasheet for a description of SoC boot modes and how to execute them.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

---

**Note:** During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

---

Second stage bootloader binary image is loaded from the start of flash at offset 0x0.

## 4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x0 in flash is the second stage bootloader. Second stage bootloader source code is available in [components/bootloader](#) directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (*configurable value*). See [partition tables](#) documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the `otadata` partition to determine which one should be booted. See [Over The Air Updates \(OTA\)](#) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see [Bootloader](#).

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal *IRAM (Instruction RAM)* or *DRAM (Data RAM)*, the contents are copied from flash to the load address.
- For segments which have load addresses in *DROM (data stored in Flash)* or *IROM (code executed from Flash)* regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

## 4.2.3 Application startup

Application startup covers everything that happens after the app starts executing and before the `app_main` function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling `app_main`.

---

**Note:** Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer's perspective only, skip forward to [Running the main task](#).

---

## Port Initialization

ESP-IDF application entry point is `call_start_cpu0` function found in `components/esp_system/port/cpu_start.c`. This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment ( “CRT” ) and performs initial configuration of the SoC’ s internal hardware:

- Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing *Fatal Errors* to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
- If the option `CONFIG_BOOTLOADER_WDT_ENABLE` is not set then the RTC watchdog timer is disabled.
- Initialize internal memory (data & bss).
- Finish configuring the MMU cache.
- Set the CPU clocks to the frequencies configured for the project.
- Initialize memory protection if configured.

Once `call_start_cpu0` completes running, it calls the “system layer” initialization function `start_cpu0` found in `components/esp_system/startup.c`.

## System Initialization

The main system initialization function is `start_cpu0`. By default, this function is weak-linked to the function `start_cpu0_default`. This means that it’ s possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

- Log information about this application (project name, *App version*, etc.) if default log level enables this.
- Initialize the heap allocator (before this point all allocations must be static or on the stack).
- Initialize newlib component syscalls and time functions.
- Configure the brownout detector.
- Setup libc stdin, stdout, and stderr according to the *serial console configuration*.
- Perform any security-related checks, including burning efuses that should be burned for this configuration (including *permanently limiting ROM download modes*).
- Initialize SPI flash API support.
- Call global C++ constructors and any C functions marked with `__attribute__((constructor))`.

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the `ESP_SYSTEM_INIT_FN` macro, it will be called as part of secondary initialization.

## Running the main task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function `app_main` in the firmware.

The main task that runs `app_main` has a fixed RTOS priority (one higher than the minimum) and a *configurable stack size*.

Unlike normal FreeRTOS tasks (or embedded C `main` functions), the `app_main` task is allowed to return. If this happens, The task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement `app_main` as either a function that creates other application tasks and then returns, or as a main application task itself.

## 4.3 BluFi

### 4.3.1 Overview

The BluFi for ESP32-C3 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32-C3. Using this information ESP32-C3 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

### 4.3.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32-C3 into GATT Server mode and then it will send broadcasts with specific *advertising data*. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32-C3 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32-C3 (see the section *The Frame Formats Defined in BluFi* for details).
4. After ESP32-C3 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32-C3 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32-C3.
7. When receiving this control frame, ESP32-C3 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of *The Frame Formats Defined in BluFi*, with the Wi-Fi configuration information to ESP32-C3, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32-C3. When receiving this control frame, ESP32-C3 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32-C3 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

---

**Note:**

1. After ESP32-C3 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
  2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.
- 

### 4.3.3 The flow chart of BluFi

### 4.3.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32-C3 are defined as follows:

The frame format with no fragment (8 bit):

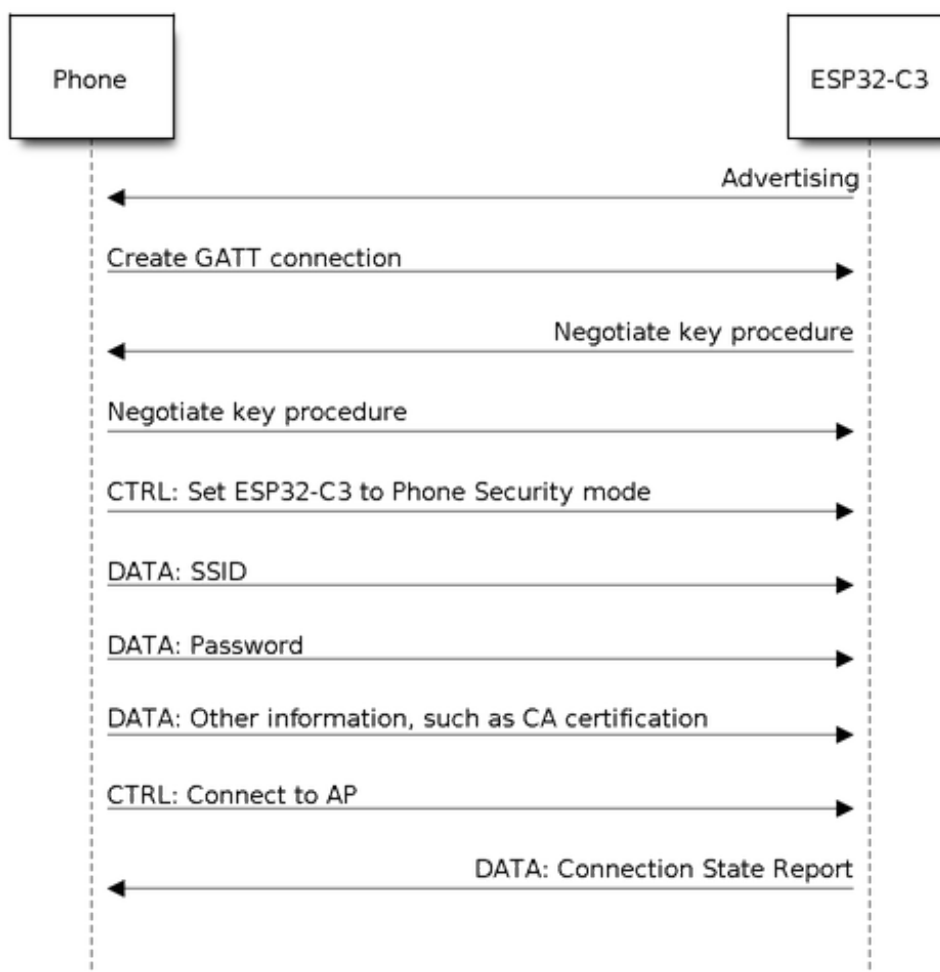

Fig. 2: BluFi Flow Chart

Description	Value
LSB - Type	1
Frame Control	1
Sequence Number	1
Data Length	1
Data	\${Data Length}
MSB - CheckSum	2

If the **Frame Ctrl** bit is enabled, the **Total length** bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit) :

Description	Value
LSB - Type	1
FrameControl(Frag)	1
SequenceNumber	1
DataLength	1
Data	Total Content Length   2
	Content   \${Data Length} - 2
MSB - CheckSum	2

Normally, the control frame does not contain data bits, except for Ack Frame.

The format of Ack Frame (8 bit) :

Description	Value
LSB - Type (Ack)	1
Frame Control	1
SequenceNumber	1
DataLength	1
Data	Acked Sequence Number   2
MSB - CheckSum	2

#### 1. Type

The **Type** field, taking 1 byte, is divided into **Type** and **Subtype**, that Type uses the lower 2 bits and **Subtype** uses the upper 6 bits.

- The control frame is not encrypted for the time being and supports to be verified;
- The data frame supports to be encrypted and verified.

##### 1.1 Control Frame (0x0 b' 00)

Control Frame (Binary)	Implication	Explanation	Note
0x0 (b' 000000)	Ack	The data field of the Ack frame uses the same sequence value of the frame to reply to.	The data field consumes a byte and its value is the same as the sequence field of the frame to reply to.
0x1 (b' 000001)	Set ESP device to the security mode.	To inform ESP device of the security mode to use when sending data, which is allowed to be reset multiple times during the process. Each setting affects the subsequent security mode used. If it is not set, ESP device will send the control frame and data frame with no checksum and encryption by default. The data transmission from the mobile phone to ESP device is controlled by this control frame.	<p>The data field consumes a byte. The higher 4 bits are for the security mode setting of the control frame, and the lower 4 bits are for the security mode setting of the data frame.</p> <p>b' 0000: no checksum and no encryption;</p> <p>b' 0001: with checksum but no encryption;</p> <p>b' 0010: no checksum but with encryption;</p> <p>b' 0011: with both checksum and encryption.</p>
0x2 (b' 000010)	Set the opmode of Wi-Fi.	The frame contains opmode settings for configuring for the Wi-Fi mode of ESP device.	<p>data[0] is for opmode settings, including:</p> <p>0x00: NULL;</p> <p>0x01: STA;</p> <p>0x02: SoftAP;</p> <p>0x03: SoftAP&amp;STA.</p> <p>Please set the SSID/Password/Max Connection Number of the AP mode in the first place if an AP gets involved.</p>
0x3 (b' 000011)	Connect ESP device to the AP.	To notify ESP device that the essential information has been sent and it is allowed to connect to the AP.	No data field is contained.
0x4 (b' 000100)	Disconnect ESP device from the AP.		No data field is contained.
0x5 (b' 000101)	To get the information of ESP device's		No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi connection state report to the mobile phone with the information of the current opmode, connection status, SSID and so on. The types of information sent to the
Espressif Systems	Wi-Fi mode and its status	<b>1385</b>	the mobile phone is defined by the application installed on the phone.

**1.2 Data Frame (0x1 b' 01)**

Data Frame(Binary)	Implication	Explanation
0x0 (b' 000000)	Send the negotiation data.	The negotiation data will be sent to the callback
0x1 (b' 000001)	Send the BSSID for STA mode.	To send the BSSID of the AP for the STA device
0x2 (b' 000010)	Send the SSID for STA mode.	To send the SSID of the AP for the STA device
0x3 (b' 000011)	Send the password for STA mode.	To send the password of the AP for the STA device
0x4 (b' 000100)	Send the SSID for SoftAP mode.	
0x5 (b' 000101)	Send the password for SoftAP mode.	
0x6 (b' 000110)	Set the maximum connection number for SoftAP mode.	
0x7 (b' 000111)	Set the authentication mode for the SoftAP.	
0x8 (b' 001000)	Set the channel amount for SoftAP mode.	
0x9 (b' 001001)	Username	It provides the username of the GATT client when using encryption
0xa (b' 001010)	CA Certification	It provides the CA Certification when using encryption
0xb (b' 001011)	Client Certification	It provides the client certification when using encryption
0xc (b' 001100)	Server Certification	It provides the server certification when using encryption
0xd (b' 001101)	ClientPrivate Key	It provides the private key of the client when using encryption
0xe (b' 001110)	ServerPrivate Key	It provides the private key of the server when using encryption
0xf (b' 001111)	Wi-Fi Connection State Report	To notify the phone of the ESP device's Wi-Fi status, including STA status and SoftAP status. It is for the STA device to connect to the mobile phone or the SoftAP. However, when the mobile phone receives the Wi-Fi status, it can reply to other frames in addition to this frame.
0x10 (b' 010000)	Version	
0x11 (b' 010001)	Wi-Fi List	To send the Wi-Fi list to ESP device.
0x12 (b' 010010)	Report Error	To notify the mobile phone that there is an error with BluFi.
0x13 (b' 010011)	Custom Data	To send or receive custom data.
0x14 (b' 010100)	Set the maximum Wi-Fi reconnecting time	
0x15 (b' 010101)	Set the Wi-Fi connection end reason	

Data Frame(Binary)	Implication	Explanation
0x16 (b' 010110)	Set the RSSI at Wi-Fi connection end	

## 2. Frame Control

Control field, takes 1 byte and each bit has a different meaning.

Bit	Meaning
0x01	Indicates whether the frame is encrypted.
	1 means encryption, and 0 means unencrypted.
	The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum).
	Control frame is not encrypted, so this bit is 0.
0x02	The data field that indicates whether a frame contains a checksum (such as SHA1,MD5,CRC, etc.) for the end of the frame data field includes SEQUCNE + data length + clear text. Both the control frame and the data frame can contain a check bit or not.
0x04	Represents the data direction.
	0 means the mobile phone to ESP device; 1 means ESP device to the mobile phone.
0x08	Indicates whether the other person is required to reply to an ACK.
	0 indicates no requirement; 1 indicates to reply Ack.
0x10	Indicates whether there are subsequent data fragments.
	0 indicates that there are no subsequent data fragments for this frame;
	1 indicates that there are subsequent data fragments and used to transmit longer data.
	In the case of a frag frame, the total length of the current content section + subsequent content section is given, in the first 2 bytes of the data field (that is, the content data of the maximum support 64K).
0x10~0x80 re- served	

## 3. Sequence Control

Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

## 4. Length

The length of the data field that does not include CheckSum.

## 5. Data

The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

## 6. CheckSum

This field takes 2 bytes that is used to check “sequence + data length + clear text data” .

### 4.3.5 The Security Implementation of ESP32-C3

#### 1. Securing data

To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

#### 2. Ensuring data integrity

To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

#### 3. Securing identity (signature)

Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as a companion for signature.

#### 4. Replay attack prevention

It is added to the Sequence field and used during the checksum verification.

For the coding of ESP32-C3, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32-C3 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.

The application layer needs to register several security-related functions to BluFi:

```
typedef void (*esp_blufi_negotiate_data_handler_t) (uint8_t *data, int len, uint8_t *
↳**output_data, int *output_len, bool *need_free)
```

This function is for ESP32-C3 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output\_data and Output\_len.

BluFi will send output\_data from Negotiate\_data\_handler after Negotiate\_data\_handler is called.

Here are two “\*” , because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED\_FREE.

```
typedef int (* esp_blufi_encrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef int (* esp_blufi_decrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t iv8, uint8_t *data, int len)
```

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

### 4.3.6 GATT Related Instructions

#### UUID

BluFi Service UUID: 0xFFFF, 16 bit

BluFi (the mobile -> ESP32-C3): 0xFF01, writable

Blufi (ESP32-C3 -> the mobile phone): 0xFF02, readable and callable

## 4.4 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Initialize *Flash Encryption* and/or *Secure* features, if configured;
3. Select the application partition to boot, based on the partition table and ota\_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to it.

Bootloader is located at the address 0x0 in the flash.

For a full description of the startup process including the the ESP-IDF bootloader, see [Application Startup Flow](#).

### 4.4.1 Bootloader compatibility

It is recommended to update to newer *versions of ESP-IDF*: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

---

**Note:** If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

---

### SPI Flash Configuration

Each ESP-IDF application or bootloader .bin file contains a header with `CONFIG_ESPTOOLPY_FLASHMODE`, `CONFIG_ESPTOOLPY_FLASHFREQ`, `CONFIG_ESPTOOLPY_FLASHSIZE` embedded in it. These are used to configure the SPI flash during boot.

The *First stage bootloader* in ROM reads the *Second stage bootloader* header from flash and uses these settings to load it. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the *Second stage bootloader* then runs and re-configures the flash, it reads values from the currently selected app binary header not the bootloader header. This allows an OTA update to change the SPI flash settings in use.

### 4.4.2 Factory reset

The user can write a basic working firmware and load it into the factory app partition.

Next, update the firmware via OTA (over the air). The updated firmware will be loaded into an OTA app partition slot and the OTA data partition is updated to boot from this partition.

If you want to be able to roll back to the factory firmware and clear the settings, then you need to set `CONFIG_BOOTLOADER_FACTORY_RESET`. The factory reset mechanism allows to reset the device to factory settings:

- Clear one or more data partitions.
- Boot from “factory” partition.

`CONFIG_BOOTLOADER_DATA_FACTORY_RESET` allows customers to select which data partitions will be erased when the factory reset is executed. Can specify the names of partitions through comma-delimited with optional spaces for readability. (Like this: “nvs, phy\_init, nvs\_custom, ...”). Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

`CONFIG_BOOTLOADER_OTA_DATA_ERASE` - the device will boot from “factory” partition after a factory reset. The OTA data partition will be cleared.

`CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET` - number of the GPIO input for factory reset uses to trigger a factory reset, this GPIO must be pulled low on reset to trigger this.

`CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Partition table.:

```
# Name, Type, SubType, Offset, Size, Flags
# Note: if you have increased the bootloader size, make sure to update the offsets.
↳to avoid overlap
nvs, data, nvs, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
```

(continues on next page)

(continued from previous page)

factory,	0,	0,	0x10000,	1M
test,	0,	test,	,	512K
ota_0,	0,	ota_0,	,	512K
ota_1,	0,	ota_1,	,	512K

### 4.4.3 Boot from test app partition

The user can write a special firmware for testing in production, and run it as needed. The partition table also needs a dedicated partition for this testing firmware (See *partition table*). To trigger a test app you need to set `CONFIG_BOOTLOADER_APP_TEST`.

`CONFIG_BOOTLOADER_NUM_PIN_APP_TEST` - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the normally configured application will boot (factory or any OTA slot).

`CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

### 4.4.4 Fast boot from Deep Sleep

The bootloader has the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` option which allows to reduce the wake-up time (useful to reduce consumption). This option is available when the `CONFIG_SECURE_BOOT` option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

### 4.4.5 Custom bootloader

The current bootloader implementation allows a project to override it. To do this, you must copy the directory `/esp-idf/components/bootloader` to your project components directory and then edit `/your_project/components/bootloader/subproject/main/bootloader_start.c`.

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project's `bootloader` directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the *partition table offset* value to place the partition table later in the flash. This increases the space available for the bootloader.

---

**Note:** The first time you copy the bootloader into an existing project, the project may fail to build as paths have changed unexpectedly. If this happens, run `idf.py fullclean` (or delete the project build directory) and then build again.

---

## 4.5 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organize and build a new ESP-IDF project or component.

## 4.5.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

### Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. At the moment, ESP-IDF supports `esp32`, `esp32s2` and `esp32c3` targets.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line `PATH`.

## 4.5.2 Using the Build System

### `idf.py`

The `idf.py` command line tool provides a front-end for easily managing your project builds. It manages the following tools:

- [CMake](#), which configures the project to be built
- A command line build tool (either [Ninja](#) build or *GNU Make*)
- [esptool.py](#) for flashing the target.

The [getting started guide](#) contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

`idf.py` should be run in an ESP-IDF “project” directory, ie one containing a `CMakeLists.txt` file. Older style projects with a `Makefile` will not work with `idf.py`.

Type `idf.py --help` for a list of commands. Here are a summary of the most useful ones:

- `idf.py set-target <target>` sets the target (chip) for which the project is built. See [Selecting the Target](#).
- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
  - Run [CMake](#) as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool ([Ninja](#) or *GNU Make*). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete CMake configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.
- `idf.py flash` will automatically build the project if necessary, and then flash it to the target. The `-p` and `-b` options can be used to set serial port name and flasher baud rate, respectively.
- `idf.py monitor` will display serial output from the target. The `-p` option can be used to set the serial port name. Type `Ctrl-J` to exit the monitor. See [IDF Monitor](#) for more details about using the monitor.

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports [shell autocompletion](#) for bash, zsh and fish shells.

In order to make [shell autocompletion](#) supported, please make sure you have at least Python 3.5 and [click 7.1](#) or newer ([see also](#)).

To enable autocompletion for `idf.py` use the `export` command ([see this](#)). Autocompletion is initiated by pressing the TAB key. Type “`idf.py -`” and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

---

**Note:** The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

---

### Advanced Commands

- `idf.py app`, `idf.py bootloader`, `idf.py partition_table` can be used to build only the app, bootloader, or partition table from the project as applicable.
- There are matching commands `idf.py app-flash`, etc. to flash only that single part of the project to the target.
- `idf.py -p PORT erase_flash` will use `esptool.py` to erase the target’s entire flash chip.
- `idf.py size` prints some size information about the app. `size-components` and `size-files` are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable `-DOUTPUT_JSON=1` when running CMake (or `idf.py`), the output will be formatted as JSON not as human readable text.
- `idf.py reconfigure` re-runs [CMake](#) even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.
- `idf.py python-clean` deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

**idf.py options** To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable [CCache](#) when compiling source files, if the [CCache](#) tool is installed. This can dramatically reduce some build times.

Note that some older versions of [CCache](#) may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling [CCache](#) and build again. [CCache](#) can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.

### Start a new project

Use the command `idf.py create-project` for starting a new project. Execute `idf.py create-project --help` for more information.

Example:

```
idf.py create-project --path my_projects my_new_project
```

This example will create a new project called `my_new_project` directly into the directory `my_projects`.

### Using CMake Directly

`idf.py` is a wrapper around [CMake](#) for convenience. However, you can also invoke CMake directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):

```
mkdir -p build
cd build
cmake .. -G Ninja # or 'Unix Makefiles'
ninja
```

In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is [Ninja](#): running `ninja` actually builds the project.

It's not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

---

**Note:** If you're already familiar with [CMake](#), you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake's functionality to reduce boilerplate. See [writing pure CMake components](#) for some

information about writing more “CMake style” components.

---

**Flashing with ninja or make** It’s possible to build and flash directly from ninja or make by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

---

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

---

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

---

**Note:** Providing variables at the end of the command line is make syntax, and works for make on all platforms.

---

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute `idf.py` for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).

### Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default `python` interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

`idf.py` and other Python scripts will run with the default Python interpreter, i.e. `python`. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py . . .`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 . . .` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the `PYTHON` value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools [pyenv](#) or [virtualenv](#). These let you change the default Python version.

**Possible issues** The user of `idf.py` may sometimes experience `ImportError` described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in
↳<module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

The exception is often caused by `.pyc` files generated by different Python versions. To solve the issue run the following command:

```
idf.py python-clean
```

### 4.5.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project `CMakeLists.txt` file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file `/tools/cmake/project.cmake` which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “`sdkconfig`” project configuration file. This file is created/updated when `idf.py menuconfig` runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “`sdkconfig`” file may or may not be added to the source control system of the project.
- Optional “`components`” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, `EXTRA_COMPONENT_DIRS` can be set in the top-level `CMakeLists.txt` to look for components in other places. See the [renaming main](#) section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “`main`”.
- “`main`” directory is a special component that contains source code for the project itself. “`main`” is a default name, the CMake variable `COMPONENT_DIRS` includes this component but you can modify this variable.
- “`build`” directory is where build output is created. This directory is created by `idf.py` if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component `CMakeLists.txt` file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See [Component CMakeLists Files](#) for more details.

Each component may also include a `Kconfig` file defining the [component configuration](#) options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for [overriding parts of the project](#).

## 4.5.4 Project CMakeLists File

Each project has a single top-level `CMakeLists.txt` file that contains build settings for the entire project. By default, the project CMakeLists can be quite minimal.

### Minimal Example CMakeLists

Minimal project:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

### Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

- `cmake_minimum_required(VERSION 3.5)` tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the `CMakeLists.txt` file.
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie `myProject.elf`, `myProject.bin`. Only one project can be defined per CMakeLists file.

### Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in [/tools/cmake/project.cmake](#) for all of the implementation details.

- `COMPONENT_DIRS`: Directories to search for components. Defaults to `IDF_PATH/components`, `PROJECT_DIR/components`, and `EXTRA_COMPONENT_DIRS`. Override this variable if you don't want to search for components in these places.
- `EXTRA_COMPONENT_DIRS`: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
- `COMPONENTS`: A list of component names to build into the project. Defaults to all components found in the `COMPONENT_DIRS` directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the `REQUIRES` or `PRIV_REQUIRES` arguments on component registration will automatically have it added to this list, so the `COMPONENTS` list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the [cmake set command](#) ie `set(VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...)` line but before the `include(...)` line.

### Renaming main component

The build system provides special treatment to the `main` component. It is a component that gets automatically added to the build provided that it is in the expected location, `PROJECT_DIR/main`. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the `main` component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming `main` are as follows:

1. Rename `main` directory.

2. Set `EXTRA_COMPONENT_DIRS` in the project `CMakeLists.txt` to include the renamed `main` directory.
3. Specify the dependencies in the renamed component's `CMakeLists.txt` file via `REQUIRES` or `PRIV_REQUIRES` arguments *on component registration*.

## 4.5.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project's own components directory, or added from custom component directories (*see above*).

A component is any directory in the `COMPONENT_DIRS` list which contains a `CMakeLists.txt` file.

### Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project's components. Directories in this list can either be components themselves (ie they contain a `CMakeLists.txt` file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

### Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`; by default, this means ESP-IDF's internal components first, then the project's components, and finally any components set in `EXTRA_COMPONENT_DIRS`. If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

---

**Note:** If a component is overridden in an existing project by moving it to a new location, the project will not automatically see the new component path. Run `idf.py reconfigure` (or delete the project build folder) and then build again.

---

### Minimal Component CMakeLists

The minimal component `CMakeLists.txt` file simply registers the component to the build system using `idf_component_register`:

```
idf_component_register(SRCS "foo.c" "bar.c"
                      INCLUDE_DIRS "include"
                      REQUIRES mbedtls)
```

- `SRCS` is a list of source files (`*.c`, `*.cpp`, `*.cc`, `*.S`). These source files will be compiled into the component library.
- `INCLUDE_DIRS` is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- `REQUIRES` is not actually required, but it is very often required to declare what other components this component will use. See *Component Requirements*.

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the `CMakeLists.txt` file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed *here*.

See [example component requirements](#) and [example component CMakeLists](#) for more complete component `CMakeLists.txt` examples.

### Create a new component

Use the command `idf.py create-component` for creating a new component. The new component will contain set of files necessary for building a component. You may include the component's header file into your project and use its functionality. For more information execute `idf.py create-component --help`.

Example:

```
idf.py -C components create-component my_component
```

The example will create a new component in the subdirectory `components` under the current working directory. For more information about components follow the documentation page [see above](#).

### Preset Component Variables

The following component-specific variables are available for use inside component `CMakeLists`, but should not be modified:

- `COMPONENT_DIR`: The component directory. Evaluates to the absolute path of the directory containing `CMakeLists.txt`. The component path cannot contain spaces. This is the same as the `CMAKE_CURRENT_SOURCE_DIR` variable.
- `COMPONENT_NAME`: Name of the component. Same as the name of the component directory.
- `COMPONENT_ALIAS`: Alias of the library created internally by the build system for the component.
- `COMPONENT_LIB`: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component `CMakeLists`:

- `CONFIG_*`: Each value in the project configuration has a corresponding variable available in `cmake`. All names begin with `CONFIG_`. [More information here](#).
- `ESP_PLATFORM`: Set to 1 when the `CMake` file is processed within ESP-IDF build system.

### Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using `idf_build_get_property` from the component `CMakeLists.txt`:

- `PROJECT_NAME`: Name of the project, as set in project `CMakeLists.txt` file.
- `PROJECT_DIR`: Absolute path of the project directory containing the project `CMakeLists`. Same as the `CMAKE_SOURCE_DIR` variable.
- `COMPONENTS`: Names of all components that are included in this build, formatted as a semicolon-delimited `CMake` list.
- `IDF_VER`: Git version of ESP-IDF (produced by `git describe`)
- `IDF_VERSION_MAJOR`, `IDF_VERSION_MINOR`, `IDF_VERSION_PATCH`: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. `v4.0-dev-*`, `v4.0-beta1`, `v4.0-rc1` and `v4.0` will all have the same values of `IDF_VERSION_*` variables, but different `IDF_VER` values.
- `IDF_TARGET`: Name of the target for which the project is being built.
- `PROJECT_VER`: Project version.
  - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
  - Else, if `PROJECT_VER` variable is set in project `CMakeLists.txt` file, its value will be used.
  - Else, if the `PROJECT_DIR/version.txt` exists, its contents will be used as `PROJECT_VER`.
  - Else, if the project is located inside a Git repository, the output of `git describe` will be used.
  - Otherwise, `PROJECT_VER` will be "1".

Other build properties are listed [here](#).

## Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the `target_compile_options` function:

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake `set_source_files_properties` command:

```
set_source_files_properties(mysrc.c
    PROPERTIES COMPILE_FLAGS
        -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.

## 4.5.6 Component Configuration

Each component can also have a `Kconfig` file, alongside `CMakeLists.txt`. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when `menuconfig` is run.

To create a component `Kconfig` file, it is easiest to start with one of the `Kconfig` files distributed with ESP-IDF.

For an example, see [Adding conditional configuration](#).

## 4.5.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- `ESP_PLATFORM`: Can be used to detect that build happens within ESP-IDF.
- `IDF_VER`: Defined to a git version string. E.g. `v2.0` for a tagged release or `v1.0-275-g0efaa4f` for an arbitrary commit.

## 4.5.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on ( “requires” ).

### When writing a component

```
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` should be set to all components whose header files are `#included` from the *public* header files of this component.
- `PRIV_REQUIRES` should be set to all components whose header files are `#included` from *any source files* in this component, unless already listed in `REQUIRES`. Also any component which is required to be linked in order for this component to function correctly.
- The values of `REQUIRES` and `PRIV_REQUIRES` should not depend on any configuration choices (`CONFIG_XXX` macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.

- Not setting either or both `REQUIRES` variables is fine. If the component has no requirements except for the *Common component requirements* needed for RTOS, libc, etc.

If a component only supports some target chips (values of `IDF_TARGET`) then it can specify `REQUIRED_IDF_TARGETS` in the `idf_component_register` call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

---

**Note:** In CMake terms, `REQUIRES` & `PRIV_REQUIRES` are approximate wrappers around the CMake functions `target_link_libraries(... PUBLIC ...)` and `target_link_libraries(... PRIVATE ...)`.

---

### Example of component requirements

Imagine there is a `car` component, which uses the `engine` component, which uses the `spark_plug` component:

```
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
                    - car.c
                    - car.h
                - engine/ - CMakeLists.txt
                    - engine.c
                    - include/ - engine.h
            - spark_plug/ - CMakeLists.txt
                    - plug.c
                    - plug.h
```

**Car component** The `car.h` header file is the public interface for the `car` component. This header includes `engine.h` directly because it uses some declarations from this header:

```
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

And `car.c` includes `car.h` as well:

```
/* car.c */
#include "car.h"
```

This means the `car/CMakeLists.txt` file needs to declare that `car` requires `engine`:

```
idf_component_register(SRCS "car.c"
                      INCLUDE_DIRS "."
                      REQUIRES engine)
```

- `SRCS` gives the list of source files in the `car` component.
- `INCLUDE_DIRS` gives the list of public include directories for this component. Because the public interface is `car.h`, the directory containing `car.h` is listed here.
- `REQUIRES` gives the list of components required by the public interface of this component. Because `car.h` is a public header and includes a header from `engine`, we include `engine` here. This makes sure that any other component which includes `car.h` will be able to recursively include the required `engine.h` also.

**Engine component** The engine component also has a public header file `include/engine.h`, but this header is simpler:

```
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

The implementation is in `engine.c`:

```
/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...
```

In this component, `engine` depends on `spark_plug` but this is a private dependency. `spark_plug.h` is needed to compile `engine.c`, but not needed to include `engine.h`.

This means that the `engine/CMakeLists.txt` file can use `PRIV_REQUIRES`:

```
idf_component_register(SRCS "engine.c"
                      INCLUDE_DIRS "include"
                      PRIV_REQUIRES spark_plug)
```

As a result, source files in the `car` component don't need the `spark_plug` include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

**Spark Plug Component** The `spark_plug` component doesn't depend on anything else. It has a public header file `spark_plug.h`, but this doesn't include headers from any other components.

This means that the `spark_plug/CMakeLists.txt` file doesn't need any `REQUIRES` or `PRIV_REQUIRES` clauses:

```
idf_component_register(SRCS "spark_plug.c"
                      INCLUDE_DIRS ".")
```

### Source File Include Directories

Each component's source file is compiled with these include path directories, as specified in the passed arguments to `idf_component_register`:

```
idf_component_register(..
                      INCLUDE_DIRS "include"
                      PRIV_INCLUDE_DIRS "other")
```

- The current component's `INCLUDE_DIRS` and `PRIV_INCLUDE_DIRS`.
- The `INCLUDE_DIRS` belonging to all other components listed in the `REQUIRES` and `PRIV_REQUIRES` parameters (ie all the current component's public and private dependencies).
- Recursively, all of the `INCLUDE_DIRS` of those components `REQUIRES` lists (ie all public dependencies of this component's dependencies, recursively expanded).

### Main component requirements

The component named `main` is special because it automatically requires all other components in the build. So it's not necessary to pass `REQUIRES` or `PRIV_REQUIRES` to this component. See [renaming main](#) for a description of what needs to be changed if no longer using the `main` component.

### Common component requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: `freertos`, `newlib`, `heap`, `log`, `soc`, `esp_rom`, `esp_common`, `xtensa/riscv`, `cxx`.

### Including components in the build

- By default, every component is included in the build.
- If you set the `COMPONENTS` variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  - Components mentioned explicitly in `COMPONENTS`.
  - Those components’ requirements (evaluated recursively).
  - The “common” components that every component depends on.
- Setting `COMPONENTS` to the minimal list of required components can significantly reduce compile times.

### Requirements in the build system implementation

- Very early in the CMake configuration process, the script `expand_requirements.cmake` is run. This script does a partial evaluation of all component `CMakeLists.txt` files and builds a graph of component requirements (this graph may have cycles). The graph is used to generate a file `component_depends.cmake` in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal `BUILD_COMPONENTS` variable). The `BUILD_COMPONENTS` variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed for all components. The order should be deterministic given the same set of components and component dependencies.
- The value of `BUILD_COMPONENTS` is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the `CMakeLists.txt` file is evaluated again to add the component libraries to the build.

**Component Dependency Order** The order of components in the `BUILD_COMPONENTS` variable determines other orderings during the build:

- Order that `project_include.cmake` files are included into the project.
- Order that the list of header paths is generated for compilation (via `-I` argument). (Note that for a given component’ s source files, only that component’ s dependency’ s header paths are passed to the compiler.)

## 4.5.9 Overriding Parts of the Project

### `project_include.cmake`

For components that have build requirements which must be evaluated before any component `CMakeLists` files are evaluated, you can create a file called `project_include.cmake` in the component directory. This CMake file is included when `project.cmake` is evaluating the entire project.

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app” .

Unlike component `CMakeLists.txt` files, when including a `project_include.cmake` file the current source directory (`CMAKE_CURRENT_SOURCE_DIR` and working directory) is the project directory. Use the variable `COMPONENT_DIR` for the absolute directory of the component.

Note that `project_include.cmake` isn't necessary for the most common component uses - such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customised via the `CMakeLists.txt` file itself. See [Optional Project Variables](#) for details.

`project_include.cmake` files are included in the order given in `BUILD_COMPONENTS` variable (as logged by CMake). This means that a component's `project_include.cmake` file will be included after it's all dependencies' `project_include.cmake` files, unless both components are part of a dependency cycle. This is important if a `project_include.cmake` file relies on variables set by another component. See also [above](#).

Take great care when setting variables or targets in a `project_include.cmake` file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

### KConfig.projbuild

This is an equivalent to `project_include.cmake` for [Component Configuration](#) KConfig files. If you want to include configuration options at the top-level of `menuconfig`, rather than inside the "Component Configuration" sub-menu, then these can be defined in the `KConfig.projbuild` file alongside the `CMakeLists.txt` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it's generally better to create a KConfig file for [Component Configuration](#).

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader "special app" .

## 4.5.10 Configuration-Only Components

Special components which contain no source files, only `Kconfig.projbuild` and `KConfig`, can have a one-line `CMakeLists.txt` file which calls the function `idf_component_register()` with no arguments specified. This function will include the component in the project build, but no library will be built *and* no header files will be added to any include paths.

## 4.5.11 Debugging CMake

For full details about CMake and CMake commands, see the [CMake v3.5 documentation](#).

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the [cmake command line documentation](#).

When included from a project `CMakeLists` file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in `CMake` `project` function. This function is overridden to add all of the ESP-IDF specific project functionality.

### Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to CMake so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don't want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the [/tools/cmake/project.cmake](#) file and supporting functions in [/tools/cmake/](#) for more details.

### 4.5.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component `CMakeLists.txt` can be very small or even empty (see *Minimal Component CMakeLists*). However, overriding *component variables* is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

#### Adding conditional configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
    list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
    set(srcs lcd-real.c lcd-spi.c)
else()
    set(srcs lcd-dummy.c)
endif()
```

(continues on next page)

```
# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
    list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

### Conditions which depend on the target

The current target is available to CMake files via `IDF_TARGET` variable.

In addition to that, if target `xyz` is used (`IDF_TARGET=xyz`), then Kconfig variable `CONFIG_IDF_TARGET_XYZ` will be set.

Note that component dependencies may depend on `IDF_TARGET` variable, but not on Kconfig variables. Also one can not use Kconfig variables in `include` statements in CMake files, but `IDF_TARGET` can be used in such context.

### Source Code Generation

Some components will have a situation where a source file isn't supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called `bmp2h`. The header file is then included in as C source file called `graphics_lib.c`:

```
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)

set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
    ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

This answer is adapted from the [CMake FAQ entry](#), which contains some other examples that will also work with ESP-IDF builds.

In this example, `logo.h` will be generated in the current directory (the build directory) while `logo.bmp` comes with the component and resides under the component path. Because `logo.h` is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the [ADDITIONAL\\_MAKE\\_CLEAN\\_FILES](#) property.

---

**Note:** If generating files as part of the project `CMakeLists.txt` file, not a component `CMakeLists.txt`, then use build property `PROJECT_DIR` instead of `${COMPONENT_DIR}` and `${PROJECT_NAME}.elf` instead of `${COMPONENT_LIB}`.)

---

If a source file from another component included `logo.h`, then `add_dependencies` would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

### Embedding Binary Data

Sometimes you have a file with some binary or text data that you'd like to make available to your component - but you don't want to reformat the file as C source.

You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file's contents will be added to the `.rodata` section in flash, and are available via symbol names as follows:

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters `/`, `.`, etc. are replaced with underscores. The `_binary` prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project `CMakeLists.txt` file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see the “main” component of the [file\\_serving example protocols/http\\_server/file\\_serving/main/CMakeLists.txt](#) - two files are loaded at build time and linked into the firmware.

It is also possible embed a generated file:

```
add_custom_command(OUTPUT my_processed_file.bin
    COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

In the example above, `my_processed_file.bin` is generated from `my_unprocessed_file.bin` through some command `my_process_file_cmd`, then embedded into the target.

To specify a dependence on a target, use the `DEPENDS` argument:

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

The `DEPENDS` argument to `target_add_binary_data` ensures that the target executes first.

## Code and Data Placements

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See [Linker Script Generation](#) for a quick start guide as well as a detailed discussion of the mechanism.

## Fully Overriding The Component Build Process

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it's possible to forego the ESP-IDF build system entirely by using a CMake feature called [ExternalProject](#). Example component CMakeLists:

```
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named `quirc` that builds the `quirc` project using its own Makefile.)

- `externalproject_add` defines an external build system.
  - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
  - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise you can set `BUILD_DIR`.
  - Consult the [ExternalProject](#) documentation for more details about `externalproject_add()`
- The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
- Finally, the generated library is added to `ADDITIONAL_MAKE_CLEAN_FILES`. This means `make clean` will delete this library. (Note that the other object files from the build won't be deleted.)

**ExternalProject dependencies, clean builds** CMake has some unusual behaviour around external project builds:

- `ADDITIONAL_MAKE_CLEAN_FILES` only works when “make” is used as the build system. If [Ninja](#) or an IDE build system is used, it won't delete these files when cleaning.
- However, the [ExternalProject](#) `configure` & `build` commands will *always* be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external `BUILD_COMMAND` run a full clean compile of all sources. The build command will be run if any of the dependencies passed to `externalproject_add` with `DEPENDS` have changed, or if this is a clean build (ie any of `idf.py clean`, `ninja clean`, or `make clean` was run.)
  2. Have the external `BUILD_COMMAND` be an incremental build command. Pass the parameter `BUILD_ALWAYS 1` to `externalproject_add`. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn't take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

### 4.5.13 Custom sdkconfig defaults

For example projects or other projects where you don't want to specify a full `sdkconfig` configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn't yet been set in the `sdkconfig` file.

To override the name of this file or to specify multiple files, set the `SDKCONFIG_DEFAULTS` environment variable or set `SDKCONFIG_DEFAULTS` in top-level `CMakeLists.txt`. If specifying multiple files, use semicolon as the list separator. File names not specified as full paths are resolved relative to current project.

#### Target-dependent sdkconfig defaults

In addition to `sdkconfig.defaults` file, build system will also load defaults from `sdkconfig.defaults.TARGET_NAME` file, where `TARGET_NAME` is the value of `IDF_TARGET`. For example, for `esp32` target, default settings will be taken from `sdkconfig.defaults` first, and then from `sdkconfig.defaults.esp32`.

If `SDKCONFIG_DEFAULTS` is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from `SDKCONFIG_DEFAULTS` value/values using the rule above.

### 4.5.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, `esptool.py` and `esptool write_flash` arguments. It's simple to write a script to save binaries and `esptool.py`.

After running a project build, the build directory contains binary output files (`.bin` files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.5.15 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project `CMakeLists.txt` file and builds separate `.ELF` and `.BIN` files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes

discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.5.16 Selecting the Target

ESP-IDF supports multiple targets (chips). The identifiers used for each chip are as follows:

- `esp32` —for ESP32-D0WD, ESP32-D2WD, ESP32-S0WD (ESP-SOLO), ESP32-U4WDH, ESP32-PICO-D4
- `esp32s2`—for ESP32-S2
- `esp32c3`—for ESP32-C3

To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

---

**Important:** `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

---

**Note:** The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)
  2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
  3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)
- 

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the `_default_` value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

### 4.5.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```
add_library(json STATIC
cJSON/cJSON.c
cJSON/cJSON_Utils.c)

target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF `json` component `/components/json/CMakeLists.txt`.
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.)
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.5.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects —code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library `foo` to be used in the `main` component:

```
# Register the component
idf_component_register(...)

# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at [build\\_system/cmake/import\\_lib](#). Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library's documentation for instructions on how to import it from other projects. Studying the library's `CMakeLists.txt` and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the `mbedtls` component is a wrapper for Espressif's fork of `mbedtls`. See its [component CMakeLists.txt](#).

The CMake variable `ESP_PLATFORM` is set to 1 whenever the ESP-IDF build system is being used. Tests such as `if (ESP_PLATFORM)` can be used in generic CMake code if special IDF-specific logic is required.

#### Using ESP-IDF components from external libraries

The above example assumes that the external library `foo` (or `tinyclib` in the case of the `import_lib` example) doesn't need to use any ESP-IDF APIs apart from common APIs such as `libc`, `libstdc++`, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external `CMakeLists.txt` file by adding a dependency on the library target `idf::<componentname>`.

For example, in the `foo/CMakeLists.txt` file:

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

### 4.5.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (`.a` file), built by some other build process.

The ESP-IDF build system provides a utility function `add_prebuilt_library` for users to be able to easily import and use prebuilt libraries:

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES_
→req1 req2 ...])
```

where:

- `target_name`- name that can be used to reference the imported library, such as when linking to other targets

- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments `REQUIRES` and `PRIV_REQUIRES` specify dependency on other components. These have the same meaning as the arguments for `idf_component_register`.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at [build\\_system/cmake/import\\_prebuilt](#).

## 4.5.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user's targets (libraries/ executables).

It is possible to do so by using the *build system APIs provided* by `tools/cmake/idf.cmake`. For example:

```
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF_
↔build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets, ↪
↔dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in [build\\_system/cmake/idf\\_as\\_lib](#) demonstrates the creation of an application equivalent to [hello world application](#) using a custom CMake project.

## 4.5.21 ESP-IDF CMake Build System API

### idf-build-commands

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a *build property* `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_build_set_property(property val [APPEND])
```

Set a *build property* `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_build_component (component_dir)
```

Present a directory *component\_dir* that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before *idf\_build\_process*.

This command does not guarantee that the component will be processed during build (see the *COMPONENTS* argument description for *idf\_build\_process*)

```
idf_build_process (target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user's perspective is the libraries creation by calling each component's *idf\_component\_register*. This command creates the libraries for each component, which are accessible using aliases in the form *idf::component\_name*. These aliases can be used to link the components to the user's own targets, either libraries or executables.

The call requires the target chip to be specified with *target* argument. Optional arguments for the call include:

- **PROJECT\_DIR** - directory of the project; defaults to **CMAKE\_SOURCE\_DIR**
- **PROJECT\_NAME** - name of the project; defaults to **CMAKE\_PROJECT\_NAME**
- **PROJECT\_VER** - version/revision of the project; defaults to "1"
- **SDKCONFIG** - output path of generated *sdkconfig* file; defaults to **PROJECT\_DIR/sdkconfig** or **CMAKE\_SOURCE\_DIR/sdkconfig** depending if **PROJECT\_DIR** is set
- **SDKCONFIG\_DEFAULTS** - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value *filename* in the list, the config from file *filename.target*, if it exists, is also loaded.
- **BUILD\_DIR** - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to **CMAKE\_BINARY\_DIR**
- **COMPONENTS** - select components to process among the components known by the build system (added via *idf\_build\_component*). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```
idf_build_executable (executable)
```

Specify the executable *executable* for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after *idf\_build\_process*.

```
idf_build_get_config (var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying *GENERATOR\_EXPRESSION* will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to *idf\_build\_process*, however.

### idf-build-properties

These are properties that describe the build. Values of build properties can be retrieved by using the build command *idf\_build\_get\_property*. For example, to get the Python interpreter used for the build:

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- BUILD\_DIR - build directory; set from `idf_build_process BUILD_DIR` argument
- BUILD\_COMPONENTS - list of components included in the build; set by `idf_build_process`
- BUILD\_COMPONENT\_ALIASES - list of library alias of components included in the build; set by `idf_build_process`
- C\_COMPILE\_OPTIONS - compile options applied to all components' C source files
- COMPILE\_OPTIONS - compile options applied to all components' source files, regardless of it being C or C++
- COMPILE\_DEFINITIONS - compile definitions applied to all component source files
- CXX\_COMPILE\_OPTIONS - compile options applied to all components' C++ source files
- EXECUTABLE - project executable; set by call to `idf_build_executable`
- EXECUTABLE\_NAME - name of project executable without extension; set by call to `idf_build_executable`
- EXECUTABLE\_DIR - path containing the output executable
- IDF\_COMPONENT\_MANAGER - the component manager is enabled by default, but if this property is set to 0 it was disabled by the `IDF_COMPONENT_MANAGER` environment variable
- IDF\_PATH - ESP-IDF path; set from `IDF_PATH` environment variable, if not, inferred from the location of `idf.cmake`
- IDF\_TARGET - target chip for the build; set from the required target argument for `idf_build_process`
- IDF\_VER - ESP-IDF version; set from either a version file or the Git revision of the `IDF_PATH` repository
- INCLUDE\_DIRECTORIES - include directories for all component source files
- KCONFIGS - list of Kconfig files found in components in build; set by `idf_build_process`
- KCONFIG\_PROJBUILDS - list of Kconfig.projbuild files found in components in build; set by `idf_build_process`
- PROJECT\_NAME - name of the project; set from `idf_build_process PROJECT_NAME` argument
- PROJECT\_DIR - directory of the project; set from `idf_build_process PROJECT_DIR` argument
- PROJECT\_VER - version of the project; set from `idf_build_process PROJECT_VER` argument
- PYTHON - Python interpreter used for the build; set from `PYTHON` environment variable if available, if not "python" is used
- SDKCONFIG - full path to output config file; set from `idf_build_process SDKCONFIG` argument
- SDKCONFIG\_DEFAULTS - list of files containing default config to use in the build; set from `idf_build_process SDKCONFIG_DEFAULTS` argument
- SDKCONFIG\_HEADER - full path to C/C++ header file containing component configuration; set by `idf_build_process`
- SDKCONFIG\_CMAKE - full path to CMake file containing component configuration; set by `idf_build_process`
- SDKCONFIG\_JSON - full path to JSON file containing component configuration; set by `idf_build_process`
- SDKCONFIG\_JSON\_MENUS - full path to JSON file containing config menus; set by `idf_build_process`

### idf-component-commands

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

Retrieve a specified *component's component property, property* and store it in *var* accessible from the current scope. Specifying *GENERATOR\_EXPRESSION* will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_component_set_property(component property val [APPEND])
```

Set a specified *component's component property, property* with value *val*. Specifying *APPEND* will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
↪SRCS src1 src2 ...]])
    [INCLUDE_DIRS dir1 dir2 ...]
    [PRIV_INCLUDE_DIRS dir1 dir2 ...]
    [REQUIRES component1 component2 ...]
    [PRIV_REQUIRES component1 component2 ...]
    [LDFRAGMENTS ldfragment1 ldfragment2 ...]
    [REQUIRED_IDF_TARGETS target1 target2 ...]
    [EMBED_FILES file1 file2 ...]
    [EMBED_TXTFILES file1 file2 ...]
    [KCONFIG kconfig]
    [KCONFIG_PROJBUILD kconfig_projbuild])
```

Register a component to the build system. Much like the `project()` CMake command, this should be called from the component's `CMakeLists.txt` directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can **not** be called before `idf_component_register`:

- commands that are not valid in CMake script mode
- custom commands defined in `project_include.cmake`
- build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`.

The arguments for `idf_component_register` include:

- `SRCS` - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- `SRC_DIRS`, `EXCLUDE_SRCS` - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via `SRCS`. Note that this is subject to the *limitations of globbing in CMake*. Source files specified in `EXCLUDE_SRCS` are removed from the globbed files.
- `INCLUDE_DIRS` - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
- `PRIV_INCLUDE_DIRS` - directory paths, must be relative to the component directory, which will be added to the include search path for this component's source files only
- `REQUIRES` - public component requirements for the component
- `PRIV_REQUIRES` - private component requirements for the component; ignored on config-only components
- `LDFRAGMENTS` - component linker fragment files
- `REQUIRED_IDF_TARGETS` - specify the only target the component supports
- `KCONFIG` - override the default Kconfig file
- `KCONFIG_PROJBUILD` - override the default Kconfig.projbuild file

The following are used for *embedding data into the component*, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- `EMBED_FILES` - binary files to be embedded in the component
- `EMBED_TXTFILES` - text files to be embedded in the component

### idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the `freertos` component:

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- `COMPONENT_ALIAS` - alias for `COMPONENT_LIB` used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- `COMPONENT_DIR` - component directory; set by `idf_build_component`

- `COMPONENT_OVERRIDEN_DIR` - contains the directory of the original component if *this component overrides another component*
- `COMPONENT_LIB` - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- `COMPONENT_NAME` - name of the component; set by `idf_build_component` based on the component directory name
- `COMPONENT_TYPE` - type of the component, whether `LIBRARY` or `CONFIG_ONLY`. A component is of type `LIBRARY` if it specifies source files or embeds a file
- `EMBED_FILES` - list of files to embed in component; set from `idf_component_register` `EMBED_FILES` argument
- `EMBED_TXTFILES` - list of text files to embed in component; set from `idf_component_register` `EMBED_TXTFILES` argument
- `INCLUDE_DIRS` - list of component include directories; set from `idf_component_register` `INCLUDE_DIRS` argument
- `KCONFIG` - component Kconfig file; set by `idf_build_component`
- `KCONFIG_PROJBUILD` - component Kconfig.projbuild; set by `idf_build_component`
- `LDFRAGMENTS` - list of component linker fragment files; set from `idf_component_register` `LDFRAGMENTS` argument
- `PRIV_INCLUDE_DIRS` - list of component private include directories; set from `idf_component_register` `PRIV_INCLUDE_DIRS` on components of type `LIBRARY`
- `PRIV_REQUIRES` - list of private component dependencies; set from `idf_component_register` `PRIV_REQUIRES` argument
- `REQUIRED_IDF_TARGETS` - list of targets the component supports; set from `idf_component_register` `EMBED_TXTFILES` argument
- `REQUIRES` - list of public component dependencies; set from `idf_component_register` `REQUIRES` argument
- `SRCS` - list of component source files; set from `SRCS` or `SRC_DIRS/EXCLUDE_SRCS` argument of `idf_component_register`

### 4.5.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via `SRCS` argument to `idf_component_register`:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
    ...)
```

This preference reflects the [CMake best practice](#) of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using `SRC_DIRS`:

```
idf_component_register(SRC_DIRS library platform
    ...)
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won't know to automatically re-run and this file won't be added to the build.

The trade-off is acceptable when you're adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git...

For components which are part of ESP-IDF, we use a third party Git CMake integration module ([/tools/cmake/third\\_party/GetGitRevisionDescription.cmake](#)) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use `SRCS` argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

### 4.5.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains `esptool.py` arguments to flash the project's binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See *Flash arguments*.
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in `menuconfig`, for use in external IDE UIs.

### JSON Configuration Server

A tool called `confserver.py` is provided to allow IDEs to easily integrate with the configuration system logic. `confserver.py` is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run `confserver.py` from a project via `idf.py confserver` or `ninja confserver`, or a similar target triggered from a different build generator.

For more information about `confserver.py`, see [tools/kconfig\\_new/README.md](tools/kconfig_new/README.md).

### 4.5.24 Build System Internals

#### Build Scripts

The listfiles for the ESP-IDF build system reside in `/tools/cmake`. The modules which implement core build system functionality are as follows:

- `build.cmake` - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- `component.cmake` - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- `kconfig.cmake` - Generation of configuration files (`sdkconfig`, `sdkconfig.h`, `sdkconfig.cmake`, etc.) from Kconfig files.
- `ldgen.cmake` - Generation of final linker script from linker fragment files.
- `target.cmake` - Setting build target and toolchain file.
- `utilities.cmake` - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in `/tools/cmake`:

- `idf.cmake` - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- `project.cmake` - Includes `idf.cmake` and provides a custom `project()` command that takes care of all the heavy lifting of building an executable. Included in the top-level `CMakeLists.txt` of standard ESP-IDF projects.

The rest of the files in `/tools/cmake` are support or third-party scripts used in the build process.

## Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

Fig. 3: ESP-IDF Build System Process

**Initialization** This phase sets up necessary parameters for the build.

- **Upon inclusion of `idf.cmake` in `project.cmake`, the following steps are performed:**
  - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level `CMakeLists.txt`.
  - Add `/tools/cmake` to `CMAKE_MODULE_PATH` and include core modules plus the various helper/third-party scripts.
  - Set build tools/executables such as default Python interpreter.
  - Get ESP-IDF git revision and store as `IDF_VER`.
  - Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
  - Add components in `components` to the build.
- **The initial part of the custom `project()` command performs the following steps:**
  - Set `IDF_TARGET` from environment variable or CMake cache and the corresponding `CMAKE_TOOLCHAIN_FILE` to be used.
  - Add components in `EXTRA_COMPONENTS_DIRS` to the build.
  - Prepare arguments for calling command `idf_build_process()` from variables such as `COMPONENTS/EXCLUDE_COMPONENTS`, `SDKCONFIG`, `SDKCONFIG_DEFAULTS`.

The call to `idf_build_process()` command marks the end of this phase.

## Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of `idf_build_process()`.

- Retrieve each component's public and private requirements. A child process is created which executes each component's `CMakeLists.txt` in script mode. The values of `idf_component_register` `REQUIRES` and `PRIV_REQUIRES` argument is returned to the parent build process. This is called early expansion. The variable `CMAKE_BUILD_EARLY_EXPANSION` is defined during this step.
- Recursively include components based on public and private requirements.

## Processing

This phase processes the components in the build, and is the second half of `idf_build_process()`.

- Load project configuration from `sdkconfig` file and generate an `sdkconfig.cmake` and `sdkconfig.h` header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
- Include each component's `project_include.cmake`.
- Add each component as a subdirectory, processing its `CMakeLists.txt`. The component `CMakeLists.txt` calls the registration command, `idf_component_register` which adds source files, include directories, creates component library, links dependencies, etc.

## Finalization

This phase is everything after `idf_build_process()`.

- Create executable and link the component libraries to it.
- Generate project metadata files such as `project_description.json` and display relevant information about the project built.

Browse </tools/cmake/project.cmake> for more details.

### 4.5.25 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, `idf_component_register`.

#### Automatic Conversion Tool

An automatic project conversion tool is available in [/tools/cmake/convert\\_to\\_cmake.py](/tools/cmake/convert_to_cmake.py). Run this command line tool with the path to a project like this:

```
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
```

The project directory must contain a Makefile, and GNU Make (`make`) must be installed and available on the `PATH`.

The tool will convert the project Makefile and any component `component.mk` files to their equivalent CMake-`Lists.txt` files.

It does so by running `make` to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent CMakefiles to set the same variables.

---

**Important:** When the conversion tool converts a `component.mk` file, it doesn't determine what other components that component depends on. This information needs to be added manually by editing the new component `CMakeLists.txt` file and adding `REQUIRES` and/or `PRIV_REQUIRES` clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See [Component Requirements](#).

---

The conversion tool is not capable of dealing with complex Makefile logic or unusual targets. These will need to be converted by hand.

#### No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- `COMPONENT_BUILD_DIR`: Use `CMAKE_CURRENT_BINARY_DIR` instead.

- `COMPONENT_LIBRARY`: Defaulted to `$(COMPONENT_NAME).a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- `CC`, `LD`, `AR`, `OBJCOPY`: Full paths to each tool from the gcc xtensa cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. [Full list here](#).
- `HOSTCC`, `HOSTLD`, `HOSTAR`: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- `COMPONENT_ADD_LDFLAGS`: Used to override linker flags. Use the CMake [target\\_link\\_libraries](#) command instead.
- `COMPONENT_ADD_LINKER_DEPS`: List of files that linking should depend on. [target\\_link\\_libraries](#) will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- `COMPONENT_SUBMODULES`: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- `COMPONENT_EXTRA_INCLUDES`: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `COMPONENT_PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- `COMPONENT_OBJS`: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRC` argument to `idf_component_register`.
- `COMPONENT_OBJEXCLUDE`: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- `COMPONENT_EXTRA_CLEAN`: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note [CMake has some restrictions around this functionality](#).
- `COMPONENT_OWNBUILDTARGET` & `COMPONENT_OWNCLEANTARGET`: Use CMake [ExternalProject](#) instead. See [Fully Overriding The Component Build Process](#) for full details.
- `COMPONENT_CONFIG_ONLY`: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](#).
- `CFLAGS`, `CPPFLAGS`, `CXXFLAGS`: Use equivalent CMake commands instead. See [Controlling Component Compilation](#).

### No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)
- Include directories (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)

### No Longer Necessary

- In the legacy Make-based build system, it is required to also set `COMPONENT_SRCDIRS` if `COMPONENT_SRCS` is set. In CMake, the equivalent is not necessary i.e. specifying `SRC_DIRS` to `idf_component_register` if `SRC` is also specified (in fact, `SRC` is ignored if `SRC_DIRS` is specified).

### Flashing from make

`make flash` and similar targets still work to build and flash. However, project `sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See [Flashing with ninja or make](#) for more details.

## 4.6 Deep Sleep Wake Stubs

ESP32-C3 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

### 4.6.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

### 4.6.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`.

It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under `components/esp32c3`.

### 4.6.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

## 4.6.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into `RTC_FAST` and `RTC_SLOW` memory respectively, but for ESP32-C3 there is only RTC fast memory, so both attributes will map to this region.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` Kconfig option, see more information in [Fast boot from Deep Sleep](#).

## 4.6.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32-C3 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

---

**Note:** When the `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

---

## 4.7 Error Handling

### 4.7.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using `throw` keyword

- Unrecoverable (fatal) errors:
  - Failed assertions (using `assert` macro and equivalent methods) and `abort()` calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see [Fatal Errors](#).

## 4.7.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with `ESP_OK` code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR_` prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see [Error Code Reference](#).

## 4.7.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing `0x101` to `esp_err_to_name()` will return “ESP\_ERR\_NO\_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a [standard POSIX error code](#), if no matching `ESP_ERR_` value is found. This is done using `strerror_r` function. POSIX error codes (such as `ENOENT`, `ENOMEM`) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#). When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return `UNKNOWN_ERROR`, and `esp_err_to_name_r()` will return `Unknown error 0xXXXX(YYYYY)`, where `0xXXXX` and `YYYYY` are the hexadecimal and decimal representations of the error code, respectively.

## 4.7.4 ESP\_ERROR\_CHECK macro

`ESP_ERROR_CHECK()` macro serves similar purpose as `assert`, except that it checks `esp_err_t` value rather than a `bool` condition. If the argument of `ESP_ERROR_CHECK()` is not equal `ESP_OK`, then an error message is printed on the console, and `abort()` is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030_
↳0x400d0816:0x3ffb5050
```

---

**Note:** If *IDF monitor* is used, addresses in the backtrace will be converted to file names and line numbers.

---

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on *CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP* option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where `ESP_ERROR_CHECK()` macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See *Fatal Errors* for more information about the backtrace.

### 4.7.5 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g reset an external peripheral which is not responding).

Example:

```
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}
```

2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.

Example:

```
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g. to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}
```

3. Convert into unrecoverable error, for example using `ESP_ERROR_CHECK`. See *ESP\_ERROR\_CHECK macro* section for details.

Terminating the application in case of an error is usually undesirable behaviour for middleware components, but is sometimes acceptable at application level.

Many ESP-IDF examples use `ESP_ERROR_CHECK` to handle errors from various APIs. This is not the best practice for applications, and is done to make example code more concise.

Example:

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.7.6 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using *CONFIG\_COMPILER\_CXX\_EXCEPTIONS* option.

Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` variable.

If an exception is thrown, but there is no `catch` block, the program will be terminated by `abort` function, and backtrace will be printed. See [Fatal Errors](#) for more information about backtraces.

See [cxx/exceptions](#) for an example of C++ exception handling.

## 4.8 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation, sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is dependent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the [ESP-BLE-MESH Architecture](#) for information about the implementation of ESP-BLE-MESH architecture and [ESP-BLE-MESH API Reference](#) for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer [here](#) for the certification details of ESP-BLE-MESH.

---

**Note:** If you are looking for Wi-Fi based implementation of mesh for ESP32-C3, please check another product by Espressif called ESP-MESH. For more information and documentation see [ESP-MESH](#).

---

### 4.8.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32-C3 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF [Get Started](#) documentation.

#### What You Need

Hardware:

- Three ESP32-C3 boards, see [options](#).
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

Software:

- Example application [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) code to load to the ESP32-C3 boards.
- Mobile App: **nRF Mesh** for Android or iOS. Optionally you can use some other Apps:
  - [EspBLEMesh](#) Android App
  - Silicon Labs Android or iOS App

### Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

**Step 1. Check Hardware** Both [ESP32-DevKitC](#) and [ESP-WROVER-KIT](#) development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: `idf.py menuconfig` > Example Configuration > Board selection for ESP-BLE-MESH

---

**Note:** If you plan to use [ESP32-DevKitC](#), connect a RGB LED to GPIO pins 25, 26 and 27.

---

**Step 2. Configure Software** Enter the [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) example directory, run `idf.py menuconfig` to select your board and then run `idf.py build` to compile the example.

**Step 3. Upload Application to Nodes** After the [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) example is compiled successfully, users can run `idf.py flash` to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn **GREEN**.

Fig. 4: ESP-BLE-MESH Devices Power On

**Step 4. Provision Nodes** In this section, we will use the **nRF Mesh Android** App to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

**4.1 Scanner** The Scanner is App's functionality to search for unprovisioned devices in range. Open the App, press **Scanner** at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

Fig. 5: nRF Mesh - Scanner

**4.2 Identify** Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the **IDENTIFY** interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

**Note:** The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the **IDENTIFY** interface button, no signs can be seen from the device except from the log on the serial monitor.

After the **IDENTIFY** interface button is pressed, users can see the **PROVISION** interface button.

**4.3 Provision** Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing **OK**, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

Fig. 6: nRF Mesh - IDENTIFY - PROVISION

Fig. 7: nRF Mesh - Configuration Complete

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing **OK**, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press **CONNECT** on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

Fig. 8: nRF Mesh - Initial Configuration Failed

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing **CONNECT**, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

**4.4 Configuration** When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.

**Note:** No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

**Step 5. Operate Network** After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

Fig. 9: nRF Mesh - Reconnect - Initial Configuration

Fig. 10: nRF Mesh - Reconnect - Three Nodes

Fig. 11: nRF Mesh - Model Bind AppKey

In the [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

The following screenshot shows different board with different color on.

---

**Note:** For **nRF Mesh** iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

---

## 4.8.2 ESP-BLE-MESH Examples

- [ESP-BLE-MESH Node OnOff Server](#) - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see [example code](#) .
- [ESP-BLE-MESH Node OnOff Client](#) - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Provisioner](#) - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Fast Provisioning - Client](#) and [Server](#) - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see [example client code](#) and [example server code](#) .
- [ESP-BLE-MESH and Wi-Fi Coexistence](#) - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32-C3. Simply put, users can use the Wi-Fi while operating Bluetooth, see [example code](#) .
- [ESP-BLE-MESH Console](#) - an example that implements BLE Mesh basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see [example node code](#) .

## ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

- ESP-BLE-MESH Architecture Overview
  - Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
- ESP-BLE-MESH Architecture Implementation
  - Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
- ESP-BLE-MESH Auxiliary Routines
  - Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

**1. ESP-BLE-MESH Architecture Overview** Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth [certification](#).

ESP-BLE-MESH architecture includes five key parts:

- Mesh Protocol Stack
  - Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
  - Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
  - Mesh Models is responsible for the implementation of SIG-defined models.
- Network Management

Fig. 14: Figure 1.1 ESP-BLE-MESH Architecture Diagram

- Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
- Features
  - Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
- Mesh Bearer Layer
  - Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.
- Applications
  - Based on ESP-BLE-MESH protocol stack and Mesh Models.
  - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

## 1.1 Mesh Protocol Stack

**1.1.1 Mesh Networking** Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

Table 2: Table 1.1 Mesh Networking Architecture Description

Layer	Function
Access Layer	Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.
Upper Transport Layer	Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages” , including messages related to “friendship” and heartbeat messages.
Lower Transport Layer	Lower Transport Layer handles segmentation and reassembly of PDU.
Network Layer	Network Layer defines the address type and format of the network messages, and implements the relay function of the device.

**1.1.2 Mesh Provisioning** Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

Table 3: Table 1.2 Mesh Provisioning Architecture Description

Layer	Function
Provisioning PDUs	Provisioning PDUs from different layers are handled using provisioning protocol.
Generic Provisioning PDU/Proxy PDU	The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.
PB-ADV/PB-GATT	These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.
Advertising/Provisioning Service	The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.

**1.1.3 Mesh Models** `Mesh Models` in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:

Table 4: Table 1.3 Mesh Models Architecture Description

Layer	Function
Model Layer	Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.
Foundation Model Layer	Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.

**1.2 Mesh Network Management** `Network Management` implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node's IV Index.
- IV update procedure is used to update the nodes' IV Index.
- Key refresh procedure is used to update the nodes' NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node's networking information.

**1.3 Mesh Features** `Features` includes the following options:

- Low Power feature is used to reduce node's power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

**1.4 Mesh Bearer Layer** `Bearers` in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

`Bearers` can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

Table 5: Table 1.3 Mesh Bearers Description

Layer	Function
GATT Bearer	The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.
Advertising Bearer	When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.

**1.5 Mesh Applications** The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
  - Call the provisioning-related API for provisioning.
  - Call the model-related API to send messages.
  - Call the device-attributes-related API to get local information about the device.
- Application layer processes Event
 

The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.

  - **The events completed by calling API.**
    - \* Such as nodes sending messages.
  - **The events that the protocol stack actively reports to the application layer.**
    - \* The Event that the protocol stack actively reports.
    - \* The Event that Model actively reports.
- The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between API / Event and ESP-BLE-MESH protocol stack

- API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
- The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.

**2. ESP-BLE-MESH Architecture Implementation** The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

- **Layer-based Approach:** With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.
- **Module-based Approach:** Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

## 2.1 Mesh Protocol Stack Implementation

**2.1.1 Mesh Networking Implementation** The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

Fig. 15: Figure 2.1 ESP-BLE-MESH Architecture Implementation Diagram

Table 6: Table 2.1 Mesh Networking File Description :widths: 40 150  
:header-rows: 1

File	Functionality
<a href="#">ac- cess.c</a>	ESP-BLE-MESH Access Layer
<a href="#">trans- port.c</a>	ESP-BLE-MESH Lower/Upper Transport Layer
<a href="#">net.c</a>	ESP-BLE-MESH Network Layer
<a href="#">adv.c</a>	A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers

**2.1.2 Mesh Provisioning Implementation** The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

Table 7: Table 2.2 Mesh Provisioning (Node) File Description

File	Functionality
<a href="#">prov.c</a>	ESP-BLE-MESH Node provisioning (PB-ADV & PB-GATT)
<a href="#">proxy_server.c</a>	ESP-BLE-MESH Proxy Server related functionalities
<a href="#">beacon.c</a>	APIs used to handle ESP-BLE-MESH Beacons

Specific files that implement functions of Provisioner are shown in Table 2.3:

Table 8: Table 2.3 Mesh Provisioning (Provisioner) File Description

File	Functionality
<a href="#">provisioner_prov.c</a>	ESP-BLE-MESH Provisioner provisioning (PB-ADV & PB-GATT)
<a href="#">proxy_client.c</a>	ESP-BLE-MESH Proxy Client related functionalities
<a href="#">provisioner_main.c</a>	ESP-BLE-MESH Provisioner networking related functionalities

**2.1.3 Mesh Models Implementation** Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

Table 9: Table 2.4 Mesh Models File Description

File	Functionality
<a href="#">cfg_cli.c</a>	Send Configuration Client messages and receive corresponding response messages
<a href="#">cfg_srv.c</a>	Receive Configuration Client messages and send proper response messages
<a href="#">health_cli.c</a>	Send Health Client messages and receive corresponding response messages
<a href="#">health_srv.c</a>	Receive Health Client messages and send proper response messages
<a href="#">client_common.c</a>	ESP-BLE-MESH model related operations
<a href="#">generic_client.c</a>	Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages
<a href="#">lighting_client.c</a>	Send ESP-BLE-MESH Lighting Client messages and receive corresponding response messages
<a href="#">sensor_client.c</a>	Send ESP-BLE-MESH Sensor Client messages and receive corresponding response messages
<a href="#">time_scene_client.c</a>	Send ESP-BLE-MESH Time Scene Client messages and receive corresponding response messages
<a href="#">generic_server.c</a>	Receive ESP-BLE-MESH Generic Client messages and send corresponding response messages
<a href="#">lighting_server.c</a>	Receive ESP-BLE-MESH Lighting Client messages and send corresponding response messages
<a href="#">sensor_server.c</a>	Receive ESP-BLE-MESH Sensor Client messages and send corresponding response messages
<a href="#">time_scene_server.c</a>	Receive ESP-BLE-MESH Time Scene Client messages and send corresponding response messages

**2.2 Mesh Bearers Implementation** Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify [mesh\\_bearer\\_adapt.c](#) (example of [NimBLE version](#)).

Table 10: Table 2.5 Mesh Bearers File Description

File	Functionality
<a href="#">mesh_bearer_adapt.c</a>	ESP-BLE-MESH Bearer Layer adapter , This file provides the interfaces used to receive and send ESP-BLE-MESH ADV & GATT related packets.

---

**Note:** [mesh\\_bearer\\_adapt.c](#) is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

---

**2.3 Mesh Applications Implementation** We have provided a series of application examples for customer development, and users can develop products based on [ESP-BLE-MESH Examples](#).

**3. Auxiliary Routine** Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through [CONFIG\\_BLE\\_MESH](#).

### 3.1 Features

- Low Power
- Friend
- Relay
- Proxy Client/Server

### 3.2 Network Management

- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

**3.3 Auxiliary Routine Implementation** When adopting the design of independent module, the two main factors should be considered:

- The module can not be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

Table 11: Table 3.1 Module File Description

File	Functionality
<a href="#">lpn.c</a>	ESP-BLE-MESH Low Power functionality
<a href="#">friend.c</a>	ESP-BLE-MESH Friend functionality
<a href="#">net.c</a>	ESP-BLE-MESH Relay feature, network creation, IV Update procedure, IV Index recovery procedure, Key Refresh procedure related functionalities
<a href="#">proxy_server.c</a>	ESP-BLE-MESH Proxy Server related functionalities
<a href="#">proxy_client.c</a>	ESP-BLE-MESH Proxy Client related functionalities
<a href="#">settings.c</a>	ESP-BLE-MESH NVS storage functionality
<a href="#">main.c</a>	ESP-BLE-MESH stack initialize, stack enable, node removal related functionalities

### ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:

- [1. Provisioner Development](#)
- [2. Node Development](#)
- [3. ESP-BLE-MESH and Wi-Fi Coexistence](#)
- [4. Fast Provisioning](#)
- [5. Log Help](#)
- [6. Example Help](#)
- [7. Others](#)

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

**1. Provisioner Development** Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.

#### 1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.

- The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

### 1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

- Client model that corresponds to server model of the node is required.
- NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
- The address owned by the node shall be known, which could be its unicast address or subscription address.

### 1.3 How can NetKey and AppKey be used?

- NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
- AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

### 1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

- The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
- The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

### 1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can't be changed afterwards.

### 1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message ?

The unicast address of Provisioner can be set only once during initialization and can't be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address. Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.

### 1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed ?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can't be changed afterwards.

### 1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.

### 1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner set to unprovisioned device during provisioning. It can be set only once during initialization and can't be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.

**1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples ?**

There are four authentication methods, i.e. No OOB, Static OOB, Output OOB and Input OOB. In the provided examples, No OOB is used.

**1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?**

- Device UUID
- OOB Info
- URL Hash (optional)

**1.12 Can such information be used for device identification?**

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

**1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?**

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

**1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?**

- Provisioner can get the Composition Data of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `comp_data_get` in the parameter `esp_ble_mesh_cfg_client_get_state_t` set properly.
- Users can refer to the following code to parse the Composition Data:

```
#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A0001000800030000010501000000800100001003103F002A00
//0C00 1A00 0100 0800 0300 0001 05 01 0000 0080 0100 0010 0310 3F002A00

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000,
→ 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model_
→Identifier 0x002A

ret = decode_comp_data(&head, &data, mystr, sizeof(mystr));
if (ret == -1) {
    printf("decode_comp_data error");
}
}

```

### 1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()`.

- Add AppKey to nodes with `app_key_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Add subscription address to the models of nodes with `model_sub_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Set publication information to the models of nodes with `model_pub_set` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

### 1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```

esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t_
→group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == group_addr) {
                break;
            }
        }
    }
}

```

(continues on next page)

```

    }
}
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGW(TAG, "%s: Group address already exists, element_
↪index: %d", __func__, i);
    continue;
}
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
        model->groups[j] = group_addr;
        break;
    }
}
if (j == ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element_
↪index: %d", __func__, i);
}
}

return ESP_OK;
}

```

**Note:** When the NVS storage of the node is enabled, group address added and AppKey bound by this method will not be saved in the NVS when the device is powered off currently. These configuration information can only be saved if they are configured by Configuration Client Model.

### 1.17 How does Provisioner control nodes by grouping?

Generally there are two approaches to implement group control in ESP-BLE-MESH network, group address approach and virtual address approach. And supposing there are 10 devices, i.e., five devices with blue lights and five devices with red lights.

- Method 1: 5 blue lights can subscribe to a group address, 5 red lights subscribe to another one. By sending messages to different group addresses, Provisioner can realize group control.
- Method 2: 5 blue lights can subscribe to a virtual address, 5 red lights subscribe to another one. By sending messages to different virtual addresses, Provisioner can realize group control.

### 1.18 How does Provisioner add nodes to multiple subnets?

Provisioner can add multiple NetKeys to nodes during configuration, and nodes sharing the same NetKey belong to the same subnet. Provisioner can communicate with nodes on different subnets by using different NetKeys.

### 1.19 How does Provisioner know if a node in the mesh network is offline?

Node offline is usually defined as: the condition that the node cannot be properly communicated with other nodes in the mesh network due to power failure or some other reasons.

There is no connection between nodes and nodes in the ESP-BLE-MESH network. They communicate with each other through advertising channels.

An example is given here to show how to detect a node is offline by Provisioner.

- The node can periodically send heartbeat messages to Provisioner. And if Provisioner failed to receive heartbeat messages in a certain period, the node is considered to be offline.

**Note:** The heartbeat message should be designed into a single package (less than 11 bytes), so the transmission and reception of it can be more efficient.

---

### 1.20 What operations should be performed when Provisioner removes nodes from the network?

Usually when Provisioner tries to remove node from the mesh network, the procedure includes three main steps:

- Firstly, Provisioner adds the node that need to be removed to the “blacklist” .
- Secondly, Provisioner performs the *Key Refresh procedure*.
- Lastly, the node performs node reset procedure, and switches itself to an unprovisioned device.

### 1.21 In the Key Refresh procedure, how does Provisioner update the Netkey owned by nodes?

- Provisioner updates the NetKey of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `net_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Provisioner updates the AppKey of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `app_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

### 1.22 How does Provisioner manage nodes in the mesh network?

ESP-BLE-MESH implements several functions related to basic node management in the example, such as `esp_ble_mesh_store_node_info()`. And ESP-BLE-MESH also provides the API `esp_ble_mesh_provisioner_set_node_name()` which can be used to set the node’s local name and the API `esp_ble_mesh_provisioner_get_node_name()` which can be used to get the node’s local name.

### 1.23 What does Provisioner need when trying to control the server model of nodes?

Provisioner must include corresponding client model before controlling the server model of nodes.

Provisioner shall add its local NetKey and AppKey.

- Provisioner add NetKey by calling the API `esp_ble_mesh_provisioner_add_local_net_key()`.
- Provisioner add AppKey by calling the API `esp_ble_mesh_provisioner_add_local_app_key()`.

Provisioner shall configure its own client model.

- Provisioner bind AppKey to its own client model by calling the API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()`.

### 1.24 How does Provisioner control the server model of nodes?

ESP-BLE-MESH supports all SIG-defined client models. Provisioner can use these client models to control the server models of nodes. And the client models are divided into 6 categories with each category has the corresponding functions.

- Configuration Client Model
  - The API `esp_ble_mesh_config_client_get_state()` can be used to get the `esp_ble_mesh_cfg_client_get_state_t` values of Configuration Server Model.
  - The API `esp_ble_mesh_config_client_set_state()` can be used to set the `esp_ble_mesh_cfg_client_set_state_t` values of Configuration Server Model.
- Health Client Model
  - The API `esp_ble_mesh_health_client_get_state()` can be used to get the `esp_ble_mesh_health_client_get_state_t` values of Health Server Model.

- The API `esp_ble_mesh_health_client_set_state()` can be used to set the `esp_ble_mesh_health_client_set_state_t` values of Health Server Model.
- **Generic Client Models**
  - The API `esp_ble_mesh_generic_client_get_state()` can be used to get the `esp_ble_mesh_generic_client_get_state_t` values of Generic Server Models.
  - The API `esp_ble_mesh_generic_client_set_state()` can be used to set the `esp_ble_mesh_generic_client_set_state_t` values of Generic Server Models.
- **Lighting Client Models**
  - The API `esp_ble_mesh_light_client_get_state()` can be used to get the `esp_ble_mesh_light_client_get_state_t` values of Lighting Server Models.
  - The API `esp_ble_mesh_light_client_set_state()` can be used to set the `esp_ble_mesh_light_client_set_state_t` values of Lighting Server Models.
- **Sensor Client Models**
  - The API `esp_ble_mesh_sensor_client_get_state()` can be used to get the `esp_ble_mesh_sensor_client_get_state_t` values of Sensor Server Model.
  - The API `esp_ble_mesh_sensor_client_set_state()` can be used to set the `esp_ble_mesh_sensor_client_set_state_t` values of Sensor Server Model.
- **Time and Scenes Client Models**
  - The API `esp_ble_mesh_time_scene_client_get_state()` can be used to get the `esp_ble_mesh_time_scene_client_get_state_t` values of Time and Scenes Server Models.
  - The API `esp_ble_mesh_time_scene_client_set_state()` can be used to set the `esp_ble_mesh_time_scene_client_set_state_t` values of Time and Scenes Server Models.

## 2. Node Development

### 2.1 What kind of models are included by nodes?

- In ESP-BLE-MESH, nodes are all composed of a series of models with each model implements some functions of the node.
- Model has two types, client model and server model. Client model can get and set the states of server model.
- Model can also be divided into SIG model and vendor model. All behaviors of SIG models are officially defined while behaviors of vendor models are defined by users.

### 2.2 Is the format of messages corresponding to each model fixed?

- Messages, which consist of opcode and payload, are divided by opcode.
- The type and the format of the messages corresponding to models are both fixed, which means the messages transmitted between models are fixed.

### 2.3 Which functions can be used to send messages with the models of nodes?

- For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` to send messages.
- For server models, users can use the API `esp_ble_mesh_server_model_send_msg()` to send messages.
- For publication, users call the API `esp_ble_mesh_model_publish()` to publish messages.

### 2.4 How to achieve the transmission of messages without packet loss?

Acknowledged message is needed if users want to transmit messages without packet loss. The default time to wait for corresponding response is set in `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`. If the sender waits for the response until the timer expires, the corresponding timeout event would be triggered.

---

**Note:** Response timeout can be set in the API `esp_ble_mesh_client_model_send_msg()`. The default value (4 seconds) would be applied if the parameter `msg_timeout` is set to **0**.

---

### 2.5 How to send unacknowledged messages?

For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` to send unacknowledged messages.

For server models, the messages sent by using the API `esp_ble_mesh_server_model_send_msg()` are always unacknowledged messages.

### 2.6 How to add subscription address to models?

Subscription address can be added through Configuration Client Model.

### 2.7 What is the difference between messages sent and published by models?

Messages sent by calling the API `esp_ble_mesh_client_model_send_msg()` or `esp_ble_mesh_server_model_send_msg()` will be sent in the duration determined by the Network Transmit state.

Messages published by calling the API `esp_ble_mesh_model_publish()` will be published determined by the Model Publication state. And the publication of messages is generally periodic or with a fixed number of counts. The publication period and publication count are controlled by the Model Publication state, and can be configured through Configuration Client Model.

### 2.8 How many bytes can be carried when sending unsegmented messages?

The total payload length (which can be set by users) of unsegmented message is 11 octets, so if the opcode of the message is 2 octets, then the message can carry 9-octets of valid information. For vendor messages, due to the 3-octets opcode, the remaining payload length is 8 octets.

### 2.9 When should the Relay feature of nodes be enabled?

Users can enable the Relay feature of all nodes when nodes detected in the mesh network are sparse.

For dense mesh network, users can choose to just enable the Relay feature of several nodes.

And users can enable the Relay feature by default if the mesh network size is unknown.

### 2.10 When should the Proxy feature of node be enabled?

If the unprovisioned device is expected to be provisioned by a phone, then it should enable the Proxy feature since almost all the phones do not support sending ESP-BLE-MESH packets through advertising bearer currently. And after the unprovisioned device is provisioned successfully and becoming a Proxy node, it will communicate with the phone using GATT bearer and using advertising bearer to communicate with other nodes in the mesh network.

### 2.11 How to use the Proxy filter?

The Proxy filter is used to reduce the number of Network PDUs exchanged between a Proxy Client (e.g. the phone) and a Proxy Server (e.g. the node). And with the Proxy filter, Proxy Client can explicitly request to receive only mesh messages with certain destination addresses from Proxy Server.

### 2.12 When a message can be relayed by a Relay node?

If a message need to be relayed, the following conditions should be met.

- The message is in the mesh network.
- The message is not sent to the unicast address of the node.
- The value of TTL in the message is greater than 1.

### 2.13 If a message is segmented into several segments, should the other Relay nodes just relay when one of these segments is received or wait until the message is received completely?

Relay nodes will forward segments when one of them are received rather than keeping waiting until all the segments are received.

### 2.14 What is the principle of reducing power consumption using Low Power feature?

- When the radio is turned on for listening, the device is consuming energy. When low power feature of the node is enabled, it will turn off its radio in the most of the time.
- And cooperation is needed between low power node and friend node, thus low power node can receive messages at an appropriate or lower frequency without the need to keep listening.
- When there are some new messages for low power node, its friend node will store the messages for it. And low power node can poll friend nodes to see if there are new messages at a fixed interval.

### 2.15 How to continue the communication on the network after powering-down and powering-up again?

Enable the configuration `Store ESP-BLE-MESH Node configuration persistently` in `menuconfig`.

### 2.16 How to send out the self-test results of nodes?

It is recommended that nodes can publish its self-test results periodically through Health Server Model.

### 2.17 How to transmit information between nodes?

One possible application scenario for transmitting information between nodes is that spray nodes would be triggered once smoke alarm detected high smoke concentration. There are two approaches in implementation.

- Approach 1 is that spray node subscribes to a group address. When smoke alarm detects high smoke concentration, it will publish a message whose destination address is the group address which has been subscribed by spray node.
- Approach 2 is that Provisioner can configure the unicast address of spray node to the smoke alarm. When high smoke concentration is detected, smoke alarm can use send messages to the spray node with the spray node's unicast address as the destination address.

### 2.18 Is gateway a must for nodes communication?

- Situation 1: nodes only communicate within the mesh network. In this situation, no gateway is need. ESP-BLE-MESH network is a flooded network, messages in the network have no fixed paths, and nodes can communicate with each other freely.
- Situation 2: if users want to control the nodes remotely, for example turn on some nodes before getting home, then a gateway is needed.

### 2.19 When will the IV Update procedure be performed?

IV Update procedure would be performed once sequence number of messages sent detected by the bottom layer of node reached a critical value.

## 2.20 How to perform IV Update procedure?

Nodes can perform IV Update procedure with Secure Network Beacon.

## 3. ESP-BLE-MESH and Wi-Fi Coexistence

### 3.1 Which modes does Wi-Fi support when it coexists with ESP-BLE-MESH?

Currently only Wi-Fi station mode supports the coexistence.

### 3.2 Why is the Wi-Fi throughput so low when Wi-Fi and ESP-BLE-MESH coexist?

The `ESP32-DevKitC` board without PSRAM can run properly but the throughput of it is low since it has no PSRAM. When Bluetooth and Wi-Fi coexist, the throughput of ESP32-DevKitC with PSRAM can be stabilized to more than 1Mbps.

And some configurations in `menuconfig` shall be enabled to support PSRAM.

- `ESP32-specific` --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
- `Bluetooth` --> `Bluedroid Enable` --> BT/BLE will first malloc the memory from the PSRAM
- `Bluetooth` --> `Bluedroid Enable` --> Use dynamic memory allocation in BT/BLE stack.
- `Bluetooth` --> `Bluetooth controller` --> BLE full scan feature supported.
- `Wi-Fi` --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi

## 4. Fast Provisioning

### 4.1 Why is fast provisioning needed?

Normally when they are several unprovisioned devices, users can provision them one by one. But when it comes to a large number of unprovisioned devices (e.g. 100), provisioning them one by one will take huge amount of time. With fast provisioning, users can provision 100 unprovisioned devices in about 50 seconds.

### 4.2 Why EspBleMesh App would wait for a long time during fast provisioning?

After the App provisioned one Proxy node, it will disconnect from the App during fast provisioning, and reconnect with the App when all the nodes are provisioned.

### 4.3 Why is the number of node addresses displayed in the App is more than that of existing node addresses?

Each time after a fast provisioning process, and before starting a new one, the node addresses in the App should be cleared, otherwise the number of the node address will be incorrect.

### 4.4 What is the usage of the count value which was input in EspBleMesh App?

The **count** value is provided to the Proxy node which is provisioned by the App so as to determine when to start Proxy advertising in advance.

### 4.5 When will Configuration Client Model of the node running fast\_prov\_server example start to work?

Configuration Client Model will start to work after the Temporary Provisioner functionality is enabled.

#### 4.6 Will the Temporary Provisioner functionality be enabled all the time?

After the nodes receive messages used to turn on/off lights, all the nodes will disable its Temporary Provisioner functionality and become nodes.

#### 5. Log Help

You can find meaning of errors or warnings when they appear at the bottom of ESP-BLE-MESH stack.

##### 5.1 What is the meaning of warning **ran out of retransmit attempts?**

When the node transmits a segmented message, and due to some reasons, the receiver doesn't receive the complete message. Then the node will retransmit the message. When the retransmission count reaches the maximum number, which is 4 currently, then this warning will appear.

##### 5.2 What is the meaning of warning **Duplicate found in Network Message Cache?**

When the node receives a message, it will compare the message with the ones stored in the network cache. If the same has been found in the cache, which means it has been received before, then the message will be dropped.

##### 5.3 What is the meaning of warning **Incomplete timer expired?**

When the node doesn't receive all the segments of a segmented message during a certain period (e.g. 10 seconds), then the Incomplete timer will expire and this warning will appear.

##### 5.4 What is the meaning of warning **No matching TX context for ack?**

When the node receives a segment ack and it doesn't find any self-send segmented message related with this ack, then this warning will appear.

##### 5.5 What is the meaning of warning **No free slots for new incoming segmented messages?**

When the node has no space for receiving new segmented message, this warning will appear. Users can make the space larger through the configuration `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`.

##### 5.6 What is the meaning of error **Model not bound to Appkey 0x0000 ?**

When the node sends messages with a model and the model has not been bound to the AppKey with AppKey Index 0x000, then this error will appear.

##### 5.7 What is the meaning of error **Busy sending message to DST xxxx?**

This error means client model of the node has transmitted a message to the target node and now is waiting for a response, users can not send messages to the same node with the same unicast address. After the corresponding response is received or timer is expired, then another message can be sent.

## 6. Example Help

### 6.1 How are the ESP-BLE-MESH callback functions classified?

- The API `esp_ble_mesh_register_prov_callback()` is used to register callback function used to handle provisioning and networking related events.
- The API `esp_ble_mesh_register_config_client_callback()` is used to register callback function used to handle Configuration Client Model related events.
- The API `esp_ble_mesh_register_config_server_callback()` is used to register callback function used to handle Configuration Server Model related events.

- The API `esp_ble_mesh_register_health_client_callback()` is used to register callback function used to handle Health Client Model related events.
- The API `esp_ble_mesh_register_health_server_callback()` is used to register callback function used to handle Health Server Model related events.
- The API `esp_ble_mesh_register_generic_client_callback()` is used to register callback function used to handle Generic Client Models related events.
- The API `esp_ble_mesh_register_light_client_callback()` is used to register callback function used to handle Lighting Client Models related events.
- The API `esp_ble_mesh_register_sensor_client_callback()` is used to register callback function used to handle Sensor Client Model related events.
- The API `esp_ble_mesh_register_time_scene_client_callback()` is used to register callback function used to handle Time and Scenes Client Models related events.
- The API `esp_ble_mesh_register_custom_model_callback()` is used to register callback function used to handle vendor model and unrealized server models related events.

## 7. Others

### 7.1 How to print the message context?

The examples use `ESP_LOG_BUFFER_HEX()` to print the message context while the ESP-BLE-MESH protocol stack uses `bt_hex()`.

### 7.2 Which API can be used to restart ESP32-C3?

The API `esp_restart()`.

### 7.3 How to monitor the remaining space of the stack of a task?

The API `vTaskList()` can be used to print the remaining space of the task stack periodically.

### 7.4 How to change the level of log without changing the menuconfig output level?

The API `esp_log_level_set()` can be used to change the log output level rather than using menuconfig to change it.

## ESP-BLE-MESH Terminology

Table 12: Table 1 ESP-BLE-MESH Terminology - Role

Term	Official Definition	Detailed Explanation
Unprovisioned Device	A device that is not a member of a mesh network is known as an unprovisioned device.	Examples: lighting devices, temperature control devices, manufacturing equipments and electric doors, etc.
Node	A node is a provisioned device.	The role of unprovisioned device will change to node after being provisioned to ESP-BLE-MESH network. Nodes (such as lighting devices, temperature control devices, manufacturing equipments, and electric doors) are devices that can send, receive, or relay messages in ESP-BLE-MESH network, and they can optionally support one or more subnets.
Relay Node	A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.	Relay nodes can receive and resend ESP-BLE-MESH messages, so the messages can be transferred further. Users can decide whether or not to enable forwarding function of nodes according to nodes' status. Messages can be relayed for multiple times, and each relay is considered as a "hop". Messages can hop up to 126 times, which is enough for message transmission in a wide area.
Proxy Node	A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.	Proxy nodes receive messages from one bearer (it generally includes advertising bearer and GATT bearer) and resend it from another one. The purpose is to connect communication equipments that only support GATT bearer to ESP-BLE-MESH network. Generally, mobile apps need a Proxy node to access Mesh network. Without Proxy nodes, mobile apps cannot communicate with members in Mesh network.
Friend Node	A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.	Friend node, like the backup of Low Power node (LPN), can store messages that are sent to Low Power node and security updates; the stored information will be transferred to Low Power node when Low Power node needs it. Low Power node must establish "friendship" with another node that supports the Friend Feature to reduce duty cycle of its receiver, thus power consumption of Low Power node can be reduced. Low Power node needs to find a Friend node to establish a friendship with it. The process involved is called "friendship establishment". Cooperation between Low Power node and Friend nodes enables Low Power node to schedule the use of the radio, thus Low Power node can receive messages at an appropriate or lower frequency without the need of keeping listening. Low Power node will poll Friend node to see if there is new message.
Low Power Node	A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.	By polling, Low Power node gets information from Friend node, such as messages, security updates, and etc.
Provisioner	A node that is capable of adding a device to a mesh network.	The device that can provision unprovisioned devices is called a Provisioner. This process usually needs to be implemented through an app that is typically provided by the product manufacturer and can be used on a gateway, a smartphone, tablet or other carriers.

Table 13: Table 2 ESP-BLE-MESH Terminology - Composition

Term	Official Definition	Detailed Explanation
State	A value representing a condition of an element that is exposed by an element of a node.	Each node in a ESP-BLE-MESH network has an independent set of state values that indicate certain states of the device, like brightness, and color of lighting device. Change of state value will lead to change of the physical state of devices. For example, changing the on/off state of a device is actually turning on/off the device.
Model	A model defines the basic functionality of a node.	A node may contain multiple models, and each model defines basic functionalities of nodes, like the states needed by the nodes, the messages controlling the states, and actions resulted from messages handling. The function implementation of the nodes is based on models, which can be divided into SIG Model and Vendor Model, with the former defined by SIG and latter defined by users.
Element	An addressable entity within a device.	A node can contain one or more elements, with each having a unicast address and one or more models, and the models contained by the same element must not be the same.
Composition Data State	The Composition Data state contains information about a node, the elements it includes, and the supported models.	By reading the value of the Composition Data state, users can know basic information of the node, such as the number of elements, and the models in each element. Provisioner gets this message to further provision the device, such as configuring subscription address and publishing address of nodes.

Table 14: Table 3 ESP-BLE-MESH Terminology - Features

Term	Official Definition	Detailed Explanation
Low Power Feature	The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.	Low Power feature reduces power consumption of nodes. When a Low Power node is searching for a Friend node, and there are multiple Friend nodes nearby, it selects the most suitable Friend node through algorithm.
Friend Feature	The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.	By enabling friend feature, the node can help to store information for Low Power node. The nodes enabled with friend feature may cause more power and memory consumption.
Relay Feature	The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.	The relay feature enables ESP-BLE-MESH messages to hop among nodes for multiple times, and the transmission distance can exceed the range of direct radio transmission between two nodes, thereby covering the entire network. When a node is enabled with the relay feature to relay messages, it only relays the messages of its own subnet, and does not relay the messages of other subnets. The data integrity will not be considered when the node enabled with relay feature relays segmented messages. The node would relay every segmented message once it receives one rather than waiting for the complete message.
Proxy Feature	The ability to receive and retransmit mesh messages between GATT and advertising bearers.	The purpose of the proxy feature is to allow nodes without an advertising bearer to access the ESP-BLE-MESH network. The proxy feature is typically used in nodes that need to connect to mobile apps.

Table 15: Table 4 ESP-BLE-MESH Terminology - Provisioning

Term	Official Definition	Detailed Explanation
PB-ADV	PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.	PB-ADV transfers packets generated during the provisioning process over the advertising channels. This way can only be used for provisioning when provisioner and unprovisioned device both support PB-ADV.
PB-GATT	PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.	PB-GATT uses connection channels to transfer packets generated during the provisioning process. If an unprovisioned device wants to be provisioned through this method, it needs to implement the related Mesh Provisioning Service. Unprovisioned devices which don't implement such service cannot be provisioned into mesh network through PB-GATT bearer.
Provisioning	Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.	The process of provisioning turns the “unprovisioned device” into a “node”, making it a member of the ESP-BLE-MESH network.
Authentication Method	Authentication is a step during the provisioning of nodes.	There are four authentication methods for unprovisioned devices: Output OOB, Input OOB, Static OOB, and No OOB.
Input OOB	Input Out-of-Band	For example, a Provisioner generates and displays a random number, and then prompts users to take appropriate actions to input the random number into the unprovisioned device. Taking lighting switch as an example, users can press the button for several times in a certain period of time to input the random number displayed on the Provisioner. Authentication method of the Input OOB is similar to that of Output OOB, but the role of the device is reversed.
Output OOB	Output Out-of-Band	For example, an unprovisioned device will choose a random number and output the number in a way that is compatible with its functionality. If the unprovisioned device is a bulb, it can flash a specified number of times. If the unprovisioned device has an LCD screen, the random number can display as a multi-digit value. Users who start provisioning should input the observed number to authenticate the unprovisioned device.
Static OOB	Static Out-of-Band	Authentication method of Static OOB: use Static OOB information. Use 0 as Static OOB information if No OOB information is needed. Use Static OOB information to authenticate devices which are going through provisioning if OOB information is needed.
No OOB	No Out-of-Band	Authentication method of No OOB: Set the value of the Static OOB field to 0. Using this way is like not authenticating the unprovisioned devices.

Table 16: Table 5 ESP-BLE-MESH Terminology - Address

Term	Official Definition	Detailed Explanation
Unassigned Address	This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.	The addresses owned by elements which has not been configured yet or no address has been allocated are unassigned addresses. These elements will not be used for messages transfer because they have no fixed address. Unassigned address is recommended to set as the value of the address before setting the address of user code.
Unicast Address	A unicast address is a unique address allocated to each element.	During provisioning, the Provisioner will assign a unicast address to each element of node within the life cycle of the nodes in the network. A unicast address may appear in the source/destination address field of a message. Messages sent to a unicast address can only be processed by the element that owns the unicast address.
Virtual Address	A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.	Associated with specific UUID labels, a virtual address may serve as the publishing or subscription address of the model. A UUID label is a 128-bit value associated with elements of one or more nodes. For virtual addresses, the 15th and 14th bits are set to 1 and 0 respectively; bits from 13th to 0 are set to hash values (providing 16384 hash values). The hash is a derivation of the Label UUID. To use subscribing elements to check the full 128-bit UUID is very inefficient while hash values provide a more efficient way to determine which elements that which messages are finally sent to.
Group Address	A group address is an address that is programmed into zero or more elements	Group address is another kind of multicast address in the ESP-BLE-MESH network, which is usually used to group nodes. A message sent to the all-proxies address shall be processed by the primary element of all nodes that have the proxy functionality enabled. A message sent to the all-friends address shall be processed by the primary element of all nodes that have the friend functionality enabled. A message sent to the all-relays address shall be processed by the primary element of all nodes that have the relay functionality enabled. A message sent to the all-nodes address shall be processed by the primary element of all nodes.

Table 17: Table 6 ESP-BLE-MESH Terminology - Security

Term	Official Definition	Detailed Explanation
Device Key (DevKey)	There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.	The device key enables you to provision the devices, configure the nodes. The device key is used to encrypt Configuration Messages, i.e. the message transferred between the Provisioner and the node when the device is configured.
Application Key (App-Key)	Application keys are used to secure communications at the upper transport layer.	Application key is used for decryption of application data before delivering application data to application layer and encryption of them during the delivery of application layer. Some nodes in the network have a specific purpose and can restrict access to potentially sensitive data based on the needs of the application. With specific application keys, these nodes are associated with specific applications. Generally speaking, the fields using different application keys include security (access control of buildings, machine rooms and CEO offices), lighting (plant, exterior building and sidewalks) and HVAC systems. Application keys are bound to Network keys. This means application keys are only used in a context of a Network key they are bound to. An application key shall only be bound to a single Network key.
Master Security Material	The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network.	The corresponding friendship messages encrypted with the friendship security material: 1. Friend Poll, 2. Friend Update, 3. Friend Subscription List, add/delete/confirm, 4. The Stored Messages” sent by friend nodes to Low Power node. The corresponding friendship messages encrypted with the master security material: 1. Friend Clear, 2. Friend Clear Confirm. Based on the setup of the applications, the messages sent from the Low Power node to the friend nodes will be encrypted with the friendship security material or master security material, with the former being used by the messages transmitted between Low Power node and friend nodes and the latter being used by other network messages.

Table 18: Table 7 ESP-BLE-MESH Terminology - Message

Term	Official Definition	Detailed Explanation
Reassembly / Segmentation	Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and reassembled in a proper order at the communication receiving end.	The lower transport layer will automatically segment the message whose size is too big. The receiving end will return a response message, and the transmitting end will send the data packet again that the receiving end does not receive according to the response message. This is automatically completed by the lower transport layer. Unsegmented messages have at most 15 bytes, of which 4 bytes are transMIC, so the remaining is 11 bytes; in the case of segmentation, there are 12 valid bytes in the first several packets, and 8 in the last one. Special case: A shorter packet requires mandatory segmentation from lower transport layer, in which case the valid byte is 8 bytes.
Unacknowledged / Acknowledged	There are two types of messages: Unacknowledged or Acknowledged	Based on the whether or not the receiving end needs to send the response message, the messages sent are divided into two kinds. The sending end should set the maximum number of retransmission.

Table 19: Table 8 ESP-BLE-MESH Terminology - Foundation Models

Term	Official Definition	Detailed Explanation
Configuration Server Model	This model is used to represent a mesh network configuration of a device.	The node must contain the Configuration Server Model, which is responsible for maintaining configuration-related states. The states that Configuration Server Model maintains include: NetKey List, AppKey List, Model to AppKey List, Node Identity, Key Refresh Phase, Heartbeat Publish, Heartbeat Subscription, Network Transmit, Relay Retransmit etc.
Configuration Client Model	The model is used to represent an element that can control and monitor the configuration of a node.	The Configuration Client Model uses messages to control the state maintained by the Configuration Server Model. The Provisioner must contain the Configuration Client Model, with which the configuration messages, like Configuration Composition Data Get can be sent.
Health Server Model	This model is used to represent a mesh network diagnostics of a device.	The Health Server Model is primarily used by devices to check their states and see if there is an error. The states maintained by Health Server model include: Current Fault, Registered Fault, Health Period, and Attention Timer.
Health Client Model	The model is used to represent an element that can control and monitor the health of a node.	The Health Client Model uses messages to control the state maintained by the Health Server Model. The model can get the self-test information of other nodes through the message "Health Fault Get" .

Table 20: Table 9 ESP-BLE-MESH Terminology - Network Management

Term	Official Definition	Detailed Explanation
Key Refresh procedure	This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.	Key Refresh Procedure is used to update network key and application key of ESP-BLE-MESH network. Key Refresh Procedure is used when the security of one or more network keys and/or one or more application keys is threatened or potentially threatened. Keys are usually updated after some nodes in the network are removed.
IV (Initialisation Vector) Update Procedure	A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.	The IV Update procedure is used to update the value of ESP-BLE-MESH network's IV Index. This value is related to the random number required for message encryption. To ensure that the value of the random number is not repeated, this value is periodically incremented. IV Index is a 32-bit value and a shared network resource. For example, all nodes in a mesh network share the same IV Index value. Starting from 0x00000000, the IV Index increments during the IV Update procedure and maintained by a specific process, ensuring the IV Index shared in the mesh network is the same. This can be done when the node believes that it has the risk of exhausting its sequence number, or when it determines that another node is nearly exhausting its sequence number. Note: The update time must not be less than 96 hours. It can be triggered when a secure network beacon is received, or when the node determines that its sequence number is greater than a certain value.

## 4.9 ESP-MESH

This guide provides information regarding the ESP-MESH protocol. Please see the [MESH API Reference](#) for more information about API usage.

### 4.9.1 Overview

ESP-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-MESH guide is split into the following sections:

1. [Introduction](#)
2. [ESP-MESH Concepts](#)
3. [Building a Network](#)
4. [Managing a Network](#)
5. [Data Transmission](#)
6. [Channel Switching](#)
7. [Performance](#)
8. [Further Notes](#)

### 4.9.2 Introduction

Fig. 16: Traditional Wi-Fi Network Architecture

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and

forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

Fig. 17: ESP-MESH Network Architecture

ESP-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for relaying each others transmissions. This allows an ESP-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

### 4.9.3 ESP-MESH Concepts

## Terminology

Term	Description
Node	Any device that <b>is</b> or <b>can be</b> part of an ESP-MESH network
Root Node	The top node in the network
Child Node	A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).
Parent Node	The converse notion of a child node
Descendant Node	Any node reachable by repeated proceeding from parent to child
Sibling Nodes	Nodes that share the same parent node
Connection	A traditional Wi-Fi association between an AP and a station. A node in ESP-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.
Upstream Connection	The connection from a node to its parent node
Downstream Connection	The connection from a node to one of its child nodes
Wireless Hop	The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as <b>single-hop</b> whereas traversing multiple connections is known as <b>multi-hop</b> .
Subnetwork	A subnetwork is subdivision of an ESP-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-MESH network.
MAC Address	Media Access Control Address used to uniquely identify each node or router within an ESP-MESH network.
DS	Distribution System (External IP Network)

## Tree Topology

ESP-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-MESH can have **multiple downstream connections using its softAP interface**, whilst simultaneously having a **single upstream connection using its station interface**. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-MESH network can communicate.

---

**Note:** The size (total number of nodes) in an ESP-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.

---

Fig. 18: ESP-MESH Tree Topology

### Node Types

**Root Node:** The root node is the top node in the network and serves as the only interface between the ESP-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-MESH network. **There can only be one root node within an ESP-MESH network** and the root node's upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.

**Leaf Nodes:** A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network's maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the networks maximum permitted layer hence have been assigned as leaf nodes .

**Intermediate Parent Nodes:** Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

**Idle Nodes:** Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see [Automatic Root Node Selection](#)). Referring to the diagram above, nodes K and O are idle nodes.

### Beacon Frames & RSSI Thresholding

Every node in ESP-MESH that is able to form downstream connections (i.e. has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)

Fig. 19: ESP-MESH Node Types

- Current layer of Node
- Maximum number of layers permitted in the network
- Current number of child nodes
- Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

**Panel A** of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has.

**Panel B** of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

---

**Note:** Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.

---

### Preferred Parent Node

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the **preferred parent node**. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has

The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-MESH network

Fig. 20: Effects of RSSI Thresholding

when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

Fig. 21: Preferred Parent Node Selection

**Panel A** of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due it having fewer downstream connections (fewer child nodes) compared to node B.

**Panel B** of the illustration above demonstrates the case where the root node is within range of the idle node G. In other words, the root node's beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-MESH network hence is always the preferred parent given multiple

parent node candidates.

**Note:** Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the [Mesh Manual Networking Example](#)).

## Routing Tables

Each node within an ESP-MESH network will maintain its individual routing table used to correctly route ESP-MESH packets (see [ESP-MESH Packet](#)) to the correct destination node. The routing table of a particular node will **consist of the MAC addresses of all nodes within the particular node's subnetwork** (including the MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

Fig. 22: ESP-MESH Routing Tables Example

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e. equivalent to the subnetwork of node B). Node B's routing table is internally partitioned into two subtables containing of nodes C to F and nodes G to I (i.e. equivalent to the subnetworks of nodes C and G respectively).

**ESP-MESH utilizes routing tables to determine whether an ESP-MESH packet should be forwarded upstream or downstream based on the following rules.**

1. If the packet's destination MAC address is within the current node's routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.
2. If the destination MAC address is not within the current node's routing table, forward the data packet upstream to the current node's parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

**Note:** Users can call `esp_mesh_get_routing_table()` to obtain a node's routing table, or `esp_mesh_get_routing_table_size()` to obtain the size of a node's routing table.

`esp_mesh_get_subnet_nodes_list()` can be used to obtain the corresponding subtable of a specific child node. Likewise `esp_mesh_get_subnet_nodes_num()` can be used to obtain the size of the subtable.

## 4.9.4 Building a Network

### General Process

**Warning:** Before the ESP-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with **the same Mesh Network ID, router configuration, and softAP configuration.**

An ESP-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-MESH network building process can be generalized into the following steps:

Fig. 23: ESP-MESH Network Building Process

**1. Root Node Selection** The root node can be designated during configuration (see section on *User Designated Root Node*), or dynamically elected based on the signal strength between each node and the router (see *Automatic Root Node Selection*). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

**2. Second Layer Formation** Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected, the second layer nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore nodes B to D form upstream connections with the root node and become intermediate parent nodes.

**3. Formation of remaining layers** The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idles nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.

**4. Limiting Tree Depth** To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer from forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network's number of maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

#### Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. **The MAC address is used to uniquely identify each node in the network** whilst the **router RSSI** is used to indicate a node's signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e. voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its **vote percentage** (number of votes/number of nodes participating in election) to determine if it should become the root node. **If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.**

The following diagram demonstrates how an ESP-MESH network is built when the root node is automatically selected.

Fig. 24: Root Node Election Example

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.
2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10 dB) hence its beacon frame is propagated throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.
3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e. the shallowest node). Nodes A/B/D/E form the second layer of the network.

4. Node F and G connect with nodes D and E respectively and the network building process is complete.

**Note:** The minimum number of iterations for the election process can be configured using `esp_mesh_set_attempts()`. Users should adjust the number of iterations based on the number of nodes within the network (i.e. the larger the network the larger number of scan iterations required).

**Warning:** `Vote percentage threshold` can also be configured using `esp_mesh_set_vote_percentage()`. Setting a low vote percentage threshold **can result in two or more nodes becoming root nodes** within the same ESP-MESH network leading to the building of multiple networks. If such is the case, ESP-MESH has internal mechanisms to autonomously resolve the **root node conflict**. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

### User Designated Root Node

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-MESH network is built when the root node is designated by the user.

Fig. 25: Root Node Designation Example (Root Node = A, Max Layers = 4)

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.
2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.
3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.
4. Node G connects with node E, forming the fourth layer of the network. However the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.

---

**Note:** When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.

---

### Parent Node Selection

By default, ESP-MESH is self organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-MESH network and to balance the number of downstream connections between potential parent nodes (see section on *Preferred Parent Node*).

However ESP-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the [Mesh Manual Networking Example](#)).

### Asynchronous Power-on Reset

ESP-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e. separated by several minutes), **the final structure of the network could differ from the ideal case where all nodes are powered on synchronously**. Nodes that are delayed in powering on will adhere to the following rules:

**Rule 1:** If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

**Rule 2:** If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e. being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see *Parent Node Switching*).

**Rule 3:** If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.

1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.
2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.
3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20 dB and -10 dB) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both nodes B/E become intermediate parent nodes after connecting.
4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.

**Synchronous Power-On:** Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10 dB). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. **However the synchronous power-on network layout can still be reached if the user manually switches the root node** (see `esp_mesh_waive_root()`).

Fig. 26: Network Building with Asynchronous Power On Example

**Note:** Differences in parent node selection caused by asynchronous power-on are autonomously corrected for to some extent in ESP-MESH (see *Parent Node Switching*)

### Loop-back Avoidance, Detection, and Handling

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node's subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node's routing table (see *Routing Tables*) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

## 4.9.5 Managing a Network

**ESP-MESH is a self healing network meaning it can detect and correct for failures in network routing.** Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

### Root Node Failure

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. **The second layer node with the strongest router RSSI will be elected as the new root node** whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g. root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

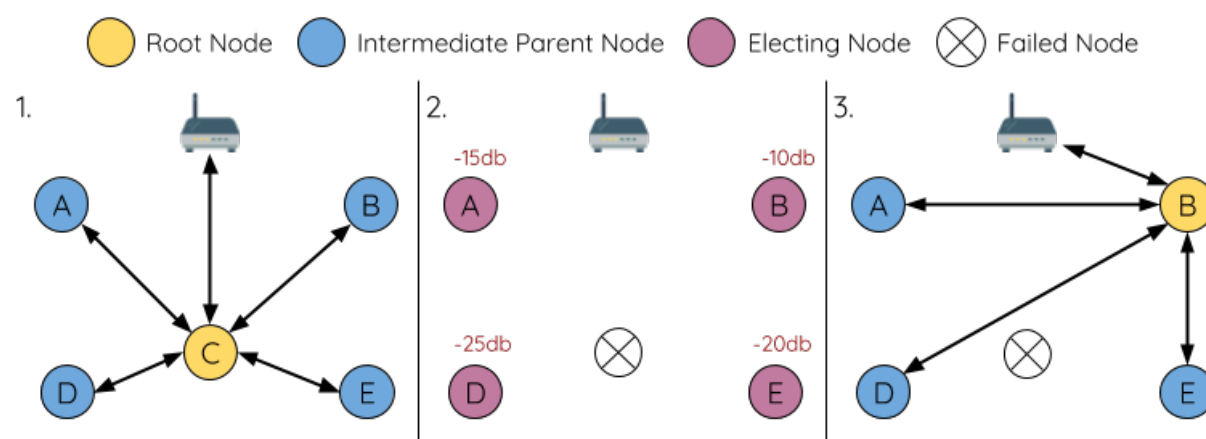

Fig. 27: Self Healing From Root Node Failure

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.

3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

**Note:** If a designated root node breaks down, the remaining nodes **will not autonomously attempt to elect a new root node** as an election process will never be attempted whilst a designated root node is used.

### Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see *Beacon Frames & RSSI Thresholding*).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see *Preferred Parent Node*) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

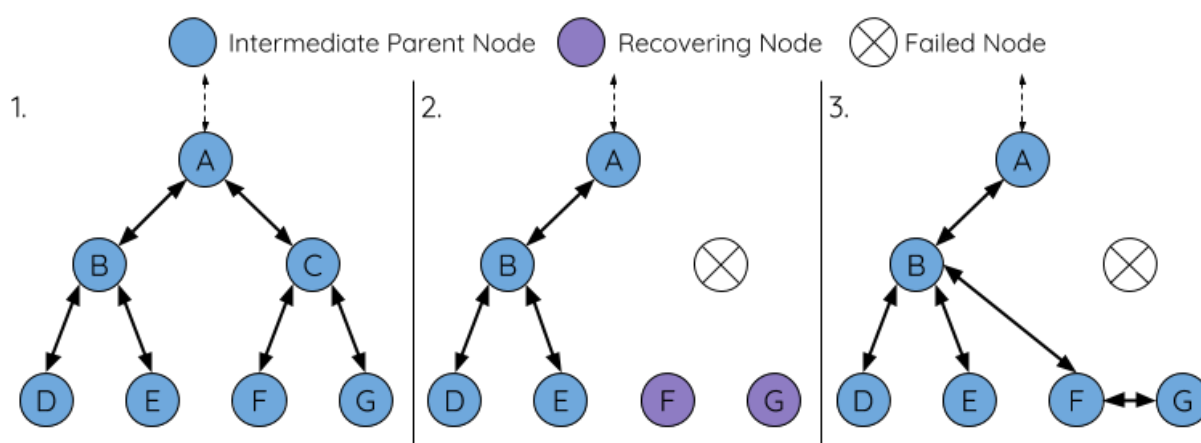

Fig. 28: Self Healing From Intermediate Parent Node Failure

1. The following branch of the network consists of nodes A to G.
2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.
3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

**Note:** If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.

### Root Node Switching

ESP-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node's router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.

To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see [Automatic Root Node Selection](#)) **whilst remaining connected to the network (i.e. not idle)**. If another node receives more votes than the current root node, a root node switch will be initiated. **The root node will remain unchanged otherwise.**

A newly elected root node sends a **switch request** to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router **whilst maintaining all of its downstream connections** and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

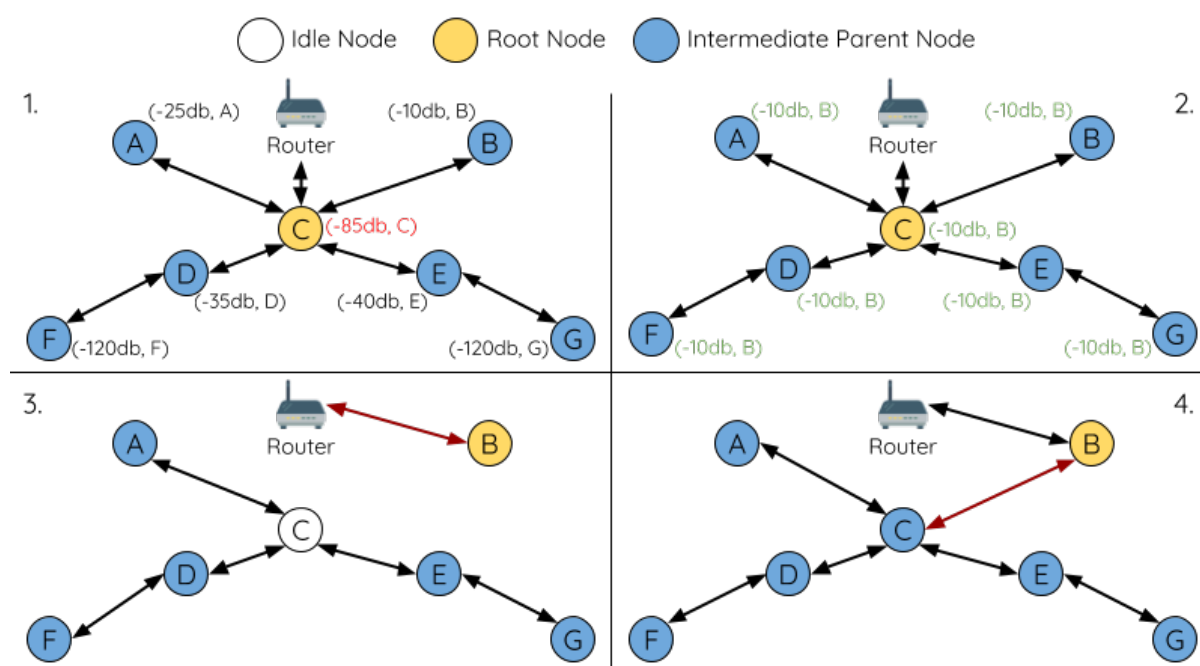

Fig. 29: Root Node Switch Example

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames **whilst still being connected**.
2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a **switch request** and node C responds with an acknowledgment.
3. Node B disconnects from its parent and connects with the router becoming the network's new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. **Node C maintains all its downstream connections throughout this process.**
4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C's subnetwork has been placed one layer deeper as a result of the switch. [Parent Node Switching](#) may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.

**Note:** Root node switching must require an election hence is only supported when using a self-organized ESP-MESH network. In other words, root node switching cannot occur if a designated root node is used.

## Parent Node Switching

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e. due to a *Asynchronous Power-on Reset*).

All potential parent nodes periodically transmit beacon frames (see *Beacon Frames & RSSI Thresholding*) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

## 4.9.6 Data Transmission

### ESP-MESH Packet

ESP-MESH network data transmissions use ESP-MESH packets. ESP-MESH packets are **entirely contained within the frame body of a Wi-Fi data frame**. A multi-hop data transmission in an ESP-MESH network will involve a single ESP-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-MESH packet and its relation with a Wi-Fi data frame.

Fig. 30: ESP-MESH Packet

The **header** of an ESP-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-MESH packets such as a group transmission or a packet originating from the external IP network (see *MESH\_OPT\_SEND\_GROUP* and *MESH\_OPT\_RECV\_DS\_ADDR*).

The **payload** of an ESP-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see *mesh\_proto\_t*).

---

**Note:** When sending an ESP-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see *mesh\_addr\_t*). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

---

## Group Control & Multicasting

Multicasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-MESH can be achieved by either specifying a list of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via *esp\_mesh\_send()*.

To multicast by specifying a list of target nodes, users must first set the ESP-MESH packet's destination address to the **Multicast-Group Address** (01:00:5E:xx:xx:xx). This signifies that the ESP-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see *mesh\_opt\_t* and *MESH\_OPT\_SEND\_GROUP*). This

method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node's MAC address must be listed in the options field of the header.

Multicasting by group allows a ESP-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via `esp_mesh_set_group_id()`. Multicasting to a group involves setting the destination address of the ESP-MESH packet to the target group ID. Furthermore, the `MESH_DATA_GROUP` flag must set. Using groups to multicast incurs less overhead, but requires nodes to previously added into groups.

---

**Note:** During a multicast, all nodes within the network still receive the ESP-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

---

## Broadcasting

Broadcasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to its parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet

## Upstream Flow Control

ESP-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node's message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a **receiving window** for each of its child nodes. **Each child node must apply for a receiving window before it is permitted to transmit upstream.** The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node's data packet that is pending transmission.
2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.
3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving windows by sending a request before it is permitted to continue transmitting.

---

**Note:** ESP-MESH does not support any downstream flow control.

---

**Warning:** Due to *Parent Node Switching*, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node's connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling `esp_mesh_post_toDS_state()`.

### Bi-Directional Data Stream

The following diagram illustrates the various network layers involved in an ESP-MESH Bidirectional Data Stream.

Fig. 31: ESP-MESH Bidirectional Data Stream

Due to the use of *Routing Tables*, **ESP-MESH is able to handle pack forwarding entirely on the mesh layer**. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP network.

## 4.9.7 Channel Switching

### Background

In traditional Wi-Fi networks, **channels** are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.

In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for **network channel switching**. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a **Channel Switch Announcement (CSA)** element within the AP's periodically transmitted beacon

frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the **New Channel Number** and a **Channel Switch Count** which indicates the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

### ESP-MESH Network Channel Switching

ESP-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-MESH is more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e. in a single hop). Therefore, an ESP-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e. with the same **New Channel Number** and **Channel Switch Count**). Given that all nodes within an ESP-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-MESH network channel switch can be triggered by either the router or the root node.

**Root Node Triggered** A root node triggered channel switch can only occur when the ESP-MESH network is not connected to a router. By calling `esp_mesh_switch_channel()`, the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in the their own beacon frames.

**Router Triggered** When an ESP-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, **the root node will not be permitted to trigger a channel switch when it is connected to a router.**

When the root node receives beacon frame containing a CSA element from the router, **the root node will set Channel Switch Count value in the CSA element to a custom value before forwarding it downstream via beacon frames.** It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by the router is irrelevant to an ESP-MESH network. By using a custom value, nodes within the ESP-MESH network are able to switch channels synchronously relative to the ESP-MESH network's beacon interval. However, this will also result in the ESP-MESH network's channel switch being unsynchronized with the channel switch of the router and its connected stations.

### Impact of Network Channel Switching

- **Due to the ESP-MESH network channel switch being unsynchronized with the router's channel switch, there will be**
  - The ESP-MESH network's channel switch time is dependent on the ESP-MESH network's beacon interval and the root node's custom Channel Switch Count value.
  - The channel discrepancy prevents any data exchange between the root node and the router during that ESP-MESH network's switch.
  - In the ESP-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the **Channel Switch Mode** field in the CSA element to 1.
  - Frequent router triggered network channel switches can degrade the ESP-MESH network's performance. Note that this can be caused by the ESP-MESH network itself (e.g. due to wireless medium

contention with ESP-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.

- **When there is a temporary channel discrepancy, the root node remains technically connected to the router.**
  - Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.
  - Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.
- **If the root node is unable to receive any of the router's CSA beacon frames (e.g. due to short switch time given by the router).**
  - After the router switches channels, the root node will no longer be able to receive the router's beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.
  - The root node will re-scan all channels for the router after disconnection.
  - The root node will maintain downstream connections throughout this process.

---

**Note:** Although ESP-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g. due to reasons such as node failures).

---

### Channel and Router Switching Configuration

ESP-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e. when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

**Allow Channel Switch:** This parameter is set via the `allow_channel_switch` field of the `mesh_cfg_t` structure and permits an ESP-MESH network to dynamically switch channels when set.

**Preset Channel:** An ESP-MESH network can have a preset channel by setting the `channel` field of the `mesh_cfg_t` structure to the desired channel number. If this field is unset, the `allow_channel_switch` parameter is overridden such that channel switches are always permitted.

**Allow Router Switch:** This parameter is set via the `allow_router_switch` field of the `mesh_router_t` and permits an ESP-MESH to dynamically switch to a different router when set.

**Preset Router BSSID:** An ESP-MESH network can have a preset router by setting the `bssid` field of the `mesh_router_t` structure to the BSSID of the desired router. If this field is unset, the `allow_router_switch` parameter is overridden such that router switches are always permitted.

**Root Node Present:** The presence of a root node will can also affect whether or a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that X represents a “don't care” for the parameter.

Preset Channel	Allow Channel Switch	Preset Router BSSID	Allow Router Switch	Root Node Present	Permitted Switches ?
N	X	N	X	X	Channel and Router
N	X	Y	N	X	Channel Only
N	X	Y	Y	X	Channel and Router
Y	Y	N	X	X	Channel and Router
Y	N	N	X	N	Router Only
Y	N	N	X	Y	Channel and Router
Y	Y	Y	N	X	Channel Only
Y	N	Y	N	N	N
Y	N	Y	N	Y	Channel Only
Y	Y	Y	Y	X	Channel and Router
Y	N	Y	Y	N	Router Only
Y	N	Y	Y	Y	Channel and Router

### 4.9.8 Performance

The performance of an ESP-MESH network can be evaluated based on multiple metrics such as the following:

**Network Building Time:** The amount of time taken to build an ESP-MESH network from scratch.

**Healing Time:** The amount of time taken for the network to detect a node break down and carry out appropriate actions to heal the network (such as generating a new root node or forming new connections).

**Per-hop latency:** The latency of data transmission over one wireless hop. In other words, the time taken to transmit a data packet from a parent node to a child node or vice versa.

**Network Node Capacity:** The total number of nodes the ESP-MESH network can simultaneously support. This number is determined by the maximum number of downstream connections a node can accept and the maximum number of layers permissible in the network.

The following table lists the common performance figures of an ESP-MESH network:

- Network Building Time: < 60 seconds
- **Healing time:**
  - Root node break down: < 10 seconds
  - Child node break down: < 5 seconds
- Per-hop latency: 10 to 30 milliseconds

**Note:** The following test conditions were used to generate the performance figures above.

- Number of test devices: **100**
- Maximum Downstream Connections to Accept: **6**
- Maximum Permissible Layers: **6**

**Note:** Throughput depends on packet error rate and hop count.

**Note:** The throughput of root node's access to the external IP network is directly affected by the number of nodes in the ESP-MESH network and the bandwidth of the router.

**Note:** The performance figures can vary greatly between installations based on network configuration and operating environment.

---

## 4.9.9 Further Notes

- Data transmission uses Wi-Fi WPA2-PSK encryption
- Mesh networking IE uses AES encryption

Router and internet icon made by [Smashicons](http://Smashicons) from [www.flaticon.com](http://www.flaticon.com)

## 4.10 Core Dump

### 4.10.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script *espcoredump.py* to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- `info_corefile` - prints crashed task's registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `dbg_corefile` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

### 4.10.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

#### Core dump data destination (Components -> Core dump -> Data destination)

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

#### Core dump data format (Components -> Core dump -> Core dump data format)

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

#### Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)

- Use CRC32 for core dump integrity verification

**Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)**

**Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)**

The value is in ms.

**Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)**

The value is base64 encoded.

- Decode and show summary (info\_corefile)
- Don't decode

**Reserved stack size (Components -> Core dump -> Reserved stack size)**

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800.

### 4.10.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash, But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets.
↳to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump,, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be 'data' and sub-type should be 'coredump'. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: `espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file>` or `espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>`

### 4.10.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: `espcoredump.py --chip <target_chip_type> info_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>` or `espcoredump.py --chip <target_chip_type> dbg_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>`

Base64-encoded body of core dump will be between the following header and footer:

```
===== CORE DUMP START =====
<body of base64-encoded core dump, save it to file on disk>
===== CORE DUMP END =====
```

The CORE DUMP START and CORE DUMP END lines must not be included in core dump text file.

### 4.10.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions' prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif ([https://dl.espressif.com/dl/esp32c3\\_rev3\\_rom.elf](https://dl.espressif.com/dl/esp32c3_rev3_rom.elf)) and pass it to 'espcoredump.py'.

### 4.10.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

#### Supported notations and RAM regions

- COREDUMP\_DRAM\_ATTR places variable into DRAM area which will be included into dump.
- COREDUMP\_RTC\_ATTR places variable into RTC area which will be included into dump.
- COREDUMP\_RTC\_FAST\_ATTR places variable into RTC\_FAST area which will be included into dump.

#### Example

1. In *Project Configuration Menu*, enable *COREDUMP TO FLASH*, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

```
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

```
global_var = 25;
assert(0);
```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where `PORT` is the device USB port:

```
espcoredump.py -p PORT dbg_corefile <path/to/elf>
```

6. In GDB shell, type `p global_var` to get the variable content:

```
(gdb) p global_var
$1 = 25 '\031'
```

### 4.10.7 Running espcoredump.py

Generic command syntax: `espcoredump.py [options] command [args]`

#### Script Options

- chip {auto,esp32,esp32s2,esp32c3} Target chip type. Default value is “auto”
- port PORT, -p PORT Serial port device. Either “chip” or “port” need to be specified to determine the port when you have multi-target connected at the same time.
- baud BAUD, -b BAUD Serial port baud rate used when flashing/reading
- gdb-timeout-sec GDB\_TIMEOUT\_SEC Overwrite the default internal delay for gdb responses

**Commands** `dbg_corefile` Starts GDB debugging session with specified corefile

`info_corefile` Print core dump info from file

### Command Arguments

- debug DEBUG, -d DEBUG** Log level (0..3)
- gdb GDB, -g GDB** Path to gdb
- core CORE, -c CORE** Path to core dump file (if skipped core dump will be read from flash)
- core-format {b64,elf,raw}, -t {b64,elf,raw}** File specified with “-c” is an ELF ( “elf” ), raw (raw) or base64-encoded (b64) binary
- off OFF, -o OFF** Offset of coredump partition in flash (type “make partition\_table” to see).
- save-core SAVE\_CORE, -s SAVE\_CORE** Save core to file. Otherwise temporary core file will be deleted. Does not work with “-c”
- rom-elf ROM\_ELF, -r ROM\_ELF** Path to ROM ELF file. Will use “<target>\_rom.elf” if not specified
- print-mem, -m** Print memory dump. Only valid when info\_corefile.
- <prog>** Path to program ELF file.

## 4.11 Event Handling

Several ESP-IDF components use *events* to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

### 4.11.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of *esp\_event library*, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called *legacy event loop*. The following sections explain each of the methods.

#### esp\_event Library Event Loop

esp\_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in *system\_event\_id\_t* enumeration and *system\_event\_info\_t* union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See *esp\_event library API reference* for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the *default event loop* provided by this library.

#### Legacy Event Loop

This event loop implementation is started using *esp\_event\_loop\_init()* function. Application typically supplies an *event handler*, a function with the following signature:

```
esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to *esp\_event\_loop\_init()*.

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority *event* task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using *CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE* and *CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE* options, respectively.

Event handler receives a pointer to the event structure (*system\_event\_t*) which describes current event. This structure follows a *tagged union* pattern: *event\_id* member indicates the type of event, and *event\_info* member is a union of description structures. Application event handler will typically use `switch(event->event_id)` to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

### Event IDs and Corresponding Data Structures

Event ID (legacy event ID)	Event data structure
<b>Wi-Fi</b>	
WIFI_EVENT_WIFI_READY (SYSTEM_EVENT_WIFI_READY)	n/a
WIFI_EVENT_SCAN_DONE (SYSTEM_EVENT_SCAN_DONE)	<i>wifi_event_sta_scan_done_t</i>
WIFI_EVENT_STA_START (SYSTEM_EVENT_STA_START)	n/a
WIFI_EVENT_STA_STOP (SYSTEM_EVENT_STA_STOP)	n/a
WIFI_EVENT_STA_CONNECTED (SYSTEM_EVENT_STA_CONNECTED)	<i>wifi_event_sta_connected_t</i>
WIFI_EVENT_STA_DISCONNECTED (SYSTEM_EVENT_STA_DISCONNECTED)	<i>wifi_event_sta_disconnected_t</i>
WIFI_EVENT_STA_AUTHMODE_CHANGE (SYSTEM_EVENT_STA_AUTHMODE_CHANGE)	<i>wifi_event_sta_authmode_change_t</i>
WIFI_EVENT_STA_WPS_ER_SUCCESS (SYSTEM_EVENT_STA_WPS_ER_SUCCESS)	n/a
WIFI_EVENT_STA_WPS_ER_FAILED (SYSTEM_EVENT_STA_WPS_ER_FAILED)	<i>wifi_event_sta_wps_fail_reason_t</i>
WIFI_EVENT_STA_WPS_ER_TIMEOUT (SYSTEM_EVENT_STA_WPS_ER_TIMEOUT)	n/a

WIFI_EVENT_AP_START (SYSTEM_EVENT_AP_START)	n/a
WIFI_EVENT_AP_STOP (SYSTEM_EVENT_AP_STOP)	n/a
WIFI_EVENT_AP_STACONNECTED (SYSTEM_EVENT_AP_STACONNECTED)	<i>wifi_event_ap_staconnected_t</i>
WIFI_EVENT_AP_STADISCONNECTED (SYSTEM_EVENT_AP_STADISCONNECTED)	<i>wifi_event_ap_stadisconnected_t</i>
WIFI_EVENT_AP_PROBEREQRCVD (SYSTEM_EVENT_AP_PROBEREQRCVD)	<i>wifi_event_ap_probe_req_rx_t</i>
<b>Ethernet</b>	
ETHERNET_EVENT_START (SYSTEM_EVENT_ETH_START)	n/a
ETHERNET_EVENT_STOP (SYSTEM_EVENT_ETH_STOP)	n/a
ETHERNET_EVENT_CONNECTED (SYSTEM_EVENT_ETH_CONNECTED)	n/a
ETHERNET_EVENT_DISCONNECTED (SYSTEM_EVENT_ETH_DISCONNECTED)	n/a
<b>IP</b>	
IP_EVENT_STA_GOT_IP (SYSTEM_EVENT_STA_GOT_IP)	<i>ip_event_got_ip_t</i>
IP_EVENT_STA_LOST_IP (SYSTEM_EVENT_STA_LOST_IP)	n/a
IP_EVENT_AP_STAIPASSIGNED (SYSTEM_EVENT_AP_STAIPASSIGNED)	n/a
IP_EVENT_GOT_IP6 (SYSTEM_EVENT_GOT_IP6)	<i>ip_event_got_ip6_t</i>
IP_EVENT_ETH_GOT_IP (SYSTEM_EVENT_ETH_GOT_IP)	<i>ip_event_got_ip_t</i>

## 4.11.2 Mesh Events

ESP-MESH uses a system similar to the *Legacy Event Loop* to deliver events to the application. See *System Events* for details.

## 4.11.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameters type.

- BLE GAP: `esp_ble_gap_register_callback()`, `esp_gap_ble_cb_event_t`, `esp_ble_gap_cb_param_t`.
- BT GAP: `esp_bt_gap_register_callback()`, `esp_bt_gap_cb_event_t`, `esp_bt_gap_cb_param_t`.
- GATT: `esp_ble_gattc_register_callback()`, `esp_bt_gattc_cb_event_t`, `esp_bt_gattc_cb_param_t`.
- GATTS: `esp_ble_gatts_register_callback()`, `esp_bt_gatts_cb_event_t`, `esp_bt_gatts_cb_param_t`.
- SPP: `esp_spp_register_callback()`, `esp_spp_cb_event_t`, `esp_spp_cb_param_t`.
- Blufi: `esp_blufi_register_callbacks()`, `esp_blufi_cb_event_t`, `esp_blufi_cb_param_t`.
- A2DP: `esp_a2d_register_callback()`, `esp_a2d_cb_event_t`, `esp_a2d_cb_param_t`.
- AVRC: `esp_avrc_ct_register_callback()`, `esp_avrc_ct_cb_event_t`, `esp_avrc_ct_cb_param_t`.
- HFP Client: `esp_hf_client_register_callback()`, `esp_hf_client_cb_event_t`, `esp_hf_client_cb_param_t`.
- HFP AG: `esp_hf_ag_register_callback()`, `esp_hf_ag_cb_event_t`, `esp_hf_ag_cb_param_t`.

## 4.12 Fatal Errors

### 4.12.1 Overview

In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:

- CPU Exceptions: Illegal Instruction, Load/Store Alignment Error, Load/Store Prohibited error.
- System level checks and safeguards:
  - *Interrupt watchdog* timeout
  - *Task watchdog* timeout (only fatal if `CONFIG_ESP_TASK_WDT_PANIC` is set)
  - Cache access error
  - Brownout detection event
  - Stack overflow
  - Stack smashing protection check
  - Heap integrity check
- Failed assertions, via `assert`, `configASSERT` and similar macros.

This guide explains the procedure used in ESP-IDF for handling these errors, and provides suggestions on troubleshooting the errors.

### 4.12.2 Panic Handler

Every error cause listed in the *Overview* will be handled by *panic handler*.

Panic handler will start by printing the cause of the error to the console. For CPU exceptions, the message will be similar to

```
Guru Meditation Error: Core 0 panic'ed (Illegal instruction). Exception_
↳was unhandled.
```

For some of the system level checks (interrupt watchdog, cache access error), the message will be similar to

```
Guru Meditation Error: Core 0 panic'ed (Cache error). Exception was_
↳unhandled.
```

In all cases, error cause will be printed in parentheses. See [Guru Meditation Errors](#) for a list of possible error causes.

Subsequent behavior of the panic handler can be set using `CONFIG_ESP_SYSTEM_PANIC` configuration choice. The available options are:

- Print registers and reboot (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`) —default option. This will print register values at the point of the exception, print the backtrace, and restart the chip.
- Print registers and halt (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`) Similar to the above option, but halt instead of rebooting. External reset is required to restart the program.
- Silent reboot (`CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT`) Don't print registers or backtrace, restart the chip immediately.
- Invoke GDB Stub (`CONFIG_ESP_SYSTEM_PANIC_GDBSTUB`) Start GDB server which can communicate with GDB over console UART port. See [GDB Stub](#) for more details.

Behavior of panic handler is affected by two other configuration options.

- If `CONFIG_ESP32C3_DEBUG_OCDAWARE` is enabled (which is the default), panic handler will detect whether a JTAG debugger is connected. If it is, execution will be halted and control will be passed to the debugger. In this case registers and backtrace are not dumped to the console, and GDBStub / Core Dump functions are not used.
- If `Core Dump` feature is enabled, then system state (task stacks and registers) will be dumped either to Flash or UART, for later analysis.
- If `CONFIG_ESP_PANIC_HANDLER_IRAM` is disabled (disabled by default), the panic handler code is placed in flash memory not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash. If this option is enabled, the panic handler code is placed in IRAM. This allows the panic handler to run without needing to re-enable cache first. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash).

The following diagram illustrates panic handler behavior:

### 4.12.3 Register Dump and Backtrace

Unless `CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT` option is enabled, panic handler prints some of the CPU registers, and the backtrace, to the console

```
Core 0 register dump:

MHARTID : 0x00000000

```

Register values printed are the register values in the exception frame, i.e. values at the moment when CPU exception or other fatal error has occurred.

Register dump is not printed if the panic handler was executed as a result of an `abort()` call.

If *IDF Monitor* is used, Program Counter values will be converted to code locations (function name, file name, and line number), and the output will be annotated with additional lines

```

MHARTID : 0x00000000

```

To find the location where a fatal error has happened, look at the lines which follow the “Backtrace” line. Fatal error location is the top line, and subsequent lines show the call stack.

## 4.12.4 GDB Stub

If `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` option is enabled, panic handler will not reset the chip when fatal error happens. Instead, it will start GDB remote protocol server, commonly referred to as GDB Stub. When this happens, GDB instance running on the host computer can be instructed to connect to the ESP32-C3 UART port.

If *IDF Monitor* is used, GDB is started automatically when GDB Stub prompt is detected on the UART. The output would look like this:

```

Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.

and "show warranty" for details.

```

(continues on next page)

(continued from previous page)

```

This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --
↳target=riscv32-esp-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
    at /Users/user/esp/example/main/main.cpp:36
36      *((int*) 0) = 0;
(gdb)

```

GDB prompt can be used to inspect CPU registers, local and static variables, and arbitrary locations in memory. It is not possible to set breakpoints, change PC, or continue execution. To reset the program, exit GDB and perform external reset: Ctrl-T Ctrl-R in IDF Monitor, or using external reset button on the development board.

### 4.12.5 Guru Meditation Errors

This section explains the meaning of different error causes, printed in parens after Guru Meditation Error: Core panic'ed message.

---

**Note:** See [Wikipedia article](#) for historical origins of “Guru Meditation” .

---

#### Illegal instruction

This CPU exception indicates that the instruction which was executed was not a valid instruction. Most common reasons for this error include:

- FreeRTOS task function has returned. In FreeRTOS, if task function needs to terminate, it should call `vTaskDelete()` function and delete itself, instead of returning.
- Failure to load next instruction from SPI flash. This usually happens if:
  - Application has reconfigured SPI flash pins as some other function (GPIO, UART, etc.). Consult Hardware Design Guidelines and the Datasheet for the chip or module for details about SPI flash pins.
  - Some external device was accidentally connected to SPI flash pins, and has interfered with communication between ESP32-C3 and SPI flash.

#### Instruction address misaligned

This CPU exception indicates that the address of the instruction to execute is not 2-byte aligned.

#### Instruction access fault, Load access fault, Store access fault

This CPU exception happens when application attempts to execute, read from or write to an invalid memory location. The address which was written/read is found in `MTVAL` register in the register dump. If this address is zero, it usually means that application attempted to dereference a NULL pointer. If this address is close to zero, it usually means that application attempted to access member of a structure, but the pointer to the structure was NULL. If this address is something else (garbage value, not in `0x3fxxxxxx - 0x6xxxxxxx` range), it likely means that the pointer used to access the data was either not initialized or was corrupted.

### Breakpoint

This CPU exception happens when the instruction `EBREAK` is executed.

### Load address misaligned, Store address misaligned

Application has attempted to read or write memory location, and address alignment did not match load/store size. For example, 32-bit load can only be done from 4-byte aligned address, and 16-bit load can only be done from a 2-byte aligned address.

### Interrupt wdt timeout on CPU0 / CPU1

Indicates that interrupt watchdog timeout has occurred. See [Watchdogs](#) for more information.

### Cache error

In some situations ESP-IDF will temporarily disable access to external SPI Flash and SPI RAM via caches. For example, this happens with `spi_flash` APIs are used to read/write/erase/mmap regions of SPI Flash. In these situations, tasks are suspended, and interrupt handlers not registered with `ESP_INTR_FLAG_IRAM` are disabled. Make sure that any interrupt handlers registered with this flag have all the code and data in IRAM/DRAM. Refer to the [SPI flash API documentation](#) for more details.

## 4.12.6 Other Fatal Errors

### Brownout

ESP32-C3 has a built-in brownout detector, which is enabled by default. Brownout detector can trigger system reset if supply voltage goes below safe level. Brownout detector can be configured using `CONFIG_ESP32C3_BROWNOUT_DET` and `CONFIG_ESP32C3_BROWNOUT_DET_LVL_SEL` options.

When brownout detector triggers, the following message is printed:

```
Brownout detector was triggered
```

Chip is reset after the message is printed.

Note that if supply voltage is dropping at a fast rate, only part of the message may be seen on the console.

### Corrupt Heap

ESP-IDF heap implementation contains a number of run-time checks of heap structure. Additional checks ( “Heap Poisoning” ) can be enabled in menuconfig. If one of the checks fails, message similar to the following will be printed:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/
↪multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

Consult [Heap Memory Debugging](#) documentation for further information.

### Stack Smashing

Stack smashing protection (based on GCC `-fstack-protector*` flags) can be enabled in ESP-IDF using `CONFIG_COMPILER_STACK_CHECK_MODE` option. If stack smashing is detected, message similar to the following will be printed:

```
Stack smashing protect failure!  
  
abort() was called at PC 0x400d2138 on core 0  
  
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0_  
↳0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0_  
↳0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910_  
↳0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80  
0
```

The backtrace should point to the function where stack smashing has occurred. Check the function code for unbounded access to local arrays.

## 4.13 Flash Encryption

This is a quick start guide to ESP32-C3's flash encryption feature. Using an application code example, it demonstrates how to test and verify flash encryption operations during development and production.

### 4.13.1 Introduction

Flash encryption is intended for encrypting the contents of the ESP32-C3's off-chip flash memory. Once this feature is enabled, firmware is flashed as plaintext, and then the data is encrypted in place on the first boot. As a result, physical readout of flash will not be sufficient to recover most flash contents.

With flash encryption enabled, the following types of data are encrypted by default:

- Firmware bootloader
- Partition Table
- All “app” type partitions

Other types of data can be encrypted conditionally:

- Any partition marked with the `encrypted` flag in the partition table. For details, see [Encrypted Partition Flag](#).
- Secure Boot bootloader digest if Secure Boot is enabled (see below).

---

**Important:** For production use, flash encryption should be enabled in the “Release” mode only.

---

---

**Important:** Enabling flash encryption limits the options for further updates of ESP32-C3. Before using this feature, read the document and make sure to understand the implications.

---

### 4.13.2 Relevant eFuses

The flash encryption operation is controlled by various eFuses available on ESP32-C3. The list of eFuses and their descriptions is given in the table below. The names in eFuse column are also used by `esp_efuse.py` tool. For usage in the eFuse API, modify the name by adding `ESP_EFUSE_`, for example: `esp_efuse_read_field_bit(ESP_EFUSE_**DISABLE_DL_ENCRYPT**)`.

Table 21: eFuses Used in Flash Encryption

eFuse	Description	Bit Depth	R/W Access Control Available	Default Value
BLOCK_KEYN	AES key storage. N is between 0 and 5.	256	Yes	x
KEY_PURPOSE_N	Controls the purpose of eFuse block BLOCK_KEYN, where N is between 0 and 5. For flash encryption the only valid value is 4 for XTS_AES_128_KEY.	4	Yes	0
DIS_DOWNLOAD_MANUAL_ENCRYPT	If set, disables flash encryption when in download bootmodes.	1	Yes	0
SPI_BOOT_CRYPT_CNT	Enables encryption and decryption, when an SPI boot mode is set. Feature is enabled if 1 or 3 bits are set in the eFuse, disabled otherwise.	3	Yes	0

Read and write access to eFuse bits is controlled by appropriate fields in the registers `WR_DIS` and `RD_DIS`. For more information on ESP32-C3 eFuses, see *eFuse manager*. To change protection bits of eFuse field using `espefuse.py`, use these two commands: `read_protect_efuse` and `write_protect_efuse`. Example `espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT`.

### 4.13.3 Flash Encryption Process

Assuming that the eFuse values are in their default states and the firmware bootloader is compiled to support flash encryption, the flash encryption process executes as shown below:

1. On the first power-on reset, all data in flash is un-encrypted (plaintext). The ROM bootloader loads the firmware bootloader.
2. Firmware bootloader reads the `SPI_BOOT_CRYPT_CNT` eFuse value (0b000). Since the value is 0 (even number of bits set), it configures and enables the flash encryption block. For more information on the flash encryption block, see [ESP32-C3 Technical Reference Manual](#).
3. Firmware bootloader uses RNG (random) module to generate an 256 bit key and then writes it into `BLOCK_KEYN` eFuse. The software also updates the `KEY_PURPOSE_N` for the block where the key were stored. The key cannot be accessed via software as the write and read protection bits for `BLOCK_KEYN` eFuse are set. `KEY_PURPOSE_N` field is write-protected as well. The flash encryption operations happen entirely by hardware, and the key cannot be accessed via software.
4. Flash encryption block encrypts the flash contents - the firmware bootloader, applications and partitions marked as `encrypted`. Encrypting in-place can take time, up to a minute for large partitions.
5. Firmware bootloader sets the first available bit in `SPI_BOOT_CRYPT_CNT` (0b001) to mark the flash contents as encrypted. Odd number of bits is set.
6. For *Development Mode*, the firmware bootloader allows the UART bootloader to re-flash encrypted binaries. Also, the `SPI_BOOT_CRYPT_CNT` eFuse bits are NOT write-protected. In addition, the firmware bootloader by default sets the eFuse bits `DIS_DOWNLOAD_ICACHE`, `DIS_PAD_JTAG`, `DIS_USB_JTAG` and `DIS_LEGACY_SPI_BOOT`.
7. For *Release Mode*, the firmware bootloader sets all the eFuse bits set under development mode as well as `DIS_DOWNLOAD_MANUAL_ENCRYPT`. It also write-protects the `SPI_BOOT_CRYPT_CNT` eFuse bits. To modify this behavior, see [Enabling UART Bootloader Encryption/Decryption](#).
8. The device is then rebooted to start executing the encrypted image. The firmware bootloader calls the flash decryption block to decrypt the flash contents and then loads the decrypted contents into IRAM.

During the development stage, there is a frequent need to program different plaintext flash images and test the flash encryption process. This requires that Firmware Download mode is able to load new plaintext images as many times as it might be needed. However, during manufacturing or production stages, Firmware Download mode should not be allowed to access flash contents for security reasons.

Hence, two different flash encryption configurations were created: for development and for production. For details on these configurations, see Section [Flash Encryption Configuration](#).

### 4.13.4 Flash Encryption Configuration

The following flash encryption modes are available:

- *Development Mode* - recommended for use ONLY DURING DEVELOPMENT, as it does not prevent modification and possible readout of encrypted flash contents.
- *Release Mode* - recommended for manufacturing and production to prevent physical readout of encrypted flash contents.

This section provides information on the mentioned flash encryption modes and step by step instructions on how to use them.

#### Development Mode

During development, you can encrypt flash using either an ESP32-C3 generated key or external host-generated key.

**Using ESP32-C3 Generated Key** Development mode allows you to download multiple plaintext images using Firmware Download mode.

To test flash encryption process, take the following steps:

1. Ensure that you have an ESP32-C3 device with default flash encryption eFuse settings as shown in *Relevant eFuses*.

See how to check *ESP32-C3 Flash Encryption Status*.

2. In *Project Configuration Menu*, do the following:

- *Enable flash encryption on boot*
- *Select encryption mode (Development mode by default)*
- **ref** *Select UART ROM download mode <CONFIG\_SECURE\_UART\_ROM\_DL\_MODE> (enabled by default.)*
- *Select the appropriate bootloader log verbosity*
- Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See *secure-boot-bootloader-size*.

3. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```

**Note:** This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-C3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

A sample output of the first ESP32-C3 boot after enabling flash encryption is given below:

```

Example to check Flash Encryption status

```

This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB_
↳external flash
FLASH_CRYPT_CNT eFuse value is 1
Flash encryption feature is enabled in DEVELOPMENT mode

```

At this stage, if you need to update and re-flash binaries, see [Re-flashing Updated Partitions](#).

**Using Host Generated Key** It is possible to pre-generate a flash encryption key on the host computer and burn it into the eFuse. This allows you to pre-encrypt data on the host and flash already encrypted data without needing a plaintext flash update. This feature can be used in both [Development Mode](#) and [Release Mode](#). Without a pre-generated key, data is flashed in plaintext and then ESP32-C3 encrypts the data in-place.

---

**Note:** This option is not recommended for production, unless a separate key is generated for each individual device.

---

To use a host generated key, take the following steps:

1. Ensure that you have an ESP32-C3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

See how to check [ESP32-C3 Flash Encryption Status](#).

2. Generate a random key by running:

```

espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin

```

3. **Before the first encrypted boot**, burn the key into your device' s eFuse using the command below. This action can be done **only once**.

```

espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_AES_128_KEY

```

where *BLOCK* is a free keyblock between *BLOCK\_KEY0* and *BLOCK\_KEY5*.

If the key is not burned and the device is started after enabling flash encryption, the ESP32-C3 will generate a random key that software cannot access or modify.

4. In [Project Configuration Menu](#), do the following:
  - [Enable flash encryption on boot](#)
  - [Select encryption mode \(Development mode by default\)](#)
  - [Select the appropriate bootloader log verbosity](#)
  - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See [secure-boot-bootloader-size](#).

5. Run the command given below to build and flash the complete images.

```

idf.py flash monitor

```

---

**Note:** This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

---

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-C3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as `encrypted` then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

At this stage, if you need to update and re-flash binaries, see [Re-flashing Updated Partitions](#).

**Re-flashing Updated Partitions** If you update your application code (done in plaintext) and want to re-flash it, you will need to encrypt it before flashing. To encrypt the application and flash it in one step, run:

```
idf.py encrypted-app-flash monitor
```

If all partitions needs to be updated in encrypted format, run:

```
idf.py encrypted-flash monitor
```

## Release Mode

In Release mode, UART bootloader cannot perform flash encryption operations. New plaintext images can ONLY be downloaded using the over-the-air (OTA) scheme which will encrypt the plaintext image before writing to flash.

To use this mode, take the following steps:

1. Ensure that you have an ESP32-C3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

See how to check [ESP32-C3 Flash Encryption Status](#).

2. In [Project Configuration Menu](#), do the following:
  - [Enable flash encryption on boot](#)
  - [Select Release mode](#) (Note that once Release mode is selected, the `EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT` eFuse bit will be burned to disable UART bootloader access to flash contents)
  - [Select UART ROM download mode](#) (By default the option to permanently switch to UART ROM Secure download mode is selected)
  - [Select the appropriate bootloader log verbosity](#)
  - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See `secure-boot-bootloader-size`.

3. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```

---

**Note:** This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

---

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-C3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as

encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

Once the flash encryption is enabled in Release mode, the bootloader will write-protect the SPI\_BOOT\_CRYPT\_CNT eFuse.

For subsequent plaintext field updates, use [OTA scheme](#).

. \_flash-encrypt-best-practices:

### Best Practices

When using Flash Encryption in production:

- Do not reuse the same flash encryption key between multiple devices. This means that an attacker who copies encrypted data from one device cannot transfer it to a second device.
- The UART ROM Download Mode should be disabled entirely if it is not needed, or permanently set to “Secure Download Mode” otherwise. Secure Download Mode permanently limits the available commands to basic flash read and write only. The default behaviour is to set Secure Download Mode on first boot in Release mode. To disable Download Mode entirely select the [CONFIG\\_SECURE\\_UART\\_ROM\\_DL\\_MODE](#) to “Permanently disable ROM Download Mode (recommended)” or call `esp_efuse_disable_rom_download_mode()` at runtime.
- Enable [Secure Boot](#) as an extra layer of protection, and to prevent an attacker from selectively corrupting any part of the flash before boot.

### 4.13.5 Possible Failures

Once flash encryption is enabled, the SPI\_BOOT\_CRYPT\_CNT eFuse value will have an odd number of bits set. It means that all the partitions marked with the encryption flag are expected to contain encrypted ciphertext. Below are the three typical failure cases if the ESP32-C3 is erroneously loaded with plaintext data:

1. If the bootloader partition is re-flashed with a **plaintext firmware bootloader image**, the ROM bootloader will fail to load the firmware bootloader resulting in the following failure:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
```

---

**Note:** The value of invalid header will be different for every application.

---

---

**Note:** This error also appears if the flash contents are erased or corrupted.

---

2. If the firmware bootloader is encrypted, but the partition table is re-flashed with a **plaintext partition table image**, the bootloader will fail to read the partition table resulting in the following failure:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2

```

### 4.13.6 ESP32-C3 Flash Encryption Status

1. Ensure that you have an ESP32-C3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

To check if flash encryption on your ESP32-C3 device is enabled, do one of the following:

- flash the application example [security/flash\\_encryption](#) onto your device. This application prints the SPI\_BOOT\_CRYPT\_CNT eFuse value and if flash encryption is enabled or disabled.
- [Find the serial port name](#) under which your ESP32-C3 device is connected, replace PORT with your port name in the following command, and run it:

```
espefuse.py -p PORT summary
```

### 4.13.7 Reading and Writing Data in Encrypted Flash

ESP32-C3 application code can check if flash encryption is currently enabled by calling `esp_flash_encryption_enabled()`. Also, a device can identify the flash encryption mode by calling `esp_get_flash_encryption_mode()`.

Once flash encryption is enabled, be more careful with accessing flash contents from code.

#### Scope of Flash Encryption

Whenever the `SPI_BOOT_CRYPT_CNT` eFuse is set to a value with an odd number of bits, all flash content accessed via the MMU's flash cache is transparently decrypted. It includes:

- Executable application code in flash (IROM).
- All read-only data stored in flash (DROM).
- Any data accessed via `spi_flash_mmap()`.
- The firmware bootloader image when it is read by the ROM bootloader.

---

**Important:** The MMU flash cache unconditionally decrypts all existing data. Data which is stored unencrypted in flash memory will also be “transparently decrypted” via the flash cache and will appear to software as random garbage.

---

#### Reading from Encrypted Flash

To read data without using a flash cache MMU mapping, you can use the partition read function `esp_partition_read()`. This function will only decrypt data when it is read from an encrypted partition. Data read from unencrypted partitions will not be decrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also use the following SPI flash API functions:

- `esp_flash_read()` to read raw (encrypted) data which will not be decrypted
- `esp_flash_read_decrypted()` to read and decrypt data

The ROM function `SPIRead()` can read data without decryption, however, this function is not supported in esp-idf applications.

Data stored using the Non-Volatile Storage (NVS) API is always stored and read decrypted from the perspective of flash encryption. It is up to the library to provide encryption feature if required. Refer to [NVS Encryption](#) for more details.

#### Writing to Encrypted Flash

It is recommended to use the partition write function `esp_partition_write()`. This function will only encrypt data when it is written to an encrypted partition. Data written to unencrypted partitions will not be encrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also pre-encrypt and write data using the function `esp_flash_write_decrypted()`

Also, the following ROM function exist but not supported in esp-idf applications:

- `esp_rom_spiflash_write_decrypted` pre-encrypts and writes data to flash
- `SPIWrite` writes unencrypted data to flash

Since data is encrypted in blocks, the minimum write size for encrypted data is 16 bytes and the alignment is also 16 bytes.

## 4.13.8 Updating Encrypted Flash

### OTA Updates

OTA updates to encrypted partitions will automatically write encrypted data if the function `esp_partition_write()` is used.

Before building the application image for OTA updating of an already encrypted device, enable the option *Enable flash encryption on boot* in project configuration menu.

For general information about ESP-IDF OTA updates, please refer to *OTA*

## 4.13.9 Disabling Flash Encryption

If flash encryption was enabled accidentally, flashing of plaintext data will soft-brick the ESP32-C3. The device will reboot continuously, printing the error `flash read err, 1000` or `invalid header: 0xFFFFFFFF`.

For flash encryption in Development mode, encryption can be disabled by burning the `SPI_BOOT_CRYPT_CNT` eFuse. It can only be done one time per chip by taking the following steps:

1. In *Project Configuration Menu*, disable *Enable flash encryption on boot*, then save and exit.
2. Open project configuration menu again and **double-check** that you have disabled this option! If this option is left enabled, the bootloader will immediately re-enable encryption when it boots.
3. With flash encryption disabled, build and flash the new bootloader and application by running `idf.py flash`.
4. Use `espefuse.py` (in `components/esptool_py/esptool`) to disable the `SPI_BOOT_CRYPT_CNT` by running:

```
espefuse.py burn_efuse SPI_BOOT_CRYPT_CNT
```

Reset the ESP32-C3. Flash encryption will be disabled, and the bootloader will boot as usual.

## 4.13.10 Key Points About Flash Encryption

- Flash memory contents is encrypted using XTS-AES-128. The flash encryption key is 256 bits and stored one `BLOCK_KEYN` eFuse internal to the chip and, by default, is protected from software access.
- Flash access is transparent via the flash cache mapping feature of ESP32-C3 - any flash regions which are mapped to the address space will be transparently decrypted when read. Some data partitions might need to remain unencrypted for ease of access or might require the use of flash-friendly update algorithms which are ineffective if the data is encrypted. NVS partitions for non-volatile storage cannot be encrypted since the NVS library is not directly compatible with flash encryption. For details, refer to *NVS Encryption*.
- If flash encryption might be used in future, the programmer must keep it in mind and take certain precautions when writing code that *uses encrypted flash*.
- If secure boot is enabled, re-flashing the bootloader of an encrypted device requires a “Re-flashable” secure boot digest (see *Flash Encryption and Secure Boot*).

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See `secure-boot-bootloader-size`.

---

**Important:** Do not interrupt power to the ESP32-C3 while the first boot encryption pass is running. If power is interrupted, the flash contents will be corrupted and will require flashing with unencrypted data again. In this case, re-flashing will not count towards the flashing limit.

---

### 4.13.11 Limitations of Flash Encryption

Flash encryption protects firmware against unauthorised readout and modification. It is important to understand the limitations of the flash encryption feature:

- Flash encryption is only as strong as the key. For this reason, we recommend keys are generated on the device during first boot (default behaviour). If generating keys off-device, ensure proper procedure is followed and don't share the same key between all production devices.
- Not all data is stored encrypted. If storing data on flash, check if the method you are using (library, API, etc.) supports flash encryption.
- Flash encryption does not prevent an attacker from understanding the high-level layout of the flash. This is because the same AES key is used for every pair of adjacent 16 byte AES blocks. When these adjacent 16 byte blocks contain identical content (such as empty or padding areas), these blocks will encrypt to produce matching pairs of encrypted blocks. This may allow an attacker to make high-level comparisons between encrypted devices (i.e. to tell if two devices are probably running the same firmware version).
- Flash encryption alone may not prevent an attacker from modifying the firmware of the device. To prevent unauthorised firmware from running on the device, use flash encryption in combination with [Secure Boot](#).

### 4.13.12 Flash Encryption and Secure Boot

It is recommended to use flash encryption in combination with Secure Boot. However, if Secure Boot is enabled, additional restrictions apply to device re-flashing:

- [OTA Updates](#) are not restricted, provided that the new app is signed correctly with the Secure Boot signing key.

### 4.13.13 Advanced Features

The following section covers advanced features of flash encryption.

#### Encrypted Partition Flag

Some partitions are encrypted by default. Other partitions can be marked in the partition table description as requiring encryption by adding the flag `encrypted` to the partitions' flag field. As a result, data in these marked partitions will be treated as encrypted in the same manner as an app partition.

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

For details on partition table description, see [partition table](#).

Further information about encryption of partitions:

- Default partition tables do not include any encrypted data partitions.
- With flash encryption enabled, the `app` partition is always treated as encrypted and does not require marking.
- If flash encryption is not enabled, the flag “encrypted” has no effect.
- You can also consider protecting `phy_init` data from physical access, readout, or modification, by marking the optional `phy` partition with the flag `encrypted`.
- The `nvs` partition cannot be encrypted, because the NVS library is not directly compatible with flash encryption.

#### Enabling UART Bootloader Encryption/Decryption

On the first boot, the flash encryption process burns by default the following eFuses:

- `DIS_DOWNLOAD_MANUAL_ENCRYPT` which disables flash encryption operation when running in UART bootloader boot mode.
- `DIS_DOWNLOAD_ICACHE` which disables the entire MMU flash cache when running in UART bootloader mode.
- `DIS_PAD_JTAG` and `DIS_USB_JTAG` which disables JTAG.
- `DIS_LEGACY_SPI_BOOT` which disables Legacy SPI boot mode

However, before the first boot you can choose to keep any of these features enabled by burning only selected eFuses and write-protect the rest of eFuses with unset value 0. For example:

```
espefuse.py --port PORT burn_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
espefuse.py --port PORT write_protect_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
```

---

**Note:** Set all appropriate bits before write-protecting!

Write protection of all the three eFuses is controlled by one bit. It means that write-protecting one eFuse bit will inevitably write-protect all unset eFuse bits.

---

Write protecting these eFuses to keep them unset is not currently very useful, as `esptool.py` does not support reading encrypted flash.

## JTAG Debugging

By default, when Flash Encryption is enabled (in either Development or Release mode) then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables flash encryption.

See *JTAG with Flash Encryption or Secure Boot* for more information about using JTAG Debugging with Flash Encryption.

## 4.13.14 Technical Details

The following sections provide some reference information about the operation of flash encryption.

### Flash Encryption Algorithm

- ESP32-C3 use the XTS-AES block cipher mode with 256 bit size for flash encryption.
- XTS-AES is a block cipher mode specifically designed for disc encryption and addresses the weaknesses other potential modes (e.g. AES-CTR) have for this use case. A detailed description of the XTS-AES algorithm can be found in [IEEE Std 1619-2007](#).
- The flash encryption key is stored in one `BLOCK_KEYN` eFuse and, by default, is protected from further writes or software readout.
- To see the full flash encryption algorithm implemented in Python, refer to the `_flash_encryption_operation()` function in the `espsecure.py` source code.

## 4.14 ESP-IDF FreeRTOS SMP Changes

### 4.14.1 Overview

The ESP-IDF FreeRTOS is a modified version of vanilla FreeRTOS which supports symmetric multiprocessing (SMP). ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0. This guide outlines the major differences between vanilla FreeRTOS and ESP-IDF FreeRTOS. The API reference for vanilla FreeRTOS can be found via <https://www.freertos.org/a00106.html>

For information regarding features that are exclusive to ESP-IDF FreeRTOS, see *ESP-IDF FreeRTOS Additions*.

*Thread Local Storage Pointers & Deletion Callbacks:* Deletion callbacks are called automatically during task deletion and are used to free memory pointed to by TLSP. Call `vTaskSetThreadLocalStoragePointerAndDeletionCallback()` to set TLSP and Deletion Callbacks.

*Configuring ESP-IDF FreeRTOS:* Several aspects of ESP-IDF FreeRTOS can be set in the project configuration (`idf.py menuconfig`) such as running ESP-IDF in Unicore (single core) Mode, or configuring the number of Thread Local Storage Pointers each task will have.

It is not necessary to manually start the FreeRTOS scheduler by calling `vTaskStartScheduler()`. In ESP-IDF the scheduler is started by the *Application Startup Flow* and is already running when the `app_main` function is called (see *Running the main task* for details).

## 4.14.2 Tasks and Task Creation

Tasks in ESP-IDF FreeRTOS are designed to run on a particular core, therefore two new task creation functions have been added to ESP-IDF FreeRTOS by appending `PinnedToCore` to the names of the task creation functions in vanilla FreeRTOS. The vanilla FreeRTOS functions of `xTaskCreate()` and `xTaskCreateStatic()` have led to the addition of `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS

For more details see [freertos/tasks.c](#)

The ESP-IDF FreeRTOS task creation functions are nearly identical to their vanilla counterparts with the exception of the extra parameter known as `xCoreID`. This parameter specifies the core on which the task should run on and can be one of the following values.

- 0 pins the task to **PRO\_CPU**
- 1 pins the task to **APP\_CPU**
- `tskNO_AFFINITY` allows the task to be run on both CPUs

For example `xTaskCreatePinnedToCore(tsk_callback, "APP_CPU Task", 1000, NULL, 10, NULL, 1)` creates a task of priority 10 that is pinned to **APP\_CPU** with a stack size of 1000 bytes. It should be noted that the `uxStackDepth` parameter in vanilla FreeRTOS specifies a task's stack depth in terms of the number of words, whereas ESP-IDF FreeRTOS specifies the stack depth in terms of bytes.

Note that the vanilla FreeRTOS functions `xTaskCreate()` and `xTaskCreateStatic()` have been defined in ESP-IDF FreeRTOS as inline functions which call `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` respectively with `tskNO_AFFINITY` as the `xCoreID` value.

Each Task Control Block (TCB) in ESP-IDF stores the `xCoreID` as a member. Hence when each core calls the scheduler to select a task to run, the `xCoreID` member will allow the scheduler to determine if a given task is permitted to run on the core that called it.

## 4.14.3 Scheduling

The vanilla FreeRTOS implements scheduling in the `vTaskSwitchContext()` function. This function is responsible for selecting the highest priority task to run from a list of tasks in the Ready state known as the Ready Tasks List (described in the next section). In ESP-IDF FreeRTOS, each core will call `vTaskSwitchContext()` independently to select a task to run from the Ready Tasks List which is shared between both cores. There are several differences in scheduling behavior between vanilla and ESP-IDF FreeRTOS such as differences in Round Robin scheduling, scheduler suspension, and tick interrupt synchronicity.

### Round Robin Scheduling

Given multiple tasks in the Ready state and of the same priority, vanilla FreeRTOS implements Round Robin scheduling between multiple ready state tasks of the same priority. This will result in running those tasks in turn each time the scheduler is called (e.g. when the tick interrupt occurs or when a task blocks/yields).

On the other hand, it is not possible for the ESP-IDF FreeRTOS scheduler to implement perfect Round Robin due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin scheduling for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield)

The following example demonstrates the Best Effort Round Robin Scheduling in action. Assume that:

- There are four ready state tasks of the same priority AX, B0, C1, D1 where: - The priority is the current highest priority with ready state tasks - The first character represents the task's names (i.e., A, B, C, D) - And the second character represents the tasks core pinning (and X means unpinned)
- The task list is always searched from the head

1. Starting state. None of the ready state tasks have been selected to run

```
Head [ AX , B0 , C1 , D0 ] Tail
```

2. Core 0 has tick interrupt and searches for a task to run.

Task A is selected and is moved to the back of the list

```
Core0--|
```

```
Head [ AX , B0 , C1 , D0 ] Tail
```

```
0
```

```
Head [ B0 , C1 , D0 , AX ] Tail
```

3. Core 1 has a tick interrupt and searches for a task to run.

Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.

Task C is selected and is moved to the back of the list

```
Core1-----|
```

```
0
```

```
Head [ B0 , C1 , D0 , AX ] Tail
```

```
0 1
```

```
Head [ B0 , D0 , AX , C1 ] Tail
```

4. Core 0 has another tick interrupt and searches for a task to run.

Task B is selected and moved to the back of the list

```
Core0--|
```

```
1
```

```
Head [ B0 , D0 , AX , C1 ] Tail
```

```
1 0
```

```
Head [ D0 , AX , C1 , B0 ] Tail
```

5. Core 1 has another tick and searches for a task to run.

Task D cannot be run due to incompatible affinity, so core 1 skips to Task A

Task A is selected and moved to the back of the list

(continues on next page)

```

Core1-----|          0
Head [ D0 , AX , C1 , B0 ] Tail

          0    1
Head [ D0 , C1 , B0 , AX ] Tail

```

The implications to users regarding the Best Effort Round Robin Scheduling:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin scheduling, users should ensure that all tasks of a particular priority are pinned to the same core.

### Scheduler Suspension

In vanilla FreeRTOS, suspending the scheduler via `vTaskSuspendAll()` will prevent calls of `vTaskSwitchContext` from context switching until the scheduler has been resumed with `xTaskResumeAll()`. However servicing ISRs are still permitted. Therefore any changes in task states as a result from the current running task or ISRs will not be executed until the scheduler is resumed. Scheduler suspension in vanilla FreeRTOS is a common protection method against simultaneous access of data shared between tasks, whilst still allowing ISRs to be serviced.

In ESP-IDF FreeRTOS, `xTaskSuspendAll()` will only prevent calls of `vTaskSwitchContext()` from switching contexts on the core that called for the suspension. Hence if **PRO\_CPU** calls `vTaskSuspendAll()`, **APP\_CPU** will still be able to switch contexts. If data is shared between tasks that are pinned to different cores, scheduler suspension is **NOT** a valid method of protection against simultaneous access. Consider using critical sections (disables interrupts) or semaphores (does not disable interrupts) instead when protecting shared resources in ESP-IDF FreeRTOS.

In general, it's better to use other RTOS primitives like mutex semaphores to protect against data shared between tasks, rather than `vTaskSuspendAll()`.

### Tick Interrupt Synchronicity

In ESP-IDF FreeRTOS, tasks on different cores that unblock on the same tick count might not run at exactly the same time due to the scheduler calls from each core being independent, and the tick interrupts to each core being unsynchronized.

In vanilla FreeRTOS the tick interrupt triggers a call to `xTaskIncrementTick()` which is responsible for incrementing the tick counter, checking if tasks which have called `vTaskDelay()` have fulfilled their delay period, and moving those tasks from the Delayed Task List to the Ready Task List. The tick interrupt will then call the scheduler if a context switch is necessary.

In ESP-IDF FreeRTOS, delayed tasks are unblocked with reference to the tick interrupt on **PRO\_CPU** as **PRO\_CPU** is responsible for incrementing the shared tick count. However tick interrupts to each core might not be synchronized (same frequency but out of phase) hence when **PRO\_CPU** receives a tick interrupt, **APP\_CPU** might not have received it yet. Therefore if multiple tasks of the same priority are unblocked on the same tick count, the task pinned to **PRO\_CPU** will run immediately whereas the task pinned to **APP\_CPU** must wait until **APP\_CPU** receives its out of sync tick interrupt. Upon receiving the tick interrupt, **APP\_CPU** will then call for a context switch and finally switches contexts to the newly unblocked task.

Therefore, task delays should **NOT** be used as a method of synchronization between tasks in ESP-IDF FreeRTOS. Instead, consider using a counting semaphore to unblock multiple tasks at the same time.

### 4.14.4 Critical Sections & Disabling Interrupts

Vanilla FreeRTOS implements critical sections with `taskENTER_CRITICAL()` which calls `portDISABLE_INTERRUPTS()`. This prevents preemptive context switches and servicing of ISRs during a critical section. Therefore, critical sections are used as a valid protection method against simultaneous access in vanilla FreeRTOS.

ESP-IDF contains some modifications to work with dual core concurrency, and the dual core API is used even on a single core only chip.

For this reason, ESP-IDF FreeRTOS implements critical sections using special mutexes, referred by `portMUX_Type` objects. These are implemented on top of a specific spinlock component. Calls to `taskENTER_CRITICAL` or `taskEXIT_CRITICAL` each provide a spinlock object as an argument. The spinlock is associated with a shared resource requiring access protection. When entering a critical section in ESP-IDF FreeRTOS, the calling core will disable interrupts similar to the vanilla FreeRTOS implementation, and will then take the spinlock and enter the critical section. The other core is unaffected at this point, unless it enters its own critical section and attempts to take the same spinlock. In that case it will spin until the lock is released. Therefore, the ESP-IDF FreeRTOS implementation of critical sections allows a core to have protected access to a shared resource without disabling the other core. The other core will only be affected if it tries to concurrently access the same resource.

The ESP-IDF FreeRTOS critical section functions have been modified as follows...

- `taskENTER_CRITICAL(mux)`, `taskENTER_CRITICAL_ISR(mux)`, `portENTER_CRITICAL(mux)`, `portENTER_CRITICAL_ISR(mux)` are all macro defined to call internal function `vPortEnterCritical()`
- `taskEXIT_CRITICAL(mux)`, `taskEXIT_CRITICAL_ISR(mux)`, `portEXIT_CRITICAL(mux)`, `portEXIT_CRITICAL_ISR(mux)` are all macro defined to call internal function `vPortExitCritical()`
- `portENTER_CRITICAL_SAFE(mux)`, `portEXIT_CRITICAL_SAFE(mux)` macro identifies the context of execution, i.e. ISR or Non-ISR, and calls appropriate critical section functions (`port*_CRITICAL` in Non-ISR and `port*_CRITICAL_ISR` in ISR) in order to be in compliance with Vanilla FreeRTOS.

For more details see [esp\\_hw\\_support/include/soc/spinlock.h](#), [freertos/include/freertos/task.h](#), and [freertos/tasks.c](#)

It should be noted that when modifying vanilla FreeRTOS code to be ESP-IDF FreeRTOS compatible, it is trivial to modify the type of critical section called as they are all defined to call the same function. As long as the same spinlock is provided upon entering and exiting, the exact macro or function used for the call should not matter.

### 4.14.5 Task Deletion

In FreeRTOS task deletion the freeing of task memory will occur immediately (within `vTaskDelete()`) if the task being deleted is not currently running or is not pinned to the other core (with respect to the core `vTaskDelete()` is called on). TLSP deletion callbacks will also run immediately if the same conditions are met.

However, calling `vTaskDelete()` to delete a task that is either currently running or pinned to the other core will still result in the freeing of memory being delegated to the Idle Task.

### 4.14.6 Thread Local Storage Pointers & Deletion Callbacks

Thread Local Storage Pointers (TLSP) are pointers stored directly in the TCB. TLSP allow each task to have its own unique set of pointers to data structures. However task deletion behavior in vanilla FreeRTOS does not automatically free the memory pointed to by TLSP. Therefore if the memory pointed to by TLSP is not explicitly freed by the user before task deletion, memory leak will occur.

ESP-IDF FreeRTOS provides the added feature of Deletion Callbacks. Deletion Callbacks are called automatically during task deletion to free memory pointed to by TLSP. Each TLSP can have its own Deletion Callback. Note that due to the to [Task Deletion](#) behavior, there can be instances where Deletion Callbacks are called in the context of the Idle Tasks. Therefore Deletion Callbacks **should never attempt to block** and critical sections should be kept as short as possible to minimize priority inversion.

Deletion callbacks are of type `void (*TlsDeleteCallbackFunction_t)(int, void *)` where the first parameter is the index number of the associated TLSP, and the second parameter is the TLSP itself.

Deletion callbacks are set alongside TLSP by calling `vTaskSetThreadLocalStoragePointerAndDeleteCallback()`. Calling the vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP's associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion. If a deletion callback is `NULL`, users should manually free the memory pointed to by the associated TLSP before task deletion in order to avoid memory leak.

For more details see [FreeRTOS API reference](#).

### 4.14.7 Configuring ESP-IDF FreeRTOS

The ESP-IDF FreeRTOS can be configured in the project configuration menu (`idf.py menuconfig`) under `Component Config/FreeRTOS`. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see [FreeRTOS](#)

As ESP32-C3 is a single core SoC, the config item `CONFIG_FREERTOS_UNICORE` is always set. This means ESP-IDF only runs on the single CPU. Note that this is **not equivalent to running vanilla FreeRTOS**. Behaviors of multiple components in ESP-IDF will be modified. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.

`CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION` will trigger a halt in particular functions in ESP-IDF FreeRTOS which have not been fully tested in an SMP context.

`CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER` will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!  
abort() was called at PC 0x40085c53 on core 0
```

## 4.15 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. [Architecture](#)
2. [LL \(Low Level\) Layer](#)
3. [HAL \(Hardware Abstraction Layer\)](#)

**Warning:** Hardware abstraction API (excluding the driver and `xxx_types.h`) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF's versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

---

**Note:** Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU's features are partially abstracted).

---

### 4.15.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the `hal` component. Each layer is dependent on the layer below it (i.e., driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral `xxx`, its hardware abstraction will generally consist of the header files described in the table below. Files that are **Target Specific** will have a separate implementation for each target (i.e., a separate copy for each chip). However, the `#include` directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.

Table 22: Hardware Abstraction Header Files

Include Directive	Target Specific	Description
<code>#include 'soc/xxx_caps.h'</code>	Y	This header contains a list of C macros specifying the various capabilities of the ESP32-C3's peripheral <code>xxx</code> . Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc.
<code>#include "soc/xxx_struct.h"</code> <code>#include "soc/xxx_reg.h"</code>	Y	The two headers contain a representation of a peripheral's registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files.
<code>#include "soc/xxx_pins.h"</code>	Y	If certain signals of a peripheral are mapped to a particular pin of the ESP32-C3, their mappings are defined in this header as C macros.
<code>#include "soc/xxx_periph.h"</code>	N	This header is mainly used as a convenience header file to automatically include <code>xxx_caps.h</code> , <code>xxx_struct.h</code> , and <code>xxx_reg.h</code> .
<code>#include "hal/xxx_types.h"</code>	N	This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following: <ul style="list-style-type: none"> <li>• Protocol related types/macros such as frames, modes, common bus speeds, etc.</li> <li>• Features/characteristics of an <code>xxx</code> peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc.</li> </ul>
<code>#include "hal/xxx_ll.h"</code>	Y	This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions.
<code>#include "hal/xxx_hal.h"</code>	Y	The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer.
<code>#include "driver/xxx.h"</code>	N	The driver layer is the highest level of ESP-IDF's hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can be used in a multi-threaded environment.

### 4.15.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of `get/set`

functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
                                       xxx_ll_clk_src_t clock_source,
                                       uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_
↪FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
    hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}

static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}
```

The code snippet above illustrates typical LL functions for a peripheral `xxx`. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral's registers, thus the first argument is always a pointer to the starting address of the peripheral's registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

### 4.15.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral's register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modelling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT's operation life cycle, thus illustrating how a HAL abstracts a peripheral's operation into functional steps.

```
// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler,
↪bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t
↪timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);
```

(continues on next page)

```
// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);
```

HAL functions will generally have the following characteristics:

- The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e. the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
  - The channel number of this instance
  - Pointer to the peripheral's (or channel's) registers (i.e., a `xxx_dev_t *` type)
  - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  - Some configuration values for the instance (e.g., channel configurations)
  - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)
- HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
- Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
- Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

## 4.16 JTAG Debugging

This document provides a guide to installing OpenOCD for ESP32-C3 and debugging using GDB. The document is structured as follows:

**Introduction** Introduction to the purpose of this guide.

**How it Works?** Description how ESP32-C3, JTAG interface, OpenOCD and GDB are interconnected and working together to enable debugging of ESP32-C3.

**Selecting JTAG Adapter** What are the criteria and options to select JTAG adapter hardware.

**Setup of OpenOCD** Procedure to install OpenOCD and verify that it is installed.

**Configuring ESP32-C3 Target** Configuration of OpenOCD software and setting up of JTAG adapter hardware, which together make up the debugging target.

**Launching Debugger** Steps to start up a debug session with GDB from *Eclipse* and from *Command Line*.

**Debugging Examples** If you are not familiar with GDB, check this section for debugging examples provided from *Eclipse* as well as from *Command Line*.

**Building OpenOCD from Sources** Procedure to build OpenOCD from sources for *Windows*, *Linux* and *macOS* operating systems.

**Tips and Quirks** This section provides collection of tips and quirks related to JTAG debugging of ESP32-C3 with OpenOCD and GDB.

### 4.16.1 Introduction

Espressif has ported OpenOCD to support the ESP32-C3 processor and the multi-core FreeRTOS (which is the foundation of most ESP32-C3 apps). Additionally, some extra tools have been written to provide extra features that OpenOCD does not support natively.

This document provides a guide to installing OpenOCD for ESP32-C3 and debugging using GDB under Linux, Windows and macOS. Except for OS specific installation procedures, the s/w user interface and use procedures are the same across all supported operating systems.

**Note:** Screenshots presented in this document have been made for Eclipse Neon 3 running on Ubuntu 16.04 LTS. There may be some small differences in what a particular user interface looks like, depending on whether you are using Windows, macOS or Linux and / or a different release of Eclipse.

### 4.16.2 How it Works?

The key software and hardware components that perform debugging of ESP32-C3 with OpenOCD over JTAG (Joint Test Action Group) interface is presented in the diagram below under the “Debugging With JTAG” label. These components include riscv32-esp-elf-gdb debugger, OpenOCD on chip debugger, and the JTAG adapter connected to ESP32-C3 target.

Fig. 33: JTAG debugging - overview diagram

Likewise, the “Application Loading and Monitoring” label indicates the key software and hardware components that allow an application to be compiled, built, and flashed to ESP32-C3, as well as to provide means to monitor diagnostic messages from ESP32-C3.

“Debugging With JTAG” and “Application Loading and Monitoring” is integrated under the [Eclipse](#) IDE in order to provide a quick and easy transition between writing/compiling/loading/debugging code. The Eclipse IDE (and the integrated debugging software) is available for Windows, Linux and macOS platforms. Depending on user preferences, both the debugger and `idf.py build` can also be used directly from terminal/command line, instead of Eclipse.

The connection from PC to ESP32-C3 is done effectively with a single USB cable. This is made possible by the ESP32-C3 chip itself, which provides two USB channels, one for JTAG and the other for the USB terminal connection. The USB cable should be connected to the D+/D- USB pins of ESP32-C3 and not to the serial Rx/D/TxD through a USB-to-UART chip. The proper connection is explained later in subsection [Configuring ESP32-C3 Target](#).

**Note:** Debugging through the USB interface implemented in ESP32-C3 requires to have a chip with revision 3 or newer. Please use other debugging options (e.g. with ESP-Prog) for chip revision 1 and 2. The easiest way to

determine the chip revision is to look for the `Chip is ESP32-C3 (revision 3)` message near the end of a successful chip flashing done by `idf.py flash`.

---

Depending on user preferences, both *debugger* and *idf.py build* can be operated directly from terminal/command line, instead from Eclipse.

### 4.16.3 Selecting JTAG Adapter

The quickest and most convenient way to start with JTAG debugging is through a USB cable connected to the D+/D-USB pins of ESP32-C3. No need for an external JTAG adapter and extra wiring / cable to connect JTAG to ESP32-C3.

If you decide to use separate JTAG adapter, look for one that is compatible with both the voltage levels on the ESP32-C3 as well as with the OpenOCD software. The JTAG port on the ESP32-C3 is an industry-standard JTAG port which lacks (and does not need) the TRST pin. The JTAG I/O pins all are powered from the VDD\_3P3\_RTC pin (which normally would be powered by a 3.3 V rail) so the JTAG adapter needs to be able to work with JTAG pins in that voltage range.

On the software side, OpenOCD supports a fair amount of JTAG adapters. See <http://openocd.org/doc/html/Debug-Adapter-Hardware.html> for an (unfortunately slightly incomplete) list of the adapters OpenOCD works with. This page lists SWD-compatible adapters as well; take note that the ESP32-C3 does not support SWD. JTAG adapters that are hardcoded to a specific product line, e.g. ST-LINK debugging adapters for STM32 families, will not work.

The minimal signalling to get a working JTAG connection are TDI, TDO, TCK, TMS and GND. Some JTAG debuggers also need a connection from the ESP32-C3 power line to a line called e.g. Vtar to set the working voltage. SRST can optionally be connected to the CH\_PD of the ESP32-C3, although for now, support in OpenOCD for that line is pretty minimal.

[ESP-Prog](#) is an example for using an external board for debugging by connecting it to the JTAG pins of ESP32-C3.

### 4.16.4 Setup of OpenOCD

If you have already set up ESP-IDF with CMake build system according to the *Getting Started Guide*, then OpenOCD is already installed. After *setting up the environment* in your terminal, you should be able to run OpenOCD. Check this by executing the following command:

```
openocd --version
```

The output should be as follows (although the version may be more recent than listed here):

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
  http://openocd.org/doc/doxygen/bugs.html
```

You may also verify that OpenOCD knows where its configuration scripts are located by printing the value of OPENOCD\_SCRIPTS environment variable, by typing `echo $OPENOCD_SCRIPTS` (for Linux and macOS) or `echo %OPENOCD_SCRIPTS%` (for Windows). If a valid path is printed, then OpenOCD is set up correctly.

If any of these steps do not work, please go back to the *setting up the tools* section of the Getting Started Guide.

---

**Note:** It is also possible to build OpenOCD from source. Please refer to *Building OpenOCD from Sources* section for details.

---

### 4.16.5 Configuring ESP32-C3 Target

Once OpenOCD is installed, you can proceed to configuring the ESP32-C3 target (i.e ESP32-C3 board with JTAG interface). Configuring the target is split into the following three steps:

- Configure and connect JTAG interface
- Run OpenOCD
- Upload application for debugging

#### Configure and connect JTAG interface

This step depends on the JTAG and ESP32-C3 board you are using (see the two cases described below).

**Configure ESP32-C3 built-in JTAG Interface** ESP32-C3 has a built-in JTAG circuitry and can be debugged without any additional chip. Only an USB cable connected to the D+/D- pins is necessary. The necessary connections are shown in the following section.

#### Configure Hardware

Table 23: ESP32-C3 pins and USB signals

ESP32-C3 Pin	USB Signal
GPIO18	D-
GPIO19	D+
5V	V_BUS
GND	Ground

Please verify that the ESP32-C3 pins used for USB communication are not connected to some other HW that may disturb the JTAG operation.

**Configure USB Drivers** JTAG communication should work on all supported platforms. Windows users might get *LIBUSB\_ERROR\_NOT\_FOUND* errors. Please use version 2.8 (or newer) of the *ESP-IDF Tools Installer* and select the driver “Espressif - WinUSB support for JTAG (ESP32-C3)” in order to resolve this issue. If you don’t want to re-run the installer then the same can be achieved with *idf-env* by running the following command from PowerShell:

```
Invoke-WebRequest 'https://dl.espressif.com/dl/idf-env/idf-env.exe' -OutFile .\idf-
↪env.exe; .\idf-env.exe driver install --espressif
```

**Configure Other JTAG Interface** Refer to section *Selecting JTAG Adapter* for guidance what JTAG interface to select, so it is able to operate with OpenOCD and ESP32-C3. Then follow three configuration steps below to get it working.

#### Configure Hardware

1. Identify all pins / signals on JTAG interface and ESP32-C3 board, that should be connected to establish communication.

Table 24: ESP32-C3 pins and JTAG signals

ESP32-C3 Pin	JTAG Signal
MTDO / GPIO7	TDO
MTDI / GPIO5	TDI
MTCK / GPIO6	TCK
MTMS / GPIO4	TMS

2. Verify if ESP32-C3 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation.

3. Connect identified pin / signals of ESP32-C3 and JTAG interface.

**Configure Drivers** You may need to install driver s/w to make JTAG work with computer. Refer to documentation of JTAG adapter, that should provide related details.

**Connect** Connect JTAG interface to the computer. Power on ESP32-C3 and JTAG interface boards. Check if JTAG interface is visible by computer.

To carry on with debugging environment setup, proceed to section [Run OpenOCD](#).

### Run OpenOCD

Once target is configured and connected to computer, you are ready to launch OpenOCD.

Open a terminal and set it up for using the ESP-IDF as described in the [setting up the environment](#) section of the Getting Started Guide. Then run OpenOCD (this command works on Windows, Linux, and macOS):

```
openocd -f board/esp32c3-builtin.cfg
```

---

**Note:** The files provided after `-f` above are specific for ESP32-C3 through built-in USB connection. You may need to provide different files depending on the hardware that is used. For guidance see [Configuration of OpenOCD for specific target](#).

For example, `board/esp32c3-ftdi.cfg` can be used for a custom board with an FT2232H or FT232H chip used for JTAG connection, or with ESP-Prog.

---

You should now see similar output (this log is for ESP32-C3 through built-in USB connection):

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32c3-builtin.cfg
Open On-Chip Debugger v0.10.0-esp32-20201202-26-g05a036c2 (2021-03-15-17:18)
Licensed under GNU GPL v2
For bug reports, read
  http://openocd.org/doc/doxygen/bugs.html
Info : only one transport option; autoselect 'jtag'
Warn : Transport "jtag" was already selected
force hard breakpoints
Info : Listening on port 6666 for tcl connections
Info : Listening on port 4444 for telnet connections
Info : esp_usb_jtag: Device found. Base speed 40000KHz, div range 1 to 255
Info : clock speed 40000 kHz
Info : JTAG tap: esp32c3.cpu tap/device found: 0x00005c25 (mfg: 0x612 (Espressif_
↔Systems), part: 0x0005, ver: 0x0)
Info : datacount=2 progbufsize=16
Info : Examined RISC-V core; found 1 harts
Info : hart 0: XLEN=32, misa=0x40101104
Info : Listening on port 3333 for gdb connections
```

- If there is an error indicating permission problems, please see section on “Permissions delegation” in the OpenOCD README file located in the `~/esp/openocd-esp32` directory.
- In case there is an error in finding the configuration files, e.g. Can't find `board/esp32c3-builtin.cfg`, check if the `OPENOCD_SCRIPTS` environment variable is set correctly. This variable is used by OpenOCD to look for the files specified after the `-f` option. See [Setup of OpenOCD](#) section for details. Also check if the file is indeed under the provided path.
- If you see JTAG errors (e.g., `...all ones` or `...all zeroes`), please check your JTAG connections, whether other signals are connected to JTAG besides ESP32-C3's pins, and see if everything is powered on correctly.

### Upload application for debugging

Build and upload your application to ESP32-C3 as usual, see [Step 8. Build the Project](#).

Another option is to write application image to flash using OpenOCD via JTAG with commands like this:

```
openocd -f board/esp32c3-builtin.cfg -c "program_esp filename.bin 0x10000 verify_
↵exit"
```

OpenOCD flashing command `program_esp` has the following format:

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - Path to program image file.
- `offset` - Offset in flash bank to write image.
- `verify` - Optional. Verify flash contents after writing.
- `reset` - Optional. Reset target after programing.
- `exit` - Optional. Finally exit OpenOCD.

You are now ready to start application debugging. Follow the steps described in the section below.

### 4.16.6 Launching Debugger

The toolchain for ESP32-C3 features GNU Debugger, in short GDB. It is available with other toolchain programs under filename: `riscv32-esp-elf-gdb`. GDB can be called and operated directly from command line in a terminal. Another option is to call it from within IDE (like Eclipse, Visual Studio Code, etc.) and operate indirectly with help of GUI instead of typing commands in a terminal.

Both options of using debugger are discussed under links below.

- [Eclipse](#)
- [Command Line](#)

It is recommended to first check if debugger works from [Command Line](#) and then move to using [Eclipse](#).

### 4.16.7 Debugging Examples

This section is intended for users not familiar with GDB. It presents example debugging session from [Eclipse](#) using simple application available under [get-started/blink](#) and covers the following debugging actions:

1. [Navigating through the code, call stack and threads](#)
2. [Setting and clearing breakpoints](#)
3. [Halting the target manually](#)
4. [Stepping through the code](#)
5. [Checking and setting memory](#)
6. [Watching and setting program variables](#)
7. [Setting conditional breakpoints](#)

Similar debugging actions are provided using GDB from [Command Line](#).

Before proceeding to examples, set up your ESP32-C3 target and load it with [get-started/blink](#).

### 4.16.8 Building OpenOCD from Sources

Please refer to separate documents listed below, that describe build process.

### Building OpenOCD from Sources for Windows

The following instructions are alternative to downloading binary OpenOCD from [Espressif GitHub](#). To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section *Setup of OpenOCD*.

---

**Note:** Following instructions are assumed to be runned in MSYS2 environment with MINGW32 subsystem!

---

**Install Dependencies** Install packages that are required to compile OpenOCD:

```
pacman -S --noconfirm --needed autoconf automake git make \  
mingw-w64-i686-gcc \  
mingw-w64-i686-toolchain \  
mingw-w64-i686-libtool \  
mingw-w64-i686-pkg-config \  
mingw-w64-cross-winpthreads-git \  
p7zip
```

**Download Sources of OpenOCD** The sources for the ESP32-C3-enabled variant of OpenOCD are available from Espressif GitHub under <https://github.com/espressif/openocd-esp32>. To download the sources, use the following commands:

```
cd ~/esp  
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

**Downloading libusb** Build and export variables for a following OpenOCD compilation:

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z  
7z x -olibusb ./libusb-1.0.22.7z  
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"  
export LDFLAGS="$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"
```

**Build OpenOCD** Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32  
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="  
↪$CFLAGS -Wno-error"  
./bootstrap  
./configure --disable-doxxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --  
↪build=i686-w64-mingw32 --host=i686-w64-mingw32  
make  
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src  
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

Optionally you can add `make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten. Also you could use `export DESTDIR="/custom/install/dir"; make install`.

---

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.

- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
  - If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
  - For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.Windows`.
  - Don't forget to copy `libusb-1.0.dll` and `libwinpthread-1.dll` into `OOCD_INSTALLDIR/bin` from `~/esp/openocd-esp32/src`.
- 

Once make process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src` directory.

**Full Listing** A complete described previously process is provided below for the faster execution, e.g. as a shell script:

```
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-
↳w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-
↳cross-winpthreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git

wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0"; export LDFLAGS="
↳$LDFLAGS -L${PWD}/libusb/MinGW32/.libs/dll"

export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
↳$CFLAGS -Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
↳build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="$PWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin
```

**Next Steps** To carry on with debugging environment setup, proceed to section [Configuring ESP32-C3 Target](#).

### Building OpenOCD from Sources for Linux

The following instructions are alternative to downloading binary OpenOCD from [Espressif GitHub](#). To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section [Setup of OpenOCD](#).

**Download Sources of OpenOCD** The sources for the ESP32-C3-enabled variant of OpenOCD are available from Espressif GitHub under <https://github.com/espressif/openocd-esp32>. To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in `~/esp/openocd-esp32` directory.

**Install Dependencies** Install packages that are required to compile OpenOCD.

---

**Note:** Install the following packages one by one, check if installation was successful and then proceed to the next package. Resolve reported problems before moving to the next step.

---

```
sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0
```

---

**Note:**

- Version of pkg-config should be 0.2.3 or above.
  - Version of autoconf should be 2.6.4 or above.
  - Version of automake should be 1.9 or above.
  - When using USB-Blaster, ASIX Presto, OpenJTAG and FT2232 as adapters, drivers libFTDI and FTD2XX need to be downloaded and installed.
  - When using CMSIS-DAP, HIDAPI is needed.
- 

**Build OpenOCD** Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

---

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.
  - If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
  - If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
  - If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
  - For details concerning compiling OpenOCD, please refer to `openocd-esp32/README`.
- 

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/openocd-esp32/bin` directory.

**Next Steps** To carry on with debugging environment setup, proceed to section [Configuring ESP32-C3 Target](#).

### Building OpenOCD from Sources for MacOS

The following instructions are alternative to downloading binary OpenOCD from [Espressif GitHub](#). To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section [Setup of OpenOCD](#).

**Download Sources of OpenOCD** The sources for the ESP32-C3-enabled variant of OpenOCD are available from Espressif GitHub under <https://github.com/espressif/openocd-esp32>. To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in `~/esp/openocd-esp32` directory.

**Install Dependencies** Install packages that are required to compile OpenOCD using Homebrew:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

**Build OpenOCD** Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

---

**Note:**

- Should an error occur, resolve it and try again until the command `make` works.
  - If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
  - If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
  - If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
  - For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.OSX`.
- 

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src/openocd` directory.

**Next Steps** To carry on with debugging environment setup, proceed to section [Configuring ESP32-C3 Target](#).

The examples of invoking OpenOCD in this document assume using pre-built binary distribution described in section [Setup of OpenOCD](#).

To use binaries build locally from sources, change the path to OpenOCD executable to `src/openocd` and set the `OPENOCD_SCRIPTS` environment variable so that OpenOCD can find the configuration files. For Linux and macOS:

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

For Windows:

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

Example of invoking OpenOCD build locally from sources, for Linux and macOS:

```
src/openocd -f board/esp32c3-builtin.cfg
```

and Windows:

```
src\openocd -f board/esp32c3-builtin.cfg
```

### 4.16.9 Tips and Quirks

This section provides collection of links to all tips and quirks referred to from various parts of this guide.

#### Tips and Quirks

This section provides collection of all tips and quirks referred to from various parts of this guide.

**Breakpoints and watchpoints available** ESP32-C3 debugger supports 2 hardware implemented breakpoints and 64 software ones. Hardware breakpoints are implemented by ESP32-C3 chip's logic and can be set anywhere in the code: either in flash or IRAM program's regions. Additionally there are 2 types of software breakpoints implemented by OpenOCD: flash (up to 32) and IRAM (up to 32) breakpoints. Currently GDB can not set software breakpoints in flash. So until this limitation is removed those breakpoints have to be emulated by OpenOCD as hardware ones (see [below](#) for details). ESP32-C3 also supports two watchpoints, so two variables can be watched for change or read by the GDB command `watch myVariable`. Note that menuconfig option `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` uses the 2nd watchpoint and will not provide expected results, if you also try to use it within OpenOCD / GDB. See menuconfig's help for detailed description.

**What else should I know about breakpoints?** Emulating part of hardware breakpoints using software flash ones means that the GDB command `hb myFunction` which is invoked for function in flash will use pure hardware breakpoint if it is available otherwise one of the 32 software flash breakpoints is used. The same rule applies to `b myFunction`-like commands. In this case GDB will decide what type of breakpoint to set itself. If `myFunction` is resided in writable region (IRAM) software IRAM breakpoint will be used otherwise hardware or software flash breakpoint is used as it is done for `hb` command.

**Flash Mappings vs SW Flash Breakpoints** In order to set/clear software breakpoints in flash, OpenOCD needs to know their flash addresses. To accomplish conversion from the ESP32-C3 address space to the flash one, OpenOCD uses mappings of program's code regions resided in flash. Those mappings are kept in the image header which is prepended to program binary data (code and data segments) and is specific to every application image written to the flash. So to support software flash breakpoints OpenOCD should know where application image under debugging is resided in the flash. By default OpenOCD reads partition table at 0x8000 and uses mappings from the first found application image, but there can be the cases when it will not work, e.g. partition table is not at standard flash location or even there can be multiple images: one factory and two OTA and you may want to debug any of them. To cover all possible debugging scenarios OpenOCD supports special command which can be used to set arbitrary location of application image to debug. The command has the following format:

```
esp appimage_offset <offset>
```

Offset should be in hex format. To reset to the default behaviour you can specify `-1` as offset.

---

**Note:** Since GDB requests memory map from OpenOCD only once when connecting to it, this command should be specified in one of the TCL configuration files, or passed to OpenOCD via its command line. In the latter case command line should look like below:

```
openocd -f board/esp32c3-builtin.cfg -c "init; halt; esp appimage_offset 0x210000"
```

Another option is to execute that command via OpenOCD telnet session and then connect GDB, but it seems to be less handy.

---

**Why stepping with “next” does not bypass subroutine calls?** When stepping through the code with `next` command, GDB is internally setting a breakpoint (one out of two available) ahead in the code to bypass the subroutine calls. This functionality will not work, if the two available breakpoints are already set elsewhere in the code. If this is the case, delete breakpoints to have one “spare”. With both breakpoints already used, stepping through the code with `next` command will work as like with `step` command and debugger will step inside subroutine calls.

**Support options for OpenOCD at compile time** ESP-IDF has some support options for OpenOCD debugging which can be set at compile time:

- `CONFIG_ESP32C3_DEBUG_OCDAWARE` is enabled by default. If a panic or unhandled exception is thrown and a JTAG debugger is connected (ie OpenOCD is running), ESP-IDF will break into the debugger.
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` (disabled by default) sets watchpoint index 1 (the second of two) at the end of any task stack. This is the most accurate way to debug task stack overflows. Click the link for more details.

Please see the [project configuration menu](#) menu for more details on setting compile-time options.

**FreeRTOS support** OpenOCD has explicit support for the ESP-IDF FreeRTOS. GDB can see FreeRTOS tasks as threads. Viewing them all can be done using the GDB `i threads` command, changing to a certain task is done with `thread n`, with `n` being the number of the thread. FreeRTOS detection can be disabled in target’s configuration. For more details see [Configuration of OpenOCD for specific target](#).

**Optimize JTAG speed** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG. To do so use the following tips.

1. The upper limit of JTAG clock frequency is 20 MHz if CPU runs at 80 MHz, or 26 MHz if CPU runs at 160 MHz or 240 MHz.
2. Depending on particular JTAG adapter and the length of connecting cables, you may need to reduce JTAG frequency below 20 / 26 MHz.
3. In particular reduce frequency, if you get DSR/DIR errors (and they do not relate to OpenOCD trying to read from a memory range without physical memory being present there).
4. ESP-WROVER-KIT operates stable at 20 / 26 MHz.

**What is the meaning of debugger’s startup commands?** On startup, debugger is issuing sequence of commands to reset the chip and halt it at specific line of code. This sequence (shown below) is user defined to pick up at most convenient / appropriate line and start debugging.

- `set remote hardware-watchpoint-limit 2`—Restrict GDB to using two hardware watchpoints supported by the chip, 2 for ESP32-C3. For more information see <https://sourceware.org/gdb/onlinedocs/gdb/Remote-Configuration.html>.
- `mon reset halt`—reset the chip and keep the CPUs halted
- `flushregs`—monitor (`mon`) command can not inform GDB that the target state has changed. GDB will assume that whatever stack the target had before `mon reset halt` will still be valid. In fact, after reset the target state will change, and executing `flushregs` is a way to force GDB to get new state from the target.
- `thb app_main`—insert a temporary hardware breakpoint at `app_main`, put here another function name if required
- `c`—resume the program. It will then stop at breakpoint inserted at `app_main`.

**Configuration of OpenOCD for specific target** There are several kinds of OpenOCD configuration files (\*.`cfg`). All configuration files are located in subdirectories of `share/openocd/scripts` directory of OpenOCD distribution (or `tcl/scripts` directory of the source repository). For the purposes of this guide, the most important ones are `board`, `interface` and `target`.

- `interface` configuration files describe the JTAG adapter. Examples of JTAG adapters are ESP-Prog and J-Link.
- `target` configuration files describe specific chips, or in some cases, modules.

- `board` configuration files are provided for development boards with a built-in JTAG adapter. Such files include an `interface` configuration file to choose the adapter, and `target` configuration file to choose the chip/module.

The following configuration files are available for ESP32-C3:

Table 25: OpenOCD configuration files for ESP32-C3

Name	Description
<code>board/esp32c3-builtin.cfg</code>	Board configuration file for ESP32-C3 through built-in USB, includes target and adapter configuration.
<code>board/esp32c3-ftdi.cfg</code>	Board configuration file for ESP32-C3 debug through an ESP-Prog compatible FTDI, includes target and adapter configuration.
<code>target/esp32c3.cfg</code>	ESP32-C3 target configuration file. Can be used together with one of the <code>interface/</code> configuration files.
<code>interface/esp_usb_jtag.cfg</code>	JTAG adapter configuration file for ESP32-C3.
<code>interface/ftdi/esp32_devkitj_v1.cfg</code>	JTAG adapter configuration file for ESP-Prog boards.

If you are using one of the boards which have a pre-defined configuration file, you only need to pass one `-f` argument to OpenOCD, specifying that file.

If you are using a board not listed here, you need to specify both the interface configuration file and target configuration file.

**Custom configuration files** OpenOCD configuration files are written in TCL, and include a variety of choices for customization and scripting. This can be useful for non-standard debugging situations. Please refer to [OpenOCD Manual](#) for the TCL scripting reference.

**OpenOCD configuration variables** The following variables can be optionally set before including the ESP-specific target configuration file. This can be done either in a custom configuration file, or from the command line.

The syntax for setting a variable in TCL is:

```
set VARIABLE_NAME value
```

To set a variable from the command line (replace the name of `.cfg` file with the correct file for your board):

```
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

It is important to set the variable before including the ESP-specific configuration file, otherwise the variable will not have effect. You can set multiple variables by repeating the `-c` option.

Table 26: Common ESP-related OpenOCD variables

Variable	Description
<code>ESP_RTOS</code>	Set to <code>none</code> to disable RTOS support. In this case, thread list will not be available in GDB. Can be useful when debugging FreeRTOS itself, and stepping through the scheduler code.
<code>ESP_FLASH_SIZE</code>	Set to <code>0</code> to disable Flash breakpoints support.
<code>ESP_SEMIHOST_BASED</code>	Set to the path (on the host) which will be the default directory for semihosting functions.

**How debugger resets ESP32-C3?** The board can be reset by entering `mon reset` or `mon reset halt` into GDB.

**Do not use JTAG pins for something else** Operation of JTAG may be disturbed, if some other h/w is connected to JTAG pins besides ESP32-C3 module and JTAG adapter. ESP32-C3 JTAG is using the following pins:

Table 27: ESP32-C3 pins and JTAG signals

ESP32-C3 Pin	JTAG Signal
MTDO / GPIO7	TDO
MTDI / GPIO5	TDI
MTCK / GPIO6	TCK
MTMS / GPIO4	TMS

JTAG communication will likely fail, if configuration of JTAG pins is changed by user application. If OpenOCD initializes correctly (detects the two Tensilica cores), but loses sync and spews out a lot of DTR/DIR errors when the program is ran, it is likely that the application reconfigures the JTAG pins to something else, or the user forgot to connect Vtar to a JTAG adapter that needed it.

Below is an excerpt from series of errors reported by GDB after the application stepped into the code that reconfigured MTDO pin to be an input:

```
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
↳an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
↳an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
↳an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
↳an overrun!
```

**JTAG with Flash Encryption or Secure Boot** By default, enabling Flash Encryption and/or Secure Boot will disable JTAG debugging. On first boot, the bootloader will burn an eFuse bit to permanently disable JTAG at the same time it enables the other features.

The project configuration option `CONFIG_SECURE_BOOT_ALLOW_JTAG` will keep JTAG enabled at this time, removing all physical security but allowing debugging. (Although the name suggests Secure Boot, this option can be applied even when only Flash Encryption is enabled).

However, OpenOCD may attempt to automatically read and write the flash in order to set *software breakpoints*. This has two problems:

- Software breakpoints are incompatible with Flash Encryption, OpenOCD currently has no support for encrypting or decrypting flash contents.
- If Secure Boot is enabled, setting a software breakpoint will change the digest of a signed app and make the signature invalid. This means if a software breakpoint is set and then a reset occurs, the signature verification will fail on boot.

To disable software breakpoints while using JTAG, add an extra argument `-c 'set ESP_FLASH_SIZE 0'` to the start of the OpenOCD command line, see *OpenOCD configuration variables*.

---

**Note:** For the same reason, the ESP-IDF app may fail bootloader verification of app signatures, when this option is enabled and a software breakpoint is set.

---

**Reporting issues with OpenOCD / GDB** In case you encounter a problem with OpenOCD or GDB programs itself and do not find a solution searching available resources on the web, open an issue in the OpenOCD issue tracker under <https://github.com/espressif/openocd-esp32/issues>.

1. In issue report provide details of your configuration:
  - a. JTAG adapter type, and the chip/module being debugged.

- b. Release of ESP-IDF used to compile and load application that is being debugged.
  - c. Details of OS used for debugging.
  - d. Is OS running natively on a PC or on a virtual machine?
2. Create a simple example that is representative to observed issue. Describe steps how to reproduce it. In such an example debugging should not be affected by non-deterministic behaviour introduced by the Wi-Fi stack, so problems will likely be easier to reproduce, if encountered once.
3. Prepare logs from debugging session by adding additional parameters to start up commands.  
OpenOCD:

```
openocd -l openocd_log.txt -d3 -f board/esp32c3-builtin.cfg
```

Logging to a file this way will prevent information displayed on the terminal. This may be a good thing taken amount of information provided, when increased debug level `-d3` is set. If you still like to see the log on the screen, then use another command instead:

```
openocd -d3 -f board/esp32c3-builtin.cfg 2>&1 | tee openocd.log
```

Debugger:

```
riscv32-esp-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
```

Optionally add command `remotelogfile gdb_log.txt` to the `gdbinit` file.

4. Attach both `openocd_log.txt` and `gdb_log.txt` files to your issue report.

## 4.16.10 Related Documents

### Using Debugger

This section covers configuration and running debugger using several methods:

- from [Eclipse](#)
- from [Command Line](#)
- using [idf.py debug targets](#).

### Eclipse

---

**Note:** It is recommended to first check if debugger works using [idf.py debug targets](#) or from [Command Line](#) and then move to using Eclipse.

---

Debugging functionality is provided out of box in standard Eclipse installation. Another option is to use pluggins like “GDB Hardware Debugging” plugin. We have found this plugin quite convenient and decided to use throughout this guide.

To begin with, install “GDB Hardware Debugging” plugin by opening Eclipse and going to *Help > Install New Software*.

Once installation is complete, configure debugging session following steps below. Please note that some of configuration parameters are generic and some are project specific. This will be shown below by configuring debugging for “blink” example project. If not done already, add this project to Eclipse workspace following guidance in section [Build and Flash with Eclipse IDE](#). The source of [get-started/blink](#) application is available in [examples](#) directory of ESP-IDF repository.

1. In Eclipse go to *Run > Debug Configuration*. A new window will open. In the window’s left pane double click “GDB Hardware Debugging” (or select “GDB Hardware Debugging” and press the “New” button) to create a new configuration.
  2. In a form that will show up on the right, enter the “Name:” of this configuration, e.g. “Blink checking” .
  3. On the “Main” tab below, under “Project:” , press “Browse” button and select the “blink” project.
  4. In next line “C/C++ Application:” press “Browse” button and select “blink.elf” file. If “blink.elf” is not there, then likely this project has not been build yet. See [Build and Flash with Eclipse IDE](#) how to do it.
  5. Finally, under “Build (if required) before launching” click “Disable auto build” .
- A sample window with settings entered in points 1 - 5 is shown below.

Fig. 34: Configuration of GDB Hardware Debugging - Main tab

6. Click “Debugger” tab. In field “GDB Command” enter `riscv32-esp-elf-gdb` to invoke debugger.
7. Change default configuration of “Remote host” by entering 3333 under the “Port number” .  
Configuration entered in points 6 and 7 is shown on the following picture.

Fig. 35: Configuration of GDB Hardware Debugging - Debugger tab

8. The last tab to that requires changing of default configuration is “Startup” . Under “Initialization Commands” uncheck “Reset and Delay (seconds)” and “Halt” . Then, in entry field below, enter the following lines:

```
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2
```

**Note:** If you want to update image in the flash automatically before starting new debug session add the following lines of commands at the beginning of “Initialization Commands” textbox:

```
mon reset halt
mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```

For description of `program_esp` command see [Upload application for debugging](#).

9. Under “Load Image and Symbols” uncheck “Load image” option.
10. Further down on the same tab, establish an initial breakpoint to halt CPUs after they are reset by debugger. The plugin will set this breakpoint at the beginning of the function entered under “Set break point at:” . Check out this option and enter `app_main` in provided field.
11. Checkout “Resume” option. This will make the program to resume after `mon reset halt` is invoked per point 8. The program will then stop at breakpoint inserted at `app_main`.

Configuration described in points 8 - 11 is shown below.

If the “Startup” sequence looks convoluted and respective “Initialization Commands” are not clear to you, check [What is the meaning of debugger’s startup commands?](#) for additional explanation.

Fig. 36: Configuration of GDB Hardware Debugging - Startup tab

- If you previously completed *Configuring ESP32-C3 Target* steps described above, so the target is running and ready to talk to debugger, go right to debugging by pressing “Debug” button. Otherwise press “Apply” to save changes, go back to *Configuring ESP32-C3 Target* and return here to start debugging.

Once all 1 - 12 configuration steps are satisfied, the new Eclipse perspective called “Debug” will open as shown on example picture below.

Fig. 37: Debug Perspective in Eclipse

If you are not quite sure how to use GDB, check *Eclipse* example debugging session in section *Debugging Examples*.

### Command Line

- Begin with completing steps described under *Configuring ESP32-C3 Target*. This is prerequisite to start a debugging session.
- Open a new terminal session and go to directory that contains project for debugging, e.g.

```
cd ~/esp/blink
```

- When launching a debugger, you will need to provide couple of configuration parameters and commands. Instead of entering them one by one in command line, create a configuration file and name it `gdbinit`:

```
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
flushregs
thb app_main
c
```

Save this file in current directory.

For more details what's inside `gdbinit` file, see *What is the meaning of debugger's startup commands?*

4. Now you are ready to launch GDB. Type the following in terminal:

```
riscv32-esp-elf-gdb -x gdbinit build/blink.elf
```

5. If previous steps have been done correctly, you will see a similar log concluded with (gdb) prompt:

```
user-name@computer-name:~/esp/blink$ riscv32-esp-elf-gdb -x gdbinit build/
↳blink.elf

(gdb)
```

Note the third line from bottom that shows debugger halting at breakpoint established in `gdbinit` file at function `app_main()`. Since the processor is halted, the LED should not be blinking. If this is what you see as well, you are ready to start debugging.

If you are not quite sure how to use GDB, check *Command Line* example debugging session in section *Debugging Examples*.

**idf.py debug targets** It is also possible to execute the described debugging tools conveniently from `idf.py`. These commands are supported:

1. `idf.py openocd`  
Runs OpenOCD in a console with configuration defined in the environment or via command line. It uses default script directory defined as `OPENOCD_SCRIPTS` environmental variable, which is automatically added from an Export script (`export.sh` or `export.bat`). It is possible to override the script location using command line argument `--openocd-scripts`.  
As for the JTAG configuration of the current board, please use the environmental variable `OPENOCD_COMMANDS` or `--openocd-commands` command line argument. If none of the above is defined, OpenOCD is started with `-f board/esp32c3-builtin.cfg` board definition.
2. `idf.py gdb`  
Starts the gdb the same way as the *Command Line*, but generates the initial gdb scripts referring to the current project elf file.
3. `idf.py gdbtui`  
The same as 2, but starts the gdb with `tui` argument allowing very simple source code view.
4. `idf.py gdbgui`  
Starts `gdbgui` debugger frontend enabling out-of-the-box debugging in a browser window.  
It is possible to combine these debugging actions on a single command line allowing convenient setup of blocking and non-blocking actions in one step. `idf.py` implements a simple logic to move the background actions (such as `openocd`) to the beginning and the interactive ones (such as `gdb`, `monitor`) to the end of the action list. An example of a very useful combination is:

```
idf.py openocd gdbgui monitor
```

The above command runs OpenOCD in the background, starts `gdbgui` to open a browser window with active debugger frontend and opens a serial monitor in the active console.

## Debugging Examples

This section describes debugging with GDB from *Eclipse* as well as from *Command Line*.

**Eclipse** Verify if your target is ready and loaded with [get-started/blink](#) example. Configure and start debugger following steps in section *Eclipse*. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`.

### Examples in this section

1. [Navigating through the code, call stack and threads](#)
2. [Setting and clearing breakpoints](#)
3. [Halting the target manually](#)
4. [Stepping through the code](#)
5. [Checking and setting memory](#)
6. [Watching and setting program variables](#)
7. [Setting conditional breakpoints](#)

**Navigating through the code, call stack and threads** When the target is halted, debugger shows the list of threads in “Debug” window. The line of code where program halted is highlighted in another window below, as shown on the following picture. The LED stops blinking.

Specific thread where the program halted is expanded showing the call stack. It represents function calls that lead up to the highlighted line of code, where the target halted. The first line of call stack under Thread #1 contains the last called function `app_main()`, that in turn was called from function `main_task()` shown in a line below. Each line of the stack also contains the file name and line number where the function was called. By clicking / highlighting the stack entries, in window below, you will see contents of this file.

Fig. 38: Debug Perspective in Eclipse

Fig. 39: Target halted during debugging

By expanding threads you can navigate throughout the application. Expand Thread #5 that contains much longer call stack. You will see there, besides function calls, numbers like `0x4000000c`. They represent addresses of binary code not provided in source form.

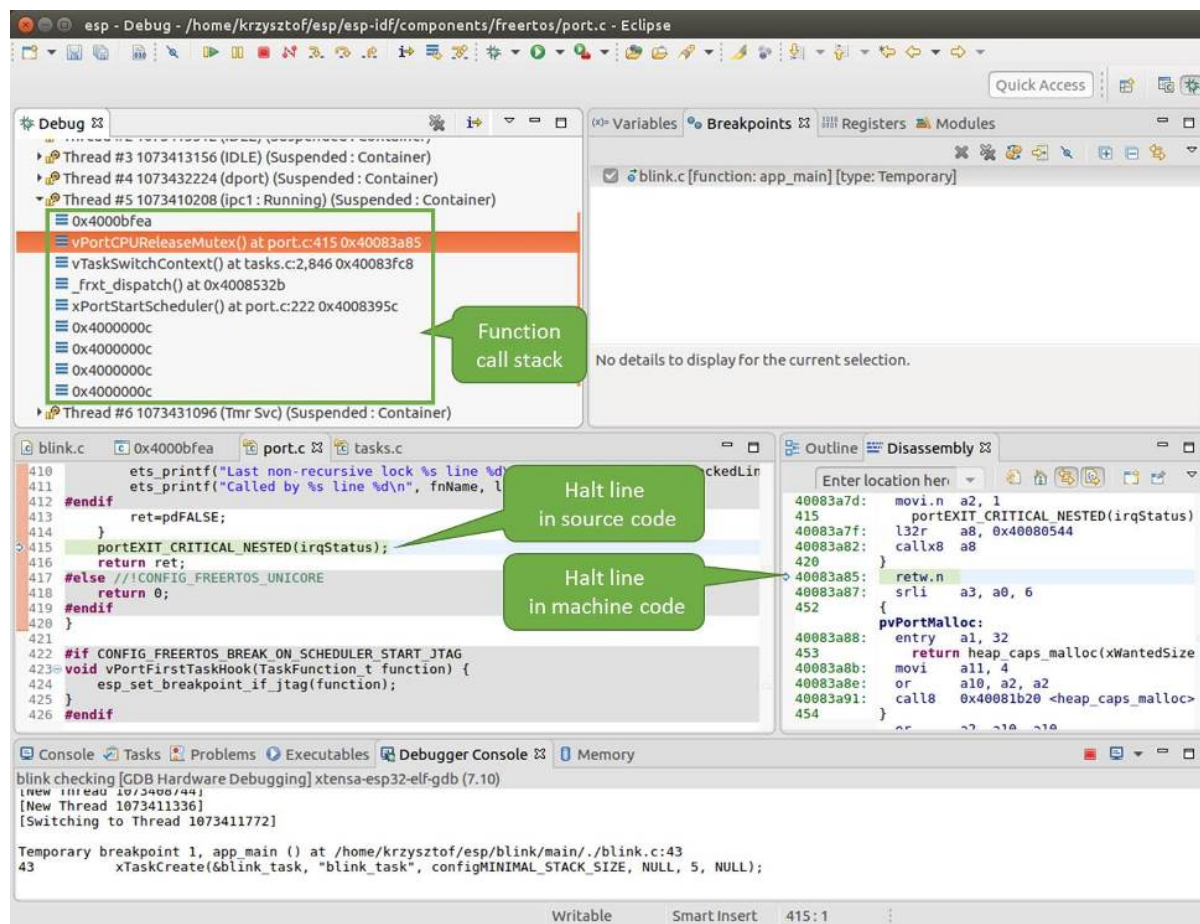

Fig. 40: Navigate through the call stack

In another window on right, you can see the disassembled machine code no matter if your project provides it in source or only the binary form.

Go back to the `app_main()` in Thread #1 to familiar code of `blink.c` file that will be examined in more details in the following examples. Debugger makes it easy to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

**Setting and clearing breakpoints** When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let's establish two breakpoints when the state of LED changes. Basing on code listing above, this happens at lines 33 and 36. To do so, hold the "Control" on the keyboard and double click on number 33 in file `blink.c` file. A dialog will open where you can confirm your selection by pressing "OK" button. If you do not like to see the dialog just double click the line number. Set another breakpoint in line 36.

Information how many breakpoints are set and where is shown in window "Breakpoints" on top right. Click "Show Breakpoints Supported by Selected Target" to refresh this list. Besides the two just set breakpoints the list may contain temporary breakpoint at function `app_main()` established at debugger start. As maximum two breakpoints are allowed (see [Breakpoints and watchpoints available](#)), you need to delete it, or debugging will fail.

If you now click "Resume" (click `blink_task()` under "Tread #8", if "Resume" button is grayed out), the processor will run and halt at a breakpoint. Clicking "Resume" another time will make it run again, halt on second breakpoint, and so on.

Fig. 41: Setting a breakpoint

Fig. 42: Three breakpoints are set / maximum two are allowed

You will be also able to see that LED is changing the state after each click to “Resume” program execution.

Read more about breakpoints under [Breakpoints and watchpoints available](#) and [What else should I know about breakpoints?](#)

**Halting the target manually** When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by pressing “Suspend” button.

To check it, delete all breakpoints and click “Resume” . Then click “Suspend” . Application will be halted at some random point and LED will stop blinking. Debugger will expand tread and highlight the line of code where application halted.

Fig. 43: Target halted manually

In particular case above, the application has been halted in line 52 of code in file `freertos_hooks.c` Now you can resume it again by pressing “Resume” button or do some debugging as discussed below.

**Stepping through the code** It is also possible to step through the code using “Step Into (F5)” and “Step Over (F6)” commands. The difference is that “Step Into (F5)” is entering inside subroutines calls, while “Step Over (F6)” steps over the call, treating it as a single source line.

Before being able to demonstrate this functionality, using information discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`.

Resume program by entering pressing F8 and let it halt. Now press “Step Over (F6)” , one by one couple of times, to see how debugger is stepping one program line at a time.

If you press “Step Into (F5)” instead, then debugger will step inside subroutine calls.

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

Fig. 44: Stepping through the code with “Step Over (F6)”

Fig. 45: Stepping through the code with “Step Into (F5)”

See *Why stepping with “next” does not bypass subroutine calls?* for potential limitation of using next command.

**Checking and setting memory** To display or set contents of memory use “Memory” tab at the bottom of “Debug” perspective.

With the “Memory” tab, we will read from and write to the memory location 0x3FF44004 labeled as GPIO\_OUT\_REG used to set and clear individual GPIO’s.

For more information, see *ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

Being in the same blink.c project as before, set two breakpoints right after gpio\_set\_level instruction. Click “Memory” tab and then “Add Memory Monitor” button. Enter 0x3FF44004 in provided dialog.

Now resume program by pressing F8 and observe “Monitor” tab.

Fig. 46: Observing memory location 0x3FF44004 changing one bit to “ON”

You should see one bit being flipped over at memory location 0x3FF44004 (and LED changing the state) each time F8 is pressed.

Fig. 47: Observing memory location 0x3FF44004 changing one bit to “OFF”

To set memory use the same “Monitor” tab and the same memory location. Type in alternate bit pattern as previously observed. Immediately after pressing enter you will see LED changing the state.

**Watching and setting program variables** A common debugging task is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file blink.c by adding a declaration of

a global variable `int i` above definition of function `blink_task`. Then add `i++` inside `while(1)` of this function to get `i` incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter a breakpoint in the line where you put `i++`.

In next step, in the window with “Breakpoints”, click the “Expressions” tab. If this tab is not visible, then add it by going to the top menu `Window > Show View > Expressions`. Then click “Add new expression” and enter `i`.

Resume program execution by pressing `F8`. Each time the program is halted you will see `i` value being incremented.

Fig. 48: Watching program variable “i”

To modify `i` enter a new number in “Value” column. After pressing “Resume (`F8`)” the program will keep incrementing `i` starting from the new entered number.

**Setting conditional breakpoints** Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Right click on the breakpoint to open a context menu and select “Breakpoint Properties”. Change the selection under “Type:” to “Hardware” and enter a “Condition:” like `i == 2`.

If current value of `i` is less than 2 (change it if required) and program is resumed, it will blink LED in a loop until condition `i == 2` gets true and then finally halt.

**Command Line** Verify if your target is ready and loaded with [get-started/blink](#) example. Configure and start debugger following steps in section [Command Line](#). Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`:

Fig. 49: Setting a conditional breakpoint

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, &
↳NULL);
(gdb)
```

### Examples in this section

1. *Navigating through the code, call stack and threads*
2. *Setting and clearing breakpoints*
3. *Halting and resuming the application*
4. *Stepping through the code*
5. *Checking and setting memory*
6. *Watching and setting program variables*
7. *Setting conditional breakpoints*

**Navigating through the code, call stack and threads** When you see the (gdb) prompt, the application is halted. LED should not be blinking.

To find out where exactly the code is halted, enter `l` or `list`, and debugger will show couple of lines of code around the halt point (line 43 of code in file `blink.c`)

```
(gdb) l
38     }
39 }
40
41 void app_main()
42 {
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, &
↳NULL);
44 }
(gdb)
```

Check how code listing works by entering, e.g. `l 30, 40` to see particular range of lines of code.

You can use `bt` or `backtrace` to see what function calls lead up to this code:

```
(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↳esp32c3/./cpu_start.c:339
(gdb)
```

Line #0 of output provides the last function call before the application halted, i.e. `app_main ()` we have listed previously. The `app_main ()` was in turn called by function `main_task` from line 339 of code located in file `cpu_start.c`.

To get to the context of `main_task` in file `cpu_start.c`, enter `frame N`, where `N = 1`, because the `main_task` is listed under #1):

```
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
↳esp32c3/./cpu_start.c:339
339     app_main();
(gdb)
```

Enter `l` and this will reveal the piece of code that called `app_main ()` (in line 339):

```
(gdb) l
334     ;
335 }
```

(continues on next page)

(continued from previous page)

```

336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
342
(gdb)

```

By listing some lines before, you will see the function name `main_task` we have been looking for:

```

(gdb) l 326, 341
326 static void main_task(void* args)
327 {
328     // Now that the application is about to start, disable boot watchdogs
329     REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330     REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331 #if !CONFIG_FREERTOS_UNICORE
332     // Wait for FreeRTOS initialization to finish on APP CPU, before replacing
↳ its startup stack
333     while (port_xSchedulerRunning[1] == 0) {
334         ;
335     }
336 #endif
337     //Enable allocation in region where the startup stacks were located.
338     heap_caps_enable_nonos_stack_heaps();
339     app_main();
340     vTaskDelete(NULL);
341 }
(gdb)

```

To see the other code, enter `i threads`. This will show the list of threads running on target:

```

(gdb) i threads
Id   Target Id           Frame
  8   Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
↳ <optimized out>)
    at /home/user-name/esp/esp-idf/components/esp32c3/./dport_access.c:170
  7   Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
↳ pvBuffer=0x0, xTicksToWait=1644638200,
    xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.
↳ c:1452
  6   Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./timers.c:445
  5   Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
  4   Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
    at /home/user-name/esp/esp-idf/components/esp32c3/./dport_access.c:150
  3   Thread 1073413156 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
  2   Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/./tasks.c:3282
* 1   Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
↳ main/./blink.c:43
(gdb)

```

The thread list shows the last function calls per each thread together with the name of C source file if available.

You can navigate to specific thread by entering `thread N`, where `N` is the thread Id. To see how it works go to thread thread 5:

```
(gdb) thread 5
```

(continues on next page)

(continued from previous page)

```
[Switching to thread 5 (Thread 1073410208)]
#0 0x4000bfea in ?? ()
(gdb)
```

Then check the backtrace:

```
(gdb) bt
#0 0x4000bfea in ?? ()
#1 0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
↳esp/esp-idf/components/freertos/./port.c:415
#2 0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
↳freertos/./tasks.c:2846
#3 0x4008532b in _frxt_dispatch ()
#4 0x4008395c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
↳freertos/./port.c:222
#5 0x4000000c in ?? ()
#6 0x4000000c in ?? ()
#7 0x4000000c in ?? ()
#8 0x4000000c in ?? ()
(gdb)
```

As you see, the backtrace may contain several entries. This will let you check what exact sequence of function calls lead to the code where the target halted. Question marks ?? instead of a function name indicate that application is available only in binary format, without any source file in C language. The value like 0x4000bfea is the memory address of the function call.

Using `bt`, `i threads`, `thread N` and `list` commands we are now able to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

**Setting and clearing breakpoints** When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let's establish two breakpoints when the state of LED changes. Basing on code listing above this happens at lines 33 and 36. Breakpoints may be established using command `break M` where `M` is the code line number:

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

If you now enter `c`, the processor will run and halt at a breakpoint. Entering `c` another time will make it run again, halt on second breakpoint, and so on:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active) APP_CPU: PC=0x400D10D8

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:33
33         gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active) APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active) APP_CPU: PC=0x400D10D8

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36         gpio_set_level(BLINK_GPIO, 1);
```

(continues on next page)

(continued from previous page)

```
(gdb)
```

You will be also able to see that LED is changing the state only if you resume program execution by entering `c`.

To examine how many breakpoints are set and where, use command `info break`:

```
(gdb) info break
Num      Type           Disp Enb Address      What
2        breakpoint     keep y   0x400db6f6 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:33
    breakpoint already hit 1 time
3        breakpoint     keep y   0x400db704 in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
    breakpoint already hit 1 time
(gdb)
```

Please note that breakpoint numbers (listed under `Num`) start with 2. This is because first breakpoint has been already established at function `app_main()` by running command `thb app_main` on debugger launch. As it was a temporary breakpoint, it has been automatically deleted and now is not listed anymore.

To remove breakpoints enter `delete N` command (in short `d N`), where `N` is the breakpoint number:

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

Read more about breakpoints under *Breakpoints and watchpoints available* and *What else should I know about breakpoints?*

**Halting and resuming the application** When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by entering `Ctrl+C`.

To check it delete all breakpoints and enter `c` to resume application. Then enter `Ctrl+C`. Application will be halted at some random point and LED will stop blinking. Debugger will print the following:

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00          APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]

Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/
↳components/esp32c3/./freertos_hooks.c:52
52          asm("waiti 0");
(gdb)
```

In particular case above, the application has been halted in line 52 of code in file `freertos_hooks.c`. Now you can resume it again by enter `c` or do some debugging as discussed below.

---

**Note:** In MSYS2 shell `Ctrl+C` does not halt the target but exists debugger. To resolve this issue consider debugging with *Eclipse* or check a workaround under [http://www.mingw.org/wiki/Workaround\\_for\\_GDB\\_Ctrl\\_C\\_Interrupt](http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt).

---

**Stepping through the code** It is also possible to step through the code using `step` and `next` commands (in short `s` and `n`). The difference is that `step` is entering inside subroutines calls, while `next` steps over the call, treating it as a single source line.

To demonstrate this functionality, using command `break` and `delete` discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`:

```
(gdb) info break
Num      Type           Disp Enb Address      What
3        breakpoint      keep y  0x400db704  in blink_task at /home/user-name/esp/
↳blink/main/./blink.c:36
        breakpoint already hit 1 time
(gdb)
```

Resume program by entering `c` and let it halt:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active)    APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:36
36      gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

Then enter `n` couple of times to see how debugger is stepping one program line at a time:

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)    APP_CPU: PC=0x400D1128
37      vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active)    APP_CPU: PC=0x400D1128
33      gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

If you enter `s` instead, then debugger will step inside subroutine calls:

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)    APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active)    APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/
↳components/driver/./gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error
↳", ESP_ERR_INVALID_ARG);
(gdb)
```

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

See [Why stepping with “next” does not bypass subroutine calls?](#) for potential limitation of using `next` command.

**Checking and setting memory** Displaying the contents of memory is done with command `x`. With additional parameters you may vary the format and count of memory locations displayed. Run `help x` to see more details. Companion command to `x` is `set` that let you write values to the memory.

We will demonstrate how `x` and `set` work by reading from and writing to the memory location `0x3FF44004` labeled as `GPIO_OUT_REG` used to set and clear individual GPIO's.

For more information, see *ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

Being in the same `blink.c` project as before, set two breakpoints right after `gpio_set_level` instruction. Enter two times `c` to get to the break point followed by `x /1wx 0x3FF44004` to display contents of `GPIO_OUT_REG` memory location:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active)   APP_CPU: PC=0x400D1128

Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:34
34         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)   APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)   APP_CPU: PC=0x400D1128

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
↳blink.c:37
37         vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```

If you are blinking LED connected to GPIO4, then you should see fourth bit being flipped each time the LED changes the state:

```
0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010
```

Now, when the LED is off, that corresponds to `0x3ff44004: 0x00000000` being displayed, try using `set` command to set this bit by writing `0x00000010` to the same memory location:

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
```

You should see the LED to turn on immediately after entering `set {unsigned int}0x3FF44004=0x000010` command.

**Watching and setting program variables** A common debugging task is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file `blink.c` by adding a declaration of a global variable `int i` above definition of function `blink_task`. Then add `i++` inside `while(1)` of this function to get `i` incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter the command `watch i`:

```
(gdb) watch i
Hardware watchpoint 2: i
(gdb)
```

This will insert so called “watchpoint” in each place of code where variable `i` is being modified. Now enter `continue` to resume the application and observe it being halted:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)   APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
↳blink.c:33
33         i++;
(gdb)
```

Resume application couple more times so `i` gets incremented. Now you can enter `print i` (in short `p i`) to check the current value of `i`:

```
(gdb) p i
$1 = 3
(gdb)
```

To modify the value of `i` use `set` command as below (you can then print it out to check if it has been indeed changed):

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
(gdb)
```

You may have up to two watchpoints, see [Breakpoints and watchpoints available](#).

**Setting conditional breakpoints** Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Delete existing breakpoints and try this:

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/.blink.c, line 34.
(gdb)
```

Above command sets conditional breakpoint to halt program execution in line 34 of `blink.c` if `i == 2`.

If current value of `i` is less than 2 and program is resumed, it will blink LED in a loop until condition `i == 2` gets true and then finally halt:

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active)   APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active)   APP_CPU: PC=0x400D112C

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
↳blink.c:34
34         gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

**Obtaining help on commands** Commands presented so far should provide a very basic and intended to let you quickly get started with JTAG debugging. Check help what are the other commands at your disposal. To obtain help on syntax and functionality of a particular command, being at `(gdb)` prompt type `help` and command name:

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine,
this command does not enter the subroutine, but instead steps over
the call, in effect treating it as a single source line.
(gdb)
```

By typing just `help`, you will get top level list of command classes, to aid you drilling down to more details. Optionally refer to available GDB cheat sheets, for instance <https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf>. Good to have as a reference (even if not all commands are applicable in an embedded environment).

**Ending debugger session** To quit debugger enter `q`:

```
(gdb) q
A debugging session is active.

    Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

## 4.17 Linker Script Generation

### 4.17.1 Overview

There are several *memory regions* where code and data can be placed. Code and read-only data are placed by default in flash, writable data in RAM, etc. However, it is sometimes necessary to change these default placements.

For example, it may be necessary to place critical code in RAM for performance reasons or to place code in RTC memory for use in a wake stub.

With the linker script generation mechanism, it is possible to specify these placements at the component level within ESP-IDF. The component presents information on how it would like to place its symbols, objects or the entire archive. During build the information presented by the components are collected, parsed and processed; and the placement rules generated is used to link the app.

### 4.17.2 Quick Start

This section presents a guide for quickly placing code/data to RAM and RTC memory - placements ESP-IDF provides out-of-the-box.

For this guide, suppose we have the following:

```
- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig
```

(continues on next page)

(continued from previous page)

```

- src/
  - my_src1.c
  - my_src2.c
  - my_src3.c
- my_linker_fragment_file.lf

```

- a component named `my_component` that is archived as library `libmy_component.a` during build
- three source files archived under the library, `my_src1.c`, `my_src2.c` and `my_src3.c` which are compiled as `my_src1.o`, `my_src2.o` and `my_src3.o`, respectively
- under `my_src1.o`, the function `my_function1` is defined; under `my_src2.o`, the function `my_function2` is defined
- there exist bool-type config `PERFORMANCE_MODE` (y/n) and int type config `PERFORMANCE_LEVEL` (with range 0-3) in `my_component`'s Kconfig

### Creating and Specifying a Linker Fragment File

Before anything else, a linker fragment file needs to be created. A linker fragment file is simply a text file with a `.lf` extension upon which the desired placements will be written. After creating the file, it is then necessary to present it to the build system. The instructions for the build systems supported by ESP-IDF are as follows:

**Make** In the component's `component.mk` file, set the variable `COMPONENT_ADD_LDFRAGMENTS` to the path of the created linker fragment file. The path can either be an absolute path or a relative path from the component directory.

```
COMPONENT_ADD_LDFRAGMENTS += my_linker_fragment_file.lf
```

**CMake** In the component's `CMakeLists.txt` file, specify argument `LDFRAGMENTS` in the `idf_component_register` call. The value of `LDFRAGMENTS` can either be an absolute path or a relative path from the component directory to the created linker fragment file.

```

# file paths relative to CMakeLists.txt
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
↳another_linker_fragment_file.lf"
    ...
)

```

### Specifying placements

It is possible to specify placements at the following levels of granularity:

- object file (`.obj` or `.o` files)
- symbol (function/variable)
- archive (`.a` files)

**Placing object files** Suppose the entirety of `my_src1.o` is performance-critical, so it is desirable to place it in RAM. On the other hand, the entirety of `my_src2.o` contains symbols needed coming out of deep sleep, so it needs to be put under RTC memory. In the linker fragment file, we can write:

```

[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)      # places all my_src1 code/read-only data under IRAM/DRAM
    my_src2 (rtc)         # places all my_src2 code/ data and read-only data under_
↳RTC fast memory/RTC slow memory

```

What happens to `my_src3.o`? Since it is not specified, default placements are used for `my_src3.o`. More on default placements [here](#).

**Placing symbols** Continuing our example, suppose that among functions defined under `object1.o`, only `my_function1` is performance-critical; and under `object2.o`, only `my_function2` needs to execute after the chip comes out of deep sleep. This could be accomplished by writing:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1:my_function1 (noflash)
    my_src2:my_function2 (rtc)
```

The default placements are used for the rest of the functions in `my_src1.o` and `my_src2.o` and the entire `object3.o`. Something similar can be achieved for placing data by writing the variable name instead of the function name, like so:

```
my_src1:my_variable (noflash)
```

**Warning:** There are *limitations* in placing code/data at symbol granularity. In order to ensure proper placements, an alternative would be to group relevant code and data into source files, and *use object-granularity placements*.

**Placing entire archive** In this example, suppose that the entire component archive needs to be placed in RAM. This can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (noflash)
```

Similarly, this places the entire component in RTC memory:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    * (rtc)
```

**Configuration-dependent placements** Suppose that the entire component library should only have special placement when a certain condition is true; for example, when `CONFIG_PERFORMANCE_MODE == y`. This could be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE = y:
        * (noflash)
    else:
        * (default)
```

For a more complex config-dependent placement, suppose the following requirements: when `CONFIG_PERFORMANCE_LEVEL == 1`, only `object1.o` is put in RAM; when `CONFIG_PERFORMANCE_LEVEL == 2`, `object1.o` and `object2.o`; and when `CONFIG_PERFORMANCE_LEVEL == 3` all object files under the archive are to be put into RAM. When these three are false however, put entire library in RTC memory. This scenario is a bit contrived, but, it can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL = 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL = 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL = 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

Nesting condition-checking is also possible. The following is equivalent to the snippet above:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
            if PERFORMANCE_LEVEL >= 2:
                object2 (noflash)
                if PERFORMANCE_LEVEL >= 3:
                    object2 (noflash)
    else:
        * (rtc)
```

### The ‘default’ placements

Up until this point, the term ‘default placements’ has been mentioned as fallback placements when the placement rules `rtc` and `noflash` are not specified. It is important to note that the tokens `noflash` or `rtc` are not merely keywords, but are actually entities called fragments, specifically *schemes*.

In the same manner as `rtc` and `noflash` are schemes, there exists a `default` scheme which defines what the default placement rules should be. As the name suggests, it is where code and data are usually placed, i.e. code/constants is placed in flash, variables placed in RAM, etc. More on the default scheme [here](#).

---

**Note:** For an example of an ESP-IDF component using the linker script generation mechanism, see [freertos/CMakeLists.txt](#). `freertos` uses this to place its object files to the instruction RAM for performance reasons.

---

This marks the end of the quick start guide. The following text discusses the internals of the mechanism in a little bit more detail. The following sections should be helpful in creating custom placements or modifying default behavior.

### 4.17.3 Linker Script Generation Internals

Linking is the last step in the process of turning C/C++ source files into an executable. It is performed by the toolchain’s linker, and accepts linker scripts which specify code/data placements, among other things. With the linker script generation mechanism, this process is no different, except that the linker script passed to the linker is dynamically generated from: (1) the collected *linker fragment files* and (2) *linker script template*.

---

**Note:** The tool that implements the linker script generation mechanism lives under `tools/ldgen`.

---

## Linker Fragment Files

As mentioned in the quick start guide, fragment files are simple text files with the `.lf` extension containing the desired placements. This is a simplified description of what fragment files contain, however. What fragment files actually contain are ‘fragments’. Fragments are entities which contain pieces of information which, when put together, form placement rules that tell where to place sections of object files in the output binary. There are three types of fragments: *sections*, *scheme* and *mapping*.

**Grammar** The three fragment types share a common grammar:

```
[type:name]
key: value
key:
  value
  value
  value
  ...
```

- **type:** Corresponds to the fragment type, can either be `sections`, `scheme` or `mapping`.
- **name:** The name of the fragment, should be unique for the specified fragment type.
- **key, value:** Contents of the fragment; each fragment type may support different keys and different grammars for the key values.

---

**Note:** In cases where multiple fragments of the same type and name are encountered, an exception is thrown.

---

---

**Note:** The only valid characters for fragment names and keys are alphanumeric characters and underscore.

---

## Condition Checking

Condition checking enable the linker script generation to be configuration-aware. Depending on whether expressions involving configuration values are true or not, a particular set of values for a key can be used. The evaluation uses `eval_string` from `kconfiglib` package and adheres to its required syntax and limitations. Supported operators are as follows:

- **comparison**
  - `LessThan <`
  - `LessThanOrEqualTo <=`
  - `MoreThan >`
  - `MoreThanOrEqualTo >=`
  - `Equal =`
  - `NotEqual !=`
- **logical**
  - `Or ||`
  - `And &&`
  - `Negation !`
- **grouping**
  - `Parenthesis ()`

Condition checking behaves as you would expect an `if...elseif/elif...else` block in other languages. Condition-checking is possible for both key values and entire fragments. The two sample fragments below are equivalent:

```
# Value for keys is dependent on config
[type:name]
key_1:
  if CONDITION = y:
    value_1
```

(continues on next page)

(continued from previous page)

```
else:
    value_2
key_2:
    if CONDITION = y:
        value_a
    else:
        value_b
```

```
# Entire fragment definition is dependent on config
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_b
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

### Comments

Comment in linker fragment files begin with #. Like in other languages, comment are used to provide helpful descriptions and documentation and are ignored during processing.

**Compatibility with ESP-IDF v3.x Linker Script Fragment Files** ESP-IDF v4.0 brings some changes to the linker script fragment file grammar:

- indentation is enforced and improperly indented fragment files generate a parse exception; this was not enforced in the old version but previous documentation and examples demonstrates properly indented grammar
- move to `if...elif...else` structure for conditionals, with the ability to nest checks and place entire fragments themselves inside conditionals
- mapping fragments now requires a name like other fragment types

Linker script generator should be able to parse ESP-IDF v3.x linker fragment files that are indented properly (as demonstrated by the ESP-IDF v3.x version of this document). Backward compatibility with the previous mapping fragment grammar (optional name and the old grammar for conditionals) has also been retained but with a deprecation warning. Users should switch to the newer grammar discussed in this document as support for the old grammar is planned to be removed in the future.

Note that linker fragment files using the new ESP-IDF v4.0 grammar is not supported on ESP-IDF v3.x, however.

### Types Sections

Sections fragments defines a list of object file sections that the GCC compiler emits. It may be a default section (e.g. `.text`, `.data`) or it may be user defined section through the `__attribute__` keyword.

The use of an optional '+' indicates the inclusion of the section in the list, as well as sections that start with it. This is the preferred method over listing both explicitly.

```
[sections:name]
entries:
    .section+
    .section
    ...
```

Example:

```
# Non-preferred
[sections:text]
entries:
    .text
    .text.*
    .literal
    .literal.*

# Preferred, equivalent to the one above
[sections:text]
entries:
    .text+           # means .text and .text.*
    .literal+       # means .literal and .literal.*
```

## Scheme

Scheme fragments define what `target` a sections fragment is assigned to.

```
[scheme:name]
entries:
    sections -> target
    sections -> target
    ...
```

Example:

```
[scheme:noflash]
entries:
    text -> iram0_text           # the entries under the sections fragment named...
    ↪text will go to iram0_text
    rodata -> dram0_data        # the entries under the sections fragment named...
    ↪rodata will go to dram0_data
```

The default scheme

There exists a special scheme with the name `default`. This scheme is special because catch-all placement rules are generated from its entries. This means that, if one of its entries is `text -> flash_text`, the placement rule

```
*(.literal .literal.* .text .text.*)
```

will be generated for the target `flash_text`.

These catch-all rules then effectively serve as fallback rules for those whose mappings were not specified.

The default scheme is defined in [esp32c3/ld/esp32c3\\_fragments.ld](#). The `noflash` and `rtc` scheme fragments which are built-in schemes referenced in the quick start guide are also defined in this file.

## Mapping

Mapping fragments define what scheme fragment to use for mappable entities, i.e. object files, function names, variable names, archives.

```
[mapping:name]
archive: archive           # output archive file name, as built (i.e. libxxx.
    ↪a)
entries:
    object:symbol (scheme) # symbol granularity
    object (scheme)       # object granularity
    * (scheme)            # archive granularity
```

There are three levels of placement granularity:

- **symbol:** The object file name and symbol name are specified. The symbol name can be a function name or a variable name.
- **object:** Only the object file name is specified.

- archive: \* is specified, which is a short-hand for all the object files under the archive.

To know what an entry means, let us expand a sample object-granularity placement:

```
object (scheme)
```

Then expanding the scheme fragment from its entries definitions, we have:

```
object (sections -> target,  
        sections -> target,  
        ...)
```

Expanding the sections fragment with its entries definition:

```
object (.section,      # given this object file  
        .section,     # put its sections listed here at this  
        ... -> target, # target  
  
        .section,  
        .section,     # same should be done for these sections  
        ... -> target,  
  
        ...)          # and so on
```

Example:

```
[mapping:map]  
archive: libfreertos.a  
entries:  
    * (noflash)
```

**On Symbol-Granularity Placements** Symbol granularity placements is possible due to compiler flags `-ffunction-sections` and `-ffdata-sections`. ESP-IDF compiles with these flags by default. If the user opts to remove these flags, then the symbol-granularity placements will not work. Furthermore, even with the presence of these flags, there are still other limitations to keep in mind due to the dependence on the compiler's emitted output sections.

For example, with `-ffunction-sections`, separate sections are emitted for each function; with section names predictably constructed i.e. `.text.{func_name}` and `.literal.{func_name}`. This is not the case for string literals within the function, as they go to pooled or generated section names.

With `-fdata-sections`, for global scope data the compiler predictably emits either `.data.{var_name}`, `.rodata.{var_name}` or `.bss.{var_name}`; and so Type I mapping entry works for these. However, this is not the case for static data declared in function scope, as the generated section name is a result of mangling the variable name with some other information.

### Linker Script Template

The linker script template is the skeleton in which the generated placement rules are put into. It is an otherwise ordinary linker script, with a specific marker syntax that indicates where the generated placement rules are placed.

To reference the placement rules collected under a `target` token, the following syntax is used:

```
mapping[target]
```

Example:

The example below is an excerpt from a possible linker script template. It defines an output section `.iram0.text`, and inside is a marker referencing the target `iram0_text`.

```
.iram0.text :
{
    /* Code marked as running out of IRAM */
    _iram_text_start = ABSOLUTE(.);

    /* Marker referencing iram0_text */
    mapping[iram0_text]

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

Suppose the generator collected the fragment definitions below:

```
[sections:text]
.text+
.literal+

[sections:iram]
.iram1+

[scheme:default]
entries:
text -> flash_text
iram -> iram0_text

[scheme:noflash]
entries:
text -> iram0_text

[mapping:freertos]
archive: libfreertos.a
entries:
* (noflash)
```

Then the corresponding excerpt from the generated linker script will be as follows:

```
.iram0.text :
{
    /* Code marked as running out of IRAM */
    _iram_text_start = ABSOLUTE(.);

    /* Placement rules generated from the processed fragments, placed where the_
↔marker was in the template */
    *(.iram1 .iram1.*)
    *libfreertos.a:(.literal .text .literal.* .text.*)

    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

```
*libfreertos.a:(.literal .text .literal.* .text.*)
```

Rule generated from the entry `* (noflash)` of the `freertos` mapping fragment. All `text` sections of all object files under the archive `libfreertos.a` will be collected under the target `iram0_text` (as per the `noflash` scheme) and placed wherever in the template `iram0_text` is referenced by a marker.

```
*(.iram1 .iram1.*)
```

Rule generated from the default scheme entry `iram -> iram0_text`. Since the default scheme specifies an `iram -> iram0_text` entry, it too is placed wherever `iram0_text` is referenced by a marker. Since it is a rule generated from the default scheme, it comes first among all other rules collected under the same target name.

The linker script template currently used is [esp32c3/ld/esp32c3.project.ld.in](#), specified by the `esp32c3` component; the generated output script is put under its build directory.

## 4.18 Memory Types

ESP32-C3 chip has multiple memory types and flexible memory mapping features. This section describes how ESP-IDF uses these features by default.

ESP-IDF distinguishes between instruction memory bus (IRAM, IROM, RTC FAST memory) and data memory bus (DRAM, DROM). Instruction memory is executable, and can only be read or written via 4-byte aligned words. Data memory is not executable and can be accessed via individual byte operations. For more information about the different memory buses consult the ESP32-C3 Technical Reference Manual\* > *System and Memory* [PDF].

### 4.18.1 DRAM (Data RAM)

Non-constant static data (`.data`) and zero-initialized data (`.bss`) is placed by the linker into Internal SRAM as data memory. Remaining space in this region is used for the runtime heap.

---

**Note:** The maximum statically allocated DRAM size is reduced by the *IRAM (Instruction RAM)* size of the compiled application. The available heap memory at runtime is reduced by the total static IRAM and DRAM usage of the application.

---

Constant data may also be placed into DRAM, for example if it is used in an non-flash-safe ISR (see explanation under *How to place code in IRAM*).

#### “noinit” DRAM

The macro `__NOINIT_ATTR` can be used as attribute to place data into `.noinit` section. The values placed into this section will not be initialized at startup and should keep its value after software restart.

Example:

```
__NOINIT_ATTR uint32_t noinit_data;
```

### 4.18.2 IRAM (Instruction RAM)

---

**Note:** Any internal SRAM which is not used for Instruction RAM will be made available as *DRAM (Data RAM)* for static data and dynamic allocation (heap).

---

#### Why place code in IRAM

Cases when parts of application should be placed into IRAM:

- Interrupt handlers must be placed into IRAM if `ESP_INTR_FLAG_IRAM` is used when registering the interrupt handler. For more information, see *IRAM-Safe Interrupt Handlers*.
- Some timing critical code may be placed into IRAM to reduce the penalty associated with loading the code from flash. ESP32-C3 reads code and data from flash via the MMU cache. In some cases, placing a function into IRAM may reduce delays caused by a cache miss and significantly improve that function's performance.

## How to place code in IRAM

Some code is automatically placed into the IRAM region using the linker script.

If some specific application code needs to be placed into IRAM, it can be done by using the [Linker Script Generation](#) feature and adding a linker script fragment file to your component that targets entire source files or functions with the `noflash` placement. See the [Linker Script Generation](#) docs for more information.

Alternatively, it's possible to specify IRAM placement in the source code using the `IRAM_ATTR` macro:

```
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

There are some possible issues with placement in IRAM, that may cause problems with IRAM-safe interrupt handlers:

- Strings or constants inside an `IRAM_ATTR` function may not be placed in RAM automatically. It's possible to use `DRAM_ATTR` attributes to mark these, or using the linker script method will cause these to be automatically placed correctly.

```
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

Note that knowing which data should be marked with `DRAM_ATTR` can be hard, the compiler will sometimes recognize that a variable or expression is constant (even if it is not marked `const`) and optimize it into flash, unless it is marked with `DRAM_ATTR`.

- GCC optimizations that automatically generate jump tables or switch/case lookup tables place these tables in flash. There are two possible ways to resolve this issue:
  - Use a [linker script fragment](#) to mark the entire source file as `noflash`
  - Pass specific flags to the compiler to disable these optimizations in the relevant source files. For CMake, place the following in the component CMakeLists.txt file:

```
set_source_files_properties("${CMAKE_CURRENT_LIST_DIR}/relative/path/to/
↪file" PROPERTIES
                                COMPILER_FLAGS "-fno-jump-tables -fno-tree-
↪switch-conversion")
```

### 4.18.3 IROM (code executed from Flash)

If a function is not explicitly placed into *IRAM (Instruction RAM)* or RTC memory, it is placed into flash. The mechanism by which Flash MMU is used to allow code execution from flash is described in *ESP32-C3 Technical Reference Manual > Memory Management and Protection Units (MMU, MPU)* [PDF]. As IRAM is limited, most of an application's binary code must be placed into IROM instead.

During [Application Startup Flow](#), the bootloader (which runs from IRAM) configures the MMU flash cache to map the app's instruction code region to the instruction space. Flash accessed via the MMU is cached using some internal SRAM and accessing cached flash data is as fast as accessing other types of internal memory.

### 4.18.4 RTC fast memory

The same region of RTC fast memory can be accessed as both instruction and data memory. Code which has to run after wake-up from deep sleep mode has to be placed into RTC memory. Please check detailed description in [deep sleep](#) documentation.

Remaining RTC fast memory is added to the heap unless the option `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` is disabled. This memory can be used interchangeably with *DRAM (Data RAM)*, but is slightly slower to access.

### 4.18.5 DROM (data stored in Flash)

By default, constant data is placed by the linker into a region mapped to the MMU flash cache. This is the same as the *IROM (code executed from Flash)* section, but is for read-only data not executable code.

The only constant data not placed into this memory type by default are literal constants which are embedded by the compiler into application code. These are placed as the surrounding function's executable instructions.

The `DRAM_ATTR` attribute can be used to force constants from DROM into the *DRAM (Data RAM)* section (see above).

### 4.18.6 DMA Capable Requirement

Most peripheral DMA controllers (e.g. SPI, sdmmc, etc.) have requirements that sending/receiving buffers should be placed in DRAM and word-aligned. We suggest to place DMA buffers in static variables rather than in the stack. Use macro `DMA_ATTR` to declare global/local static variables like:

```
DMA_ATTR uint8_t buffer[]="I want to send something";

void app_main()
{
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

Or:

```
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

It is also possible to allocate DMA-capable memory buffers dynamically by using the `MALLOC_CAP_DMA` capabilities flag.

### 4.18.7 DMA Buffer in the stack

Placing DMA buffers in the stack is possible but discouraged. If doing so, pay attention to the following:

- Use macro `WORD_ALIGNED_ATTR` in functions before variables to place them in proper positions like:

```
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something"; //or_
    ↳the buffer will be placed right after stuff.
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // other stuff
}
```

## 4.19 lwIP

ESP-IDF uses the open source [lwIP lightweight TCP/IP stack](#). The ESP-IDF version of lwIP ([esp-lwip](#)) has some modifications and additions compared to the upstream project.

### 4.19.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- [BSD Sockets API](#)
- [Netconn API](#) is enabled but not officially supported for ESP-IDF applications

#### Adapted APIs

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the [ESP-NETIF](#) functionality
- Simple Network Time Protocol (SNTP) is supported via the [lwip/include/apps/sntp/sntp.h](#) [lwip/lwip/src/include/lwip/apps/sntp.h](#) functions (see also [SNTP Time Synchronization](#))
- ICMP Ping is supported using a variation on the lwIP ping API. See [ICMP Echo](#).
- NetBIOS lookup is available using the standard lwIP API. [protocols/http\\_server/restful\\_server](#) has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see [mDNS Service](#)), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the [CONFIG\\_LWIP\\_DNS\\_SUPPORT\\_MDNS\\_QUERIES](#) setting is enabled.

### 4.19.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

#### References

A wide range of BSD Sockets reference material is available, including:

- [Single UNIX Specification BSD Sockets page](#)
- [Berkeley Sockets Wikipedia page](#)

## Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- [protocols/sockets/tcp\\_server](#)
- [protocols/sockets/tcp\\_client](#)
- [protocols/sockets/udp\\_server](#)
- [protocols/sockets/udp\\_client](#)
- [protocols/sockets/udp\\_multicast](#)
- [protocols/http\\_request](#) (Note: this is a simplified example of using a TCP socket to send an HTTP request. The *ESP HTTP Client* is a much better option for sending HTTP requests.)

## Supported functions

The following BSD socket API functions are supported. For full details see [lwip/lwip/src/include/lwip/sockets.h](#).

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt()` & `setsockopt()` (see [Socket Options](#))
- `close()` (via [Virtual filesystem component](#))
- `read()`, `readv()`, `write()`, `writew()` (via [Virtual filesystem component](#))
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via [Virtual filesystem component](#))
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see [fcntl](#))

Non-standard functions:

- `ioctl()` (see [ioctls](#))

---

**Note:** Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

---

## Socket Error Handling

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see [Socket API Errors](#).
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see [select\(\) Errors](#).

## Socket API Errors

### The error detection

- We can know that the socket API fails according to its return value.

#### Get the error reason code

- When socket API fails, the return value doesn't contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see <[Socket Error Reason Code](#)>.

Example:

```
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}
```

### select() Errors

#### The error detection

- Socket error when `select()` has exception descriptor

#### Get the error reason code

- If the `select` indicates that the socket fails, we can't get the error reason code by accessing `errno`, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to `errno`.

---

**Note:** `getsockopt` function prototype `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in `optval`. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

---

Example:

```
int err;

if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

**Socket Error Reason Code** Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see `newlib errno.h` <<https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h>> and the platform-specific extensions `newlib/platform_include/errno.h`

Error code	Description
ECONNREFUSED	Connection refused
EADDRINUSE	Address already in use
ECONNABORTED	Software caused connection abort
ENETUNREACH	Network is unreachable
ENETDOWN	Network interface is not configured
ETIMEDOUT	Connection timed out
EHOSTDOWN	Host is down
EHOSTUNREACH	Host is unreachable
EINPROGRESS	Connection already in progress
EALREADY	Socket already connected
EDESTADDRREQ	Destination address required
EPROTONOSUPPORT	Unknown protocol

### Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

**Common options** Used with level argument `SOL_SOCKET`.

- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF` (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- `SO_SNDTIMEO` / `SO_RCVTIMEO`
- `SO_ERROR` (this option is only used with `select()`, see [Socket Error Handling](#))
- `SO_TYPE`
- `SO_NO_CHECK` (for UDP sockets only)

**IP options** Used with level argument `IPPROTO_IP`.

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO` (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

**TCP options** TCP sockets only. Used with level argument `IPPROTO_TCP`.

- `TCP_NODELAY`

Options relating to TCP keepalive probes:

- `TCP_KEEPALIVE` (int value, TCP keepalive period in milliseconds)
- `TCP_KEEPIDLE` (same as `TCP_KEEPALIVE`, but the value is in seconds)
- `TCP_KEEPINTVL` (int value, interval between keepalive probes in seconds)
- `TCP_KEEPCNT` (int value, number of keepalive probes before timing out)

**IPv6 options** IPv6 sockets only. Used with level argument `IPPROTO_IPV6`

- `IPV6_CHECKSUM`
- `IPV6_V6ONLY`

For multicast IPv6 UDP sockets:

- `IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP`
- `IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP`
- `IPV6_MULTICAST_IF`
- `IPV6_MULTICAST_HOPS`
- `IPV6_MULTICAST_LOOP`

## **fcntl**

The `fcntl()` function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the *Virtual filesystem component* layer is used to implement this function.

When the file descriptor is a socket, only the following `fcntl()` values are supported:

- `O_NONBLOCK` to set/clear non-blocking I/O mode. Also supports `O_NDELAY`, which is identical to `O_NONBLOCK`.
- `O_RDONLY`, `O_WRONLY`, `O_RDWR` flags for different read/write modes. These can read via `F_GETFL` only, they cannot be set using `F_SETFL`. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return `O_RDWR`.

## **ioctl**

The `ioctl()` function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the *Virtual filesystem component* layer is used to implement this function.

When the file descriptor is a socket, only the following `ioctl()` values are supported:

- `FIONREAD` returns the number of bytes of pending data already received in the socket's network buffer.
- `FIONBIO` is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to `fcntl(fd, F_SETFL, O_NONBLOCK, ...)`.

### **4.19.3 Netconn API**

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

---

**Important:** Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is *enabled but not supported*. Some functionality may only work correctly when used from the BSD Sockets API.

---

For more information about the Netconn API, consult [lwip/lwip/src/include/lwip/api.h](#) and [this wiki page which is part of the unofficial lwIP Application Developers Manual](#).

### **4.19.4 lwIP FreeRTOS Task**

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues ( “mailboxes” ) used to send data to/from the TCP/IP task:

- [CONFIG\\_LWIP\\_TCPIP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCPIP\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCPIP\\_TASK\\_AFFINITY](#)

### 4.19.5 esp-lwip custom modifications

#### Additions

The following code is added which is not present in the upstream lwIP release:

**Thread-safe sockets** It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

**On demand timers** lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. `esp-lwip` default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable [CONFIG\\_LWIP\\_TIMERS\\_ONDEMAND](#).

**Lwip timers API** When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see [lwip/lwip/src/include/lwip/timeouts.h](#).

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`

**Abort TCP connections when IP changes** [CONFIG\\_LWIP\\_TCP\\_KEEP\\_CONNECTION\\_WHEN\\_IP\\_CHANGES](#) is disabled by default. This disables the default lwIP behaviour of keeping TCP connections open if an interface IP changes, in case the interface IP changes back (for example, if an interface connection goes down and comes back up). Enable this option to keep TCP connections open in this case, until they time out normally. This may increase the number of sockets in use if a network interface goes down temporarily.

#### Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see *Socket Options*).
- Possible to set IPV6-only UDP and TCP sockets with `IPV6_V6ONLY` socket option (normal lwIP is TCP only).

#### IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

## Limitations

Calling `send()` or `sendto()` repeatedly on a UDP socket may eventually fail with `errno` equal to `ENOMEM`. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don't wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the *Wi-Fi* project configuration may also help.

### 4.19.6 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

#### Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the *wifi/iperf* example in an RF sealed enclosure.

The *wifi/iperf/sdkconfig.defaults* file for the *iperf* example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project *sdkconfig*.

---

**Important:** Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

---

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (*CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY*) and runs at fixed priority `ESP_TASK_TCPIP_PRI0` (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority.
- If using `select()` function with socket arguments only, setting *CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT* will make `select()` calls faster.

If using a Wi-Fi network interface, please also refer to *Wi-Fi Buffer Usage*.

#### Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard `TCP_NODELAY` flag to disable Nagle's algorithm.

#### Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing *CONFIG\_LWIP\_MAX\_SOCKETS* reduces the maximum number of sockets in the system. This will also cause TCP sockets in the `WAIT_CLOSE` state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing *CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE*, *CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE* and *CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE* reduce memory usage at the expense of throughput, depending on usage.
- Reducing *CONFIG\_LWIP\_TCP\_MSL*, *CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT* reduces the maximum segment lifetime in the system. This will also cause TCP sockets in the `TIME_WAIT`, `FIN_WAIT_2` state to be closed and recycled more rapidly
- Disable *CONFIG\_LWIP\_IPV6* can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCPIP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to [Wi-Fi Buffer Usage](#).

**Peak Buffer Usage** The peak heap memory that lwIP consumes is the **theoretically-maximum memory** that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: `lwip_udp_conn`
- the memory required to create a TCP connection: `lwip_tcp_conn`
- the number of UDP connections that the application has: `lwip_udp_con_num`
- the number of TCP connections that the application has: `lwip_tcp_con_num`
- the TCP TX window size: `lwip_tcp_tx_win_size`
- the TCP RX window size: `lwip_tcp_rx_win_size`

**So, the peak heap memory that the LwIP consumes can be calculated with the following formula:**

$$\text{lwip\_dynamic\_peek\_memory} = (\text{lwip\_udp\_con\_num} * \text{lwip\_udp\_conn}) + (\text{lwip\_tcp\_con\_num} * (\text{lwip\_tcp\_tx\_win\_size} + \text{lwip\_tcp\_rx\_win\_size} + \text{lwip\_tcp\_conn}))$$

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

## 4.20 Partition Tables

### 4.20.1 Overview

A single ESP32-C3's flash can contain multiple apps, as well as many different kinds of data (calibration data, filesystems, parameter storage, etc). For this reason a partition table is flashed to (*default offset*) 0x8000 in the flash.

Partition table length is 0xC00 bytes (maximum 95 partition table entries). An MD5 checksum, which is used for checking the integrity of the partition table, is appended after the table data.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to open the project configuration menu (`idf.py menuconfig`) and choose one of the simple predefined partition tables under `CONFIG_PARTITION_TABLE_TYPE`:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you execute `idf.py partition_table` then it will print a summary of the partition table.

### 4.20.2 Built-in Partition Tables

Here is the summary printed for the “Single factory app, no OTA” configuration:

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- At a 0x10000 (64KB) offset in the flash is the app labelled “factory” . The bootloader will run this app by default.
- There are also two data regions defined in the partition table for storing NVS library partition and PHY init data.

Here is the summary printed for the “Factory app, two OTA definitions” configuration:

```
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- There are now three app partition definitions. The type of the factory app (at 0x10000) and the next two “OTA” apps are all set to “app”, but their subtypes are different.
- There is also a new “otadata” slot, which holds the data for OTA updates. The bootloader consults this data in order to know which app to execute. If “ota data” is empty, it will execute the factory app.

### 4.20.3 Creating Custom Tables

If you choose “Custom partition table CSV” in menuconfig then you can also enter the name of a CSV file (in the project directory) to use for your partition table. The CSV file can describe any number of definitions for the table you need.

The CSV format is the same format as printed in the summaries shown above. However, not all fields are required in the CSV. For example, here is the “input” CSV for the OTA partition table:

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
ota_0, app, ota_0, , 1M
ota_1, app, ota_1, , 1M
nvs_key, data, nvs_keys, , 0x1000
```

- Whitespace between fields is ignored, and so is any line starting with # (comments).
- Each non-comment line in the CSV file is a partition definition.
- The “Offset” field for each partition is empty. The `gen_esp32part.py` tool fills in each blank offset, starting after the partition table and making sure each partition is aligned correctly.

#### Name field

Name field can be any meaningful name. It is not significant to the ESP32-C3. Names longer than 16 characters will be truncated.

#### Type field

Partition type field can be specified as `app` (0x00) or `data` (0x01). Or it can be a number 0-254 (or as hex 0x00-0xFE). Types 0x00-0x3F are reserved for ESP-IDF core functions.

If your app needs to store data in a format not already supported by ESP-IDF, then please add a custom partition type value in the range 0x40-0xFE.

See [esp\\_partition\\_type\\_t](#) for the enum definitions for `app` and `data` partitions.

If writing in C++ then specifying a application-defined partition type requires casting an integer to [esp\\_partition\\_type\\_t](#) in order to use it with the [partition API](#). For example:

```
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

The ESP-IDF bootloader ignores any partition types other than `app` (0x00) and `data` (0x01).

## SubType

The 8-bit subtype field is specific to a given partition type. ESP-IDF currently only specifies the meaning of the subtype field for `app` and `data` partition types.

See enum `esp_partition_subtype_t` for the full list of subtypes defined by ESP-IDF, including the following:

- When type is `app`, the subtype field can be specified as `factory` (0x00), `ota_0` (0x10) ... `ota_15` (0x1F) or `test` (0x20).
  - `factory` (0x00) is the default `app` partition. The bootloader will execute the factory app unless there it sees a partition of type `data/ota`, in which case it reads this partition to determine which OTA image to boot.
    - \* OTA never updates the factory partition.
    - \* If you want to conserve flash usage in an OTA project, you can remove the factory partition and use `ota_0` instead.
  - `ota_0` (0x10) ... `ota_15` (0x1F) are the OTA app slots. When *OTA* is in use, the OTA data partition configures which app slot the bootloader should boot. When using OTA, an application should have at least two OTA application slots (`ota_0` & `ota_1`). Refer to the *OTA documentation* for more details.
  - `test` (0x20) is a reserved subtype for factory test procedures. It will be used as the fallback boot partition if no other valid app partition is found. It is also possible to configure the bootloader to read a GPIO input during each boot, and boot this partition if the GPIO is held low, see *Boot from test app partition*.
- When type is `data`, the subtype field can be specified as `ota` (0x00), `phy` (0x01), `nvs` (0x02), `nvs_keys` (0x04), or a range of other component-specific subtypes (see *subtype enum*).
  - `ota` (0) is the *OTA data partition* which stores information about the currently selected OTA app slot. This partition should be 0x2000 bytes in size. Refer to the *OTA documentation* for more details.
  - `phy` (1) is for storing PHY initialisation data. This allows PHY to be configured per-device, instead of in firmware.
    - \* In the default configuration, the phy partition is not used and PHY initialisation data is compiled into the app itself. As such, this partition can be removed from the partition table to save space.
    - \* To load PHY data from this partition, open the project configuration menu (`idf.py menuconfig`) and enable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION` option. You will also need to flash your devices with phy init data as the esp-idf build system does not do this automatically.
  - `nvs` (2) is for the *Non-Volatile Storage (NVS) API*.
    - \* NVS is used to store per-device PHY calibration data (different to initialisation data).
    - \* NVS is used to store WiFi data if the `esp_wifi_set_storage(WIFI_STORAGE_FLASH)` initialisation function is used.
    - \* The NVS API can also be used for other application data.
    - \* It is strongly recommended that you include an NVS partition of at least 0x3000 bytes in your project.
    - \* If using NVS API to store a lot of data, increase the NVS partition size from the default 0x6000 bytes.
  - `nvs_keys` (4) is for the NVS key partition. See *Non-Volatile Storage (NVS) API* for more details.
    - \* It is used to store NVS encryption keys when *NVS Encryption* feature is enabled.
    - \* The size of this partition should be 4096 bytes (minimum partition size).
  - There are other predefined data subtypes for data storage supported by ESP-IDF. These include *FAT filesystem* (`ESP_PARTITION_SUBTYPE_DATA_FAT`), *SPIFFS* (`ESP_PARTITION_SUBTYPE_DATA_SPIFFS`), etc.

Other subtypes of `data` type are reserved for future ESP-IDF uses.

- If the partition type is any application-defined value (range 0x40-0xFE), then `subtype` field can be any value chosen by the application (range 0x00-0xFE).

Note that when writing in C++, an application-defined subtype value requires casting to type `esp_partition_subtype_t` in order to use it with the *partition API*.

## Offset & Size

Partitions with blank offsets in the CSV file will start after the previous partition, or after the partition table in the case of the first partition.

Partitions of type `app` have to be placed at offsets aligned to 0x10000 (64K). If you leave the offset field blank, `gen_esp32part.py` will automatically align the partition. If you specify an unaligned offset for an app partition,

the tool will return an error.

Sizes and offsets can be specified as decimal numbers, hex numbers with the prefix 0x, or size multipliers K or M (1024 and 1024\*1024 bytes).

If you want the partitions in the partition table to work relative to any placement (*CONFIG\_PARTITION\_TABLE\_OFFSET*) of the table itself, leave the offset field (in CSV file) for all partitions blank. Similarly, if changing the partition table offset then be aware that all blank partition offsets may change to match, and that any fixed offsets may now collide with the partition table (causing an error).

### Flags

Only one flag is currently supported, `encrypted`. If this field is set to `encrypted`, this partition will be encrypted if *Flash Encryption* is enabled.

---

**Note:** `app` type partitions will always be encrypted, regardless of whether this flag is set or not.

---

## 4.20.4 Generating Binary Partition Table

The partition table which is flashed to the ESP32-C3 is in a binary format, not CSV. The tool `partition_table/gen_esp32part.py` is used to convert between CSV and binary formats.

If you configure the partition table CSV name in the project configuration (`idf.py menuconfig`) and then build the project or run `idf.py partition_table`, this conversion is done as part of the build process.

To convert CSV to Binary manually:

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

To convert binary format back to CSV manually:

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

To display the contents of a binary partition table on stdout (this is how the summaries displayed when running `idf.py partition_table` are generated:

```
python gen_esp32part.py binary_partitions.bin
```

### MD5 checksum

The binary format of the partition table contains an MD5 checksum computed based on the partition table. This checksum is used for checking the integrity of the partition table during the boot.

The MD5 checksum generation can be disabled by the `--disable-md5sum` option of `gen_esp32part.py` or by the *CONFIG\_PARTITION\_TABLE\_MD5* option.

## 4.20.5 Flashing the partition table

- `idf.py partition_table-flash`: will flash the partition table with `esptool.py`.
- `idf.py flash`: Will flash everything including the partition table.

A manual flashing command is also printed as part of `idf.py partition_table` output.

**Note:** Note that updating the partition table doesn't erase data that may have been stored according to the old partition table. You can use `idf.py erase_flash` (or `esptool.py erase_flash`) to erase the entire flash contents.

---

### 4.20.6 Partition Tool (`parttool.py`)

The component `partition_table` provides a tool `parttool.py` for performing partition-related operations on a target device. The following operations can be performed using the tool:

- reading a partition and saving the contents to a file (`read_partition`)
- writing the contents of a file to a partition (`write_partition`)
- erasing a partition (`erase_partition`)
- retrieving info such as name, offset, size and flag ( “encrypted” ) of a given partition (`get_partition_info`)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool's Python API and command-line interface, respectively.

#### Python API

Before anything else, make sure that the `parttool` module is imported.

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # get value of IDF_PATH from environment
parttool_dir = os.path.join(idf_path, "components", "partition_table") # parttool.
↳py lives in $IDF_PATH/components/partition_table

sys.path.append(parttool_dir) # this enables Python to find parttool module
from parttool import * # import all names inside parttool module
```

The starting point for using the tool's Python API to do is create a `ParttoolTarget` object:

```
# Create a parttool.py target device connected on serial port /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```
# Erase partition with name 'storage'
target.erase_partition(PartitionName("storage"))

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
↳'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# Write to partition 'factory' the contents of a file named 'factory.bin'
target.write_partition(PartitionName("factory"), "factory.bin")

# Print the size of default boot partition
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

The partition to operate on is specified using `PartitionName` or `PartitionType` or `PARTITION_BOOT_DEFAULT`. As the name implies, these can be used to refer to partitions of a particular name, type-subtype combination, or the default boot partition.

More information on the Python API is available in the docstrings for the tool.

## Command-line Interface

The command-line interface of *parttool.py* has the following structure:

```
parttool.py [command-args] [subcommand] [subcommand-args]

- command-args - These are arguments that are needed for executing the main_
↳command (parttool.py), mostly pertaining to the target device
- subcommand - This is the operation to be performed
- subcommand-args - These are arguments that are specific to the chosen operation
```

```
# Erase partition with name 'storage'
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
↳'
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
↳subtype=spiffs --output "spiffs.bin"

# Write to partition 'factory' the contents of a file named 'factory.bin'
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
↳"factory.bin"

# Print the size of default boot partition
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --
↳info size
```

More information can be obtained by specifying *-help* as argument:

```
# Display possible subcommands and show main command argument descriptions
parttool.py --help

# Show descriptions for specific subcommand arguments
parttool.py [subcommand] --help
```

## 4.21 RF calibration

ESP32-C3 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

### 4.21.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`.

### 4.21.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.

5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable `CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don't mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

### 4.21.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

### 4.21.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_wifi/esp32c3/include/phy_init_data.h`.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

## 4.22 Secure Boot V2

---

**Important:** The references in this document are related to Secure Boot V2, the preferred scheme from ESP32 ECO3 onwards, in ESP32-S2, and from ESP32-C3 ECO3 onwards.

Secure Boot V2 uses RSA based app and bootloader verification. This document can also be referred for signing apps with the RSA scheme without signing the bootloader.

---

Secure Boot V2 is available for ESP32-C3 from ECO3 onwards. To get these options visible in the `menuconfig` set `CONFIG_ESP32C3_REV_MIN` greater than or equal to `Rev 3`.

### 4.22.1 Background

Secure Boot protects a device from running unsigned code (verification at time of load). A new RSA based secure boot verification scheme (Secure Boot V2) has been introduced for ESP32-S2, ESP32-C3 ECO3 onwards, and ESP32 ECO3 onwards.

- The software bootloader's RSA-PSS signature is verified by the Mask ROM and it is executed post successful verification.
- The verified software bootloader verifies the RSA-PSS signature of the application image before it is executed.

### 4.22.2 Advantages

- The RSA public key is stored on the device. The corresponding RSA private key is kept secret on a server and is never accessed by the device.
- Up to three public keys can be generated and stored in the chip during manufacturing.
- ESP32-C3 provides the facility to permanently revoke individual public keys. This can be configured conservatively or aggressively.
- Conservatively - The old key is revoked after the bootloader and application have successfully migrated to a new key. Aggressively - The key is revoked as soon as verification with this key fails.
- Same image format & signature verification is applied for applications & software bootloader.
- No secrets are stored on the device. Therefore immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.22.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process, Step by step instructions are supplied under [How To Enable Secure Boot V2](#).

1. Secure Boot V2 verifies the signature blocks appended to the bootloader and application binaries. The signature block contains the image binary signed by a RSA-3072 private key and its corresponding public key. More details on the [Signature Block Format](#).
2. On startup, ROM code checks the Secure Boot V2 bit in eFuse.
3. If secure boot is enabled, ROM checks the SHA-256 of the public key in the signature block in the eFuse.
4. The ROM code validates the public key embedded in the software bootloader's signature block by matching the SHA-256 of its public key to the SHA-256 in eFuse as per the earlier step. Boot process will be aborted if a valid hash of the public key isn't found in the eFuse.
5. The ROM code verifies the signature of the bootloader with the pre-validated public key with the RSA-PSS Scheme. In depth information on [Verifying the signature Block](#).
6. Software bootloader, reads the app partition and performs similar verification on the application. The application is verified on every boot up and OTA update. If selected OTA app partition fails verification, bootloader will fall back and look for another correctly signed partition.

### 4.22.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

Each signature block contains the following:

- **Offset 0 (1 byte):** Magic byte (0xe7)
- **Offset 1 (1 byte):** Version number byte (currently 0x02), 0x01 is for Secure Boot V1.
- **Offset 2 (2 bytes):** Padding bytes, Reserved. Should be zero.
- **Offset 4 (32 bytes):** SHA-256 hash of only the image content, not including the signature block.
- **Offset 36 (384 bytes):** RSA Public Modulus used for signature verification. (value 'n' in RFC8017).
- **Offset 420 (4 bytes):** RSA Public Exponent used for signature verification (value 'e' in RFC8017).
- **Offset 424 (384 bytes):** Precalculated R, derived from 'n'.
- **Offset 808 (4 bytes):** Precalculated M', derived from 'n'
- **Offset 812 (384 bytes):** RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC).
- **Offset 1196:** CRC32 of the preceding 1095 bytes.
- **Offset 1200 (16 bytes):** Zero padding to length 1216 bytes.

---

**Note:** R and M' are used for hardware-assisted Montgomery Multiplication.

---

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

### 4.22.5 Verifying the signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196.

Upto 3 signature blocks can be appended to the bootloader or application image in ESP32-C3.

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. The magic byte, signature block CRC is validated.
  2. Public key digests are generated per signature block and compared with the digests from eFuse. If none of the digests match, the verification process is aborted.
  3. The application image digest is generated and matched with the image digest in the signature blocks. The verification process is aborted if the digests don't match.
  4. The public key is used to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (3) for comparison.
- The application signing scheme is set to RSA for Secure Boot V2 and to ECDSA for Secure Boot V1.

---

**Important:** It is recommended to use Secure Boot V2 on the chip versions supporting them.

---

### 4.22.6 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See [secure-boot-bootloader-size](#).

### 4.22.7 eFuse usage

- `SECURE_BOOT_EN` - Enables secure boot protection on boot.
- `KEY_PURPOSE_X` - Set the purpose of the key block on ESP32-C3 by programming `SECURE_BOOT_DIGESTX` ( $X = 0, 1, 2$ ) into `KEY_PURPOSE_X` ( $X = 0, 1, 2, 3, 4, 5$ ). Example: If `KEY_PURPOSE_2` is set to `SECURE_BOOT_DIGEST1`, then `BLOCK_KEY2` will have the Secure Boot V2 public key digest. The write-protection bit must be set (this field does not have a read-protection bit).
- `BLOCK_KEYX` - The block contains the data corresponding to its purpose programmed in `KEY_PURPOSE_X`. Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, precalculated R & M' values (represented as 776 bytes –offsets 36 to 812 - as per the [Signature Block Format](#)) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.
- `KEY_REVOKEX` - The revocation bits corresponding to each of the 3 key block. Ex. Setting `KEY_REVOKE2` revokes the key block whose key purpose is `SECURE_BOOT_DIGEST2`.
- `SECURE_BOOT_AGGRESSIVE_REVOKE` - Enables aggressive revocation of keys. The key is revoked as soon as verification with this key fails.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process occurs with error, bootloader and app can not be run.

### 4.22.8 How To Enable Secure Boot V2

1. Open the [Project Configuration Menu](#), in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. The “Secure Boot V2” option will be selected and the “App Signing Scheme” would be set to RSA by default.
3. Specify the path to secure boot signing key, relative to the project directory.

4. Select the desired UART ROM download mode in “UART ROM download mode” . By default, it is set to “Permanently switch to Secure mode” which is generally recommended. For production devices, the most secure option is to set it to “Permanently disabled” .
5. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.
6. The first time you run `make` or `idf.py build`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

---

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

---

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See [Generating Secure Boot Signing Key](#) for more details.

---

7. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

---

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

---

10. Reset the ESP32-C3 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32-C3 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

---

**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

---

---

**Note:** If the ESP32-C3 is reset or powered down during the first boot, it will start the process again on the next boot.

---

11. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

#### 4.22.9 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in efuse.
- After Secure Boot is enabled, no further efuses can be read protected. (If [Flash Encryption](#) is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#) is enabled then this behaviour can be disabled, but this is not recommended.

### 4.22.10 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the `openssl` command line:

```
openssl genrsa -out my_secure_boot_signing_key.pem 3072`
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

### 4.22.11 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default `esp-idf` secure boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_
↪BINARY_FILE BINARY_FILE
```

### 4.22.12 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with *flash encryption* to prevent local readout of the flash contents.

### 4.22.13 Key Management

- Between 1 and 3 RSA-3072 public keypairs (Keys #0, #1, #2) should be computed independently and stored separately.
- The `KEY_DIGEST` efuses should be write protected after being programmed.
- The unused `KEY_DIGEST` slots must have their corresponding `KEY_REVOKE` efuse burned to permanently disable them. This must happen before the device leaves the factory.
- The eFuses can either be written by the software bootloader during first boot after enabling “Secure Boot V2” from `menuconfig` or can be done using `espefuse.py` which communicates with the serial bootloader program in ROM.
- The `KEY_DIGEST`s should be numbered sequentially beginning at key digest #0. (ie if key digest #1 is used, key digest #0 should be used. If key digest #2 is used, key digest #0 & #1 must be used.)
- The software bootloader (non OTA upgradeable) is signed using at least one, possibly all three, private keys and flashed in the factory.

- Apps should only be signed with a single private key (the others being stored securely elsewhere), however they may be signed with multiple private keys if some are being revoked (see Key Revocation, below).

#### 4.22.14 Multiple Keys

- The bootloader should be signed with all the private key(s) that are needed for the life of the device, before it is flashed.
- The build system can sign with at most one private key, user has to run manual commands to append more signatures if necessary.
- **You can use the append functionality of `espsecure.py`, this command would also printed at the end of the Secure B**  
`espsecure.py sign_data -k secure_boot_signing_key2.pem -v 2 --append_signatures -o signed_bootloader.bin build/bootloader/bootloader.bin`
- While signing with multiple private keys, it is recommended that the private keys be signed independently, if possible on different servers and stored separately.
- **You can check the signatures attached to a binary using** - `espsecure.py signature_info_v2 datafile.bin`

#### 4.22.15 Key Revocation

- Keys are processed in a linear order. (key #0, key #1, key #2).
- Applications should be signed with only one key at a time, to minimise the exposure of unused private keys.
- The bootloader can be signed with multiple keys from the factory.

##### Conservative approach:

Assuming a trusted private key (N-1) has been compromised, to update to new key pair (N).

1. Server sends an OTA update with an application signed with the new private key (#N).
  2. The new OTA update is written to an unused OTA app partition.
  3. The new application's signature block is validated. The public keys are checked against the digests programmed in the eFuse & the application is verified using the verified public key.
  4. The active partition is set to the new OTA application's partition.
  5. Device resets, loads the bootloader (verified with key #N-1) which then boots new app (verified with key #N).
  6. The new app verifies bootloader with key #N (as a final check) and then runs code to revoke key #N-1 (sets KEY\_REVOKE efuse bit).
  7. The API `esp_ota_revoke_secure_boot_public_key()` can be used to revoke the key #N-1.
- A similar approach can also be used to physically reflash with a new key. For physical reflashing, the bootloader content can also be changed at the same time.

##### Aggressive approach:

ROM code has an additional feature of revoking a public key digest if the signature verification fails.

To enable this feature, you need to burn `SECURE_BOOT_AGGRESSIVE_REVOKE` efuse or enable `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`

Key revocation is not applicable unless secure boot is successfully enabled. Also, a key is not revoked in case of invalid signature block or invalid image digest, it is only revoked in case the signature verification fails, i.e. revoke key only if failure in step 4 of [Verifying the signature Block](#)

Once a key is revoked, it can never be used for verifying a signature of an image. This feature provides strong resistance against physical attacks on the device. However, this could also brick the device permanently if all the keys are revoked because of signature verification failure.

#### 4.22.16 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

## Manual Commands

Secure boot is integrated into the esp-idf build system, so `make` or `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_
↳signed.bin image-unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

### 4.22.17 Secure Boot & Flash Encryption

If secure boot is used without *Flash Encryption*, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

### 4.22.18 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware secure boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware secure boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn't verified during the update process, it's assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it's essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn't verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

only:: not esp32

Although multiple trusted keys are supported when using hardware Secure Boot, only the first public key in the signature block is used to verify updates if signature checking without Secure Boot is configured. If multiple trusted public keys are required, it's necessary to enable the full Secure Boot feature instead.

---

**Note:** In general, it's recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

---

### How To Enable Signed App Verification

1. Open *Project Configuration Menu* -> Security features
2. Ensure *App Signing Scheme* is *RSA*
3. Enable *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.

5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

**Warning:** It is very important that all apps flashed have been signed, either during the build or after the build.

## 4.22.19 Advanced Features

### JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG with Flash Encryption or Secure Boot* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

## 4.23 Thread Local Storage

### 4.23.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- *FreeRTOS Native API*: ESP-IDF FreeRTOS native API.
- *Pthread API*: ESP-IDF’s pthread API.
- *C11 Standard*: C11 standard introduces special keyword to declare variables as thread local.

### 4.23.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `configNUM_THREAD_LOCAL_STORAGE_POINTERS` macro. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses. Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables. If size of the variable is more than 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

### 4.23.3 Pthread API

The ESP-IDF provides the following pthread API to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

### 4.23.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see <https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local>. Storage for that kind of variables is allocated on the task's stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using just a few Xtensa instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

## 4.24 Tools

### 4.24.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others.

Installing the tools using an OS-specific package manager (like `apt`, `yum`, `brew`, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the *Getting Started* guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

---

**Note:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the *Getting Started Guide*.

---

#### Tools metadata file

The list of tools and tool versions required for each platform is located in [tools/tools.json](#). The schema of this file is defined by [tools/tools\\_schema.json](#).

This file is used by [tools/idf\\_tools.py](#) script when installing the tools or setting up the environment variables.

#### Tools installation directory

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` —where the archives of the tools are downloaded.
- `tools` —where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

## GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it's possible to configure a GitHub assets mirror.

To use Espressif's download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

---

**Note:** The Espressif download server doesn't currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

---

## idf\_tools.py script

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- `install`: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If `all` is given, all the tools (required and optional ones) are installed. If no argument or `required` is given, only the required tools are installed.
- `download`: Similar to `install` but doesn't extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- `export`: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:
  - `shell` produces output suitable for evaluation in the shell. For example,

```
export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
```

on Linux and macOS, and

```
set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
```

on Windows.

---

**Note:** Exporting environment variables in Powershell format is not supported at the moment. `key-value` format may be used instead.

---

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
eval `${IDF_PATH}/tools/idf_tools.py export`
```

- `key-value` produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- `list`: Lists the known versions of the tools, and indicates which ones are installed.
- `check`: For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`.

### Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into `IDF_TOOLS_PATH`, these scripts prepare a Python virtual environment, and install the required packages into that environment.

### Export scripts

Since the installed tools are not permanently added into the user or system `PATH` environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash

---

**Note:** To modify the shell environment in Bash, `export.sh` must be “sourced” : `. ./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the `IDF_PATH` environment variable must be set before running the script. When used in Bash, the script will guess the `IDF_PATH` value from its own location.

---

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the `PATH`.

### Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- *IDF Tools installer for Windows* can download and install the tools. Internally the installer uses `idf_tools.py`.
- *Eclipse plugin for ESP-IDF* includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- Visual Studio Code extension for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

### Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

### List of IDF Tools

### 4.24.2 IDF Docker Image

IDF Docker image (`espressif/idf`) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as `git`, `wget`, `curl`, `zip`.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). `IDF_PATH` environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: `CMake`, `make`, `ninja`, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up `PATH` environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

#### Tags

Multiple tags of this image are maintained:

- `latest`: tracks `master` branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release `vX.Y`
- `release-vX.Y`: tracks `release/vX.Y` branch of ESP-IDF

---

**Note:** Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

---

#### Usage

**Setting up Docker** Before using the `espressif/idf` Docker image locally, make sure you have Docker installed. Follow the instructions at <https://docs.docker.com/install/>, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

**Building a project with CMake** In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished
- `-v $PWD:/project`: mounts the current directory on the host (`$PWD`) as `/project` directory in the container
- `espressif/idf`: uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified)
- `idf.py build`: runs this command inside the container

To build with a specific docker image tag, specify it as `espressif/idf:TAG`, for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py ↵  
↵build
```

You can check the up-to-date list of available tags at <https://hub.docker.com/r/espressif/idf/tags>.

**Building a project with GNU Make** Same as for CMake, except that the build command is different:

```
docker run --rm -v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

---

**Note:** If the `sdkconfig` file does not exist, the default behavior of GNU Make build system is to open the `menuconfig` UI. This may be not desired in automated build environments. To ensure that the `sdkconfig` file exists, `defconfig` target is added before `all`.

---

If you intend to build the same project repeatedly, you may bind the `tools/kconfig` directory of ESP-IDF to a named volume. This will prevent Kconfig tools, located in ESP-IDF directory, from being rebuilt, causing a rebuild of the rest of the project:

```
docker run --rm -v $PWD:/project -v kconfig:/opt/esp/idf/tools/kconfig -w /project ↵  
↵espressif/idf make defconfig all -j4
```

If you need clean up the `kconfig` volume, run `docker volume rm kconfig`.

Binding the `tools/kconfig` directory to a volume is not necessary when using the CMake build system.

**Using the image interactively** It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig  
idf.py build
```

---

**Note:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (<https://github.com/docker/for-win/issues/1018>) and Docker for Mac (<https://github.com/docker/for-mac/issues/900>).

---

## Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- `IDF_CLONE_URL`: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is `https://github.com/espressif/esp-idf.git`.
- `IDF_CLONE_BRANCH_OR_TAG`: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to `git clone` command using the `--branch` argument. Default is `master`.
- `IDF_CHECKOUT_REF`: If this argument is set to a non-empty value, `git checkout $IDF_CHECKOUT_REF` command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- `IDF_CLONE_SHALLOW`: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing `git clone`. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a “shallow” repository is necessary, an additional `git fetch origin <branch>` command must be executed first.
- `IDF_INSTALL_TARGETS`: Comma-separated list of IDF targets to install toolchains for, or `all` to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is `all`.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3 \
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1 \
  --build-arg IDF_CLONE_SHALLOW=1 \
  --build-arg IDF_INSTALL_TARGETS=esp32c3 \
  tools/docker
```

### 4.24.3 IDF Windows Installer

#### Command-line parameters

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: `yes`
- `/GITREPO=[URL|PATH]` - URL of repository to clone ESP-IDF. Default: <https://github.com/espressif/esp-idf.git>
- `/GITRESET=[yes|no]` - Enable/Disable git reset of repository during installation. Default: `yes`.
- `/HELP` - Display command line options provided by Inno Setup installer.
- `/IDFDIR=[PATH]` - Path to directory where it will be installed. Default: `{userdesktop}\esp-idf`
- `/IDFVERSION=[v4.3|v4.1|master]` - Use specific IDF version. E.g. `v4.1`, `v4.2`, `master`. Default: empty, pick the first version in the list.
- `/IDFVERSIONSURL=[URL]` - Use URL to download list of IDF versions. Default: [https://dl.espressif.com/dl/esp-idf/idf\\_versions.txt](https://dl.espressif.com/dl/esp-idf/idf_versions.txt)
- `/LOG=[PATH]` - Store installation log file in specific directory. Default: empty.
- `/OFFLINE=[yes|no]` - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable `PIP_NO_INDEX`. Default: `no`.
- `/USEEMBEDDEDPYTHON=[yes|no]` - Use Embedded Python version for the installation. Set to `no` to allow Python selection screen in the installer. Default: `yes`.
- `/PYTHONWHEELSURL=[URL]` - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable `PIP_EXTRA_INDEX_URL`. Default: <https://dl.espressif.com/pypi>
- `/SKIPSYSTEMCHECK=[yes|no]` - Skip System Check page. Default: `no`.
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - Perform silent installation.

## Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

## Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror.

Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.
↳org/simple/
```

### 4.24.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from [the component registry](#) or from a git repository.

A list of components can be found on <https://components.espressif.com/>

#### Using with a project

Dependencies for each component in the project are defined in a separate manifest file named `idf_component.yml` placed in the root of the component. The manifest file template can be created for a component by running `idf.py create-manifest --component=my_component`. When a new manifest is added to one of the components in the project it's necessary to reconfigure it manually by running `idf.py reconfigure`. Then build will track changes in `idf_component.yml` manifests and automatically triggers CMake when necessary.

There is an example application: `example:build_system/cmake/component_manager` that uses components installed by the component manager.

It's not necessary to have a manifest for components that don't need any managed dependencies.

When CMake configures the project (e.g. `idf.py reconfigure`) component manager does a few things:

- Processes `idf_component.yml` manifests for every component in the project and recursively solves dependencies
- Creates a `dependencies.lock` file in the root of the project with a full list of dependencies
- Downloads all dependencies to the `managed_components` directory

The lock-file `dependencies.lock` and content of `managed_components` directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it's possible to re-run the component manager by triggering CMake with `idf.py reconfigure`

## Defining dependencies in the manifest

```
dependencies:
# Required IDF version
idf: ">=4.1"
# Defining a dependency from the registry:
# https://components.espressif.com/component/example/cmp
example/cmp: ">=1.0.0"

# # Other ways to define dependencies
#
# # For components maintained by Espressif only name can be used.
# # Same as `espressif/cmp`
# component: "~1.0.0"
#
# # Or in a longer form with extra parameters
# component2:
#   version: ">=2.0.0"
#
# # For transient dependencies `public` flag can be set.
# # `public` flag doesn't affect the `main` component.
# # All dependencies of `main` are public by default.
# public: true
#
# # For components hosted on non-default registry:
# service_url: "https://componentregistry.company.com"
#
# # For components in git repository:
# test_component:
#   path: test_component
#   git: ssh://git@gitlab.com/user/components.git
#
# # For test projects during component development
# # components can be used from a local directory
# # with relative or absolute path
# some_local_component:
#   path: ../../projects/component
```

## Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to 0.

## 4.25 Unit Testing in ESP32-C3

ESP-IDF comes with a unit test application that is based on the Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in the `test` subdirectories of each component respectively.

### 4.25.1 Normal Test Cases

Unit tests are located in the `test` subdirectory of a component. Tests are written in C, and a single C source file can contain multiple test cases. Test files start with the word “test” .

Each test file should include the `unity.h` header and the header for the C module to be tested.

Tests are added in a function in the C file as follows:

```
TEST_CASE("test name", "[module name]"
{
    // Add test here
})
```

The first argument is a descriptive name for the test, the second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

**Note:** There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()` autonomously, and run the test cases, then call `UNITY_END()`.

The test subdirectory should contain a *component CMakeLists.txt*, since they are themselves, components. ESP-IDF uses the `unity` test framework and should be specified as a requirement for the component. Normally, components *should list their sources manually*; for component tests however, this requirement is relaxed and the use of the `SRC_DIRS` argument in `idf_component_register` is advised.

Overall, the minimal test subdirectory `CMakeLists.txt` file should contain the following:

```
idf_component_register(SRC_DIRS "."
                      INCLUDE_DIRS "."
                      REQUIRES unity)
```

See <http://www.throwtheswitch.org/unity> for more information about writing tests in Unity.

### 4.25.2 Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). However, components that require some form of communication (e.g., GPIO, SPI) require another device to communicate with, thus cannot be tested normal test cases. Multi-device test cases involve writing multiple test functions, and running them on multiple DUTs.

The following is an example of a multi-device test case:

```
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_
↪master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare a multi-device test case. The first argument is test case name, the second argument is test case description. From the third argument, up to 5 test functions can be

defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt and user interaction is required:

DUT1 (master) console:

```
Waiting for signal: [output high level]!
Please press "Enter" key to once any board send this signal.
```

DUT2 (slave) console:

```
Send signal: [output high level]!
```

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from `unity_wait_for_signal` and starts to change GPIO level.

### 4.25.3 Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we expect to run some specific tests after certain kinds of reset. For example, we expect to test if the reset reason is correct after a wakeup from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support this, we can define multi-stage test cases, to group a set of test functions:

```
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    RESET_REASON reason = rtc_get_reset_reason(0);
    TEST_ASSERT(reason == DEEPSLEEP_RESET);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32c3]", trigger_
↪deepsleep, check_deepsleep_reset_reason);
```

Multi-stage test cases present a group of test functions to users. It needs user interactions (select cases and select different stages) to run the case.

### 4.25.4 Tests For Different Targets

Some tests (especially those related to hardware) cannot run on all targets. Below is a guide how to make your unit tests run on only specified targets.

1. Wrap your test code by `!(TEMPORARY_)DISABLED_FOR_TARGETS()` macros and place them either in the original test file, or separate the code into files grouped by functions, but make sure all these files will be processed by the compiler. E.g.:

```
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[ ]")
{
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

Once you need one of the tests to be compiled on a specified target, just modify the targets in the disabled list. It's more encouraged to use some general conception that can be described in `soc_caps.h` to control the disabling of tests. If this is done but some of the tests are not ready yet, use both of them (and remove `!(TEMPORARY_)DISABLED_FOR_TARGETS()` later). E.g.:

```
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //!TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

- For test code that you are 100% for sure that will not be supported (e.g. no peripheral at all), use `DISABLED_FOR_TARGETS`; for test code that should be disabled temporarily, or due to lack of runners, etc., use `TEMPORARY_DISABLED_FOR_TARGETS`.

Some old ways of disabling unit tests for targets, that have obvious disadvantages, are deprecated:

- DON'T put the test code under `test/target` folder and use `CMakeLists.txt` to choose one of the target folder. This is prevented because test code is more likely to be reused than the implementations. If you put something into `test/esp32` just to avoid building it on `esp32s2`, it's hard to make the code tidy if you want to enable the test again on `esp32s3`.
- DON'T use `CONFIG_IDF_TARGET_XXX` macros to disable the test items any more. This makes it harder to track disabled tests and enable them again. Also, a black-list style `#if !disabled` is preferred to white-list style `#if CONFIG_IDF_TARGET_XXX`, since you will not silently disable cases when new targets are added in the future. But for test implementations, it's allowed to use `#if CONFIG_IDF_TARGET_XXX` to pick one of the implementation code.
  - Test item: some items that will be performed on some targets, but skipped on other targets. E.g. There are three test items SD 1-bit, SD 4-bit and SDSPI. For ESP32-S2, which doesn't have SD host, among the tests only SDSPI is enabled on ESP32-S2.
  - Test implementation: some code will always happen, but in different ways. E.g. There is no SDIO PKT\_LEN register on ESP8266. If you want to get the length from the slave as a step in the test process, you can have different implementation code protected by `#if CONFIG_IDF_TARGET_XXX` reading in different ways. But please avoid using `#else` macro. When new target is added, the test case will fail at building stage, so that the maintainer will be aware of this, and choose one of the implementations explicitly.

### 4.25.5 Building Unit Test App

Follow the setup instructions in the top-level `esp-idf` README. Make sure that `IDF_PATH` environment variable is set to point to the path of `esp-idf` top-level directory.

Change into `tools/unit-test-app` directory to configure and build it:

- `idf.py menuconfig` - configure unit test app.
- `idf.py -T all build` - build unit test app with tests for each component having tests in the `test` subdirectory.
- `idf.py -T "xxx yyy" build` - build unit test app with tests for some space-separated specific components (For instance: `idf.py -T heap build` - build unit tests only for heap component directory).
- `idf.py -T all -E "xxx yyy" build` - build unit test app with all unit tests, except for unit tests of some components (For instance: `idf.py -T all -E "ulp mbedt1s" build` - build all unit tests excludes `ulp` and `mbedt1s` components).

When the build finishes, it will print instructions for flashing the chip. You can simply run `idf.py flash` to flash all build output.

You can also run `idf.py -T all flash` or `idf.py -T xxx flash` to build and flash. Everything needed will be rebuilt automatically before flashing.

Use `menuconfig` to set the serial port for flashing.

### 4.25.6 Running Unit Tests

After flashing reset the ESP32-C3 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:

```
Here's the test menu, pick your combo:
(1)    "esp_ota_begin() verifies arguments" [ota]
(2)    "esp_ota_get_next_update_partition logic" [ota]
(3)    "Verify bootloader image in flash" [bootloader_support]
(4)    "Verify unit test app image" [bootloader_support]
(5)    "can use new and delete" [cxx]
(6)    "can call virtual functions" [cxx]
(7)    "can use static initializers for non-POD types" [cxx]
(8)    "can use std::vector" [cxx]
(9)    "static initialization guards work as expected" [cxx]
(10)   "global initializers run in the correct order" [cxx]
(11)   "before scheduler has started, static initializers work correctly" [cxx]
(12)   "adc2 work with wifi" [adc]
(13)   "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_
↪device]
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
(14)   "SPI Master clockdiv calculation routines" [spi]
(15)   "SPI Master test" [spi][ignore]
(16)   "SPI Master test, interaction of multiple devs" [spi][ignore]
(17)   "SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)" ↪
↪[spi]
(18)   "SPI Master DMA test, TX and RX in different regions" [spi]
(19)   "SPI Master DMA test: length, start, not aligned" [spi]
(20)   "reset reason check for deepsleep" [esp32c3][test_env=UT_T2_1][multi_stage]
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"
```

The normal case will print the case name and description. Master-slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks to run a single test case
- Test case index to run a single test case
- Module name in square brackets to run all test cases for a specific module
- An asterisk to run all test cases

[multi\_device] and [multi\_stage] tags tell the test runner whether a test case is a multiple devices or multiple stages of test case. These tags are automatically added by `TEST_CASE_MULTIPLE_STAGES` and `TEST_CASE_MULTIPLE_DEVICES` macros.

After you select a multi-device test case, it will print sub-menu:

```
Running gpio master/slave test example...
gpio master/slave test example
      (1)    "gpio_master_test"
      (2)    "gpio_slave_test"
```

You need to input a number to select the test running on the DUT.

Similar to multi-device test cases, multi-stage test cases will also print sub-menu:

```
Running reset reason check for deepsleep...
reset reason check for deepsleep
      (1)    "trigger_deepsleep"
      (2)    "check_deepsleep_reset_reason"
```

First time you execute this case, input 1 to run first stage (trigger deepsleep). After DUT is rebooted and able to run test cases, select this case again and input 2 to run the second stage. The case only passes if the last stage passes and all previous stages trigger reset.

### 4.25.7 Timing Code with Cache Compensated Timer

Instructions and data stored in external memory (e.g. SPI Flash and SPI RAM) are accessed through the CPU's unified instruction and data cache. When code or data is in cache, access is very fast (i.e., a cache hit).

However, if the instruction or data is not in cache, it needs to be fetched from external memory (i.e., a cache miss). Access to external memory is significantly slower, as the CPU must execute stall cycles whilst waiting for the instruction or data to be retrieved from external memory. This can cause the overall code execution speed to vary depending on the number of cache hits or misses.

Code and data placements can vary between builds, and some arrangements may be more favorable with regards to cache access (i.e., minimizing cache misses). This can technically affect execution speed, however these factors are usually irrelevant as their effect 'average out' over the device's operation.

The effect of the cache on execution speed, however, can be relevant in benchmarking scenarios (especially microbenchmarks). There might be some variability in measured time between runs and between different builds. A technique for eliminating for some of the variability is to place code and data in instruction or data RAM (IRAM/DRAM), respectively. The CPU can access IIRAM and DRAM directly, eliminating the cache out of the equation. However, this might not always be viable as the size of IIRAM and DRAM is limited.

The cache compensated timer is an alternative to placing the code/data to be benchmarked in IIRAM/DRAM. This timer uses the processor's internal event counters in order to determine the amount of time spent on waiting for code/data in case of a cache miss, then subtract that from the recorded wall time.

```
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

One limitation of the cache compensated timer is that the task that benchmarked functions should be pinned to a core. This is due to each core having its own event counters that are independent of each other. For example, if `ccomp_timer_start` gets called on one core, put to sleep by the scheduler, wakes up, and gets rescheduled on the other core, then the corresponding `ccomp_timer_stop` will be invalid.

### 4.25.8 Mocks

ESP-IDF has a component which integrates the CMock mocking framework. CMock usually uses Unity as a submodule, but due to some Espressif-internal limitations with CI, we still have Unity as an ordinary module in ESP-IDF. To use the IDF-supplied Unity component which isn't a submodule, the build system needs to pass an environment variable `UNITY_IDR` to CMock. This variable simply contains the path to the Unity directory in IDF, e.g. `export "UNITY_IDR=${IDF_PATH}/components/unity/unity"`. Refer to `cmock/CMock/lib/cmock_generator.rb` to see how the Unity directory is determined in CMock.

An example `cmake` build command to create mocks of a component inside that component's `CMakeLists.txt` may look like this:

```
add_custom_command(
  OUTPUT ${MOCK_OUTPUT}
  COMMAND ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_
  ↪config.yaml ${MOCK_HEADERS}
```

(continues on next page)

(continued from previous page)

```

COMMAND ${CMAKE_COMMAND} -E env "UNITY_DIR=${IDF_PATH}/components/unity/unity" \
↳ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_config.
↳yaml ${MOCK_HEADERS}
)

```

`${MOCK_OUTPUT}` contains all CMock generated output files, `${MOCK_HEADERS}` contains all headers to be mocked and `${CMOCK_DIR}` needs to be set to CMock directory inside IDF. `${CMAKE_COMMAND}` is automatically set.

Refer to [cmock/CMock/docs/CMock\\_Summary.md](#) for more details on how CMock works and how to create and use mocks.

## 4.26 USB Serial/JTAG Controller Console

On chips with an integrated USB Serial/JTAG Controller, it is possible to use the part of this controller that implements a serial port (CDC) to implement the serial console, instead of using UART with an external USB-UART bridge chip. ESP32-C3 contains this controller, providing the following functions:

- Bidirectional serial console, which can be used with *IDF Monitor* or another serial monitor
- Flashing using `esptool.py` and `idf.py flash`.
- JTAG debugging using e.g. OpenOCD, simultaneous with serial operations

Note that, in contrast with the USB OTG peripheral found in some Espressif chips, the USB Serial/JTAG Controller is a fixed function device, implemented entirely in hardware. This means it cannot be reconfigured to perform any function other than to provide a serial channel and JTAG debugging functionality.

### 4.26.1 Hardware Requirements

Connect ESP32-C3 to the USB port as follows:

GPIO	USB
19	D+ (green)
18	D- (white)
GND	GND (black)
	+5V (red)

Some development boards may offer a USB connector for the USB Serial/JTAG Controller —in that case, no extra connections are required.

### 4.26.2 Software Configuration

USB console feature can be enabled using `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` option in menuconfig tool (see [CONFIG\\_ESP\\_CONSOLE\\_UART](#)).

Once the option is enabled, build the project as usual.

### 4.26.3 Uploading the Application

The USB Serial/JTAG Controller is able to put the ESP32-C3 into download mode automatically. Simply flash as usual, but specify the USB Serial/JTAG Controller port on your system: `idf.py flash -p PORT` where `PORT` is the name of the proper port.

## 4.26.4 Limitations

There are several limitations to the USB console feature. These may or may not be significant, depending on the type of application being developed, and the development workflow.

1. If the application accidentally reconfigures the USB peripheral pins, or disables the USB Serial/JTAG Controller, the device will disappear from the system. After fixing the issue in the application, you will need to manually put the ESP32-C3 into download mode by pulling low GPIO9 and resetting the chip.
2. If the application enters deep sleep mode, USB CDC device will disappear from the system.
3. The behaviour between an actual USB-to-serial bridge chip and the USB Serial/JTAG Controller is slightly different if the ESP-IDF application does not listen for incoming bytes. An USB-to-serial bridge chip will just send the bytes to a (not listening) chip, while the USB Serial/JTAG Controller will block until the application reads the bytes. This can lead to a non-responsive looking terminal program.
4. The USB CDC device won't work in sleep modes as normal due to the lack of APB clock in sleep modes. This includes deep-sleep, light-sleep (automatic light-sleep as well).
5. The power consumption in sleep modes will be higher if the USB CDC device is in use. This is because we want to keep the USB CDC device alive during software reset by default. However there is an issue that this might also increase the power consumption in sleep modes. This is because the software keeps a clock source on during the reset to keep the USB CDC device alive. As a side-effect, the clock is also kept on during sleep modes. There is one exception: the clock will only be kept on when your USB CDC port is really in use (like data transaction), therefore, if your USB CDC is connected to power bank or battery, etc., instead of a valid USB host (for example, a PC), the power consumption will not increase.

If you still want to keep low power consumption in sleep modes:

1. If you are not using the USB CDC port, you don't need to do anything. Software will detect if the CDC device is connected to a valid host before going to sleep, and keep the clocks only when the host is connected. Otherwise the clocks will be turned off as normal.
2. If you are using the USB CDC port, please disable the menuconfig option `CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB`. The clock will be switched off as normal during software reset and in sleep modes. In these cases, the USB CDC device may be unplugged from the host.

## 4.27 Wi-Fi Driver

### 4.27.1 ESP32-C3 Wi-Fi Feature List

- Support 4 virtual WiFi interfaces, which are STA, AP, Sniffer and reserved.
- Support station-only mode, AP-only mode, station/AP-coexistence mode
- Support IEEE 802.11b, IEEE 802.11g, IEEE 802.11n, and APIs to configure the protocol mode
- Support WPA/WPA2/WPA3/WPA2-Enterprise and WPS
- Support AMSDU, AMPDU, HT40, QoS and other key features
- Support Modem-sleep
- Support an Espressif-specific protocol which, in turn, supports up to **1 km** of data traffic
- Up to 20 MBit/s TCP throughput and 30 MBit/s UDP throughput over the air
- Support Sniffer
- Support both fast scan and all-channel scan
- Support multiple antennas
- Support channel state information

### 4.27.2 How To Write a Wi-Fi Application

#### Preparation

Generally, the most effective way to begin your own Wi-Fi application is to select an example which is similar to your own application, and port the useful part into your project. It is not a MUST but it is strongly recommended that you take some time to read this article first, especially if you want to program a robust Wi-Fi application.

This article is supplementary to the Wi-Fi APIs/Examples. It describes the principles of using the Wi-Fi APIs, the limitations of the current Wi-Fi API implementation, and the most common pitfalls in using Wi-Fi. This article also reveals some design details of the Wi-Fi driver. We recommend you to select an [example](#).

### Setting Wi-Fi Compile-time Options

Refer to [Wi-Fi Menuconfig](#).

### Init Wi-Fi

Refer to [ESP32-C3 Wi-Fi Station General Scenario](#), [ESP32-C3 Wi-Fi AP General Scenario](#).

### Start/Connect Wi-Fi

Refer to [ESP32-C3 Wi-Fi Station General Scenario](#), [ESP32-C3 Wi-Fi AP General Scenario](#).

### Event-Handling

Generally, it is easy to write code in “sunny-day” scenarios, such as [WIFI\\_EVENT\\_STA\\_START](#), [WIFI\\_EVENT\\_STA\\_CONNECTED](#) etc. The hard part is to write routines in “rainy-day” scenarios, such as [WIFI\\_EVENT\\_STA\\_DISCONNECTED](#) etc. Good handling of “rainy-day” scenarios is fundamental to robust Wi-Fi applications. Refer to [ESP32-C3 Wi-Fi Event Description](#), [ESP32-C3 Wi-Fi Station General Scenario](#), [ESP32-C3 Wi-Fi AP General Scenario](#). See also [an overview of event handling in ESP-IDF](#).

### Write Error-Recovery Routines Correctly at All Times

Just like the handling of “rainy-day” scenarios, a good error-recovery routine is also fundamental to robust Wi-Fi applications. Refer to [ESP32-C3 Wi-Fi API Error Code](#).

#### 4.27.3 ESP32-C3 Wi-Fi API Error Code

All of the ESP32-C3 Wi-Fi APIs have well-defined return values, namely, the error code. The error code can be categorized into:

- No errors, e.g. ESP\_OK means that the API returns successfully.
- Recoverable errors, such as ESP\_ERR\_NO\_MEM, etc.
- Non-recoverable, non-critical errors.
- Non-recoverable, critical errors.

Whether the error is critical or not depends on the API and the application scenario, and it is defined by the API user.

**The primary principle to write a robust application with Wi-Fi API is to always check the error code and write the error-handling code.** Generally, the error-handling code can be used:

- For recoverable errors, in which case you can write a recoverable-error code. For example, when [esp\\_wifi\\_start\(\)](#) returns ESP\_ERR\_NO\_MEM, the recoverable-error code `vTaskDelay` can be called in order to get a microseconds’ delay for another try.
- For non-recoverable, yet non-critical errors, in which case printing the error code is a good method for error handling.
- For non-recoverable and also critical errors, in which case “assert” may be a good method for error handling. For example, if [esp\\_wifi\\_set\\_mode\(\)](#) returns ESP\_ERR\_WIFI\_NOT\_INIT, it means that the Wi-Fi driver is not initialized by [esp\\_wifi\\_init\(\)](#) successfully. You can detect this kind of error very quickly in the application development phase.

In `esp_err.h`, `ESP_ERROR_CHECK` checks the return values. It is a rather commonplace error-handling code and can be used as the default error-handling code in the application development phase. However, we strongly recommend that API users write their own error-handling code.

#### 4.27.4 ESP32-C3 Wi-Fi API Parameter Initialization

When initializing struct parameters for the API, one of two approaches should be followed:

- explicitly set all fields of the parameter
- use `get API` to get current configuration first, then set application specific fields

Initializing or getting the entire structure is very important because most of the time the value 0 indicates the default value is used. More fields may be added to the struct in the future and initializing these to zero ensures the application will still work correctly after IDF is updated to a new release.

#### 4.27.5 ESP32-C3 Wi-Fi Programming Model

The ESP32-C3 Wi-Fi programming model is depicted as follows:

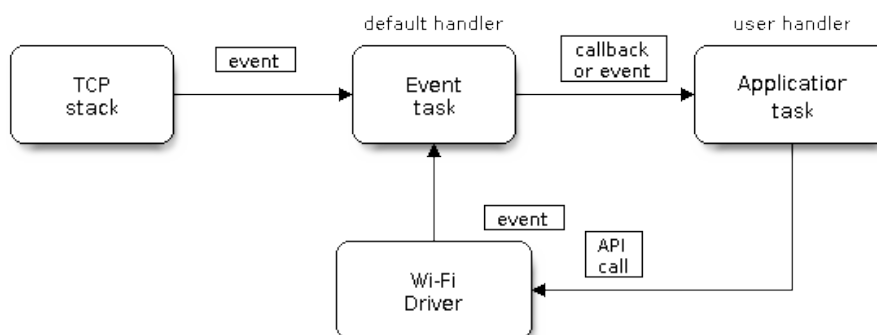

Fig. 50: Wi-Fi Programming Model

The Wi-Fi driver can be considered a black box that knows nothing about high-layer code, such as the TCP/IP stack, application task, and event task. The application task (code) generally calls *Wi-Fi driver APIs* to initialize Wi-Fi and handles Wi-Fi events when necessary. Wi-Fi driver receives API calls, handles them, and posts events to the application.

Wi-Fi event handling is based on the *esp\_event library*. Events are sent by the Wi-Fi driver to the *default event loop*. Application may handle these events in callbacks registered using `esp_event_handler_register()`. Wi-Fi events are also handled by *esp\_netif component* to provide a set of default behaviors. For example, when Wi-Fi station connects to an AP, `esp_netif` will automatically start the DHCP client by default.

#### 4.27.6 ESP32-C3 Wi-Fi Event Description

##### WIFI\_EVENT\_WIFI\_READY

The Wi-Fi driver will never generate this event, which, as a result, can be ignored by the application event callback. This event may be removed in future releases.

## WIFI\_EVENT\_SCAN\_DONE

The scan-done event is triggered by `esp_wifi_scan_start()` and will arise in the following scenarios:

- The scan is completed, e.g., the target AP is found successfully, or all channels have been scanned.
- The scan is stopped by `esp_wifi_scan_stop()`.
- The `esp_wifi_scan_start()` is called before the scan is completed. A new scan will override the current scan and a scan-done event will be generated.

The scan-done event will not arise in the following scenarios:

- It is a blocked scan.
- The scan is caused by `esp_wifi_connect()`.

Upon receiving this event, the event task does nothing. The application event callback needs to call `esp_wifi_scan_get_ap_num()` and `esp_wifi_scan_get_ap_records()` to fetch the scanned AP list and trigger the Wi-Fi driver to free the internal memory which is allocated during the scan (**do not forget to do this!**). Refer to *ESP32-C3 Wi-Fi Scan* for a more detailed description.

## WIFI\_EVENT\_STA\_START

If `esp_wifi_start()` returns `ESP_OK` and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will initialize the LwIP network interface (netif). Generally, the application event callback needs to call `esp_wifi_connect()` to connect to the configured AP.

## WIFI\_EVENT\_STA\_STOP

If `esp_wifi_stop()` returns `ESP_OK` and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will release the station's IP address, stop the DHCP client, remove TCP/UDP-related connections and clear the LwIP station netif, etc. The application event callback generally does not need to do anything.

## WIFI\_EVENT\_STA\_CONNECTED

If `esp_wifi_connect()` returns `ESP_OK` and the station successfully connects to the target AP, the connection event will arise. Upon receiving this event, the event task starts the DHCP client and begins the DHCP process of getting the IP address. Then, the Wi-Fi driver is ready for sending and receiving data. This moment is good for beginning the application work, provided that the application does not depend on LwIP, namely the IP address. However, if the application is LwIP-based, then you need to wait until the `got ip` event comes in.

## WIFI\_EVENT\_STA\_DISCONNECTED

This event can be generated in the following scenarios:

- When `esp_wifi_disconnect()`, or `esp_wifi_stop()`, or `esp_wifi_deinit()` is called and the station is already connected to the AP.
- When `esp_wifi_connect()` is called, but the Wi-Fi driver fails to set up a connection with the AP due to certain reasons, e.g. the scan fails to find the target AP, authentication times out, etc. If there are more than one AP with the same SSID, the disconnected event is raised after the station fails to connect all of the found APs.
- When the Wi-Fi connection is disrupted because of specific reasons, e.g., the station continuously loses N beacons, the AP kicks off the station, the AP's authentication mode is changed, etc.

Upon receiving this event, the default behavior of the event task is:

- Shuts down the station's LwIP netif.
- Notifies the LwIP task to clear the UDP/TCP connections which cause the wrong status to all sockets. For socket-based applications, the application callback can choose to close all sockets and re-create them, if necessary, upon receiving this event.

The most common event handle code for this event in application is to call `esp_wifi_connect()` to reconnect the Wi-Fi. However, if the event is raised because `esp_wifi_disconnect()` is called, the application should not call `esp_wifi_connect()` to reconnect. It's application's responsibility to distinguish whether the event is caused by `esp_wifi_disconnect()` or other reasons. Sometimes a better reconnect strategy is required, refer to *Wi-Fi Reconnect* and *Scan When Wi-Fi Is Connecting*.

Another thing deserves our attention is that the default behavior of LwIP is to abort all TCP socket connections on receiving the disconnect. Most of time it is not a problem. However, for some special application, this may not be what they want, consider following scenarios:

- The application creates a TCP connection to maintain the application-level keep-alive data that is sent out every 60 seconds.
- Due to certain reasons, the Wi-Fi connection is cut off, and the `WIFI_EVENT_STA_DISCONNECTED` is raised. According to the current implementation, all TCP connections will be removed and the keep-alive socket will be in a wrong status. However, since the application designer believes that the network layer should NOT care about this error at the Wi-Fi layer, the application does not close the socket.
- Five seconds later, the Wi-Fi connection is restored because `esp_wifi_connect()` is called in the application event callback function. **Moreover, the station connects to the same AP and gets the same IPV4 address as before.**
- Sixty seconds later, when the application sends out data with the keep-alive socket, the socket returns an error and the application closes the socket and re-creates it when necessary.

In above scenarios, ideally, the application sockets and the network layer should not be affected, since the Wi-Fi connection only fails temporarily and recovers very quickly. The application can enable “Keep TCP connections when IP changed” via LwIP menuconfig.

### IP\_EVENT\_STA\_GOT\_IP

This event arises when the DHCP client successfully gets the IPV4 address from the DHCP server, or when the IPV4 address is changed. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

The IPV4 may be changed because of the following reasons:

- The DHCP client fails to renew/rebind the IPV4 address, and the station's IPV4 is reset to 0.
- The DHCP client rebinds to a different address.
- The static-configured IPV4 address is changed.

Whether the IPV4 address is changed or NOT is indicated by field `ip_change` of `ip_event_got_ip_t`.

The socket is based on the IPV4 address, which means that, if the IPV4 changes, all sockets relating to this IPV4 will become abnormal. Upon receiving this event, the application needs to close all sockets and recreate the application when the IPV4 changes to a valid one.

### IP\_EVENT\_GOT\_IP6

This event arises when the IPV6 SLAAC support auto-configures an address for the ESP32-C3, or when this address changes. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

### IP\_EVENT\_STA\_LOST\_IP

This event arises when the IPV4 address become invalid.

`IP_EVENT_STA_LOST_IP` doesn't arise immediately after the Wi-Fi disconnects, instead it starts an IPV4 address lost timer, if the IPV4 address is got before ip lost timer expires, `IP_EVENT_STA_LOST_IP` doesn't happen. Otherwise, the event arises when IPV4 address lost timer expires.

Generally the application don't need to care about this event, it is just a debug event to let the application know that the IPV4 address is lost.

### WIFI\_EVENT\_AP\_START

Similar to [WIFI\\_EVENT\\_STA\\_START](#).

### WIFI\_EVENT\_AP\_STOP

Similar to [WIFI\\_EVENT\\_STA\\_STOP](#).

### WIFI\_EVENT\_AP\_STACONNECTED

Every time a station is connected to ESP32-C3 AP, the [WIFI\\_EVENT\\_AP\\_STACONNECTED](#) will arise. Upon receiving this event, the event task will do nothing, and the application callback can also ignore it. However, you may want to do something, for example, to get the info of the connected STA, etc.

### WIFI\_EVENT\_AP\_STADISCONNECTED

This event can happen in the following scenarios:

- The application calls [esp\\_wifi\\_disconnect\(\)](#), or [esp\\_wifi\\_deinit\\_sta\(\)](#), to manually disconnect the station.
- The Wi-Fi driver kicks off the station, e.g., because the AP has not received any packets in the past five minutes. The time can be modified by [esp\\_wifi\\_set\\_inactive\\_time\(\)](#).
- The station kicks off the AP.

When this event happens, the event task will do nothing, but the application event callback needs to do something, e.g., close the socket which is related to this station, etc.

### WIFI\_EVENT\_AP\_PROBEREQRCVD

This event is disabled by default. The application can enable it via API [esp\\_wifi\\_set\\_event\\_mask\(\)](#). When this event is enabled, it will be raised each time the AP receives a probe request.

### WIFI\_EVENT\_STA\_BEACON\_TIMEOUT

If the station does not receive the beacon of the connected AP within the inactive time, the beacon timeout happens, the [WIFI\\_EVENT\\_STA\\_BEACON\\_TIMEOUT](#) will arise. The application can set inactive time via API [esp\\_wifi\\_set\\_inactive\\_time\(\)](#).

## 4.27.7 ESP32-C3 Wi-Fi Station General Scenario

Below is a “big scenario” which describes some small scenarios in Station mode:

### 1. Wi-Fi/LwIP Init Phase

- s1.1: The main task calls [esp\\_netif\\_init\(\)](#) to create an LwIP core task and initialize LwIP-related work.
- s1.2: The main task calls [esp\\_event\\_loop\\_create\(\)](#) to create a system Event task and initialize an application event’s callback function. In the scenario above, the application event’s callback function does nothing but relaying the event to the application task.
- s1.3: The main task calls [esp\\_netif\\_create\\_default\\_wifi\\_ap\(\)](#) or [esp\\_netif\\_create\\_default\\_wifi\\_sta\(\)](#) to create default network interface instance binding station or AP with TCP/IP stack.
- s1.4: The main task calls [esp\\_wifi\\_init\(\)](#) to create the Wi-Fi driver task and initialize the Wi-Fi driver.

Fig. 51: Sample Wi-Fi Event Scenarios in Station Mode

- s1.5: The main task calls OS API to create the application task.

Step 1.1 ~ 1.5 is a recommended sequence that initializes a Wi-Fi-/LwIP-based application. However, it is **NOT** a must-follow sequence, which means that you can create the application task in step 1.1 and put all other initializations in the application task. Moreover, you may not want to create the application task in the initialization phase if the application task depends on the sockets. Rather, you can defer the task creation until the IP is obtained.

## 2. Wi-Fi Configuration Phase

Once the Wi-Fi driver is initialized, you can start configuring the Wi-Fi driver. In this scenario, the mode is Station, so you may need to call `esp_wifi_set_mode()` (WIFI\_MODE\_STA) to configure the Wi-Fi mode as Station. You can call other `esp_wifi_set_XXX` APIs to configure more settings, such as the protocol mode, country code, bandwidth, etc. Refer to [ESP32-C3 Wi-Fi Configuration](#).

Generally, the Wi-Fi driver should be configured before the Wi-Fi connection is set up. But this is **NOT** mandatory, which means that you can configure the Wi-Fi connection anytime, provided that the Wi-Fi driver is initialized successfully. However, if the configuration does not need to change after the Wi-Fi connection is set up, you should configure the Wi-Fi driver at this stage, because the configuration APIs (such as `esp_wifi_set_protocol()`) will cause the Wi-Fi to reconnect, which may not be desirable.

If the Wi-Fi NVS flash is enabled by menuconfig, all Wi-Fi configuration in this phase, or later phases, will be stored into flash. When the board powers on/reboots, you do not need to configure the Wi-Fi driver from scratch. You only need to call `esp_wifi_get_XXX` APIs to fetch the configuration stored in flash previously. You can also configure the Wi-Fi driver if the previous configuration is not what you want.

## 3. Wi-Fi Start Phase

- s3.1: Call `esp_wifi_start()` to start the Wi-Fi driver.
- s3.2: The Wi-Fi driver posts `WIFI_EVENT_STA_START` to the event task; then, the event task will do some common things and will call the application event callback function.
- s3.3: The application event callback function relays the `WIFI_EVENT_STA_START` to the application task. We recommend that you call `esp_wifi_connect()`. However, you can also call `esp_wifi_connect()` in other phrases after the `WIFI_EVENT_STA_START` arises.

## 4. Wi-Fi Connect Phase

- s4.1: Once `esp_wifi_connect()` is called, the Wi-Fi driver will start the internal scan/connection process.
- s4.2: If the internal scan/connection process is successful, the `WIFI_EVENT_STA_CONNECTED` will be generated. In the event task, it starts the DHCP client, which will finally trigger the DHCP process.
- s4.3: In the above-mentioned scenario, the application event callback will relay the event to the application task. Generally, the application needs to do nothing, and you can do whatever you want, e.g., print a log, etc.

In step 4.2, the Wi-Fi connection may fail because, for example, the password is wrong, the AP is not found, etc. In a case like this, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason for such a failure will be provided. For handling events that disrupt Wi-Fi connection, please refer to phase 6.

## 5. Wi-Fi ‘Got IP’ Phase

- s5.1: Once the DHCP client is initialized in step 4.2, the *got IP* phase will begin.
- s5.2: If the IP address is successfully received from the DHCP server, then `IP_EVENT_STA_GOT_IP` will arise and the event task will perform common handling.
- s5.3: In the application event callback, `IP_EVENT_STA_GOT_IP` is relayed to the application task. For LwIP-based applications, this event is very special and means that everything is ready for the application to begin its tasks, e.g. creating the TCP/UDP socket, etc. A very common mistake is to initialize the socket before `IP_EVENT_STA_GOT_IP` is received. **DO NOT start the socket-related work before the IP is received.**

## 6. Wi-Fi Disconnect Phase

- s6.1: When the Wi-Fi connection is disrupted, e.g. because the AP is powered off, the RSSI is poor, etc., `WIFI_EVENT_STA_DISCONNECTED` will arise. This event may also arise in phase 3. Here, the event task will notify the LwIP task to clear/remove all UDP/TCP connections. Then, all application sockets will be in a wrong status. In other words, no socket can work properly when this event happens.
- s6.2: In the scenario described above, the application event callback function relays `WIFI_EVENT_STA_DISCONNECTED` to the application task. We recommend that `esp_wifi_connect()` be called to reconnect the Wi-Fi, close all sockets and re-create them if necessary. Refer to `WIFI_EVENT_STA_DISCONNECTED`.

## 7. Wi-Fi IP Change Phase

- s7.1: If the IP address is changed, the `IP_EVENT_STA_GOT_IP` will arise with “ip\_change” set to true.
- s7.2: **This event is important to the application. When it occurs, the timing is good for closing all created sockets and recreating them.**

## 8. Wi-Fi Deinit Phase

- s8.1: Call `esp_wifi_disconnect()` to disconnect the Wi-Fi connectivity.
- s8.2: Call `esp_wifi_stop()` to stop the Wi-Fi driver.
- s8.3: Call `esp_wifi_deinit()` to unload the Wi-Fi driver.

### 4.27.8 ESP32-C3 Wi-Fi AP General Scenario

Below is a “big scenario” which describes some small scenarios in AP mode:

### 4.27.9 ESP32-C3 Wi-Fi Scan

Currently, the `esp_wifi_scan_start()` API is supported only in Station or Station+AP mode.

#### Scan Type

Mode	Description
Active Scan	Scan by sending a probe request. The default scan is an active scan.
Passive Scan	No probe request is sent out. Just switch to the specific channel and wait for a beacon. Application can enable it via the <code>scan_type</code> field of <code>wifi_scan_config_t</code> .
Foreground Scan	This scan is applicable when there is no Wi-Fi connection in station mode. Foreground or background scanning is controlled by the Wi-Fi driver and cannot be configured by the application.
Background Scan	This scan is applicable when there is a Wi-Fi connection in station mode or in station/AP mode. Whether it is a foreground scan or background scan depends on the Wi-Fi driver and cannot be configured by the application.
All-Channel Scan	It scans all of the channels. If the <code>channel</code> field of <code>wifi_scan_config_t</code> is set to 0, it is an all-channel scan.
Specific Channel Scan	It scans specific channels only. If the <code>channel</code> field of <code>wifi_scan_config_t</code> set to 1-14, it is a specific-channel scan.

The scan modes in above table can be combined arbitrarily, so we totally have 8 different scans:

- All-Channel Background Active Scan
- All-Channel Background Passive Scan

Fig. 52: Sample Wi-Fi Event Scenarios in AP Mode

- All-Channel Foreground Active Scan
- All-Channel Foreground Passive Scan
- Specific-Channel Background Active Scan
- Specific-Channel Background Passive Scan
- Specific-Channel Foreground Active Scan
- Specific-Channel Foreground Passive Scan

### Scan Configuration

The scan type and other per-scan attributes are configured by `esp_wifi_scan_start()`. The table below provides a detailed description of `wifi_scan_config_t`.

Field	Description
ssid	If the SSID is not NULL, it is only the AP with the same SSID that can be scanned.
bssid	If the BSSID is not NULL, it is only the AP with the same BSSID that can be scanned.
channel	If “channel” is 0, there will be an all-channel scan; otherwise, there will be a specific-channel scan.
show_hidden	If “show_hidden” is 0, the scan ignores the AP with a hidden SSID; otherwise, the scan considers the hidden AP a normal one.
scan_type	If “scan_type” is <code>WIFI_SCAN_TYPE_ACTIVE</code> , the scan is “active” ; otherwise, it is a “passive” one.
scan_time	<p>This field is used to control how long the scan dwells on each channel.</p> <p>For passive scans, <code>scan_time.passive</code> designates the dwell time for each channel.</p> <p>For active scans, dwell times for each channel are listed in the table below. Here, min is short for <code>scan_time.active.min</code> and max is short for <code>scan_time.active.max</code>.</p> <ul style="list-style-type: none"> <li>• min=0, max=0: scan dwells on each channel for 120 ms.</li> <li>• min&gt;0, max=0: scan dwells on each channel for 120 ms.</li> <li>• min=0, max&gt;0: scan dwells on each channel for max ms.</li> <li>• min&gt;0, max&gt;0: the minimum time the scan dwells on each channel is min ms. If no AP is found during this time frame, the scan switches to the next channel. Otherwise, the scan dwells on the channel for max ms.</li> </ul> <p>If you want to improve the performance of the scan, you can try to modify these two parameters.</p>

There are also some global scan attributes which are configured by API `esp_wifi_set_config()`, refer to [Station Basic Configuration](#)

### Scan All APs on All Channels (Foreground)

Scenario:

The scenario above describes an all-channel, foreground scan. The foreground scan can only occur in Station mode where the station does not connect to any AP. Whether it is a foreground or background scan is totally determined by the Wi-Fi driver, and cannot be configured by the application.

Detailed scenario description:

### Scan Configuration Phase

- s1.1: Call `esp_wifi_set_country()` to set the country info if the default country info is not what you want, refer to [Wi-Fi Country Code](#).
- s1.2: Call `esp_wifi_scan_start()` to configure the scan. To do so, you can refer to [Scan Configuration](#). Since this is an all-channel scan, just set the SSID/BSSID/channel to 0.

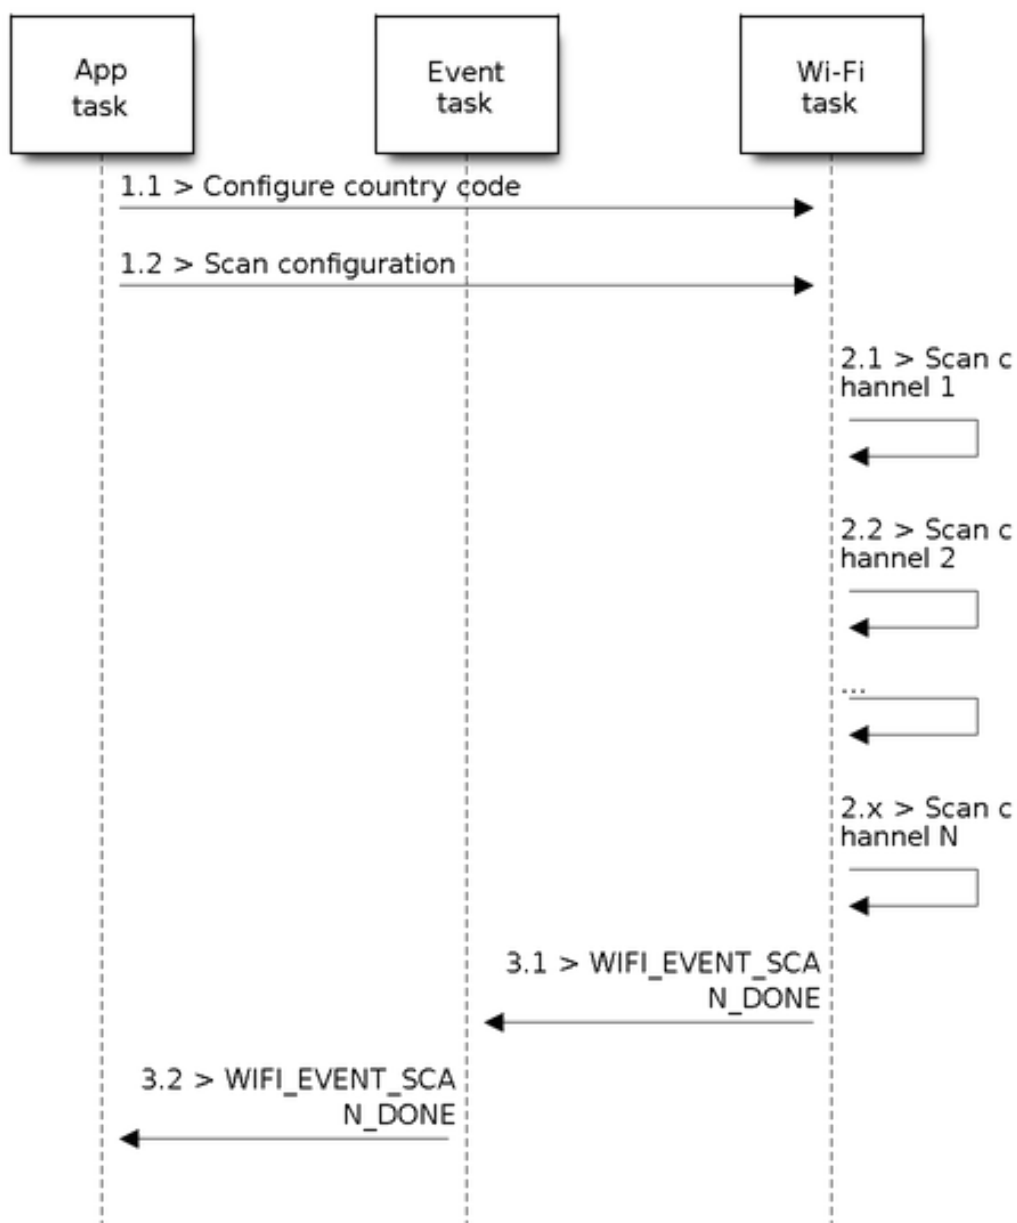

Fig. 53: Foreground Scan of all Wi-Fi Channels

### Wi-Fi Driver's Internal Scan Phase

- s2.1: The Wi-Fi driver switches to channel 1, in case the scan type is `WIFI_SCAN_TYPE_ACTIVE`, and broadcasts a probe request. Otherwise, the Wi-Fi will wait for a beacon from the APs. The Wi-Fi driver will stay in channel 1 for some time. The dwell time is configured in min/max time, with default value being 120 ms.
- s2.2: The Wi-Fi driver switches to channel 2 and performs the same operation as in step 2.1.
- s2.3: The Wi-Fi driver scans the last channel N, where N is determined by the country code which is configured in step 1.1.

### Scan-Done Event Handling Phase

- s3.1: When all channels are scanned, `WIFI_EVENT_SCAN_DONE` will arise.
- s3.2: The application's event callback function notifies the application task that `WIFI_EVENT_SCAN_DONE` is received. `esp_wifi_scan_get_ap_num()` is called to get the number of APs that have been found in this scan. Then, it allocates enough entries and calls `esp_wifi_scan_get_ap_records()` to get the AP records. Please note that the AP records in the Wi-Fi driver will be freed, once `esp_wifi_scan_get_ap_records()` is called. Do not call `esp_wifi_scan_get_ap_records()` twice for a single scan-done event. If `esp_wifi_scan_get_ap_records()` is not called when the scan-done event occurs, the AP records allocated by the Wi-Fi driver will not be freed. So, make sure you call `esp_wifi_scan_get_ap_records()`, yet only once.

### Scan All APs on All Channels (Background)

Scenario:

The scenario above is an all-channel background scan. Compared to *Scan All APs on All Channels (Foreground)*, the difference in the all-channel background scan is that the Wi-Fi driver will scan the back-to-home channel for 30 ms before it switches to the next channel to give the Wi-Fi connection a chance to transmit/receive data.

### Scan for Specific AP on All Channels

Scenario:

This scan is similar to *Scan All APs on All Channels (Foreground)*. The differences are:

- s1.1: In step 1.2, the target AP will be configured to SSID/BSSID.
- s2.1~s2.N: Each time the Wi-Fi driver scans an AP, it will check whether it is a target AP or not. If the scan is `WIFI_FAST_SCAN` scan and the target AP is found, then the scan-done event will arise and scanning will end; otherwise, the scan will continue. Please note that the first scanned channel may not be channel 1, because the Wi-Fi driver optimizes the scanning sequence.

If there are multiple APs which match the target AP info, for example, if we happen to scan two APs whose SSID is "ap". If the scan is `WIFI_FAST_SCAN`, then only the first scanned "ap" will be found, if the scan is `WIFI_ALL_CHANNEL_SCAN`, both "ap" will be found and the station will connect the "ap" according to the configured strategy, refer to *Station Basic Configuration*.

You can scan a specific AP, or all of them, in any given channel. These two scenarios are very similar.

### Scan in Wi-Fi Connect

When `esp_wifi_connect()` is called, the Wi-Fi driver will try to scan the configured AP first. The scan in "Wi-Fi Connect" is the same as *Scan for Specific AP On All Channels*, except that no scan-done event will be generated when the scan is completed. If the target AP is found, the Wi-Fi driver will start the Wi-Fi connection; otherwise, `WIFI_EVENT_STA_DISCONNECTED` will be generated. Refer to *Scan for Specific AP On All Channels*.

Fig. 54: Background Scan of all Wi-Fi Channels

Fig. 55: Scan of specific Wi-Fi Channels

### Scan In Blocked Mode

If the block parameter of `esp_wifi_scan_start()` is true, then the scan is a blocked one, and the application task will be blocked until the scan is done. The blocked scan is similar to an unblocked one, except that no scan-done event will arise when the blocked scan is completed.

### Parallel Scan

Two application tasks may call `esp_wifi_scan_start()` at the same time, or the same application task calls `esp_wifi_scan_start()` before it gets a scan-done event. Both scenarios can happen. **However, the Wi-Fi driver does not support multiple concurrent scans adequately. As a result, concurrent scans should be avoided.** Support for concurrent scan will be enhanced in future releases, as the ESP32-C3's Wi-Fi functionality improves continuously.

### Scan When Wi-Fi is Connecting

The `esp_wifi_scan_start()` fails immediately if the Wi-Fi is in connecting process because the connecting has higher priority than the scan. If scan fails because of connecting, the recommended strategy is to delay sometime and retry scan again, the scan will succeed once the connecting is completed.

However, the retry/delay strategy may not work all the time. Considering following scenario:

- The station is connecting a non-existed AP or if the station connects the existed AP with a wrong password, it always raises the event `WIFI_EVENT_STA_DISCONNECTED`.
- The application call `esp_wifi_connect()` to do reconnection on receiving the disconnect event.
- Another application task, e.g. the console task, call `esp_wifi_scan_start()` to do scan, the scan always fails immediately because the station is keeping connecting.
- When scan fails, the application simply delay sometime and retry the scan.

In above scenario the scan will never succeed because the connecting is in process. So if the application supports similar scenario, it needs to implement a better reconnect strategy. E.g.

- The application can choose to define a maximum continuous reconnect counter, stop reconnect once the reconnect reaches the max counter.
- The application can choose to do reconnect immediately in the first N continuous reconnect, then give a delay sometime and reconnect again.

The application can define its own reconnect strategy to avoid the scan starve to death. Refer to [<Wi-Fi Reconnect>](#).

## 4.27.10 ESP32-C3 Wi-Fi Station Connecting Scenario

This scenario only depicts the case when there is only one target AP are found in scan phase, for the scenario that more than one AP with the same SSID are found, refer to [ESP32-C3 Wi-Fi Station Connecting When Multiple APs Are Found](#).

Generally, the application does not need to care about the connecting process. Below is a brief introduction to the process for those who are really interested.

Scenario:

### Scan Phase

- s1.1, The Wi-Fi driver begins scanning in “Wi-Fi Connect” . Refer to [Scan in Wi-Fi Connect](#) for more details.
- s1.2, If the scan fails to find the target AP, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason-code will be `WIFI_REASON_NO_AP_FOUND`. Refer to [Wi-Fi Reason Code](#).

Fig. 56: Wi-Fi Station Connecting Process

### Auth Phase

- s2.1, The authentication request packet is sent and the auth timer is enabled.
- s2.2, If the authentication response packet is not received before the authentication timer times out, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason-code will be `WIFI_REASON_AUTH_EXPIRE`. Refer to *Wi-Fi Reason Code*.
- s2.3, The auth-response packet is received and the auth-timer is stopped.
- s2.4, The AP rejects authentication in the response and `WIFI_EVENT_STA_DISCONNECTED` arises, while the reason-code is `WIFI_REASON_AUTH_FAIL` or the reasons specified by the AP. Refer to *Wi-Fi Reason Code*.

### Association Phase

- s3.1, The association request is sent and the association timer is enabled.
- s3.2, If the association response is not received before the association timer times out, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason-code will be `WIFI_REASON_ASSOC_EXPIRE`. Refer to *Wi-Fi Reason Code*.
- s3.3, The association response is received and the association timer is stopped.
- s3.4, The AP rejects the association in the response and `WIFI_EVENT_STA_DISCONNECTED` arises, while the reason-code is the one specified in the association response. Refer to *Wi-Fi Reason Code*.

### Four-way Handshake Phase

- s4.1, The handshake timer is enabled, the 1/4 EAPOL is not received before the handshake timer expires, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason-code will be `WIFI_REASON_HANDSHAKE_TIMEOUT`. Refer to *Wi-Fi Reason Code*.
- s4.2, The 1/4 EAPOL is received.
- s4.3, The STA replies 2/4 EAPOL.
- s4.4, If the 3/4 EAPOL is not received before the handshake timer expires, `WIFI_EVENT_STA_DISCONNECTED` will arise and the reason-code will be `WIFI_REASON_HANDSHAKE_TIMEOUT`. Refer to *Wi-Fi Reason Code*.
- s4.5, The 3/4 EAPOL is received.
- s4.6, The STA replies 4/4 EAPOL.
- s4.7, The STA raises `WIFI_EVENT_STA_CONNECTED`.

### Wi-Fi Reason Code

The table below shows the reason-code defined in ESP32-C3. The first column is the macro name defined in `esp_wifi_types.h`. The common prefix `WIFI_REASON` is removed, which means that `UNSPECIFIED` actually stands for `WIFI_REASON_UNSPECIFIED` and so on. The second column is the value of the reason. The third column is the standard value to which this reason is mapped in section 9.4.1.7 of IEEE 802.11-2020. (For more information, refer to the standard mentioned above.) The last column describes the reason.

Reason code	Value	Mapped To	Description
UNSPECIFIED		1	Generally, it means an internal failure, e.g., the memory runs out, the internal TX fails, or the reason is received from the remote side, etc.

Continued on next page

Table 28 – continued from previous page

ReasonValue code	Mapped To	Description
AUTH_EXPIRE	2	<p>The previous authentication is no longer valid.</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• auth is timed out.</li> <li>• the reason is received from the AP.</li> </ul> <p>For the ESP AP, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• the AP has not received any packets from the station in the past five minutes.</li> <li>• the AP is stopped by calling <code>esp_wifi_stop()</code>.</li> <li>• the station is de-authed by calling <code>esp_wifi_deauth_sta()</code>.</li> </ul>
AUTH_BEAVE	3	<p>De-authenticated, because the sending station is leaving (or has left).</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• it is received from the AP.</li> </ul>
ASSOC_EXPIRE	4	<p>Disassociated due to inactivity.</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• it is received from the AP.</li> </ul> <p>For the ESP AP, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• the AP has not received any packets from the station in the past five minutes.</li> <li>• the AP is stopped by calling <code>esp_wifi_stop()</code>.</li> <li>• the station is de-authed by calling <code>esp_wifi_deauth_sta()</code>.</li> </ul>
ASSOC_TOO_MANY	5	<p>Disassociated, because the AP is unable to handle all currently associated STAs at the same time.</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• it is received from the AP.</li> </ul> <p>For the ESP AP, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• the stations associated with the AP reach the maximum number that the AP can support.</li> </ul>
NOT_AUTHED	6	<p>Class-2 frame received from a non-authenticated STA.</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• it is received from the AP.</li> </ul> <p>For the ESP AP, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• the AP receives a packet with data from a non-authenticated station.</li> </ul>
NOT_ASSOCED	7	<p>Class-3 frame received from a non-associated STA.</p> <p>For the ESP station, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• it is received from the AP.</li> </ul> <p>For the ESP AP, this reason is reported when:</p> <ul style="list-style-type: none"> <li>• the AP receives a packet with data from a non-associated station.</li> </ul>

Continued on next page

Table 28 – continued from previous page

ReasonValue code	Mapped To	Description
ASSOC_LEAVE	8	Disassociated, because the sending station is leaving (or has left) BSS. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> <li>the station is disconnected by <code>esp_wifi_disconnect ()</code> and other APIs.</li> </ul>
ASSOC_NOT_AUTHED	9	station requesting (re)association is not authenticated by the responding STA. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul> For the ESP AP, this reason is reported when: <ul style="list-style-type: none"> <li>the AP receives packets with data from an associated, yet not authenticated, station.</li> </ul>
DISASSOC_PWRCAP_BAD	10	Disassociated, because the information in the Power Capability element is unacceptable. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
DISASSOC_SUPCHAN_BAD	11	Disassociated, because the information in the Supported Channels element is unacceptable. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
IE_INVALID	13	Invalid element, i.e. an element whose content does not meet the specifications of the Standard in frame formats clause. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul> For the ESP AP, this reason is reported when: <ul style="list-style-type: none"> <li>the AP parses a wrong WPA or RSN IE.</li> </ul>
MIC_FAILURE	14	Message integrity code (MIC) failure. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
4WAY_HANDSHAKE_TIMEOUT	15	Four-way handshake times out. For legacy reasons, in ESP this reason-code is replaced with <code>WIFI_REASON_HANDSHAKE_TIMEOUT</code> . For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>the handshake times out.</li> <li>it is received from the AP.</li> </ul>
GROUP_KEY_UPDATE_TIMEOUT	16	Group-Key Handshake times out. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>

Continued on next page

Table 28 – continued from previous page

ReasonValue code	Mapped To	Description
IE_IN_4WAY_DIFFERS	17	The element in the four-way handshake is different from the (Re-)Association Request/Probe and Response/Beacon frame. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> <li>the station finds that the four-way handshake IE differs from the IE in the (Re-)Association Request/Probe and Response/Beacon frame.</li> </ul>
GROUP_CIPHER_INVALID	18	Invalid group cipher. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
PAIRWISE_CIPHER_INVALID	19	Invalid pairwise cipher. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
AKMP_INVALID	20	Invalid AKMP. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
UNSUPPORTED_RSN_IE_VERSION	21	Unsupported RSNE version. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
INVALID_RSN_IE_CAP	22	Invalid RSNE capabilities. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
802_1X_AUTH_FAILED	23	IEEE 802.1X. authentication failed. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul> For the ESP AP, this reason is reported when: <ul style="list-style-type: none"> <li>IEEE 802.1X. authentication fails.</li> </ul>
CIPHER_SUITE_REJECTED	24	Cipher suite rejected due to security policies. For the ESP station, this reason is reported when: <ul style="list-style-type: none"> <li>it is received from the AP.</li> </ul>
TDLS_PEER_UNREACHABLE	25	TDLS direct-link teardown due to TDLS peer STA unreachable via the TDLS direct link.
TDLS_UNSPECIFIED	26	TDLS direct-link teardown for unspecified reason.
SSP_REQUESTED_DISASSOC	27	Disassociated because session terminated by SSP request.
NO_SSP_ROAMING_AGREEMENT	28	Disassociated because of lack of SSP roaming agreement.
BAD_CIPHER_OR_AKM	29	Requested service rejected because of SSP cipher suite or AKM requirement.
NOT_AUTHORIZED_THIS_LOCATION	30	Requested service not authorized in this location.
SERVICE_CHANGE_PRECLUDES_TS	31	TS deleted because QoS AP lacks sufficient bandwidth for this QoS STA due to a change in BSS service characteristics or operational mode (e.g., an HT BSS change from 40 MHz channel to 20 MHz channel).
UNSPECIFIED_QOS	32	Disassociated for unspecified, QoS-related reason.
NOT_ENOUGH_BANDWIDTH	33	Disassociated because QoS AP lacks sufficient bandwidth for this QoS STA.

Continued on next page

Table 28 – continued from previous page

Reason code	Value	Mapped To	Description
MISSING_ACKS	34		Disassociated because excessive number of frames need to be acknowledged, but are not acknowledged due to AP transmissions and/or poor channel conditions.
EXCEEDED_TXOP	35		Disassociated because STA is transmitting outside the limits of its TXOPs.
STA_LEAVING	36		Requesting STA is leaving the BSS (or resetting).
END_BA	37		Requesting STA is no longer using the stream or session.
UNKNOWN_BA	38		Requesting STA received frames using a mechanism for which a setup has not been completed.
TIMEOUT	39		Requested from peer STA due to timeout
Reserved	40 ~ 45		
PEER_INITIATED	46		In a Disassociation frame: Disassociated because authorized access limit reached.
AP_INITIATED	47		In a Disassociation frame: Disassociated due to external service requirements.
INVALID_FT_ACTION_FRAME_COUNT	48		Invalid FT Action frame count.
INVALID_PMKID	49		Invalid pairwise master key identifier (PMKID).
INVALID_MDE	50		Invalid MDE.
INVALID_FTE	51		Invalid FTE
TRANSMISSION_LINK_ESTABLISHMENT_FAILED	52		Transmission link establishment in alternative channel failed.
ALTERNATIVE_CHANNEL_OCCUPIED	53		The alternative channel is occupied.
BEACON_TIMEOUT	reserved		Espressif-specific Wi-Fi reason-code: when the station loses N beacons continuously, it will disrupt the connection and report this reason.
NO_AP_FOUND	reserved		Espressif-specific Wi-Fi reason-code: when the station fails to scan the target AP, this reason code will be reported.
AUTH_FAIL	reserved		Espressif-specific Wi-Fi reason-code: the authentication fails, but not because of a timeout.
ASSOC_FAIL	reserved		Espressif-specific Wi-Fi reason-code: the association fails, but not because of ASSOC_EXPIRE or ASSOC_TOOMANY.
HANDSHAKE_TIMEOUT	reserved		Espressif-specific Wi-Fi reason-code: the handshake fails for the same reason as that in WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT.
CONNECTION_FAIL	reserved		Espressif-specific Wi-Fi reason-code: the connection to the AP has failed.

### Wi-Fi Reason code related to wrong password

The table below shows the Wi-Fi reason-code may related to wrong password.

Reason code	Value	Description
4WAY_HANDSHAKE_TIMEOUT		Four-way handshake times out. Setting wrong password when STA connecting to an encrypted AP.
NO_AP_FOUND		This may related to wrong password in the two scenarios: <ul style="list-style-type: none"> <li>Setting password when STA connecting to an unencrypted AP.</li> <li>Doesn't setting password when STA connecting to an encrypted AP.</li> </ul>
HANDSHAKE_TIMEOUT		Four-way handshake fails.

### Wi-Fi Reason code related to low RSSI

The table below shows the Wi-Fi reason-code may related to low RSSI.

Reason code	Value	Description
NO_AP_FOUND	NO_AP_FOUND	The station fails to scan the target AP due to low RSSI
HANDSHAKE_TIMEOUT	HANDSHAKE_TIMEOUT	Four-way handshake fails.

#### 4.27.11 ESP32-C3 Wi-Fi Station Connecting When Multiple APs Are Found

This scenario is similar as [ESP32-C3 Wi-Fi Station Connecting Scenario](#), the difference is the station will not raise the event [WIFI\\_EVENT\\_STA\\_DISCONNECTED](#) unless it fails to connect all of the found APs.

#### 4.27.12 Wi-Fi Reconnect

The station may disconnect due to many reasons, e.g. the connected AP is restarted etc. It's the application's responsibility to do the reconnect. The recommended reconnect strategy is to call `esp_wifi_connect()` on receiving event [WIFI\\_EVENT\\_STA\\_DISCONNECTED](#).

Sometimes the application needs more complex reconnect strategy:

- If the disconnect event is raised because the `esp_wifi_disconnect()` is called, the application may not want to do reconnect.
- If the `esp_wifi_scan_start()` may be called at anytime, a better reconnect strategy is necessary, refer to [Scan When Wi-Fi is Connecting](#).

Another thing we need to consider is the reconnect may not connect the same AP if there are more than one APs with the same SSID. The reconnect always select current best APs to connect.

#### 4.27.13 Wi-Fi Beacon Timeout

The beacon timeout mechanism is used by ESP32-C3 station to detect whether the AP is alive or not. If the station does not receive the beacon of the connected AP within the inactive time, the beacon timeout happens. The application can set inactive time via API `esp_wifi_set_inactive_time()`.

After the beacon timeout happens, the station sends 5 probe requests to AP, it disconnects the AP and raises the event [WIFI\\_EVENT\\_STA\\_DISCONNECTED](#) if still no probe response or beacon is received from AP.

It should be considered that the timer used for beacon timeout will be reset during the scanning process. It means that the scan process will affect the triggering of the event [WIFI\\_EVENT\\_STA\\_BEACON\\_TIMEOUT](#).

#### 4.27.14 ESP32-C3 Wi-Fi Configuration

All configurations will be stored into flash when the Wi-Fi NVS is enabled; otherwise, refer to [Wi-Fi NVS Flash](#).

#### Wi-Fi Mode

Call `esp_wifi_set_mode()` to set the Wi-Fi mode.

Mode	Description
WIFI_MODE_NULL	NULL mode: in this mode, the internal data struct is not allocated to the station and the AP, while both the station and AP interfaces are not initialized for RX/TX Wi-Fi data. Generally, this mode is used for Sniffer, or when you only want to stop both the station and the AP without calling <code>esp_wifi_deinit()</code> to unload the whole Wi-Fi driver.
WIFI_MODE_STA	Station mode: in this mode, <code>esp_wifi_start()</code> will init the internal station data, while the station's interface is ready for the RX and TX Wi-Fi data. After <code>esp_wifi_connect()</code> , the station will connect to the target AP.
WIFI_MODE_AP	AP mode: in this mode, <code>esp_wifi_start()</code> will init the internal AP data, while the AP's interface is ready for RX/TX Wi-Fi data. Then, the Wi-Fi driver starts broad-casting beacons, and the AP is ready to get connected to other stations.
WIFI_MODE_APSTA	Station/AP coexistence mode: in this mode, <code>esp_wifi_start()</code> will simultaneously init both the station and the AP. This is done in station mode and AP mode. Please note that the channel of the external AP, which the ESP station is connected to, has higher priority over the ESP AP channel.

### Station Basic Configuration

API `esp_wifi_set_config()` can be used to configure the station. And the configuration will be stored in NVS. The table below describes the fields in detail.

Field	Description
ssid	This is the SSID of the target AP, to which the station wants to connect to.
password	Password of the target AP.
scan_method	For WIFI_FAST_SCAN scan, the scan ends when the first matched AP is found. For WIFI_ALL_CHANNEL_SCAN, the scan finds all matched APs on all channels. The default scan is WIFI_FAST_SCAN.
bssid_set	If bssid_set is 0, the station connects to the AP whose SSID is the same as the field "ssid", while the field "bssid" is ignored. In all other cases, the station connects to the AP whose SSID is the same as the "ssid" field, while its BSSID is the same the "bssid" field.
bssid	This is valid only when bssid_set is 1; see field "bssid_set".
channel	If the channel is 0, the station scans the channel 1 ~ N to search for the target AP; otherwise, the station starts by scanning the channel whose value is the same as that of the "channel" field, and then scans the channel 1 ~ N but skip the specific channel to find the target AP. For example, if the channel is 3, the scan order will be 3, 1, 2, 4, ..., N. If you do not know which channel the target AP is running on, set it to 0.
sort_method	This field is only for WIFI_ALL_CHANNEL_SCAN. If the sort_method is WIFI_CONNECT_AP_BY_SIGNAL, all matched APs are sorted by signal, for AP with best signal will be connected firstly. E.g. if the station want to connect AP whose ssid is "apxx", the scan finds two AP whose ssid equals to "apxx", the first AP's signal is -90 dBm, the second AP's signal is -30 dBm, the station connects the second AP firstly, it doesn't connect the first one unless it fails to connect the second one. If the sort_method is WIFI_CONNECT_AP_BY_SECURITY, all matched APs are sorted by security. E.g. if the station wants to connect AP whose ssid is "apxx", the scan finds two AP whose ssid is "apxx", the security of the first found AP is open while the second one is WPA2, the stations connects to the second AP firstly, it doesn't connect the second one unless it fails to connect the first one.
threshold	The threshold is used to filter the found AP, if the RSSI or security mode is less than the configured threshold, the AP will be discard. If the RSSI set to 0, it means default threshold, the default RSSI threshold is -127 dBm. If the authmode threshold is set to 0, it means default threshold, the default authmode threshold is open.

**Attention:** WEP/WPA security modes are deprecated in IEEE 802.11-2016 specifications and are recommended not to be used. These modes can be rejected using authmode threshold by setting threshold as WPA2 by threshold.authmode as WIFI\_AUTH\_WPA2\_PSK.

## AP Basic Configuration

API `esp_wifi_set_config()` can be used to configure the AP. And the configuration will be stored in NVS. The table below describes the fields in detail.

Field	Description
ssid	SSID of AP; if the ssid[0] is 0xFF and ssid[1] is 0xFF, the AP defaults the SSID to ESP_aabbcc, where “aabbcc” is the last three bytes of the AP MAC.
password	Password of AP; if the auth mode is WIFI_AUTH_OPEN, this field will be ignored.
ssid_len	Length of SSID; if ssid_len is 0, check the SSID until there is a termination character. If ssid_len > 32, change it to 32; otherwise, set the SSID length according to ssid_len.
channel	Channel of AP; if the channel is out of range, the Wi-Fi driver defaults the channel to channel 1. So, please make sure the channel is within the required range. For more details, refer to <a href="#">Wi-Fi Country Code</a> .
authmode	Auth mode of ESP AP; currently, ESP Wi-Fi does not support AUTH_WEP. If the authmode is an invalid value, AP defaults the value to WIFI_AUTH_OPEN.
ssid_hidden	If ssid_hidden is 1, AP does not broadcast the SSID; otherwise, it does broadcast the SSID.
max_connection	Currently, ESP Wi-Fi supports up to 10 Wi-Fi connections. If max_connection > 10, AP defaults the value to 10.
beacon_interval	Beacon interval; the value is 100 ~ 60000 ms, with default value being 100 ms. If the value is out of range, AP defaults it to 100 ms.

## Wi-Fi Protocol Mode

Currently, the IDF supports the following protocol modes:

Protocol Mode	Description
802.11b	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)</code> to set the station/AP to 802.11b-only mode.
802.11bg	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> to set the station/AP to 802.11bg mode.
802.11g	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G)</code> and <code>esp_wifi_config_11b_rate(ifx, true)</code> to set the station/AP to 802.11g mode.
802.11bgn	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> to set the station/ AP to BGN mode.
802.11gn	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N)</code> and <code>esp_wifi_config_11b_rate(ifx, true)</code> to set the station/AP to 802.11gn mode.
802.11 BGNLR	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B WIFI_PROTOCOL_11G WIFI_PROTOCOL_11N WIFI_PROTOCOL_LR)</code> to set the station/AP to BGN and the LR mode.
802.11 LR	Call <code>esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR)</code> to set the station/AP only to the LR mode. <b>This mode is an Espressif-patented mode which can achieve a one-kilometer line of sight range. Please, make sure both the station and the AP are connected to an ESP device.</b>

## Long Range (LR)

Long Range (LR) mode is an Espressif-patented Wi-Fi mode which can achieve a one-kilometer line of sight range. It has better reception sensitivity, stronger anti-interference ability and longer transmission distance than the traditional 802.11B mode.

**LR Compatibility** Since LR is Espressif unique Wi-Fi mode, only ESP32-C3 devices can transmit and receive the LR data. In other words, the ESP32-C3 device should NOT transmit the data in LR data rate if the connected device doesn't support LR. The application can achieve this by configuring suitable Wi-Fi mode. If the negotiated mode supports LR, the ESP32-C3 may transmit data in LR rate, otherwise, ESP32-C3 will transmit all data in traditional Wi-Fi data rate.

Following table depicts the Wi-Fi mode negotiation:

APSTA	BGN	BG	B	BGNLR	BGLR	BLR	LR
BGN	BGN	BG	B	BGN	BG	B	.
BG	BG	BG	B	BG	BG	B	.
B	B	B	B	B	B	B	.
BGNLR	.	.	.	BGNLR	BGLR	BLR	LR
BGLR	.	.	.	BGLR	BGLR	BLR	LR
BLR	.	.	.	BLR	BLR	BLR	LR
LR	.	.	.	LR	LR	LR	LR

In above table, the row is the Wi-Fi mode of AP and the column is the Wi-Fi mode of station. The “.” indicates Wi-Fi mode of the AP and station are not compatible.

According to the table, we can conclude that:

- For LR enabled in ESP32-C3 AP, it's incompatible with traditional 802.11 mode because the beacon is sent in LR mode.
- For LR enabled in ESP32-C3 station and the mode is NOT LR only mode, it's compatible with traditional 802.11 mode.
- If both station and AP are ESP32-C3 devices and both of them enable LR mode, the negotiated mode supports LR.

If the negotiated Wi-Fi mode supports both traditional 802.11 mode and LR mode, it's the Wi-Fi driver's responsibility to automatically select the best data rate in different Wi-Fi mode and the application don't need to care about it.

**LR Impacts to Traditional Wi-Fi device** The data transmission in LR rate has no impacts on the traditional Wi-Fi device because:

- The CCA and backoff process in LR mode are consistent with 802.11 specification.
- The traditional Wi-Fi device can detect the LR signal via CCA and do backoff.

In other words, the impact transmission in LR mode is similar as the impact in 802.11B mode.

**LR Transmission Distance** The reception sensitivity of LR has about 4 dB gain than the traditional 802.11B mode, theoretically the transmission distance is about 2 to 2.5 times the distance of 11B.

**LR Throughput** The LR rate has very limited throughput, because the raw PHY data rate are 1/2 Mbps and 1/4 Mbps.

**When to Use LR** The general conditions for using LR are:

- Both the AP and station are Espressif devices.
- Long distance Wi-Fi connection and data transmission is required.
- Data throughput requirements are very small, such as remote device control, etc.

### Wi-Fi Country Code

Call `esp_wifi_set_country()` to set the country info. The table below describes the fields in detail, please consult local 2.4 GHz RF operating regulations before configuring these fields.

Field	Description
cc[3]	Country code string, this attributes identify the country or noncountry entity in which the station/AP is operating. If it's a country, the first two octets of this string is the two character country info as described in document ISO/IEC3166-1. The third octet is one of the following: <ul style="list-style-type: none"> <li>• an ASCII space character, if the regulations under which the station/AP is operating encompass all environments for the current frequency band in the country.</li> <li>• an ASCII 'O' character if the regulations under which the station/AP is operating are for an outdoor environment only.</li> <li>• an ASCII 'I' character if the regulations under which the station/AP is operating are for an indoor environment only.</li> <li>• an ASCII 'X' character if the station/AP is operating under a noncountry entity. The first two octets of the noncountry entity is two ASCII 'XX' characters.</li> <li>• the binary representation of the Operating Class table number currently in use. Refer to Annex E, IEEE Std 802.11-2020.</li> </ul>
schan	Start channel, it's the minimum channel number of the regulations under which the station/AP can operate.
nchan	Total number of channels as per the regulations, e.g. if the schan=1, nchan=13, it means the station/AP can send data from channel 1 to 13.
policy	Country policy, this field control which country info will be used if the configured country info is conflict with the connected AP's. More description about policy is provided in following section.

The default country info is:

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

If the Wi-Fi Mode is station/AP coexist mode, they share the same configured country info. Sometimes, the country info of AP, to which the station is connected, is different from the country info of configured. For example, the configured station has country info:

```
wifi_country_t config = {
    .cc = "JP",
    .schan = 1,
    .nchan = 14,
    .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

but the connected AP has country info:

```
wifi_country_t config = {
    .cc = "CN",
    .schan = 1,
    .nchan = 13,
};
```

then country info of connected AP' s is used.

Following table depicts which country info is used in different Wi-Fi Mode and different country policy, also describe the impact to active scan.

Wi-Fi Mode	Policy	Description
Station	WIFI_COUNTRY_POLICY_AUTO	If the connected AP has country IE in its beacon, the country info equals to the country info in beacon. Otherwise, use the default country info. For scan: Use active scan from 1 to 11 and use passive scan from 12 to 14. Always keep in mind that if an AP with hidden SSID and station is set to a passive scan channel, the passive scan will not find it. In other words, if the application hopes to find the AP with hidden SSID in every channel, the policy of country info should be configured to WIFI_COUNTRY_POLICY_MANUAL.
Station	WIFI_COUNTRY_POLICY_MANUAL	Always use the configured country info. For scan: Use active scan from schan to schan+nchan-1.
AP	WIFI_COUNTRY_POLICY_AUTO	Always use the configured country info.
AP	WIFI_COUNTRY_POLICY_MANUAL	Always use the configured country info.
Station/AP-coexistence	WIFI_COUNTRY_POLICY_AUTO	Station: Same as station mode with policy WIFI_COUNTRY_POLICY_AUTO. AP: If the station does not connect to any external AP, the AP uses the configured country info. If the station connects to an external AP, the AP has the same country info as the station.
Station/AP-coexistence	WIFI_COUNTRY_POLICY_MANUAL	Station: Same as station mode with policy WIFI_COUNTRY_POLICY_MANUAL. AP: Same as AP mode with policy WIFI_COUNTRY_POLICY_MANUAL.

**Home Channel** In AP mode, the home channel is defined as the AP channel. In Station mode, home channel is defined as the channel of AP which the station is connected to. In Station/AP-coexistence mode, the home channel of AP and station must be the same, if they are different, the station' s home channel is always in priority. Take the following as an example: the AP is on channel 6, and the station connects to an AP whose channel is 9. Since the station' s home channel has higher priority, the AP needs to switch its channel from 6 to make sure that it has the same home channel as the station. While switching channel, the ESP32-C3 in SoftAP mode will notify the connected stations about the channel migration using a Channel Switch Announcement (CSA). Station that supports channel switching will transit without disconnecting and reconnecting to the SoftAP.

### Wi-Fi Vendor IE Configuration

By default, all Wi-Fi management frames are processed by the Wi-Fi driver, and the application does not need to care about them. Some applications, however, may have to handle the beacon, probe request, probe response and other management frames. For example, if you insert some vendor-specific IE into the management frames,

it is only the management frames which contain this vendor-specific IE that will be processed. In ESP32-C3, `esp_wifi_set_vendor_ie()` and `esp_wifi_set_vendor_ie_cb()` are responsible for this kind of tasks.

#### 4.27.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™ (or Device Provisioning Protocol) is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. More information can be found on the API reference page [esp\\_dpp](#).

#### WPA2-Enterprise

WPA2-Enterprise is the secure authentication mechanism for enterprise wireless networks. It uses RADIUS server for authentication of network users before connecting to the Access Point. The authentication process is based on 802.1X policy and comes with different Extended Authentication Protocol (EAP) methods like TLS, TTLS, PEAP etc. RADIUS server authenticates the users based on their credentials (username and password), digital certificates or both. When ESP32-C3 in Station mode tries to connect to an AP in enterprise mode, it sends authentication request to AP which is sent to RADIUS server by AP for authenticating the Station. Based on different EAP methods, the parameters can be set in configuration which can be opened using `idf.py menuconfig`. WPA2\_Enterprise is supported by ESP32-C3 only in Station mode.

For establishing a secure connection, AP and Station negotiate and agree on the best possible cipher suite to be used. ESP32-C3 supports 802.1X/EAP (WPA) method of AKM and Advanced encryption standard with Counter Mode Cipher Block Chaining Message Authentication protocol (AES-CCM) cipher suite. It also supports the cipher suites supported by mbedtls if `USE_MBEDTLS_CRYPT` flag is set.

#### ESP32-C3 currently supports the following EAP methods:

- EAP-TLS: This is certificate based method and only requires SSID and EAP-IDF.
- PEAP: This is Protected EAP method. Username and Password are mandatory.
- **EAP-TTLS: This is credentials based method. Only server authentication is mandatory while user authentication**
  - PAP: Password Authentication Protocol.
  - CHAP: Challenge Handshake Authentication Protocol.
  - MSCHAP and MSCHAP-V2.
- EAP-FAST: This is a Protected Access Credentials (PAC) based authentication method which also uses identity and password. Currently, `USE_MBEDTLS_CRYPT` flag should be disabled to use this feature.

Detailed information on creating certificates and how to run `wpa2_enterprise` example on ESP32-C3 can be found in [wifi/wpa2\\_enterprise](#).

#### 4.27.16 Wireless Network Management

Wireless Network Management allows client devices to exchange information about the network topology, including information related to RF environment. This makes each client network-aware, facilitating overall improvement in the performance of the wireless network. It is part of 802.11v specification. It also enables client to support Network assisted Roaming.

Network assisted Roaming: Enables WLAN to send messages to associated clients, resulting clients to associate with APs with better link metrics. This is useful for both load balancing and in directing poorly connected clients.

Current implementation of 802.11v includes support for BSS transition management frames.

#### 4.27.17 Radio Resource Measurement

Radio Resource Measurement (802.11k) is intended to improve the way traffic is distributed within a network. In a wireless LAN, each device normally connects to the access point (AP) that provides the strongest signal. Depending on the number and geographic locations of the subscribers, this arrangement can sometimes lead to excessive demand on one AP and underutilization of others, resulting in degradation of overall network performance. In a network

conforming to 802.11k, if the AP having the strongest signal is loaded to its full capacity, a wireless device can be moved to one of the underutilized APs. Even though the signal may be weaker, the overall throughput is greater because more efficient use is made of the network resources.

Current implementation of 802.11k includes support for beacon measurement report, link measurement report and neighbor request.

Refer IDF example [examples/wifi/roaming/README.md](#) to set up and use these APIs. Example code only demonstrates how these APIs can be used, the application should define its own algorithm and cases as required.

## 4.27.18 ESP32-C3 Wi-Fi Power-saving Mode

### Station Sleep

Currently, ESP32-C3 Wi-Fi supports the Modem-sleep mode which refers to the legacy power-saving mode in the IEEE 802.11 protocol. Modem-sleep mode works in Station-only mode and the station must connect to the AP first. If the Modem-sleep mode is enabled, station will switch between active and sleep state periodically. In sleep state, RF, PHY and BB are turned off in order to reduce power consumption. Station can keep connection with AP in modem-sleep mode.

Modem-sleep mode includes minimum and maximum power save modes. In minimum power save mode, station wakes up every DTIM to receive beacon. Broadcast data will not be lost because it is transmitted after DTIM. However, it can not save much more power if DTIM is short for DTIM is determined by AP.

In maximum power-saving mode, station wakes up in every listen interval to receive beacon. This listen interval can be set to be longer than the AP DTIM period. Broadcast data may be lost because station may be in sleep state at DTIM time. If listen interval is longer, more power is saved, but broadcast data is more easy to lose. Listen interval can be configured by calling API `esp_wifi_set_config()` before connecting to AP.

Call `esp_wifi_set_ps(WIFI_PS_MIN_MODEM)` to enable Modem-sleep minimum power-saving mode or `esp_wifi_set_ps(WIFI_PS_MAX_MODEM)` to enable Modem-sleep maximum power-saving mode after calling `esp_wifi_init()`. When station connects to AP, Modem-sleep will start. When station disconnects from AP, Modem-sleep will stop.

Call `esp_wifi_set_ps(WIFI_PS_NONE)` to disable modem sleep entirely. This has much higher power consumption, but provides minimum latency for receiving Wi-Fi data in real time. When modem sleep is enabled, received Wi-Fi data can be delayed for as long as the DTIM period (minimum power save mode) or the listen interval (maximum power save mode). Disabling modem sleep entirely is not possible for Wi-Fi and Bluetooth coexist mode.

The default Modem-sleep mode is `WIFI_PS_MIN_MODEM`.

### AP Sleep

Currently ESP32-C3 AP doesn't support all of the power save feature defined in Wi-Fi specification. To be specific, the AP only caches unicast data for the stations connect to this AP, but doesn't cache the multicast data for the stations. If stations connected to the ESP32-C3 AP are power save enabled, they may experience multicast packet loss.

In the future, all power save features will be supported on ESP32-C3 AP.

## 4.27.19 ESP32-C3 Wi-Fi Throughput

The table below shows the best throughput results we got in Espressif's lab and in a shield box.

类型/吞吐量	实验室空气状况	屏蔽箱	测试工具	IDF 版本 (commit ID)
原始 802.11 数据包接收数据	N/A	<b>130 MBit/s</b>	内部工具	N/A
原始 802.11 数据包发送数据	N/A	<b>130 MBit/s</b>	内部工具	N/A
UDP 接收数据	30 MBit/s	50 MBit/s	iperf example	15575346
UDP 发送数据	30 MBit/s	40 MBit/s	iperf example	15575346
TCP 接收数据	20 MBit/s	35 MBit/s	iperf example	15575346
TCP 发送数据	20 MBit/s	37 MBit/s	iperf example	15575346

When the throughput is tested by iperf example, the sdkconfig is [examples/wifi/iperf/sdkconfig.defaults.esp32c3](#).

#### 4.27.20 Wi-Fi 80211 Packet Send

The `esp_wifi_80211_tx()` API can be used to:

- Send the beacon, probe request, probe response, action frame.
- Send the non-QoS data frame.

It cannot be used for sending encrypted or QoS frames.

##### Preconditions of Using `esp_wifi_80211_tx()`

- The Wi-Fi mode is station, or AP, or station/AP.
- Either `esp_wifi_set_promiscuous(true)`, or `esp_wifi_start()`, or both of these APIs return ESP\_OK. This is because Wi-Fi hardware must be initialized before `esp_wifi_80211_tx()` is called. In ESP32-C3, both `esp_wifi_set_promiscuous(true)` and `esp_wifi_start()` can trigger the initialization of Wi-Fi hardware.
- The parameters of `esp_wifi_80211_tx()` are hereby correctly provided.

##### Data rate

- The default data rate is 1 Mbps.
- Can set any rate through `esp_wifi_config_80211_tx_rate()` API.
- Can set any bandwidth through `esp_wifi_set_bandwidth()` API.

##### Side-Effects to Avoid in Different Scenarios

Theoretically, if the side-effects the API imposes on the Wi-Fi driver or other stations/APs are not considered, a raw 802.11 packet can be sent over the air with any destination MAC, any source MAC, any BSSID, or any other types of packet. However, robust or useful applications should avoid such side-effects. The table below provides some tips and recommendations on how to avoid the side-effects of `esp_wifi_80211_tx()` in different scenarios.

Scenario	Description
No Wi-Fi connection	<p>In this scenario, no Wi-Fi connection is set up, so there are no side-effects on the Wi-Fi driver. If <code>en_sys_seq==true</code>, the Wi-Fi driver is responsible for the sequence control. If <code>en_sys_seq==false</code>, the application needs to ensure that the buffer has the correct sequence. Theoretically, the MAC address can be any address. However, this may impact other stations/APs with the same MAC/BSSID.</p> <p>Side-effect example#1 The application calls <code>esp_wifi_80211_tx</code> to send a beacon with BSSID == <code>mac_x</code> in AP mode, but the <code>mac_x</code> is not the MAC of the AP interface. Moreover, there is another AP, say “other-AP”, whose bssid is <code>mac_x</code>. If this happens, an “unexpected behavior” may occur, because the stations which connect to the “other-AP” cannot figure out whether the beacon is from the “other-AP” or the <code>esp_wifi_80211_tx</code>.</p> <p>To avoid the above-mentioned side-effects, we recommend that:</p> <ul style="list-style-type: none"> <li>• If <code>esp_wifi_80211_tx</code> is called in station mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the station interface.</li> <li>• If <code>esp_wifi_80211_tx</code> is called in AP mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the AP interface.</li> </ul> <p>The recommendations above are only for avoiding side-effects and can be ignored when there are good reasons for doing this.</p>
Have Wi-Fi connection	<p>When the Wi-Fi connection is already set up, and the sequence is controlled by the application, the latter may impact the sequence control of the Wi-Fi connection, as a whole. So, the <code>en_sys_seq</code> need to be true, otherwise <code>ESP_ERR_WIFI_ARG</code> is returned.</p> <p>The MAC-address recommendations in the “No Wi-Fi connection” scenario also apply to this scenario.</p> <p>If the Wi-Fi mode is station mode and the MAC address1 is the MAC of AP to which the station is connected, the MAC address2 is the MAC of station interface, we say the packets is from the station to AP. On the other hand, if the Wi-Fi mode is AP mode and the MAC address1 is the MAC of the station who connects to this AP, the MAC address2 is the MAC of AP interface, we say the packet is from the AP to station. To avoid conflicting with Wi-Fi connections, the following checks are applied:</p> <ul style="list-style-type: none"> <li>• If the packet type is data and is from the station to AP, the ToDS bit in IEEE 80211 frame control should be 1, the FromDS bit should be 0, otherwise the packet will be discarded by Wi-Fi driver.</li> <li>• If the packet type is data and is from the AP to station, the ToDS bit in IEEE 80211 frame control should be 0, the FromDS bit should be 1, otherwise the packet will be discarded by Wi-Fi driver.</li> <li>• If the packet is from station to AP or from AP to station, the Power Management, More Data, Re-Transmission bits should be 0, otherwise the packet will be discarded by Wi-Fi driver.</li> </ul> <p><code>ESP_ERR_WIFI_ARG</code> is returned if any check fails.</p>

### 4.27.21 Wi-Fi Sniffer Mode

The Wi-Fi sniffer mode can be enabled by `esp_wifi_set_promiscuous()`. If the sniffer mode is enabled, the following packets **can** be dumped to the application:

- 802.11 Management frame.
- 802.11 Data frame, including MPDU, AMPDU, AMSDU, etc.
- 802.11 MIMO frame, for MIMO frame, the sniffer only dumps the length of the frame.
- 802.11 Control frame.

The following packets will **NOT** be dumped to the application:

- 802.11 error frame, such as the frame with a CRC error, etc.

For frames that the sniffer **can** dump, the application can additionally decide which specific type of packets can be filtered to the application by using `esp_wifi_set_promiscuous_filter()` and

`esp_wifi_set_promiscuous_ctrl_filter()`. By default, it will filter all 802.11 data and management frames to the application.

The Wi-Fi sniffer mode can be enabled in the Wi-Fi mode of `WIFI_MODE_NULL`, or `WIFI_MODE_STA`, or `WIFI_MODE_AP`, or `WIFI_MODE_APSTA`. In other words, the sniffer mode is active when the station is connected to the AP, or when the AP has a Wi-Fi connection. Please note that the sniffer has a **great impact** on the throughput of the station or AP Wi-Fi connection. Generally, we should **NOT** enable the sniffer, when the station/AP Wi-Fi connection experiences heavy traffic unless we have special reasons.

Another noteworthy issue about the sniffer is the callback `wifi_promiscuous_cb_t`. The callback will be called directly in the Wi-Fi driver task, so if the application has a lot of work to do for each filtered packet, the recommendation is to post an event to the application task in the callback and defer the real work to the application task.

## 4.27.22 Wi-Fi Multiple Antennas

The Wi-Fi multiple antennas selecting can be depicted as following picture:

ESP32-C3 supports up to sixteen antennas through external antenna switch. The antenna switch can be controlled by up to four address pins - `antenna_select[0:3]`. Different input value of `antenna_select[0:3]` means selecting different antenna. E.g. the value '0b1011' means the antenna 11 is selected. The default value of `antenna_select[3:0]` is '0b0000', it means the antenna 0 is selected by default.

Up to four GPIOs are connected to the four active high antenna\_select pins. ESP32-C3 can select the antenna by control the GPIO[0:3]. The API `esp_wifi_set_ant_gpio()` is used to configure which GPIOs are connected to antenna\_selects. If `GPIO[x]` is connected to `antenna_select[x]`, then `gpio_config->gpio_cfg[x].gpio_select` should be set to 1 and `gpio_config->gpio_cfg[x].gpio_num` should be provided.

For the specific implementation of the antenna switch, there may be illegal values in `antenna_select[0:3]`. It means that ESP32-C3 may support less than sixteen antennas through the switch. For example, ESP32-WROOM-DA which uses RTC6603SP as the antenna switch, supports two antennas. Two GPIOs are connected to two active high antenna selection inputs. The value '0b01' means the antenna 0 is selected, the value '0b10' means the antenna 1 is selected. Values '0b00' and '0b11' are illegal.

Although up to sixteen antennas are supported, only one or two antennas can be simultaneously enabled for RX/TX. The API `esp_wifi_set_ant()` is used to configure which antennas are enabled.

The enabled antennas selecting algorithm is also configured by `esp_wifi_set_ant()`. The RX/TX antenna mode can be `WIFI_ANT_MODE_ANT0`, `WIFI_ANT_MODE_ANT1` or `WIFI_ANT_MODE_AUTO`. If the antenna mode is `WIFI_ANT_MODE_ANT0`, the enabled antenna 0 is selected for RX/TX data. If the antenna mode is `WIFI_ANT_MODE_ANT1`, the enabled antenna 1 is selected for RX/TX data. Otherwise, Wi-Fi automatically selects the antenna that has better signal from the enabled antennas.

If the RX antenna mode is `WIFI_ANT_MODE_AUTO`, the default antenna mode also needs to be set. Because the RX antenna switching only happens when some conditions are met, e.g. the RX antenna starts to switch if the RSSI is lower than -65 dBm and if another antenna has better signal etc, RX uses the default antenna if the conditions are not met. If the default antenna mode is `WIFI_ANT_MODE_ANT1`, the enabled antenna 1 is used as the default RX antenna, otherwise the enabled antenna 0 is used as the default RX antenna.

Some limitations need to be considered:

- The TX antenna can be set to `WIFI_ANT_MODE_AUTO` only if the RX antenna mode is `WIFI_ANT_MODE_AUTO` because TX antenna selecting algorithm is based on RX antenna in `WIFI_ANT_MODE_AUTO` type.
- Currently Bluetooth® doesn't support the multiple antennas feature, please don't use multiple antennas related APIs.

Following is the recommended scenarios to use the multiple antennas:

- In Wi-Fi mode `WIFI_MODE_STA`, both RX/TX antenna modes are configured to `WIFI_ANT_MODE_AUTO`. The Wi-Fi driver selects the better RX/TX antenna automatically.
- The RX antenna mode is configured to `WIFI_ANT_MODE_AUTO`. The TX antenna mode is configured to `WIFI_ANT_MODE_ANT0` or `WIFI_ANT_MODE_ANT1`. The applications can choose to always select a specified antenna for TX, or implement their own TX antenna selecting algorithm, e.g. selecting the TX antenna mode based on the channel switch information etc.
- Both RX/TX antenna modes are configured to `WIFI_ANT_MODE_ANT0` or `WIFI_ANT_MODE_ANT1`.

### Wi-Fi Multiple Antennas Configuration

Generally, following steps can be taken to configure the multiple antennas:

- Configure which GPIOs are connected to the antenna\_selects, for example, if four antennas are supported and GPIO20/GPIO21 are connected to antenna\_select[0]/antenna\_select[1], the configurations look like:

```
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- Configure which antennas are enabled and how RX/TX use the enabled antennas, for example, if antenna1 and antenna3 are enabled, the RX needs to select the better antenna automatically and uses antenna1 as its default antenna, the TX always selects the antenna3. The configuration looks like:

```
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.27.23 Wi-Fi Channel State Information

Channel state information (CSI) refers to the channel information of a Wi-Fi connection. In ESP32-C3, this information consists of channel frequency responses of sub-carriers and is estimated when packets are received from the transmitter. Each channel frequency response of sub-carrier is recorded by two bytes of signed characters. The first one is imaginary part and the second one is real part. There are up to three fields of channel frequency responses according to the type of received packet. They are legacy long training field (LLTF), high throughput LTF (HT-LTF) and space time block code HT-LTF (STBC-HT-LTF). For different types of packets which are received on channels with different state, the sub-carrier index and total bytes of signed characters of CSI is shown in the following table.

channel information	secondary channel bandwidth	none			below					above				
		signal mode	non HT	HT	non HT	HT	20 MHz	40 MHz	20 MHz	40 MHz	non HT	HT	20 MHz	40 MHz
sub-carrier index	STBC	non STBC	non STBC	STBC	non STBC	non STBC	STBC	non STBC	STBC	non STBC	non STBC	STBC	non STBC	STBC
LLTF	•	0~31, - 32~ 1	0~31, - 32~ 1	0~31, - 32~ 1	0~63	0~63	0~63	0~63	0~63	- 64~ 1	- 64~ 1	- 64~ 1	- 64~ 1	- 64~ 1
HT-LTF	•	0~31, - 32~ 1	0~31, - 32~ 1	0~31, - 32~ 1	•	0~63	0~62	0~63, - 64~ 1	0~60, - 60~ 1	•	- 64~ 1	- 62~ 1	0~63, - 64~ 1	0~60, - 60~ 1
STBC- HT-LTF	•	•	•	0~31, - 32~ 1	•	•	0~62	•	0~60, - 60~ 1	•	•	- 62~ 1	•	0~60, - 60~ 1
total bytes		128	256	384	128	256	380	384	612	128	256	376	384	612

All of the information in the table can be found in the structure `wifi_csi_info_t`.

- Secondary channel refers to `secondary_channel` field of `rx_ctrl` field.
- Signal mode of packet refers to `sig_mode` field of `rx_ctrl` field.
- Channel bandwidth refers to `cwb` field of `rx_ctrl` field.
- STBC refers to `stbc` field of `rx_ctrl` field.
- Total bytes refers to `len` field.
- The CSI data corresponding to each Long Training Field(LTF) type is stored in a buffer starting from the `buf` field. Each item is stored as two bytes: imaginary part followed by real part. The order of each item is the same as the sub-carrier in the table. The order of LTF is: LLTF, HT-LTF, STBC-HT-LTF. However all 3 LTFs may not be present, depending on the channel and packet information (see above).
- If `first_word_invalid` field of `wifi_csi_info_t` is true, it means that the first four bytes of CSI data is invalid due to a hardware limitation in ESP32-C3.
- More information like RSSI, noise floor of RF, receiving time and antenna is in the `rx_ctrl` field.

When imaginary part and real part data of sub-carrier are used, please refer to the table below.

PHY standard	Sub-carrier range	Pilot sub-carrier	Sub-carrier(total/data)
802.11a/g	-26 to +26	-21, -7, +7, +21	52 total, 48 usable
802.11n, 20MHz	-28 to +28	-21, -7, +7, +21	56 total, 52 usable
802.11n, 40MHz	-57 to +57	-53, -25, -11, +11, +25, +53	114 total, 108 usable

#### Note:

- For STBC packet, CSI is provided for every space-time stream without CSD (cyclic shift delay). As each cyclic shift on the additional chains shall be -200 ns, only the CSD angle of first space-time stream is recorded in sub-carrier 0 of HT-LTF and STBC-HT-LTF for there is no channel frequency response in sub-carrier 0. `CSD[10:0]` is 11 bits, ranging from  $-\pi$  to  $\pi$ .
- If LLTF, HT-LTF, or STBC-HT-LTF is not enabled by calling API `esp_wifi_set_csi_config()`, the total bytes of CSI data will be fewer than that in the table. For example, if LLTF and HT-LTF is not enabled and STBC-HT-LTF is enabled, when a packet is received with the condition above/HT/40MHz/STBC, the total bytes of CSI data is 244  $((61 + 60) * 2 + 2 = 244$ . The result is aligned to four bytes, and the last two bytes are invalid).

### 4.27.24 Wi-Fi Channel State Information Configure

To use Wi-Fi CSI, the following steps need to be done.

- Select Wi-Fi CSI in menuconfig. Go to `Menuconfig > Components config > Wi-Fi > Wi-Fi CSI (Channel State Information)`.
- Set CSI receiving callback function by calling API `esp_wifi_set_csi_rx_cb()`.
- Configure CSI by calling API `esp_wifi_set_csi_config()`.
- Enable CSI by calling API `esp_wifi_set_csi()`.

The CSI receiving callback function runs from Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task. Because station does not receive any packet when it is disconnected and only receives packets from AP when it is connected, it is suggested to enable sniffer mode to receive more CSI data by calling `esp_wifi_set_promiscuous()`.

### 4.27.25 Wi-Fi HT20/40

ESP32-C3 supports Wi-Fi bandwidth HT20 or HT40 and does not support HT20/40 coexist. `esp_wifi_set_bandwidth()` can be used to change the default bandwidth of station or AP. The default bandwidth for ESP32-C3 station and AP is HT40.

In station mode, the actual bandwidth is firstly negotiated during the Wi-Fi connection. It is HT40 only if both the station and the connected AP support HT40, otherwise it's HT20. If the bandwidth of connected AP is changes, the actual bandwidth is negotiated again without Wi-Fi disconnecting.

Similarly, in AP mode, the actual bandwidth is negotiated between AP and the stations that connect to the AP. It's HT40 if the AP and one of the stations support HT40, otherwise it's HT20.

In station/AP coexist mode, the station/AP can configure HT20/40 separately. If both station and AP are negotiated to HT40, the HT40 channel should be the channel of station because the station always has higher priority than AP in ESP32-C3. E.g. the configured bandwidth of AP is HT40, the configured primary channel is 6 and the configured secondary channel is 10. The station is connected to an router whose primary channel is 6 and secondary channel is 2, then the actual channel of AP is changed to primary 6 and secondary 2 automatically.

Theoretically the HT40 can gain better throughput because the maximum raw physical (PHY) data rate for HT40 is 150Mbps while it's 72Mbps for HT20. However, if the device is used in some special environment, e.g. there are too many other Wi-Fi devices around the ESP32-C3 device, the performance of HT40 may be degraded. So if the applications need to support same or similar scenarios, it's recommended that the bandwidth is always configured to HT20.

### 4.27.26 Wi-Fi QoS

ESP32-C3 supports all the mandatory features required in WFA Wi-Fi QoS Certification.

Four ACs(Access Category) are defined in Wi-Fi specification, each AC has a its own priority to access the Wi-Fi channel. Moreover a map rule is defined to map the QoS priority of other protocol, such as 802.11D or TCP/IP precedence to Wi-Fi AC.

Below is a table describes how the IP Precedences are mapped to Wi-Fi ACs in ESP32-C3, it also indicates whether the AMPDU is supported for this AC. The table is sorted with priority descending order, namely, the AC\_VO has highest priority.

IP Precedence	Wi-Fi AC	Support AMPDU?
6, 7	AC_VO (Voice)	No
4, 5	AC_VI (Video)	Yes
3, 0	AC_BE (Best Effort)	Yes
1, 2	AC_BK (Background)	Yes

The application can make use of the QoS feature by configuring the IP precedence via socket option IP\_TOS. Here is an example to make the socket to use VI queue:

```
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

Theoretically the higher priority AC has better performance than the low priority AC, however, it's not always be true, here are some suggestions about how to use the Wi-Fi QoS:

- For some really important application traffic, can put it into AC\_VO queue. Avoid sending big traffic via AC\_VO queue. On one hand, the AC\_VO queue doesn't support AMPDU and it can't get better performance than other queue if the traffic is big, on the other hand, it may impact the the management frames that also use AC\_VO queue.
- Avoid using more than two different AMPDU supported precedences, e.g. socket A uses precedence 0, socket B uses precedence 1, socket C uses precedence 2, this is a bad design because it may need much more memory. To be detailed, the Wi-Fi driver may generate a Block Ack session for each precedence and it needs more memory if the Block Ack session is setup.

#### 4.27.27 Wi-Fi AMSDU

ESP32-C3 supports receiving AMSDU.

#### 4.27.28 Wi-Fi Fragment

ESP32C3 supports Wi-Fi receiving and transmitting fragment.

#### 4.27.29 WPS Enrollee

ESP32-C3 supports WPS enrollee feature in Wi-Fi mode WIFI\_MODE\_STA or WIFI\_MODE\_APSTA. Currently ESP32-C3 supports WPS enrollee type PBC and PIN.

#### 4.27.30 Wi-Fi Buffer Usage

This section is only about the dynamic buffer configuration.

##### Why Buffer Configuration Is Important

In order to get a , high-performance system, we need to consider the memory usage/configuration very carefully, because:

- the available memory in ESP32-C3 is limited.
- currently, the default type of buffer in LwIP and Wi-Fi drivers is “dynamic” , **which means that both the LwIP and Wi-Fi share memory with the application**. Programmers should always keep this in mind; otherwise, they will face a memory issue, such as “running out of heap memory” .
- it is very dangerous to run out of heap memory, as this will cause ESP32-C3 an “undefined behavior” . Thus, enough heap memory should be reserved for the application, so that it never runs out of it.
- the Wi-Fi throughput heavily depends on memory-related configurations, such as the TCP window size, Wi-Fi RX/TX dynamic buffer number, etc.
- the peak heap memory that the ESP32-C3 LwIP/Wi-Fi may consume depends on a number of factors, such as the maximum TCP/UDP connections that the application may have, etc.
- the total memory that the application requires is also an important factor when considering memory configuration.

Due to these reasons, there is not a good-for-all application configuration. Rather, we have to consider memory configurations separately for every different application.

### Dynamic vs. Static Buffer

The default type of buffer in Wi-Fi drivers is “dynamic” . Most of the time the dynamic buffer can significantly save memory. However, it makes the application programming a little more difficult, because in this case the application needs to consider memory usage in Wi-Fi.

lwIP also allocates buffers at the TCP/IP layer, and this buffer allocation is also dynamic. See [lwIP documentation section about memory use and performance](#).

### Peak Wi-Fi Dynamic Buffer

The Wi-Fi driver supports several types of buffer (refer to [Wi-Fi Buffer Configure](#)). However, this section is about the usage of the dynamic Wi-Fi buffer only. The peak heap memory that Wi-Fi consumes is the **theoretically-maximum memory** that the Wi-Fi driver consumes. Generally, the peak memory depends on:

- the number of dynamic rx buffers that are configured: `wifi_rx_dynamic_buf_num`
- the number of dynamic tx buffers that are configured: `wifi_tx_dynamic_buf_num`
- the maximum packet size that the Wi-Fi driver can receive: `wifi_rx_pkt_size_max`
- the maximum packet size that the Wi-Fi driver can send: `wifi_tx_pkt_size_max`

So, the peak memory that the Wi-Fi driver consumes can be calculated with the following formula:

$$\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} * \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} * \text{wifi\_tx\_pkt\_size\_max})$$

Generally, we do not need to care about the dynamic tx long buffers and dynamic tx long long buffers, because they are management frames which only have a small impact on the system.

## 4.27.31 How to improve Wi-Fi performance

The performance of ESP32-C3 Wi-Fi is affected by many parameters, and there are mutual constraints between each parameter. A proper configuration can not only improve performance but also increase available memory for applications and improve stability.

In this section, we will briefly explain the operating mode of the Wi-Fi/LWIP protocol stack and explain the role of each parameter. We will give several recommended configuration ranks, user can choose the appropriate rank according to the usage scenario.

### Protocol stack operation mode

The ESP32-C3 protocol stack is divided into four layers: Application, LWIP, Wi-Fi, and Hardware.

- During receiving, hardware puts the received packet into DMA buffer, and then transfers it into the RX buffer of Wi-Fi, LWIP in turn for related protocol processing, and finally to the application layer. The Wi-Fi RX buffer and the LWIP RX buffer shares the same buffer by default. In other words, the Wi-Fi forwards the packet to LWIP by reference by default.
- During sending, the application copies the messages to be sent into the TX buffer of the LWIP layer for TCP/IP encapsulation. The messages will then be passed to the TX buffer of the Wi-Fi layer for MAC encapsulation and wait to be sent.

### Parameters

Increasing the size or number of the buffers mentioned above properly can improve Wi-Fi performance. Meanwhile, it will reduce available memory to the application. The following is an introduction to the parameters that users need to configure:

Fig. 57: ESP32-C3 datapath

**RX direction:**

- ***CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM*** This parameter indicates the number of DMA buffer at the hardware layer. Increasing this parameter will increase the sender's one-time receiving throughput, thereby improving the Wi-Fi protocol stack ability to handle burst traffic.
- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*** This parameter indicates the number of RX buffer in the Wi-Fi layer. Increasing this parameter will improve the performance of packet reception. This parameter needs to match the RX buffer size of the LWIP layer.
- ***CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN*** This parameter indicates the size of the AMPDU BA Window at the receiving end. This parameter should be configured to the smaller value between twice of ***CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM*** and ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM***.
- ***CONFIG\_LWIP\_TCP\_WND\_DEFAULT*** This parameter represents the RX buffer size of the LWIP layer for each TCP stream. Its value should be configured to the value of ***WIFI\_DYNAMIC\_RX\_BUFFER\_NUM***(KB) to reach a high and stable performance. Meanwhile, in case of multiple streams, this value needs to be reduced proportionally.

**TX direction:**

- ***CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM*** This parameter indicates the type of TX buffer, it is recommended to configure it as a dynamic buffer, which can make full use of memory.
- ***CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM*** This parameter indicates the number of TX buffer on the Wi-Fi layer. Increasing this parameter will improve the performance of packet sending. The parameter value needs to match the TX buffer size of the LWIP layer.
- ***CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*** This parameter represents the TX buffer size of the LWIP layer for each TCP stream. Its value should be configured to the value of ***WIFI\_DYNAMIC\_TX\_BUFFER\_NUM***(KB) to reach a high and stable performance. In case of multiple streams, this value needs to be reduced proportionally.

**Throughput optimization by placing code in IRAM:**

---

**Note:** The buffer size mentioned above is fixed as 1.6 KB.

---

**How to configure parameters**

ESP32-C3's memory is shared by protocol stack and applications.

Here, we have given several configuration ranks. In most cases, the user should select a suitable rank for parameter configuration according to the size of the memory occupied by the application.

The parameters not mentioned in the following table should be set to the default.

Rank	lperf	Default	Minimum
Available memory (KB)	59	160	180
WIFI_STATIC_RX_BUFFER_NUM	8	8	3
WIFI_DYNAMIC_RX_BUFFER_NUM	16	16	6
WIFI_DYNAMIC_TX_BUFFER_NUM	16	16	6
WIFI_RX_BA_WIN	32	16	6
TCP_SND_BUF_DEFAULT (KB)	40	16	6
TCP_WND_DEFAULT (KB)	40	16	6
LWIP_IRAM_OPTIMIZATION	13	13	0
TCP TX throughput (Mbit/s)	38.1	27.2	20.4
TCP RX throughput (Mbit/s)	35.3	24.2	17.4
UDP TX throughput (Mbit/s)	40.6	38.9	34.1
UDP RX throughput (Mbit/s)	52.4	44.5	44.2

#### Ranks:

- **Iperf rank** ESP32-C3 extreme performance rank used to test extreme performance.
- **Default rank** ESP32-C3's default configuration rank, the available memory, and performance are in balance.
- **Minimum rank** This is the minimum configuration rank of ESP32-C3. The protocol stack only uses the necessary memory for running. It is suitable for scenarios that have no requirement for performance and the application requires lots of space.

### 4.27.32 Wi-Fi Menuconfig

#### Wi-Fi Buffer Configure

If you are going to modify the default number or type of buffer, it would be helpful to also have an overview of how the buffer is allocated/freed in the data path. The following diagram shows this process in the TX direction:

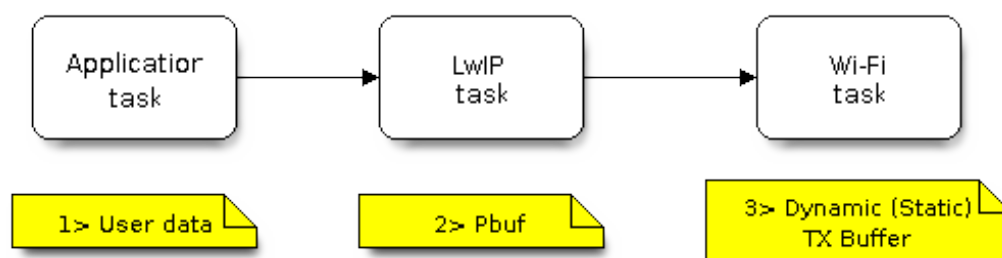

Fig. 58: TX Buffer Allocation

Description:

- The application allocates the data which needs to be sent out.
- The application calls TCP/IP-/Socket-related APIs to send the user data. These APIs will allocate a PBUF used in LwIP, and make a copy of the user data.

- When LwIP calls a Wi-Fi API to send the PBUF, the Wi-Fi API will allocate a “Dynamic Tx Buffer” or “Static Tx Buffer” , make a copy of the LwIP PBUF, and finally send the data.

The following diagram shows how buffer is allocated/freed in the RX direction:

Fig. 59: RX Buffer Allocation

Description:

- The Wi-Fi hardware receives a packet over the air and puts the packet content to the “Static Rx Buffer” , which is also called “RX DMA Buffer” .
- The Wi-Fi driver allocates a “Dynamic Rx Buffer” , makes a copy of the “Static Rx Buffer” , and returns the “Static Rx Buffer” to hardware.
- The Wi-Fi driver delivers the packet to the upper-layer (LwIP), and allocates a PBUF for holding the “Dynamic Rx Buffer” .
- The application receives data from LwIP.

The diagram shows the configuration of the Wi-Fi internal buffer.

Buffer Type	Alloc Type	Default	Configurable	Description
Static RX Buffer (Hardware RX Buffer)	Static	10 * 1600 Bytes	Yes	<p>This is a kind of DMA memory. It is initialized in <code>esp_wifi_init()</code> and freed in <code>esp_wifi_deinit()</code>. The ‘Static Rx Buffer’ forms the hardware receiving list. Upon receiving a frame over the air, hardware writes the frame into the buffer and raises an interrupt to the CPU. Then, the Wi-Fi driver reads the content from the buffer and returns the buffer back to the list.</p> <p>If the application want to reduce the the memory statically allocated by Wi-Fi, they can reduce this value from 10 to 6 to save 6400 Bytes memory. It’s not recommended to reduce the configuration to a value less than 6 unless the AMPDU feature is disabled.</p>
Dynamic RX Buffer	Dynamic	32	Yes	<p>The buffer length is variable and it depends on the received frames’ length. When the Wi-Fi driver receives a frame from the ‘Hardware Rx Buffer’, the ‘Dynamic Rx Buffer’ needs to be allocated from the heap. The number of the Dynamic Rx Buffer, configured in the menu-config, is used to limit the total un-freed Dynamic Rx Buffer number.</p>
Dynamic TX Buffer	Dynamic	32	Yes	<p>This is a kind of DMA memory. It is allocated to the heap. When the upper-layer (LwIP) sends packets to the Wi-Fi driver, it firstly allocates a ‘Dynamic TX Buffer’ and makes a copy of the upper-layer buffer.</p> <p>The Dynamic and Static TX Buffers are mutually exclusive.</p>
Static TX Buffer	Static	16 * 1600Bytes	Yes	<p>This is a kind of DMA memory. It is initialized in <code>esp_wifi_init()</code> and freed in <code>esp_wifi_deinit()</code>. When the upper-layer (LwIP) sends packets to the Wi-Fi driver, it firstly allocates a ‘Static TX Buffer’ and makes a copy of the upper-layer buffer.</p> <p>The Dynamic and Static TX Buffer are mutually exclusive.</p> <p>Since the TX buffer must be DMA buffer, so when PSRAM is enabled, the TX buffer must be static.</p>
Management Short Buffer	Dynamic	8	NO	Wi-Fi driver’ s internal buffer.
Management Long Buffer	Dynamic	32	NO	Wi-Fi driver’ s internal buffer.
Management Long Long Buffer	Dynamic	32	NO	Wi-Fi driver’ s internal buffer.

## Wi-Fi NVS Flash

If the Wi-Fi NVS flash is enabled, all Wi-Fi configurations set via the Wi-Fi APIs will be stored into flash, and the Wi-Fi driver will start up with these configurations next time it powers on/reboots. However, the application can choose to disable the Wi-Fi NVS flash if it does not need to store the configurations into persistent memory, or has its own persistent storage, or simply due to debugging reasons, etc.

## Wi-Fi AMPDU

ESP32-C3 supports both receiving and transmitting AMPDU, the AMPDU can greatly improve the Wi-Fi throughput.

Generally, the AMPDU should be enabled. Disabling AMPDU is usually for debugging purposes.

### 4.27.33 Troubleshooting

Please refer to a separate document with [Espressif Wireshark User Guide](#).

## Espressif Wireshark User Guide

### 1. Overview

**1.1 What is Wireshark?** [Wireshark](#) (originally named “Ethereal” ) is a network packet analyzer that captures network packets and displays the packet data as detailed as possible. It uses WinPcap as its interface to directly capture network traffic going through a network interface controller (NIC).

You could think of a network packet analyzer as a measuring device used to examine what is going on inside a network cable, just like a voltmeter is used by an electrician to examine what is going on inside an electric cable.

In the past, such tools were either very expensive, proprietary, or both. However, with the advent of Wireshark, all that has changed.

Wireshark is released under the terms of the GNU General Public License, which means you can use the software and the source code free of charge. It also allows you to modify and customize the source code.

Wireshark is, perhaps, one of the best open source packet analyzers available today.

**1.2 Some Intended Purposes** Here are some examples of how Wireshark is typically used:

- Network administrators use it to troubleshoot network problems.
- Network security engineers use it to examine security problems.
- Developers use it to debug protocol implementations.
- People use it to learn more about network protocol internals.

Beside these examples, Wireshark can be used for many other purposes.

**1.3 Features** The main features of Wireshark are as follows:

- Available for UNIX and Windows
- Captures live packet data from a network interface
- Displays packets along with detailed protocol information
- Opens/saves the captured packet data
- Imports/exports packets into a number of file formats, supported by other capture programs
- Advanced packet filtering
- Searches for packets based on multiple criteria
- Colorizes packets according to display filters
- Calculates statistics
- ...and a lot more!

## 1.4 Wireshark Can or Can't Do

- **Live capture from different network media.**  
Wireshark can capture traffic from different network media, including wireless LAN.
- **Import files from many other capture programs.**  
Wireshark can import data from a large number of file formats, supported by other capture programs.
- **Export files for many other capture programs.**  
Wireshark can export data into a large number of file formats, supported by other capture programs.
- **Numerous protocol dissectors.**  
Wireshark can dissect, or decode, a large number of protocols.
- **Wireshark is not an intrusion detection system.**  
It will not warn you if there are any suspicious activities on your network. However, if strange things happen, Wireshark might help you figure out what is really going on.
- **Wireshark does not manipulate processes on the network, it can only perform “measurements” within it.**  
Wireshark does not send packets on the network or influence it in any other way, except for resolving names (converting numerical address values into a human readable format), but even that can be disabled.

**2. Where to Get Wireshark** You can get Wireshark from the official website: <https://www.wireshark.org/download.html>

Wireshark can run on various operating systems. Please download the correct version according to the operating system you are using.

**3. Step-by-step Guide** This demonstration uses **Wireshark 2.2.6 on Linux.**

### a) Start Wireshark

On Linux, you can run the shell script provided below. It starts Wireshark, then configures NIC and the channel for packet capture.

```
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

In the above script, the parameter \$1 represents NIC and \$2 represents channel. For example, wlan0 in ./xxx.sh wlan0 6, specifies the NIC for packet capture, and 6 identifies the channel of an AP or Soft-AP.

### b) Run the Shell Script to Open Wireshark and Display Capture Interface

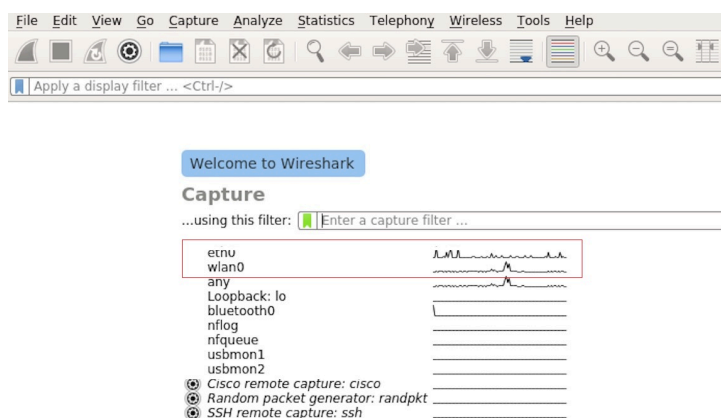

Fig. 60: Wireshark Capture Interface

### c) Select the Interface to Start Packet Capture

As the red markup shows in the picture above, many interfaces are available. The first one is a local NIC and the second one is a wireless NIC.

Please select the NIC according to your requirements. This document will use the wireless NIC to demonstrate packet capture.

Double click `wlan0` to start packet capture.

### d) Set up Filters

Since all packets in the channel will be captured, and many of them are not needed, you have to set up filters to get the packets that you need.

Please find the picture below with the red markup, indicating where the filters should be set up.

Fig. 61: Setting up Filters in Wireshark

Click *Filter*, the top left blue button in the picture below. The *display filter* dialogue box will appear.

Fig. 62: Display Filter Dialogue Box

Click the *Expression* button to bring up the *Filter Expression* dialogue box and set the filter according to your requirements.

**The quickest way:** enter the filters directly in the toolbar.

Click on this area to enter or modify the filters. If you enter a wrong or unfinished filter, the built-in syntax check turns the background red. As soon as the correct expression is entered, the background becomes green.

The previously entered filters are automatically saved. You can access them anytime by opening the drop down list.

For example, as shown in the picture below, enter two MAC addresses as the filters and click *Apply* (the blue arrow). In this case, only the packet data transmitted between these two MAC addresses will be captured.

Fig. 63: Filter Expression Dialogue Box

Fig. 64: Filter Toolbar

Fig. 65: Example of MAC Addresses applied in the Filter Toolbar

**e) Packet List**

You can click any packet in the packet list and check the detailed information about it in the box below the list. For example, if you click the first packet, its details will appear in that box.

Fig. 66: Example of Packet List Details

**f) Stop/Start Packet Capture**

As shown in the picture below, click the red button to stop capturing the current packet.

Fig. 67: Stopping Packet Capture

Click the top left blue button to start or resume packet capture.

**g) Save the Current Packet**

On Linux, go to *File -> Export Packet Dissections -> As Plain Text File* to save the packet.

Please note that *All packets, Displayed* and *All expanded* must be selected.

By default, Wireshark saves the captured packet in a libpcap file. You can also save the file in other formats, e.g. txt, to analyze it in other tools.

**4.28 Wi-Fi Security**

Fig. 68: Starting or Resuming the Packets Capture

Fig. 69: Saving Captured Packets

### 4.28.1 ESP32-C3 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32-C3 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

### 4.28.2 Protected Management Frames (PMF)

#### Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

**There are 3 types of PMF configuration modes on both Station and AP side -**

- PMF Optional
- PMF Required
- PMF Disabled

Depending on the PMF configuration on Station and AP side, the resulting connection will behave differently. Below table summarises all possible outcomes.

STA Setting	AP Setting	Outcome
PMF Optional	PMF Optional/Required	Mgmt Frames Protected
PMF Optional	PMF Disabled	Mgmt Frames Not Protected
PMF Required	PMF Optional/Required	Mgmt Frames Protected
PMF Required	PMF Disabled	STA refuses Connection
PMF Disabled	PMF Optional/Disabled	Mgmt Frames Not Protected
PMF Disabled	PMF Required	AP refuses Connection

#### API & Usage

ESP32-C3 supports PMF only in Station mode. Station defaults to PMF Optional mode and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the `required` flag in `pmf_cfg` while using the `esp_wifi_set_config()` API. This will result in Station only connecting to a PMF enabled AP and rejecting all other AP's. An example of this configuration is given below.

```
wifi_config_t wifi_config = {
    .sta = {
        .ssid = EXAMPLE_WIFI_SSID,
        .password = EXAMPLE_WIFI_PASSWORD,
```

(continues on next page)

(continued from previous page)

```
.pmf_cfg = {  
    .required = true  
}  
};
```

**Attention:** `capable` flag in `pmf_cfg` is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

### 4.28.3 WPA3-Personal

#### Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
- Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to [Security](#) section of Wi-Fi Alliance's official website for further details.

#### Setting up WPA3 with ESP32-C3

In IDF Menuconfig under Wi-Fi component, a config option "Enable WPA3-Personal" is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32-C3 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to [Protected Management Frames \(PMF\)](#) on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.

## Chapter 5

# Libraries and Frameworks

### 5.1 Cloud Frameworks

ESP32-C3 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

#### 5.1.1 AWS IoT

<https://github.com/espressif/esp-aws-iot> is an open source repository for ESP32-C3 based on Amazon Web Services' `aws-iot-device-sdk-embedded-C`.

#### 5.1.2 Azure IoT

<https://github.com/espressif/esp-azure> is an open source repository for ESP32-C3 based on Microsoft Azure' s `azure-iot-sdk-c` SDK.

#### 5.1.3 Google IoT Core

<https://github.com/espressif/esp-google-iot> is an open source repository for ESP32-C3 based on Google' s `iot-device-sdk-embedded-c` SDK.

#### 5.1.4 Aliyun IoT

<https://github.com/espressif/esp-aliyun> is an open source repository for ESP32-C3 based on Aliyun' s `iotkit-embedded` SDK.

#### 5.1.5 Joylink IoT

<https://github.com/espressif/esp-joylink> is an open source repository for ESP32-C3 based on Joylink' s `joylink_dev_sdk` SDK.

#### 5.1.6 Tencent IoT

<https://github.com/espressif/esp-welink> is an open source repository for ESP32-C3 based on Tencent' s `welink` SDK.

### 5.1.7 Tencentyun IoT

<https://github.com/espressif/esp-qcloud> is an open source repository for ESP32-C3 based on Tencentyun' s `qcloud-iot-sdk-embedded-c` SDK.

### 5.1.8 Baidu IoT

<https://github.com/espressif/esp-baidu-iot> is an open source repository for ESP32-C3 based on Baidu' s `iot-sdk-c` SDK.

# Chapter 6

## Contributions Guide

We welcome contributions to the esp-idf project!

### 6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via [Github Pull Requests](#).

### 6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
- Does any new code conform to the esp-idf *Style Guide*?
- Have you installed the *pre-commit hook* for esp-idf project?
- Does the code documentation follow requirements in *Documenting Code*?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in *examples* readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the *Creating Examples* guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” *squashed into previous commits*?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

### 6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

## 6.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

## 6.5 Related Documents

### 6.5.1 Espressif IoT Development Framework Style Guide

#### About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

#### C Code Formatting

##### Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

**Indentation** Use 4 spaces for each indentation level. Don't use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

**Vertical Space** Place one empty line between functions. Don't begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
}
// INCORRECT, don't place empty line here
// place empty line here
void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

(continues on next page)

(continued from previous page)

```
}
}
```

The maximum line length is 120 characters as long as it doesn't seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```
if (condition) {    // correct
    // ...
}

switch (n) {        // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);        // also okay

int y_cur = -y;                                         // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,    I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,    I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF,  I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK,  I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

## Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{
}
}
```

(continues on next page)

(continued from previous page)

```
// NOT like this:
void function(int arg) {
}

```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}

```

**Comments** Use // for single line comments. For multi-line comments it is okay to use either // on each line or a /\* \*/ block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don't use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources(); // WHY is this thing commented, asks_
    ↪the reader?
    start_timer();
}

```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated_
    ↪yet.
    // load_resources();
    start_timer();
}

```

- Same goes for #if 0 ... #endif blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don't use #if 0 ... #endif or comments to store code snippets which you may need in the future.
- Don't add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}

```

**Line Endings** Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *GitHub has a document about setting this option* <[github-line-endings](#)>. However

because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs ↵
↳dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it's possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code** You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don't re-format the code you didn't change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**Type Definitions** Should be snake\_case, ending with `_t` suffix:

```
typedef int signed_32_bit_t;
```

**Enum** Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

## C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

**File Naming** C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

## Naming

- **Class and struct** names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake\_case.
- **Namespaces** shall be in lower snake\_case.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

**Member Order in Classes** In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

**Spacing**

- Don't indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

**Simple Example**

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

};
```

(continues on next page)

```
template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only
↳initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}

SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

### CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don't put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the [cmake-lint](#) project.

## Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see [EditorConfig Website](#).

## Documenting Code

Please see the guide here: [Documenting Code](#).

## Structure

To be written.

## Language Features

To be written.

## 6.5.2 Install pre-commit Hook for ESP-IDF Project

### Required Dependency

Python 3.6.1 or above. This is our recommendation python version for IDF developers.

If you still have versions not compatible, please do not install pre-commit hook and update your python versions.

### Install pre-commit

```
Run pip install pre-commit
```

### Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you're running `git commit` command

### What's More?

For detailed usage, Please refer to the documentation of [pre-commit](#).

### Common Problems For Windows Users

1. `/usr/bin/env: python: Permission denied.`  
If you're in Git Bash or MSYS terminal, please check the python executable location by run `which python`. If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it's a link to Windows AppStore, not a real one.  
Please install python manually and update this in your `PATH` environment variable.

### 6.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in [espressif/esp-idf](#) repository and how to add new documentation.

#### Introduction

When documenting code for this repository, please follow [Doxygen style](#). You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized [Doxygen Manual](#).

#### Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like [Sphinx](#) and [Breathe](#) to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

```

348
349 /**
350  * @brief disable GPIO wake-up function.
351  * @param gpio_num: GPIO number
352  * @return ESP_OK: success
353  *         ESP_ERR_INVALID_ARG: parameter error
354  */
355 esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num);
356

```

```

esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)

```

disable GPIO wake-up function.

**Return**

ESP\_OK: success ESP\_ERR\_INVALID\_ARG: parameter error

**Parameters**

- `gpio_num` - GPIO number

### Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information on purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

```

41 /**
42  * @brief Set log level for given tag
43  *
44  * If logging for given component has already been enabled, changes previous setting.
45  *
46  * @param tag Tag of the log entries to enable. Must be a non-NULL zero terminated string.
47  *           Value "" resets log level for all tags to the given value.
48  *
49  * @param level Selects log level to enable.
50  *             Only logs at this and lower levels will be shown.
51  */
52 void esp_log_level_set(const char *tag, esp_log_level_t level);

```

do not add data type

white spaces are compressed

a line break that will render

this line break will not render

```

void esp_log_level_set(const char *tag, esp_log_level_t level)

```

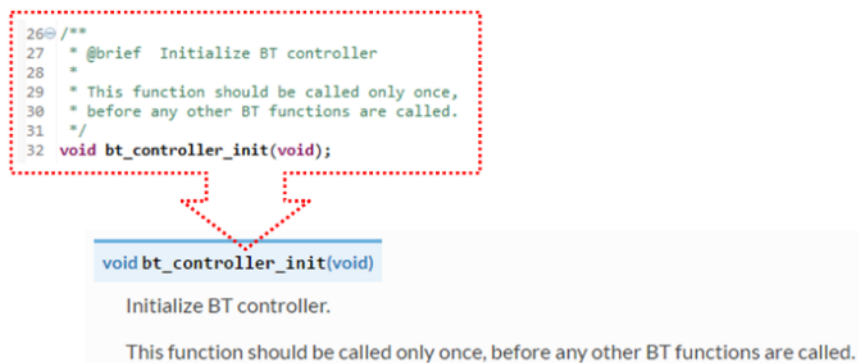

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

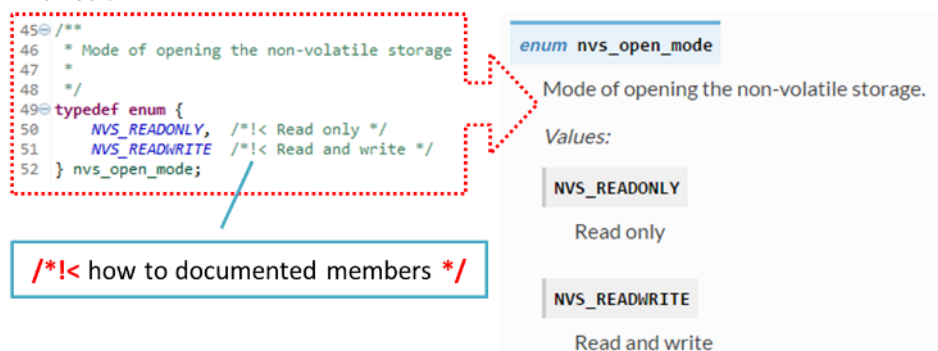

**Parameters**

- `tag` - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "" resets log level for all tags to the given value.
- `level` - Selects log level to enable. Only logs at this and lower levels will be shown.

4. If function has void input or does not return any value, then skip @param or @return

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like @return in example below).

```

*
* @return
* - ESP_OK if erase operation was successful
* - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
* - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
* - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
* - other error codes from the underlying storage driver
*

```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in the same directory in a separate README.rst file. If directory contains header files for different APIs, then the file name should be apiname-readme.rst.

### Go one extra mile

There is couple of tips, how you can make your documentation even better and more useful to the reader.

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```

*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
* @endcode
*

```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```

*
* @attention
* 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
* 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to
↳disconnect.
*

```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using `/**@{ */` and `/**@} */` markup commands:

```

/**@{ */
/**
* @brief common description of similar functions
*
*/
void first_similar_function (void);
void second_similar_function (void);
/**@} */

```

For practical example see [nvs\\_flash/include/nvs.h](#).

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in [driver/include/driver/gpio.h](#).
5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```

*
* [ESP32-C3 Technical Reference Manual] (https://www.espressif.com/sites/default/files/documentation/esp32-c3\_technical\_reference\_manual\_en.pdf)
↳
*

```

---

**Note:** Code snippets, notes, links, etc. will not make it to the documentation, if not enclosed in a comment block associated with one of documented objects.

---

6. Prepare one or more complete code examples together with description. Place description in a separate file `README.md` in specific folder of `examples` directory.

## Linking Examples

When linking to examples on GitHub, do not use absolute/hardcoded URLs. Instead, use docutils custom roles that will generate links for you. These auto-generated links point to the tree or blob for the git commit ID (or tag) of the repository. This is needed to ensure that links do not get broken when files in master branch are moved around or deleted. The roles will transparently handle files that are located in submodules and will link to the submodule's repository with the correct commit ID.

The following roles are provided:

- `:idf:`path`` - points to directory inside ESP-IDF
- `:idf_file:`path`` - points to file inside ESP-IDF
- `:idf_raw:`path`` - points to raw view of the file inside ESP-IDF
- `:component:`path`` - points to directory inside ESP-IDF components dir
- `:component_file:`path`` - points to file inside ESP-IDF components dir
- `:component_raw:`path`` - points to raw view of the file inside ESP-IDF components dir
- `:example:`path`` - points to directory inside ESP-IDF examples dir
- `:example_file:`path`` - points to file inside ESP-IDF examples dir
- `:example_raw:`path`` - points to raw view of the file inside ESP-IDF examples dir

Example implementation:

```
* :example:`get-started/hello_world`  
* :example:`Hello World! <get-started/hello_world>`
```

How it renders:

- [get-started/hello\\_world](#)
- [Hello World!](#)

A check is added to the CI build script, which searches RST files for presence of hard-coded links (identified by `tree/master`, `blob/master`, or `raw/master` part of the URL). This check can be run manually: `cd docs` and then `make gh-linkcheck`.

## Linking Language Versions

Switching between documentation in different languages may be done using `:link_to_translation:` custom role. The role placed on a page of documentation provides a link to the same page in a language specified as a parameter. Examples below show how to enter links to Chinese and English versions of documentation:

```
:link_to_translation:`zh_CN: 中文版`  
:link_to_translation:`en:English`
```

The language is specified using standard abbreviations like `en` or `zh_CN`. The text after last semicolon is not standardized and may be entered depending on the context where the link is placed, e.g.:

```
:link_to_translation:`en:see description in English`
```

## Add Illustrations

Consider adding diagrams and pictures to illustrate described concepts.

Sometimes it is better to add an illustration than writing a lengthy paragraph to describe a complex idea, a data structure or an algorithm. This repository is using [blockdiag](#) suite of tools to generate diagram images from simple text files.

The following types of diagrams are supported:

- [Block diagram](#)
- [Sequence diagram](#)
- [Activity diagram](#)
- [Logical network diagram](#)

With this suite of tools, it is possible to generate beautiful diagram images from simple text format (similar to `graphviz`'s DOT format). The diagram elements are laid out automatically. The diagram code is then converted into “.png” graphics and integrated “behind the scenes” into **Sphinx** documents.

For the diagram preparation, you can use an on-line [interactive shell](#) that instantly shows the rendered image.

Below are couple of diagram examples:

- Simple **block diagram** / `blockdiag` - [Wi-Fi Buffer Configuration](#)
- Slightly more complicated **block diagram** - [Wi-Fi programming model](#)
- **Sequence diagram** / `seqdiag` - [Scan for a Specific AP in All Channels](#)
- **Packet diagram** / `packetdiag` - [NVS Page Structure](#)

Try them out by modifying the source code and see the diagram instantly rendering below.

---

**Note:** There may be slight differences in rendering of font used by the [interactive shell](#) compared to the font used in the `esp-idf` documentation.

---

## Add Notes

Working on a document, you might need to:

- Place some suggestions on what should be added or modified in future.
- Leave a reminder for yourself or somebody else to follow up.

In this case, add a todo note to your reST file using the directive `.. todo::`. For example:

```
.. todo::  
  
    Add a package diagram.
```

If you add `.. todolist::` to a reST file, the directive will be replaced by a list of all todo notes from the whole documentation.

By default, the directives `.. todo::` and `.. todolist::` are ignored by documentation builders. If you want the notes and the list of notes to be visible in your locally built documentation, do the following:

1. Open your local `conf_common.py` file.
2. Find the parameter `todo_include_todos`.
3. Change its value from `False` to `True`.

Before pushing your changes to origin, please set the value of `todo_include_todos` back to `False`.

For more details about the extension, see [sphinx.ext.todo](#) documentation.

## Writing generic documentation for multiple chips

The documentation for all of Espressif's chips is built from the same files. To facilitate the writing of documents that can be re-used for multiple different chips (called below "targets"), we provide you with the following functionality:

**Exclusion of content based on chip-target** Occasionally there will be content that is only relevant for one of targets. When this is the case, you can exclude that content by using the `.. only:: TAG` directive, where you replace 'TAG' with one of the following names:

Chip name:

- `esp32`
- `esp32s2`
- `esp32c3`

Define identifiers from `'sdkconfig.h'`, generated by the default menuconfig settings for the target, e.g:

- `CONFIG_FREERTOS_UNICORE`

Define identifiers from the soc `'*_caps'` headers, e.g:

- `SOC_BT_SUPPORTED`
- `SOC_CAN_SUPPORTED`

Example:

```
.. only:: esp32  
  
    ESP32 specific content.
```

This directive also supports the boolean operators `'and'`, `'or'` and `'not'`. Example:

```
.. only:: SOC_BT_SUPPORTED and CONFIG_FREERTOS_UNICORE  
  
    BT specific content only relevant for single-core targets.
```

This functionality is provided by the [Sphinx selective exclude](#) extension.

A weakness in this extension is that it does not correctly handle the case where you exclude a section, that is directly followed by a labeled new section. In these cases everything will render correctly, but the label will not correctly link to the section that follows. A temporary work-around for the cases where this can't be avoided is the following:

```
.. only:: esp32
    .. _section_1_label:

    Section 1
    ^^^^^^^^^

    Section one content

    .. _section_2_label:
.. only:: not esp32
    .. _section_2_label:

Section 2
^^^^^^^^
Section 2 content
```

The `:TAG:` role is used for excluding content from a table of content tree. For example:

```
.. toctree::
    :maxdepth: 1

    :esp32: configure-wrover
    configure-other-jtag
```

When building the documents, Sphinx will use the above mentioned directive and role to include or exclude content based on the target tag it was called with.

**Note:** If excluding an entire document from the toctree based on targets, it's necessary to also update the `exclude_patterns` list in [docs/conf\\_common.py](#) to exclude the file for other targets, or a Sphinx warning "WARNING: document isn't included in any toctree" will be generated..

The recommended way of doing it is adding the document to one of the list that gets included in `conditional_include_dict` in [docs/conf\\_common.py](#), e.g. a document which should only be shown for BT capable targets should be added to `BT_DOCS`. [docs/idf\\_extensions/exclude\\_docs.py](#) will then take care of adding it to `exclude_patterns` if the corresponding tag is not set.

If you need to exclude content inside a list or bullet points, then this should be done by using the `^ :TAG: ^` role inside the `^ .. list:: ^` directive.

```
.. list::

    :esp32: - ESP32 specific content
    :SOC_BT_SUPPORTED: - BT specific content
    - Common bullet point
    - Also common bullet point
```

**Substitution macros** When you need to refer to the chip's name, toolchain name, path or other common names that depend on the target type you can consider using the substitution macros supplied by [docs/idf\\_extensions/format\\_idf\\_target.py](#).

For example, the following reStructuredText content:

```
This is a {IDF_TARGET_NAME}, with /{IDF_TARGET_PATH_NAME}/soc.c,  
compiled with {IDF_TARGET_TOOLCHAIN_PREFIX}-gcc with CON-  
FIG_{IDF_TARGET_CFG_PREFIX}_MULTI_DOC
```

Would render in the documentation as:

```
This is a ESP32-C3, with /esp32c3/soc.c, compiled with riscv32-esp-elf-gcc with CON-  
FIG_ESP32C3_MULTI_DOC.
```

This extension also supports markup for defining local (within a single source file) substitutions. Place a definition like the following into a single line of the RST file:

```
{IDF_TARGET_SUFFIX:default=" DEFAULT_VALUE" , esp32=" ESP32_VALUE" , esp32s2="  
ESP32S2_VALUE" , esp32c3=" ESP32C3_VALUE" }
```

This will define a target-dependent substitution of the tag {IDF\_TARGET\_SUFFIX} in the current RST file. For example:

```
{IDF_TARGET_TX_PIN:default=" IO3" , esp32=" IO4" , esp32s2=" IO5" , esp32c3=" IO6" }
```

Will define a substitution for the tag {IDF\_TARGET\_TX\_PIN}, which would be replaced by the text IO5 if sphinx was called with the tag esp32s2.

---

**Note:** These single-file definitions can be placed anywhere in the .rst file (on their own line), but the name of the directive must start with `IDF_TARGET_`.

---

## Put it all together

Once documentation is ready, follow instruction in [API Documentation Template](#) and create a single file, that will merge all individual pieces of prepared documentation. Finally add a link to this file to respective `.. toctree::` in `index.rst` file located in `/docs` folder or subfolders.

## OK, but I am new to Sphinx!

1. No worries. All the software you need is well documented. It is also open source and free. Start by checking [Sphinx](#) documentation. If you are not clear how to write using rst markup language, see [reStructuredText Primer](#). You can also use markdown (.md) files, and find out more about the specific markdown syntax that we use on [Recommonmark parser's documentation page](#).
2. Check the source files of this documentation to understand what is behind of what you see now on the screen. Sources are maintained on GitHub in [espressif/esp-idf](#) repository in `docs` folder. You can go directly to the source file of this page by scrolling up and clicking the link in the top right corner. When on GitHub, see what's really inside, open source files by clicking `Raw` button.
3. You will likely want to see how documentation builds and looks like before posting it on the GitHub. There are two options to do so:
  - Install [Sphinx](#), [Breathe](#), [Blockdiag](#) and [Doxygen](#) to build it locally, see chapter below.
  - Set up an account on [Read the Docs](#) and build documentation in the cloud. [Read the Docs](#) provides document building and hosting for free and their service works really quick and great.
4. To preview documentation before building, use [Sublime Text](#) editor together with [OmniMarkupPreviewer](#) plugin.

## Setup for building documentation locally

**Install Dependencies** You can setup environment to build documentation locally on your PC by installing:

1. Doxygen - <http://doxygen.nl/>
2. Sphinx - <https://github.com/sphinx-doc/sphinx/#readme-for-sphinx>
3. Breathe - <https://github.com/michaeljones/breathe#breathe>
4. Document theme "sphinx\_idf\_theme" - [https://github.com/espressif/sphinx\\_idf\\_theme](https://github.com/espressif/sphinx_idf_theme)

5. Custom 404 page “sphinx-notfound-page” - <https://github.com/readthedocs/sphinx-notfound-page>
6. Blockdiag - <http://blockdiag.com/en/index.html>
7. Recommonmark - <https://github.com/rtfd/recommonmark>

The package “sphinx\_idf\_theme” is added to have the same “look and feel” of [ESP-IDF Programming Guide](#).

Do not worry about being confronted with several packages to install. Besides Doxygen, all remaining packages are written in pure Python. Therefore installation of all of them is combined into one simple step.

---

**Important:** Docs building now supports Python 3 only. Python 2 installations will not work.

---

**Doxygen** Installation of Doxygen is OS dependent:

### Linux

```
sudo apt-get install doxygen
```

**Windows** - install in MSYS2 console

```
pacman -S doxygen
```

### MacOS

```
brew install doxygen
```

---

**Note:** If you are installing on Windows MSYS2 system (Linux and MacOS users should skip this note, Windows users who don't use MSYS2 will need to find other alternatives), **before** going further, execute two extra steps below. These steps are required to install dependencies of “blockdiag” discussed under [Add Illustrations](#).

1. Update all the system packages:

```
$ pacman -Syu
```

This process will likely require restarting of the MSYS2 MINGW32 console and repeating above commands, until update is complete.

2. Install *pillow*, that is one of dependences of the *blockdiag*:

```
$ pacman -S mingw32/mingw-w64-i686-python-pillow
```

Check the log on the screen that `mingw-w64-i686-python-pillow-4.3.0-1` or newer is installed. Previous versions of *pillow* will not work.

A downside of Windows installation is that fonts of the *blockdiag pictures* [<add-illustrations>](#) do not render correctly, you will see some random characters instead. Until this issue is fixed, you can use the [interactive shell](#) to see how the complete picture looks like.

---

**Remaining applications** All remaining applications are [Python](#) packages and you can install them in one step as follows:

```
cd ~/esp/esp-idf/docs
pip install --user -r requirements.txt
```

---

**Note:** Installation steps assume that ESP-IDF is placed in `~/esp/esp-idf` directory, that is default location of ESP-IDF used in documentation.

---

## Building Documentation

```
cd ~/esp/esp-idf/docs
```

Now you should be ready to build documentation by invoking:

```
./build_docs.py build
```

This will build docs for all supported ESP-IDF languages & targets. This can take some time, although jobs will run in parallel up to the number of CPU cores you have (can modify this with the `--sphinx-parallel-builds` option, see `./build_docs.py --help` for details).

To build for a single language and target combination only:

```
./build_docs.py -l en -t esp32 build
```

Choices for language (`-l`) are `en` and `zh_CN`. Choices for target (`-t`) are any supported ESP-IDF build system target (for example `esp32` and `esp32s2`).

Build documentation will be placed in `_build/<language>/<target>/html` folder. To see it, open the `index.html` inside this directory in a web browser.

**Building a subset of the documentation** Since building the full documentation can be quite slow, it might be useful to just build just the subset of the documentation you are interested in.

This can be achieved by listing the document you want to build:

```
./build_docs.py -l en -t esp32 -i api-reference/peripherals/can.rst build
```

Building multiple documents is also possible:

```
./build_docs.py -l en -t esp32 -i api-reference/peripherals/can.rst api-reference/  
↳peripherals/adc.rst build
```

As well as wildcards:

```
./build_docs.py -l en -t esp32 -i api-reference/peripherals/* build
```

Note that this is a feature intended to simply testing and debugging during writing of documentation. The HTML output won't be perfect, i.e. it will not build a proper index that lists all the documents, and any references to documents that are not built will result in warnings.

**Building PDF** It is also possible to build latex files and a PDF of the documentation using `build_docs.py`. To do this the following Latex packages are required to be installed:

- `latexmk`
- `texlive-latex-recommended`
- `texlive-fonts-recommended`
- `texlive-xetex`

The following fonts are also required to be installed:

- Freefont Serif, Sans and Mono OpenType fonts, available as the package `fonts-freefont-otf` on Ubuntu
- Lmodern, available as the package `fonts-lmodern` on Ubuntu
- Fandol, can be downloaded from [here](#)

Now you can build the PDF for a target by invoking:

```
./build_docs.py -bs latex -l en -t esp32 build
```

Or alternatively build both html and PDF:

```
./build_docs.py -bs html latex -l en -t esp32 build
```

Latex files and the PDF will be placed in `_build/<language>/<target>/latex` folder.

### Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

## 6.5.4 Documentation Add-ons and Extensions Reference

This documentation is created using [Sphinx](#) application that renders text source files in [reStructuredText](#) (`.rst`) format located in `docs` directory. For some more details on that process, please refer to section [Documenting Code](#).

Besides Sphinx, there are several other applications that help to provide nicely formatted and easy to navigate documentation. These applications are listed in section [Setup for building documentation locally](#) with the installed version numbers provided in file `docs/requirements.txt`.

We build ESP-IDF documentation for two languages (English, Simplified Chinese) and for multiple chips. Therefore we don't run `sphinx` directly, there is a wrapper Python program `build_docs.py` that runs Sphinx.

On top of that, we have created a couple of custom add-ons and extensions to help integrate documentation with underlining [ESP-IDF](#) repository and further improve navigation as well as maintenance of documentation.

The purpose of this section is to provide a quick reference to the add-ons and the extensions.

### Documentation Folder Structure

- The ESP-IDF repository contains a dedicated documentation folder `docs` in the root.
- The `docs` folder contains localized documentation in `docs/en` (English) and `docs/zh_CN` (simplified Chinese) subfolders.
- Graphics files and fonts common to localized documentation are contained in `docs/_static` subfolder.
- Remaining files in the root of `docs` as well as `docs/en` and `docs/zh_CN` provide configuration and scripts used to automate documentation processing including the add-ons and extensions.
- Sphinx extensions are provided in two directories, `extensions` and `idf_extensions`.
- A `_build` directory is created in the `docs` folder by `build_docs.py`. This directory is not added to the [ESP-IDF](#) repository.

### Add-ons and Extensions Reference

#### Config Files

**`docs/conf_common.py`** This file contains configuration common to each localized documentation (e.g. English, Chinese). The contents of this file is imported to standard Sphinx configuration file `conf.py` located in respective language folders (e.g. `docs/en`, `docs/zh_CN`) during build for each language.

**`docs/sphinx-known-warnings.txt`** There are couple of spurious Sphinx warnings that cannot be resolved without doing update to the Sphinx source code itself. For such specific cases, respective warnings are documented in `sphinx-known-warnings.txt` file, that is checked during documentation build, to ignore the spurious warnings.

**Scripts** `docs/build_docs.py`

Top-level executable program which runs a Sphinx build for one or more language/target combinations. Run `build_docs.py --help` for full command line options.

When `build_docs.py` runs Sphinx it sets the `idf_target` configuration variable, sets a Sphinx tag with the same name as the configuration variable, and uses some environment variables to communicate paths to *IDF-Specific Extensions*.

**`docs/check_lang_folder_sync.sh`** To reduce potential discrepancies when maintaining concurrent language version, the structure and filenames of language folders `docs/en` and `docs/zh_CN` folders should be kept identical. The script `check_lang_folder_sync.sh` is run on each documentation build to verify if this condition is met.

---

**Note:** If a new content is provided in e.g. English, and there is no any translation yet, then the corresponding file in `zh_CN` folder should contain an `.. include::` directive pointing to the source file in English. This will automatically include the English version visible to Chinese readers. For example if a file `docs/zh_CN/contribute/documenting-code.rst` does not have a Chinese translation, then it should contain `.. include:: ../../en/contribute/documenting-code.rst` instead.

---

**Non-Docs Scripts** These scripts are used to build docs but also used for other purposes:

**`tools/gen_esp_err_to_name.py`** This script is traversing the ESP-IDF directory structure looking for error codes and messages in source code header files to generate an `.inc` file to include in documentation under *Error Codes Reference*.

**`tools/kconfig_new/configgen.py`** Options to configure ESP-IDF's *components* are contained in `Kconfig` files located inside directories of individual components, e.g. `components/bt/Kconfig`. This script is traversing the component directories to collect configuration options and generate an `.inc` file to include in documentation under *Configuration Options Reference*.

**Generic Extensions** These are Sphinx extensions developed for IDF that don't rely on any IDF-docs-specific behaviour or configuration:

**`docs/extensions/toctree_filter.py`** Sphinx extensions overrides the `:toctree:` directive to allow filtering entries based on whether a tag is set, as `:tagname: toctree_entry`. See the Python file for a more complete description.

**`docs/extensions/list_filter.py`** Sphinx extensions that provides a `.. list::` directive that allows filtering of entries in lists based on whether a tag is set, as `:tagname: - list content`. See the Python file for a more complete description.

**`docs/extensions/html_redirects.py`** During documentation lifetime, some source files are moved between folders or renamed. This Sphinx extension adds a mechanism to redirect documentation pages that have changed URL by generating in the Sphinx output static HTML redirect pages. The script is used together with a redirection list `html_redirect_pages.conf_common.py` builds this list from `docs/page_redirects.txt`.

**Third Party Extensions**

- `sphinxcontrib` extensions for `blockdiag`, `seqdiag`, `actdiag`, `nwdiag`, `rackdiag` & `packetdiag` diagrams.
- `Sphinx selective exclude` `eager_only` extension.

**IDF-Specific Extensions****Build System Integration** `docs/idf_extensions/build_system/`

Python package implementing a Sphinx extension to pull IDF build system information into the docs build.

- Creates a dummy CMake IDF project and runs CMake to generate metadata.
- Registers some new configuration variables and emits a new Sphinx event, both for use by other extensions.

## Configuration Variables

- `docs_root` - The absolute path of the `$IDF_PATH/docs` directory
- `idf_path` - The value of `IDF_PATH` variable, or the absolute path of `IDF_PATH` if environment unset
- `build_dir` - The build directory passed in by `build_docs.py`, default will be like `_build/<lang>/<target>`
- `idf_target` - The `IDF_TARGET` value. Expected that `build_docs.py` set this on the Sphinx command line

**New Event** `idf-info` event is emitted early in the build, after the dummy project CMake run is complete.

Arguments are `(app, project_description)`, where `project_description` is a dict containing the values parsed from `project_description.json` in the CMake build directory.

Other IDF-specific extensions subscribe to this event and use it to set up some docs parameters based on build system info.

## Other Extensions

**docs/idf\_extensions/include\_build\_file.py** The `include-build-file` directive is like the built-in `include-file` directive, but file path is evaluated relative to `build_dir`.

**docs/idf\_extensions/kconfig\_reference.py** Subscribes to `idf-info` event and uses `confgen` to generate `kconfig.inc` from the components included in the default project build. This file is then included into *Project Configuration*.

**docs/idf\_extensions/link\_roles.py** This is an implementation of a custom [Sphinx Roles](#) to help linking from documentation to specific files and folders in ESP-IDF. For description of implemented roles, please see *Linking Examples* and *Linking Language Versions*.

**docs/idf\_extensions/esp\_err\_definitions.py** Small wrapper extension that calls `gen_esp_err_to_name.py` and updates the included `.rst` file if it has changed.

**docs/idf\_extensions/gen\_toolchain\_links.py** There couple of places in documentation that provide links to download the toolchain. To provide one source of this information and reduce effort to manually update several files, this script generates toolchain download links and toolchain unpacking code snippets based on information found in `tools/toolchain_versions.mk`.

**docs/idf\_extensions/gen\_version\_specific\_includes.py** Another extension to automatically generate reStructuredText `.inc` snippets with version-based content for this ESP-IDF version.

**docs/idf\_extensions/util.py** A collection of utility functions useful primarily when building documentation locally (see *Setup for building documentation locally*) to reduce the time to generate documentation on a second and subsequent builds.

**docs/idf\_extensions/format\_idf\_target.py** An extension for replacing generic target related names with the `idf_target` passed to the Sphinx command line. This is a `{IDF_TARGET_NAME}`, with `/{IDF_TARGET_PATH_NAME}/soc.c`, compiled with `{IDF_TARGET_TOOLCHAIN_PREFIX}-gcc` with `CONFIG_{IDF_TARGET_CFG_PREFIX}_MULTI_DOC` will, if the backspaces are removed, render as This is a ESP32-C3, with `/esp32c3/soc.c`, compiled with `riscv32-esp-elf-gcc` with `CONFIG_ESP32C3_MULTI_DOC`. Also supports markup for defining local (single `.rst`-file) substitutions with the following syntax: `{IDF_TARGET_TX_PIN:default=" IO3" ,esp32=" IO4" ,esp32s2=" IO5" }` This will define a replacement of the tag `{IDF_TARGET_TX_PIN}` in the current `.rst`-file. The extension also overrides the default `.. include::` directive in order to format any included content using the same rules.

These replacements cannot be used inside markup that rely on alignment of characters, e.g. tables.

**docs/idf\_extensions/latex\_builder.py** An extension for adding ESP-IDF specific functionality to the latex builder. Overrides the default Sphinx latex builder.

Creates and adds the `espidf.sty` latex package to the output directory, which contains some macros for run-time variables such as IDF-Target.

**docs/idf\_extensions/gen\_defines.py** Sphinx extension to integrate defines from IDF into the Sphinx build, runs after the IDF dummy project has been built.

Parses defines and adds them as sphinx tags.

Emits the new `'idf-defines-generated'` event which has a dictionary of raw text define values that other extensions can use to generate relevant data.

**docs/idf\_extensions/exclude\_docs.py** Sphinx extension that updates the excluded documents according to the conditional\_include\_dict {tag:documents}. If the tag is set, then the list of documents will be included.

Also responsible for excluding documents when building with the config value docs\_to\_build set. In these cases all documents not listed in docs\_to\_build will be excluded.

Subscribes to idf-defines-generated as it relies on the sphinx tags to determine which documents to exclude

**docs/idf\_extensions/run\_doxygen.py** Subscribes to idf-defines-generated event and runs Doxygen (docs/doxygen/Doxyfile\_common) to generate XML files describing key headers, and then runs Breathe to convert these to .inc files which can be included directly into API reference pages.

Pushes a number of target-specific custom environment variables into Doxygen, including all macros defined in the project's default sdkconfig.h file and all macros defined in all soc component xxx\_caps.h headers. This means that public API headers can depend on target-specific configuration options or soc capabilities headers options as #ifdef & #if preprocessor selections in the header.

This means we can generate different Doxygen files, depending on the target we are building docs for.

Please refer to *Documenting Code* and *API Documentation Template*, section **API Reference** for additional details on this process.

## Related Documents

- [Documenting Code](#)

## 6.5.5 Creating Examples

Each ESP-IDF example is a complete project that someone else can copy and adapt the code to solve their own problem. Examples should demonstrate ESP-IDF functionality, while keeping this purpose in mind.

### Structure

- The main directory should contain a source file named (something)\_example\_main.c with the main functionality.
- If the example has additional functionality, split it logically into separate C or C++ source files under main and place a corresponding header file in the same directory.
- If the example has a lot of additional functionality, consider adding a components directory to the example project and make some example-specific components with library functionality. Only do this if the components are specific to the example, if they're generic or common functionality then they should be added to ESP-IDF itself.
- The example should have a README.md file. Use the [template example README](#) and adapt it for your particular example.
- Examples should have an example\_test.py file for running an automated example test. If submitting a GitHub Pull Request which includes an example, it's OK not to include this file initially. The details can be discussed as part of the [Pull Request](#).

### General Guidelines

Example code should follow the *Espressif IoT Development Framework Style Guide*.

### Checklist

Checklist before submitting a new example:

- Example project name (in Makefile and README.md) uses the word "example". Use "example" instead of "demo", "test" or similar words.
- Example does one distinct thing. If the example does more than one thing at a time, split it into two or more examples.
- Example has a README.md file which is similar to the [template example README](#).

- Functions and variables in the example are named according to *naming section of the style guide*. (For non-static names which are only specific to the example's source files, you can use `example` or something similar as a prefix.)
- All code in the example is well structured and commented.
- Any unnecessary code (old debugging logs, commented-out code, etc.) is removed from the example.
- Options in the example (like network names, addresses, etc) are not hard-coded. Use configuration items if possible, or otherwise declare macros or constants)
- Configuration items are provided in a `KConfig.projbuild` file with a menu named "Example Configuration". See existing example projects to see how this is done.
- All original example code has a license header saying it is "in the public domain / CC0", and a warranty disclaimer clause. Alternatively, the example is licensed under Apache License 2.0. See existing examples for headers to adapt from.
- Any adapted or third party example code has the original license header on it. This code must be licensed compatible with Apache License 2.0.

## 6.5.6 API Documentation Template

---

### Note: INSTRUCTIONS

1. Use this file ([docs/en/api-reference/template.rst](#)) as a template to document API.
  2. Change the file name to the name of the header file that represents documented API.
  3. Include respective files with descriptions from the API folder using `..include::`
    - `README.rst`
    - `example.rst`
    - ...
  4. Optionally provide description right in this file.
  5. Once done, remove all instructions like this one and any superfluous headers.
- 

### Overview

---

### Note: INSTRUCTIONS

1. Provide overview where and how this API may be used.
  2. Where applicable include code snippets to illustrate functionality of particular functions.
  3. To distinguish between sections, use the following **heading levels**:
    - `#` with overline, for parts
    - `*` with overline, for chapters
    - `=`, for sections
    - `-`, for subsections
    - `^`, for subsubsections
    - `"`, for paragraphs
- 

### Application Example

---

### Note: INSTRUCTIONS

1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
3. Place example in this folder complete with `README.md` file.
4. Provide overview of demonstrated functionality in `README.md`.
5. With good overview reader should be able to understand what example does without opening the source code.

6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.

## API Reference

### Note: INSTRUCTIONS

1. This repository provides for automatic update of API reference documentation using *code markup retrieved by Doxygen from header files*.
1. Update is done on each documentation build by invoking Sphinx extension `docs/idf_extensions/run_doxygen.py` for all header files listed in the INPUT statement of `docs/doxygen/Doxyfile_common`.
1. Each line of the INPUT statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

1. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.
1. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
1. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see [docs/en/api-reference/network/esp\\_wifi.rst](docs/en/api-reference/network/esp_wifi.rst)

1. Optionally, rather than using `*.inc` files, you may want to describe API in your own way. See <docs/en/api-guides/ulp.rst> for example.

Below is the list of common `.. doxygen...:: directives`:

- Functions - `.. doxygenfunction:: name_of_function`
- Unions - `.. doxygenunion:: name_of_union`
- Structures - `.. doxygenstruct:: name_of_structure together with :members:`
- Macros - `.. doxygendefine:: name_of_define`
- Type Definitions - `.. doxygentypedef:: name_of_type`
- Enumerations - `.. doxygenenum:: name_of_enumeration`

See [Breathe documentation](#) for additional information.

To provide a link to header file, use the *link custom role* as follows:

```
* :component_file:`path_to/header_file.h`
```

1. In any case, to generate API reference, the file `docs/doxygen/Doxyfile_common` should be updated with paths to `*.h` headers that are being documented.
1. When changes are committed and documentation is build, check how this section has been rendered. *Correct annotations* in respective header files, if required.

## 6.5.7 Contributor Agreement

### Individual Contributor Non-Exclusive License Agreement

#### including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ( “We” or “Us” ).

The purpose of this contributor agreement ( “Agreement” ) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at [CONTRIBUTING.rst](#)

**1. DEFINITIONS** “You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“**Contribution**” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at [angus@espressif.com](mailto:angus@espressif.com).

“**Copyright**” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“**Material**” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“**Submit**” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“**Submission Date**” means the date You Submit a Contribution to Us.

“**Documentation**” means any non-software portion of a Contribution.

### 2. LICENSE GRANT 2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

### 3. PATENTS 3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter

acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

### 3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

**4. DISCLAIMER** THE CONTRIBUTION IS PROVIDED “AS IS” . MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

**5. Consequential Damage Waiver** TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

**6. Approximation of Disclaimer and Damage Waiver** IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

**7. Term** 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

**8. Miscellaneous** 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

# Chapter 7

## ESP-IDF Versions

The ESP-IDF GitHub repository is updated regularly, especially the master branch where new development takes place.

For production use, there are also stable releases available.

### 7.1 Releases

The documentation for the current stable release version can always be found at this URL:

<https://docs.espressif.com/projects/esp-idf/en/stable/>

Documentation for the latest version (master branch) can always be found at this URL:

<https://docs.espressif.com/projects/esp-idf/en/latest/>

The full history of releases can be found on the GitHub repository [Releases page](#). There you can find release notes, links to each version of the documentation, and instructions for obtaining each version.

### 7.2 Which Version Should I Start With?

- For production purposes, use the [current stable version](#). Stable versions have been manually tested, and are updated with “bugfix releases” which fix bugs without changing other functionality (see [Versioning Scheme](#) for more details). Every stable release version can be found on the [Releases page](#).
- For prototyping, experimentation or for developing new ESP-IDF features, use the [latest version \(master branch in Git\)](#). The latest version in the master branch has all the latest features and has passed automated testing, but has not been completely manually tested ( “bleeding edge” ).
- If a required feature is not yet available in a stable release, but you do not want to use the master branch, it is possible to check out a pre-release version or a release branch. It is recommended to start from a stable version and then follow the instructions for [Updating to a Pre-Release Version](#) or [Updating to a Release Branch](#).

See [Updating ESP-IDF](#) if you already have a local copy of ESP-IDF and wish to update it.

### 7.3 Versioning Scheme

ESP-IDF uses [Semantic Versioning](#). This means that:

- Major Releases, like `v3.0`, add new functionality and may change functionality. This includes removing deprecated functionality.

If updating to a new major release (for example, from v2.1 to v3.0), some of your project's code may need updating and functionality may need to be re-tested. The release notes on the [Releases page](#) include lists of Breaking Changes to refer to.

- Minor Releases like v3.1 add new functionality and fix bugs but will not change or remove documented functionality, or make incompatible changes to public APIs.

If updating to a new minor release (for example, from v3.0 to v3.1), your project's code does not require updating, but you should re-test your project. Pay particular attention to the items mentioned in the release notes on the [Releases page](#).

- Bugfix Releases like v3.0.1 only fix bugs and do not add new functionality.

If updating to a new bugfix release (for example, from v3.0 to v3.0.1), you do not need to change any code in your project, and you only need to re-test the functionality directly related to bugs listed in the release notes on the [Releases page](#).

## 7.4 Support Periods

Each ESP-IDF major and minor release version has an associated support period. After this period, the release is End of Life and no longer supported.

The [ESP-IDF Support Period Policy](#) explains this in detail, and describes how the support periods for each release are determined.

Each release on the [Releases page](#) includes information about the support period for that particular release.

As a general guideline:

- If starting a new project, use the latest stable release.
- If you have a GitHub account, click the “Watch” button in the top-right of the [Releases page](#) and choose “Releases only”. GitHub will notify you whenever a new release is available. Whenever a bug fix release is available for the version you are using, plan to update to it.
- If possible, periodically update the project to a new major or minor ESP-IDF version (for example, once a year.) The update process should be straightforward for Minor updates, but may require some planning and checking of the release notes for Major updates.
- Always plan to update to a newer release before the release you are using becomes End of Life.

Each ESP-IDF major and minor release (V4.1, V4.2, etc) is supported for 30 months after the initial stable release date.

Supported means that the ESP-IDF team will continue to apply bug fixes, security fixes, etc to the release branch on GitHub, and periodically make new bugfix releases as needed.

Support period is divided into “Service” and “Maintenance” period:

Period	Duration	Recommended for new projects?
Service	12 months	Yes
Maintenance	18 months	No

During the Service period, bugfixes releases are more frequent. In some cases, support for new features may be added during the Service period (this is reserved for features which are needed to meet particular regulatory requirements or standards for new products, and which carry a very low risk of introducing regressions.)

During the Maintenance period, the version is still supported but only bugfixes for high severity issues or security issues will be applied.

Using an “In Service” version is recommended when starting a new project.

Users are encouraged to upgrade all projects to a newer ESP-IDF release before the support period finishes and the release becomes End of Life (EOL). It is our policy to not continue fixing bugs in End of Life releases.

Pre-release versions (betas, previews, *-rc* and *-dev* versions, etc) are not covered by any support period. Sometimes a particular feature is marked as “Preview” in a release, which means it is also not covered by the support period.

The ESP-IDF Programming Guide has information about the [different versions of ESP-IDF](#) (major, minor, bugfix, etc).

## 7.5 Checking the Current Version

The local ESP-IDF version can be checked by using `idf.py`:

```
idf.py --version
```

The ESP-IDF version is also compiled into the firmware and can be accessed (as a string) via the macro `IDF_VER`. The default ESP-IDF bootloader will print the version on boot (the version information is not always updated if the code in the GitHub repo is updated, it only changes if there is a clean build or if that particular source file is recompiled).

If writing code that needs to support multiple ESP-IDF versions, the version can be checked at compile time using [compile-time macros](#).

Examples of ESP-IDF versions:

Version String	Meaning
v3.2-dev-306-gbeb3611ca	<p>Master branch pre-release.</p> <ul style="list-style-type: none"> <li>- v3.2-dev - in development for version 3.2.</li> <li>- 306 - number of commits after v3.2 development started.</li> <li>- beb3611ca - commit identifier.</li> </ul>
v3.0.2	<p>Stable release, tagged v3.0.2.</p>
v3.1-beta1-75-g346d6b0ea	<p>Beta version in development (on a <i>release branch</i>).</p> <ul style="list-style-type: none"> <li>- v3.1-beta1 - pre-release tag.</li> <li>- 75 - number of commits after the pre-release beta tag was assigned.</li> <li>- 346d6b0ea - commit identifier.</li> </ul>
v3.0.1-dirty	<p>Stable release, tagged v3.0.1.</p> <ul style="list-style-type: none"> <li>- dirty means that there are modifications in the local ESP-IDF directory.</li> </ul>

## 7.6 Git Workflow

The development (Git) workflow of the Espressif ESP-IDF team is as follows:

- New work is always added on the master branch (latest version) first. The ESP-IDF version on `master` is always tagged with `-dev` (for “in development”), for example `v3.1-dev`.
- Changes are first added to an internal Git repository for code review and testing but are pushed to GitHub after automated testing passes.
- When a new version (developed on `master`) becomes feature complete and “beta” quality, a new branch is made for the release, for example `release/v3.1`. A pre-release tag is also created, for example `v3.1-beta1`. You can see a full [list of branches](#) and a [list of tags](#) on GitHub. Beta pre-releases have release notes which may include a significant number of Known Issues.
- As testing of the beta version progresses, bug fixes will be added to both the `master` branch and the release branch. New features for the next release may start being added to `master` at the same time.
- Once testing is nearly complete a new release candidate is tagged on the release branch, for example `v3.1-rc1`. This is still a pre-release version.
- If no more significant bugs are found or reported, then the final Major or Minor Version is tagged, for example `v3.1`. This version appears on the [Releases page](#).
- As bugs are reported in released versions, the fixes will continue to be committed to the same release branch.
- Regular bugfix releases are made from the same release branch. After manual testing is complete, a bugfix release is tagged (i.e. `v3.1.1`) and appears on the [Releases page](#).

## 7.7 Updating ESP-IDF

Updating ESP-IDF depends on which version(s) you wish to follow:

- [Updating to Stable Release](#) is recommended for production use.

- [Updating to Master Branch](#) is recommended for the latest features, development use, and testing.
- [Updating to a Release Branch](#) is a compromise between the first two.

---

**Note:** These guides assume that you already have a local copy of ESP-IDF cloned. To get one, check Step 2 in the [Getting Started](#) guide for any ESP-IDF version.

---

### 7.7.1 Updating to Stable Release

To update to a new ESP-IDF release (recommended for production use), this is the process to follow:

- Check the [Releases page](#) regularly for new releases.
- When a bugfix release for the version you are using is released (for example, if using v3.0.1 and v3.0.2 is released), check out the new bugfix version into the existing ESP-IDF directory:

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- When major or minor updates are released, check the Release Notes on the releases page and decide if you want to update or to stay with your current release. Updating is via the same Git commands shown above.

---

**Note:** If you installed the stable release via zip file instead of using git, it might not be possible to update versions using the commands. In this case, update by downloading a new zip file and replacing the entire `IDF_PATH` directory with its contents.

---

### 7.7.2 Updating to a Pre-Release Version

It is also possible to `git checkout` a tag corresponding to a pre-release version or release candidate, the process is the same as [Updating to Stable Release](#).

Pre-release tags are not always found on the [Releases page](#). Consult the [list of tags](#) on GitHub for a full list. Caveats for using a pre-release are similar to [Updating to a Release Branch](#).

### 7.7.3 Updating to Master Branch

---

**Note:** Using Master branch means living “on the bleeding edge” with the latest ESP-IDF code.

---

To use the latest version on the ESP-IDF master branch, this is the process to follow:

- Check out the master branch locally:

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- Periodically, re-run `git pull` to pull the latest version of master. Note that you may need to change your project or report bugs after updating your master branch.
- To switch from master to a release branch or stable version, run `git checkout` as shown in the other sections.

---

**Important:** It is strongly recommended to regularly run `git pull` and then `git submodule update --init --recursive` so a local copy of master does not get too old. Arbitrary old master branch revisions are effectively unsupported “snapshots” that may have undocumented bugs. For a semi-stable version, try [Updating to a Release Branch](#) instead.

---

## 7.7.4 Updating to a Release Branch

In terms of stability, using a release branch is part-way between using the master branch and only using stable releases. A release branch is always beta quality or better, and receives bug fixes before they appear in each stable release.

You can find a [list of branches](#) on GitHub.

For example, to follow the branch for ESP-IDF v3.1, including any bugfixes for future releases like v3.1.1, etc:

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

Each time you `git pull` this branch, ESP-IDF will be updated with fixes for this release.

---

**Note:** There is no dedicated documentation for release branches. It is recommended to use the documentation for the closest version to the branch which is currently checked out.

---

## Chapter 8

# Resources

### 8.1 PlatformIO

- [What is PlatformIO?](#)
- [Installation](#)
- [Configuration](#)
- [Tutorials](#)
- [Project Examples](#)
- [Next Steps](#)

#### 8.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in [the official PlatformIO repositories](#).

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in [the official PlatformIO documentation](#).

#### 8.1.2 Installation

- [PlatformIO IDE](#) is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
- [PlatformIO Core \(CLI\)](#) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

### 8.1.3 Configuration

Please go through [the official PlatformIO configuration guide](#) for ESP-IDF.

### 8.1.4 Tutorials

- [ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis](#)

### 8.1.5 Project Examples

Please check ESP-IDF page in [the official PlatformIO documentation](#)

### 8.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about [integrations with other IDEs/Text Editors](#)
- Get help from [PlatformIO community](#)

## 8.2 Useful Links

- The [esp32.com forum](#) is a place to ask questions and find community resources.
- Check the [Issues](#) section on GitHub if you find a bug or have a feature request. Please check existing [Issues](#) before opening a new one.
- A comprehensive collection of [solutions](#), [practical applications](#), [components and drivers](#) based on ESP-IDF is available in [ESP IoT Solution](#) repository. In most of cases descriptions are provided both in English and in 中文.
- To develop applications using Arduino platform, refer to [Arduino core for ESP32 WiFi chip](#).
- Several [books](#) have been written about ESP32 and they are listed on [Espressif](#) web site.
- If you' re interested in contributing to ESP-IDF, please check the [Contributions Guide](#).
- For additional ESP32-C3 product related information, please refer to [documentation](#) section of [Espressif](#) site.
- [Download](#) latest and previous versions of this documentation in PDF and HTML format.

# Chapter 9

## Copyrights and Licenses

### 9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

#### 9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- [Newlib](#) is licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- [Xtensa header files](#) are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of [FreeRTOS](#) (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in [license.txt](#).
- Original parts of [LWIP](#) (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in [COPYING file](#).
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [FreeBSD net80211](#) Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- [JSMN](#) JSON Parser (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- [argtable3](#) argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license.
- [linenoise](#) line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- [libcoap](#) COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in [LICENSE file](#) and [COPYING file](#) .
- [libexpat](#) XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in [COPYING file](#) .
- [FatFS](#) library, Copyright (C) 2017 ChaN, is licensed under [a BSD-style license](#) .
- [cJSON](#) library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in [LICENSE file](#) .
- [libsodium](#) library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in [LICENSE file](#) .
- [micro-ecc](#) library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.

- [nghttp2](#) library, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in [COPYING file](#) .
- [Mbed TLS](#) library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in [LICENSE file](#) .
- [SPIFFS](#) library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in [LICENSE file](#) .
- [TinyCBOR](#) library, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in [LICENSE file](#) .
- [SD/MMC driver](#) is derived from [OpenBSD SD/MMC driver](#), Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- [Asio](#) , Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in [COPYING file](#).
- [ESP-MQTT](#) MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2,0 as described in [LICENSE file](#) .
- [BLE Mesh](#) is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
- [mynewt-nimble](#) Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in [LICENSE file](#).
- [cryptoauthlib](#) Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in [LICENSE file](#)
- `:component_file:`TLSF allocator <heap/heap_tlsf.c>` Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.`
- [qrcode](#) QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.
- [freemodbus](#) Copyright (c) 2006-2013 Christian Walter, Armink and licensed under the BSD license.

### 9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- [esptool.py](#) is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in [LICENSE file](#).
- [KConfig](#) is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

### 9.1.3 Documentation

- HTML version of the [ESP-IDF Programming Guide](#) uses the Sphinx theme [sphinx\\_idf\\_theme](#), which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on [sphinx\\_rtd\\_theme](#). Both are licensed under MIT license.

## 9.2 ROM Source Code Copyrights

ESP32 mask ROM hardware includes binaries compiled from portions of the following third party software:

- [Newlib](#) , licensed under the BSD License and is Copyright of various parties, as described in [COPYING.NEWLIB](#).
- Xtensa libhal, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- [TinyBasic](#) Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- [miniz](#), by Rich Geldreich - placed into the public domain.
- [wpa\\_supplicant](#) Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- [TJpgDec](#) Copyright (C) 2011, ChaN, all right reserved. See below for license.

### 9.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 9.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software” ), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

# Chapter 10

## About

This is documentation of [ESP-IDF](#), the framework to develop applications for ESP32-C3.

The ESP32-C3 is a 2.4 GHz Wi-Fi Bluetooth Low Energy combo, which integrates a 32-bit RISC-V RV32IMC single-core processor.

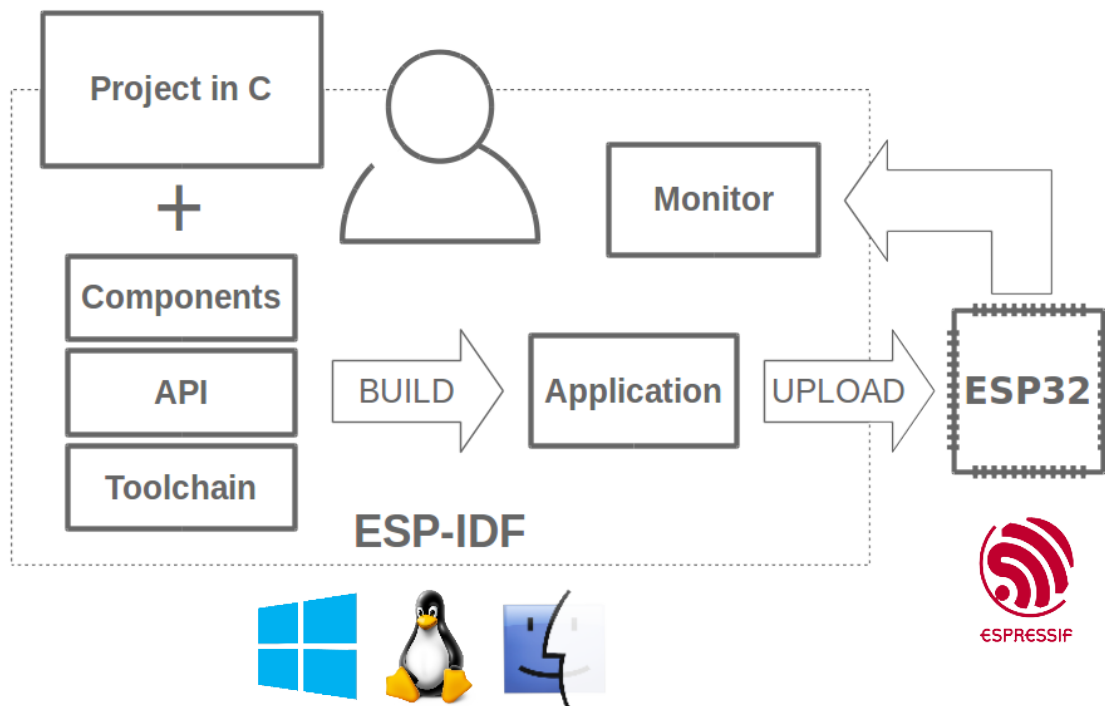

Fig. 1: Espressif IoT Integrated Development Framework

The ESP-IDF, Espressif IoT Development Framework, provides toolchain, API, components and workflows to develop applications for ESP32-C3 using Windows, Linux and Mac OS operating systems.

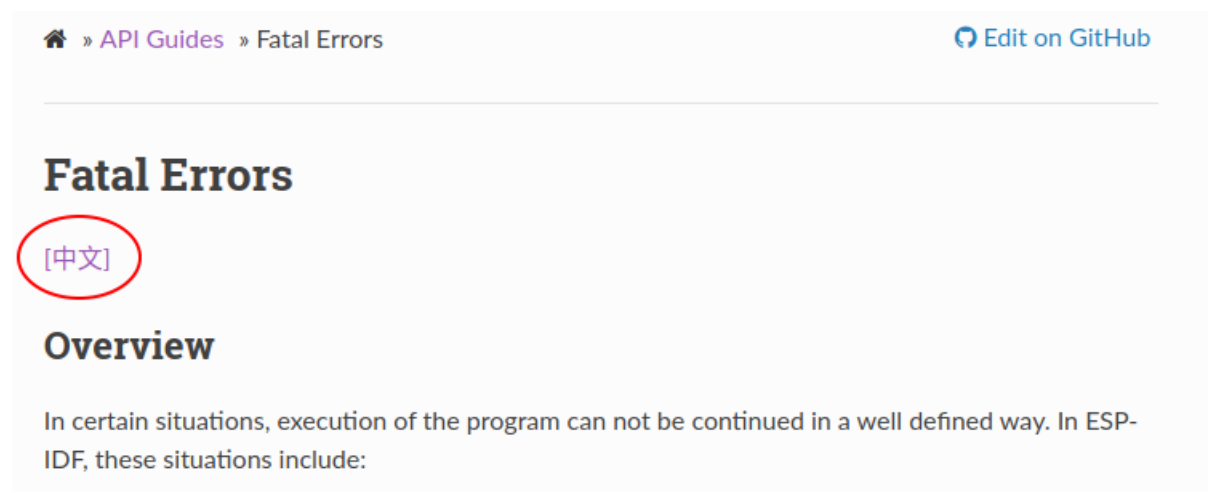

## Chapter 11

# Switch Between Languages

The ESP-IDF Programming Guide is now available in two languages. Please refer to the English version if there is any discrepancy.

- English
- Chinese

You can easily change from one language to another by clicking the language link you can find at the top of every document that has a translation.

The screenshot shows a breadcrumb trail: [Home](#) » [API Guides](#) » [Fatal Errors](#). On the right, there is a link [Edit on GitHub](#). Below the breadcrumb, the title **Fatal Errors** is displayed. A link [\[中文\]](#) is circled in red, indicating the Chinese language option. Below the title, the section **Overview** is shown, followed by the text: "In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:"
