

# ESP32-C3

## ESP-IDF Programming Guide

Release v4.3.5  
Espressif Systems  
Mar 22, 2023

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.3 Development Board Overviews	4
1.3.1 ESP32-C3-DevKitM-1	4
1.3.2 ESP32-C3-DevKitC-02	9
1.4 Installation Step by Step	13
1.4.1 Setting up Development Environment	13
1.4.2 Creating Your First Project	13
1.5 Step 1. Install prerequisites	14
1.5.1 Standard Setup of Toolchain for Windows	14
1.5.2 Standard Setup of Toolchain for Linux	19
1.5.3 Standard Setup of Toolchain for macOS	20
1.6 Step 2. Get ESP-IDF	21
1.6.1 Linux and macOS	21
1.6.2 Windows	21
1.7 Step 3. Set up the tools	22
1.7.1 Windows	22
1.7.2 Linux and macOS	22
1.7.3 Alternative File Downloads	22
1.7.4 Customizing the tools installation path	23
1.8 Step 4. Set up the environment variables	23
1.8.1 Windows	23
1.8.2 Linux and macOS	23
1.9 Step 5. Start a Project	24
1.9.1 Linux and macOS	24
1.9.2 Windows	24
1.10 Step 6. Connect Your Device	24
1.11 Step 7. Configure	25
1.11.1 Linux and macOS	25
1.11.2 Windows	25
1.12 Step 8. Build the Project	26
1.13 Step 9. Flash onto the Device	26
1.13.1 Encountered Issues While Flashing?	26
1.13.2 Normal Operation	27
1.14 Step 10. Monitor	28
1.15 Updating ESP-IDF	29
1.16 Related Documents	29
1.16.1 Establish Serial Connection with ESP32-C3	29
1.16.2 Build and Flash with Eclipse IDE	35
1.16.3 Getting Started with VS Code IDE	36
1.16.4 IDF Monitor	36
1.16.5 Customized Setup of Toolchain	41
<b>2 API Reference</b>	<b>47</b>

2.1	Bluetooth API	47
2.1.1	Controller && VHCI	47
2.1.2	BT COMMON	54
2.1.3	BT LE	60
2.1.4	NimBLE-based host APIs	153
2.1.5	ESP-BLE-MESH	156
2.2	Networking APIs	368
2.2.1	Wi-Fi	368
2.2.2	Ethernet	452
2.2.3	IP Network Layer	473
2.2.4	Application Layer	489
2.3	Peripherals API	489
2.3.1	Analog to Digital Converter	489
2.3.2	General Purpose Timer	507
2.3.3	GPIO & RTC GPIO	516
2.3.4	HMAC	529
2.3.5	Digital Signature	533
2.3.6	I2C Driver	537
2.3.7	I2S	551
2.3.8	LED Control	561
2.3.9	RMT	574
2.3.10	SD SPI Host Driver	592
2.3.11	Sigma-delta Modulation	596
2.3.12	SPI Master Driver	599
2.3.13	SPI Slave Driver	615
2.3.14	TWAI	621
2.3.15	UART	636
2.4	Application Protocols	657
2.4.1	ASIO port	657
2.4.2	ESP-MQTT	658
2.4.3	ESP-TLS	669
2.4.4	ESP HTTP Client	682
2.4.5	HTTP Server	695
2.4.6	HTTPS server	716
2.4.7	ICMP Echo	719
2.4.8	ESP Local Control	723
2.4.9	mDNS Service	731
2.4.10	ESP-Modbus	740
2.4.11	ESP WebSocket Client	745
2.4.12	ESP Serial Slave Link	752
2.4.13	ESP x509 Certificate Bundle	765
2.4.14	IP Network Layer	767
2.5	Provisioning API	767
2.5.1	Protocol Communication	767
2.5.2	Unified Provisioning	777
2.5.3	Wi-Fi Provisioning	782
2.6	Storage API	797
2.6.1	FAT Filesystem Support	797
2.6.2	Manufacturing Utility	802
2.6.3	Non-volatile storage library	806
2.6.4	NVS Partition Generator Utility	826
2.6.5	SD/SDIO/MMC Driver	833
2.6.6	SPI Flash API	841
2.6.7	SPIFFS Filesystem	864
2.6.8	Virtual filesystem component	867
2.6.9	Wear Levelling API	879
2.7	System API	883
2.7.1	App Image Format	883

2.7.2	Application Level Tracing	888
2.7.3	The Async memcpy API	892
2.7.4	Chip Revision	895
2.7.5	Console	898
2.7.6	eFuse Manager	905
2.7.7	Error Codes and Helper Functions	924
2.7.8	ESP HTTPS OTA	926
2.7.9	ESP-pthread	929
2.7.10	Event Loop Library	932
2.7.11	FreeRTOS	948
2.7.12	FreeRTOS Additions	1041
2.7.13	Heap Memory Allocation	1057
2.7.14	Heap Memory Debugging	1069
2.7.15	High Resolution Timer	1079
2.7.16	Call function with external stack	1083
2.7.17	Interrupt allocation	1084
2.7.18	Logging library	1089
2.7.19	Miscellaneous System APIs	1095
2.7.20	Over The Air Updates (OTA)	1102
2.7.21	Power Management	1112
2.7.22	Sleep Modes	1117
2.7.23	Watchdogs	1125
2.7.24	System Time	1128
2.7.25	Internal and Unstable APIs	1132
2.8	Project Configuration	1132
2.8.1	Introduction	1132
2.8.2	Project Configuration Menu	1133
2.8.3	Using sdkconfig.defaults	1133
2.8.4	Kconfig Formatting Rules	1133
2.8.5	Backward Compatibility of Kconfig Options	1134
2.8.6	Configuration Options Reference	1134
2.8.7	Customisations	1359
2.9	Error Codes Reference	1359
<b>3</b>	<b>ESP32-C3 Hardware Reference</b>	<b>1365</b>
3.1	ESP32-C3 Modules and Boards	1365
3.1.1	Related Documents	1365
3.2	Previous Versions of ESP32-C3 Modules and Boards	1365
3.2.1	Related Documents	1365
3.3	Chip Series Comparison	1365
3.3.1	Related Documents	1368
<b>4</b>	<b>API Guides</b>	<b>1369</b>
4.1	Application Level Tracing library	1369
4.1.1	Overview	1369
4.1.2	Modes of Operation	1369
4.1.3	Configuration Options and Dependencies	1370
4.1.4	How to use this library	1371
4.2	Application Startup Flow	1379
4.2.1	First stage bootloader	1379
4.2.2	Second stage bootloader	1380
4.2.3	Application startup	1380
4.3	BluFi	1381
4.3.1	Overview	1382
4.3.2	The BluFi Flow	1382
4.3.3	The flow chart of BluFi	1382
4.3.4	The Frame Formats Defined in BluFi	1382
4.3.5	The Security Implementation of ESP32-C3	1387

4.3.6	GATT Related Instructions	1388
4.4	Bootloader	1388
4.4.1	Bootloader compatibility	1389
4.4.2	Factory reset	1389
4.4.3	Boot from test app partition	1390
4.4.4	Fast boot from Deep Sleep	1390
4.4.5	Custom bootloader	1390
4.5	Build System	1390
4.5.1	Overview	1391
4.5.2	Using the Build System	1391
4.5.3	Example Project	1395
4.5.4	Project CMakeLists File	1396
4.5.5	Component CMakeLists Files	1397
4.5.6	Component Configuration	1399
4.5.7	Preprocessor Definitions	1399
4.5.8	Component Requirements	1399
4.5.9	Overriding Parts of the Project	1402
4.5.10	Configuration-Only Components	1403
4.5.11	Debugging CMake	1403
4.5.12	Example Component CMakeLists	1404
4.5.13	Custom sdkconfig defaults	1408
4.5.14	Flash arguments	1408
4.5.15	Building the Bootloader	1408
4.5.16	Selecting the Target	1409
4.5.17	Writing Pure CMake Components	1409
4.5.18	Using Third-Party CMake Projects with Components	1410
4.5.19	Using Prebuilt Libraries with Components	1410
4.5.20	Using ESP-IDF in Custom CMake Projects	1411
4.5.21	ESP-IDF CMake Build System API	1411
4.5.22	File Globbing & Incremental Builds	1415
4.5.23	Build System Metadata	1416
4.5.24	Build System Internals	1416
4.5.25	Migrating from ESP-IDF GNU Make System	1418
4.6	Deep Sleep Wake Stubs	1420
4.6.1	Rules for Wake Stubs	1420
4.6.2	Implementing A Stub	1420
4.6.3	Loading Code Into RTC Memory	1420
4.6.4	Loading Data Into RTC Memory	1421
4.6.5	CRC Check For Wake Stubs	1421
4.7	Error Handling	1421
4.7.1	Overview	1421
4.7.2	Error codes	1422
4.7.3	Converting error codes to error messages	1422
4.7.4	ESP_ERROR_CHECK macro	1422
4.7.5	Error handling patterns	1423
4.7.6	C++ Exceptions	1423
4.8	ESP-BLE-MESH	1424
4.8.1	Getting Started with ESP-BLE-MESH	1424
4.8.2	ESP-BLE-MESH Examples	1430
4.8.3	ESP-BLE-MESH Demo Videos	1432
4.8.4	ESP-BLE-MESH FAQ	1432
4.8.5	Related Documents	1432
4.9	ESP-MESH	1461
4.9.1	Overview	1461
4.9.2	Introduction	1461
4.9.3	ESP-MESH Concepts	1462
4.9.4	Building a Network	1468
4.9.5	Managing a Network	1473

4.9.6	Data Transmission	1476
4.9.7	Channel Switching	1478
4.9.8	Performance	1481
4.9.9	Further Notes	1482
4.10	Core Dump	1482
4.10.1	Overview	1482
4.10.2	Configurations	1482
4.10.3	Save core dump to flash	1483
4.10.4	Print core dump to UART	1483
4.10.5	ROM Functions in Backtraces	1484
4.10.6	Dumping variables on demand	1484
4.10.7	Running <code>espcoredump.py</code>	1484
4.11	Event Handling	1485
4.11.1	Wi-Fi, Ethernet, and IP Events	1485
4.11.2	Mesh Events	1487
4.11.3	Bluetooth Events	1487
4.12	Fatal Errors	1487
4.12.1	Overview	1487
4.12.2	Panic Handler	1487
4.12.3	Register Dump and Backtrace	1488
4.12.4	GDB Stub	1490
4.12.5	Guru Meditation Errors	1491
4.12.6	Other Fatal Errors	1492
4.13	Flash Encryption	1493
4.13.1	Introduction	1493
4.13.2	Relevant eFuses	1493
4.13.3	Flash Encryption Process	1494
4.13.4	Flash Encryption Configuration	1495
4.13.5	Possible Failures	1500
4.13.6	ESP32-C3 Flash Encryption Status	1501
4.13.7	Reading and Writing Data in Encrypted Flash	1502
4.13.8	Updating Encrypted Flash	1503
4.13.9	Disabling Flash Encryption	1503
4.13.10	Key Points About Flash Encryption	1503
4.13.11	Limitations of Flash Encryption	1504
4.13.12	Flash Encryption and Secure Boot	1504
4.13.13	Advanced Features	1504
4.13.14	Technical Details	1505
4.14	ESP-IDF FreeRTOS SMP Changes	1505
4.14.1	Overview	1505
4.14.2	Tasks and Task Creation	1506
4.14.3	Scheduling	1506
4.14.4	Critical Sections & Disabling Interrupts	1509
4.14.5	Task Deletion	1509
4.14.6	Thread Local Storage Pointers & Deletion Callbacks	1509
4.14.7	Configuring ESP-IDF FreeRTOS	1510
4.15	Hardware Abstraction	1510
4.15.1	Architecture	1511
4.15.2	LL (Low Level) Layer	1511
4.15.3	HAL (Hardware Abstraction Layer)	1512
4.16	JTAG Debugging	1513
4.16.1	Introduction	1513
4.16.2	How it Works?	1514
4.16.3	Selecting JTAG Adapter	1515
4.16.4	Setup of OpenOCD	1515
4.16.5	Configuring ESP32-C3 Target	1516
4.16.6	Launching Debugger	1518
4.16.7	Debugging Examples	1518

4.16.8	Building OpenOCD from Sources . . . . .	1518
4.16.9	Tips and Quirks . . . . .	1523
4.16.10	Related Documents . . . . .	1527
4.17	Linker Script Generation . . . . .	1552
4.17.1	Overview . . . . .	1552
4.17.2	Quick Start . . . . .	1552
4.17.3	Linker Script Generation Internals . . . . .	1555
4.18	Memory Types . . . . .	1561
4.18.1	DRAM (Data RAM) . . . . .	1561
4.18.2	IRAM (Instruction RAM) . . . . .	1561
4.18.3	IROM (code executed from Flash) . . . . .	1562
4.18.4	RTC fast memory . . . . .	1562
4.18.5	DROM (data stored in Flash) . . . . .	1563
4.18.6	DMA Capable Requirement . . . . .	1563
4.18.7	DMA Buffer in the stack . . . . .	1563
4.19	lwIP . . . . .	1564
4.19.1	Supported APIs . . . . .	1564
4.19.2	BSD Sockets API . . . . .	1564
4.19.3	Netconn API . . . . .	1568
4.19.4	lwIP FreeRTOS Task . . . . .	1568
4.19.5	esp-lwip custom modifications . . . . .	1569
4.19.6	Performance Optimization . . . . .	1570
4.20	Partition Tables . . . . .	1571
4.20.1	Overview . . . . .	1571
4.20.2	Built-in Partition Tables . . . . .	1571
4.20.3	Creating Custom Tables . . . . .	1572
4.20.4	Generating Binary Partition Table . . . . .	1574
4.20.5	Flashing the partition table . . . . .	1574
4.20.6	Partition Tool (parttool.py) . . . . .	1575
4.21	RF calibration . . . . .	1576
4.21.1	Partial calibration . . . . .	1576
4.21.2	Full calibration . . . . .	1576
4.21.3	No calibration . . . . .	1577
4.21.4	PHY initialization data . . . . .	1577
4.22	Secure Boot V2 . . . . .	1577
4.22.1	Background . . . . .	1577
4.22.2	Advantages . . . . .	1578
4.22.3	Secure Boot V2 Process . . . . .	1578
4.22.4	Signature Block Format . . . . .	1578
4.22.5	Verifying the signature Block . . . . .	1579
4.22.6	Bootloader Size . . . . .	1579
4.22.7	eFuse usage . . . . .	1579
4.22.8	How To Enable Secure Boot V2 . . . . .	1579
4.22.9	Restrictions after Secure Boot is enabled . . . . .	1580
4.22.10	Generating Secure Boot Signing Key . . . . .	1581
4.22.11	Remote Signing of Images . . . . .	1581
4.22.12	Secure Boot Best Practices . . . . .	1581
4.22.13	Key Management . . . . .	1581
4.22.14	Multiple Keys . . . . .	1582
4.22.15	Key Revocation . . . . .	1582
4.22.16	Technical Details . . . . .	1582
4.22.17	Secure Boot & Flash Encryption . . . . .	1583
4.22.18	Signed App Verification Without Hardware Secure Boot . . . . .	1583
4.22.19	Advanced Features . . . . .	1584
4.23	Thread Local Storage . . . . .	1584
4.23.1	Overview . . . . .	1584
4.23.2	FreeRTOS Native API . . . . .	1584
4.23.3	Pthread API . . . . .	1584

4.23.4	C11 Standard	1585
4.24	Tools	1585
4.24.1	Downloadable Tools	1585
4.24.2	IDF Docker Image	1593
4.24.3	IDF Windows Installer	1595
4.24.4	IDF Component Manager	1596
4.25	Unit Testing in ESP32-C3	1597
4.25.1	Normal Test Cases	1597
4.25.2	Multi-device Test Cases	1598
4.25.3	Multi-stage Test Cases	1599
4.25.4	Tests For Different Targets	1599
4.25.5	Building Unit Test App	1600
4.25.6	Running Unit Tests	1601
4.25.7	Timing Code with Cache Compensated Timer	1602
4.25.8	Mocks	1602
4.26	USB Serial/JTAG Controller Console	1603
4.26.1	Hardware Requirements	1603
4.26.2	Software Configuration	1603
4.26.3	Uploading the Application	1603
4.26.4	Limitations	1604
4.27	Wi-Fi Driver	1604
4.27.1	ESP32-C3 Wi-Fi Feature List	1604
4.27.2	How To Write a Wi-Fi Application	1604
4.27.3	ESP32-C3 Wi-Fi API Error Code	1605
4.27.4	ESP32-C3 Wi-Fi API Parameter Initialization	1606
4.27.5	ESP32-C3 Wi-Fi Programming Model	1606
4.27.6	ESP32-C3 Wi-Fi Event Description	1606
4.27.7	ESP32-C3 Wi-Fi Station General Scenario	1609
4.27.8	ESP32-C3 Wi-Fi AP General Scenario	1612
4.27.9	ESP32-C3 Wi-Fi Scan	1612
4.27.10	ESP32-C3 Wi-Fi Station Connecting Scenario	1619
4.27.11	ESP32-C3 Wi-Fi Station Connecting When Multiple APs Are Found	1626
4.27.12	Wi-Fi Reconnect	1626
4.27.13	Wi-Fi Beacon Timeout	1626
4.27.14	ESP32-C3 Wi-Fi Configuration	1626
4.27.15	Wi-Fi Easy Connect™ (DPP)	1632
4.27.16	Wireless Network Management	1632
4.27.17	Radio Resource Measurement	1632
4.27.18	ESP32-C3 Wi-Fi Power-saving Mode	1633
4.27.19	ESP32-C3 Wi-Fi Throughput	1633
4.27.20	Wi-Fi 80211 Packet Send	1634
4.27.21	Wi-Fi Sniffer Mode	1635
4.27.22	Wi-Fi Multiple Antennas	1636
4.27.23	Wi-Fi Channel State Information	1637
4.27.24	Wi-Fi Channel State Information Configure	1639
4.27.25	Wi-Fi HT20/40	1639
4.27.26	Wi-Fi QoS	1639
4.27.27	Wi-Fi AMSDU	1640
4.27.28	Wi-Fi Fragment	1640
4.27.29	WPS Enrollee	1640
4.27.30	Wi-Fi Buffer Usage	1640
4.27.31	How to improve Wi-Fi performance	1641

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#) and [ESP32-C Series SoCs](#).

This document describes using ESP-IDF with the ESP32-C3 SoC.

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C3 board.

---

**Note:** This is documentation for stable version v4.3.5 of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-C3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

Hardware:

- An **ESP32-C3** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

You have a choice to either download and install the following software manually

- **Toolchain** to compile code for ESP32-C3
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C3 and scripts to operate the **Toolchain**

or get through the onboarding process using the following official plugins for integrated development environments (IDE) described in separate documents

- [Eclipse Plugin \(installation link\)](#)
- [VS Code Extension \(setup\)](#)

Fig. 1: Development of applications for ESP32-C3

## 1.3 Development Board Overviews

If you have one of ESP32-C3 development boards listed below, you can click on the link to learn more about its hardware.

### 1.3.1 ESP32-C3-DevKitM-1

This user guide will help you get started with ESP32-C3-DevKitM-1 and will also provide more in-depth information.

ESP32-C3-DevKitM-1 is an entry-level development board based on [ESP32-C3-MINI-1](#), a module named for its small size. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the ESP32-C3-MINI-1 module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitM-1 on a breadboard.

The document consists of the following major sections:

- *Getting Started*: Overview of ESP32-C3-DevKitM-1 and hardware/software setup instructions to get started.
- *Hardware Reference*: More detailed information about the ESP32-C3-DevKitM-1's hardware.

Fig. 2: ESP32-C3-DevKitM-1

- [Hardware Revision Details](#): Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitM-1.
- [Related Documents](#): Links to related documentation.

## Getting Started

This section provides a brief introduction of ESP32-C3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components** The key components of the board are described in a counter-clockwise direction.

Key Component	Description
ESP32-C3-MINI-1	ESP32-C3-MINI-1 is a general-purpose Wi-Fi and Bluetooth LE combo module that comes with a PCB antenna. At the core of this module is <a href="#">ESP32-C3FN4</a> , a chip that has an embedded flash of 4 MB. Since flash is packaged in the ESP32-C3FN4 chip, rather than integrated into the module, ESP32-C3-MINI-1 has a smaller package size.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see <a href="#">Header Block</a> .
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3FN4 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

Fig. 3: ESP32-C3-DevKitM-1 - front

**Start Application Development** Before powering up your ESP32-C3-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-C3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

**Software Setup** Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an application example onto your ESP32-C3-DevKitM-1.

### Contents and Packaging

**Retail Orders** If you order one or several samples, each ESP32-C3-DevKitM-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/company/contact/buy-a-sample>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

### Hardware Reference

**Block Diagram** The block diagram below shows the components of ESP32-C3-DevKitM-1 and their interconnections.

Fig. 4: ESP32-C3-DevKitM-1 (click to enlarge)

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro-USB Port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

**Header Block** The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in *ESP32-C3-DevKitM-1 - front*. The numbering is the same as in the *ESP32-C3-DevKitM-1 Schematic* (PDF).

### J1

No.	Name	Type <sup>1</sup>	Function
1	GND	G	Ground
2	3V3	P	3.3 V power supply
3	3V3	P	3.3 V power supply
4	IO2	I/O/T	GPIO2 <sup>2</sup> , ADC1_CH2, FSPIQ
5	IO3	I/O/T	GPIO3, ADC1_CH3
6	GND	G	Ground
7	RST	I	CHIP_PU
8	GND	G	Ground
9	IO0	I/O/T	GPIO0, ADC1_CH0, XTAL_32K_P
10	IO1	I/O/T	GPIO1, ADC1_CH1, XTAL_32K_N
11	IO10	I/O/T	GPIO10, FSPICS0
12	GND	G	Ground
13	5V	P	5 V power supply
14	5V	P	5 V power supply
15	GND	G	Ground

<sup>1</sup>P: Power supply; I: Input; O: Output; T: High impedance.

<sup>2</sup>GPIO2, GPIO8, and GPIO9 are strapping pins of the ESP32-C3FN4 chip. These pins are used to control several chip functions depending on binary voltage values applied to the pins during chip power-up or system reset. For description and application of the strapping pins, please refer to Section Strapping Pins in [ESP32-C3 Datasheet](#).

**J3**

No.	Name	Type <sup>1</sup>	Function
1	GND	G	Ground
2	TX	I/O/T	GPIO21, U0TXD
3	RX	I/O/T	GPIO20, U0RXD
4	GND	G	Ground
5	IO9	I/O/T	GPIO9 <sup>2</sup>
6	IO8	I/O/T	GPIO8 <sup>2</sup> , RGB LED
7	GND	G	Ground
8	IO7	I/O/T	GPIO7, FSPID, MTDO
9	IO6	I/O/T	GPIO6, FSPICLK, MTCK
10	IO5	I/O/T	GPIO5, ADC2_CH0, FSPIWP, MTDI
11	IO4	I/O/T	GPIO4, ADC1_CH4, FSPIHD, MTMS
12	GND	G	Ground
13	IO18	I/O/T	GPIO18
14	IO19	I/O/T	GPIO19
15	GND	G	Ground

Fig. 5: ESP32-C3-DevKitM-1 Pin Layout (click to enlarge)

## Pin Layout

### 1.3.2 ESP32-C3-DevKitC-02

This user guide will help you get started with ESP32-C3-DevKitC-02 and will also provide more in-depth information.

ESP32-C3-DevKitC-02 is an entry-level development board based on [ESP32-C3-WROOM-02](#), a general-purpose module with 4 MB SPI flash. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitC-02 on a breadboard.

Fig. 6: ESP32-C3-DevKitC-02

The document consists of the following major sections:

- [Getting Started](#): Overview of ESP32-C3-DevKitC-02 and hardware/software setup instructions to get started.
- [Hardware Reference](#): More detailed information about the ESP32-C3-DevKitC-02's hardware.
- [Hardware Revision Details](#): Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitC-02.
- [Related Documents](#): Links to related documentation.

#### Getting Started

This section provides a brief introduction of ESP32-C3-DevKitC-02, instructions on how to do the initial hardware setup and how to flash firmware onto it.

**Description of Components** The key components of the board are described in a counter-clockwise direction.

Fig. 7: ESP32-C3-DevKitC-02 - front

Key Component	Description
ESP32-C3-WROOM-02	ESP32-C3-WROOM-02 from Espressif is a powerful and general-purpose module that offers Wi-Fi and Bluetooth LE coexistence. It has a PCB antenna and a 4 MB SPI flash.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see <a href="#">Header Block</a> .
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

**Start Application Development** Before powering up your ESP32-C3-DevKitC-02, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

## 1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

### 1.4.1 Setting up Development Environment

- *Step 1. Install prerequisites for Windows, Linux, or macOS*
- *Step 2. Get ESP-IDF*
- *Step 3. Set up the tools*
- *Step 4. Set up the environment variables*

### 1.4.2 Creating Your First Project

- *Step 5. Start a Project*
- *Step 6. Connect Your Device*
- *Step 7. Configure*
- *Step 8. Build the Project*
- *Step 9. Flash onto the Device*
- *Step 10. Monitor*

## 1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

### 1.5.1 Standard Setup of Toolchain for Windows

#### Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use *Eclipse* or another graphical IDE with CMake support instead.

---

**Note:** Limitation: the installation path of Python or ESP-IDF must not contain white spaces or parentheses.

Limitation: the installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support. System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

---

#### ESP-IDF Tools Installer

The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers from this URL: <https://dl.espressif.com/dl/esp-idf/?idf=4.3>

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

**Components of the installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option `Run ESP-IDF PowerShell Environment` or `Run ESP-IDF Command Prompt (cmd.exe)`. The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):

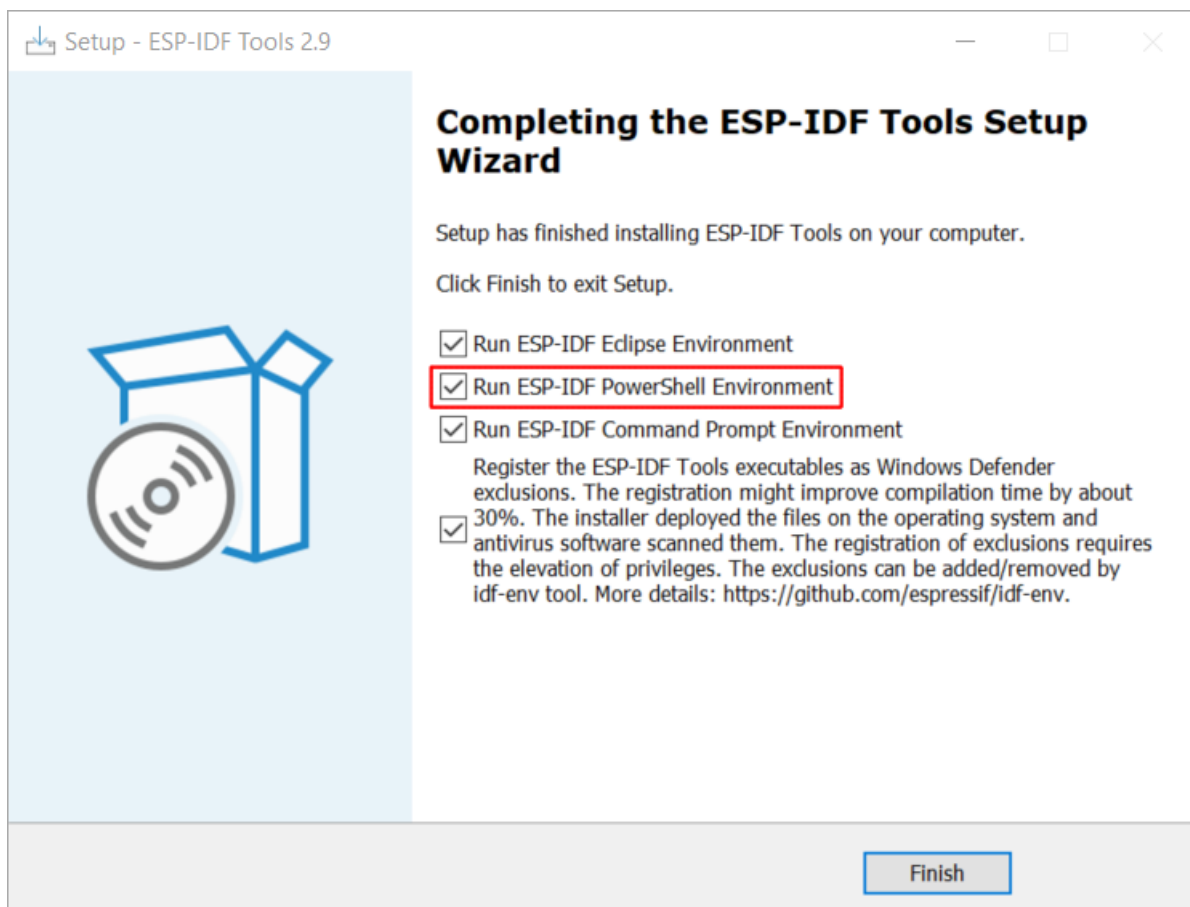

Fig. 10: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 13: ESP-IDF Command Prompt

## Using the Command Prompt

For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

## Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to [Step 5. Start a Project](#).

## Related Documents

For advanced users who want to customize the install process:

## Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to `PATH`.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

## 1.5.2 Standard Setup of Toolchain for Linux

### Install Prerequisites

To compile with ESP-IDF you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
↳setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.
↳0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3
↳python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja
↳ccache dfu-util libusb
```

---

### Note:

- CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
- 

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C3. *This can be solved by adding the current user to the dialout group.*

### Fixing broken pip on Ubuntu 16.04

Package python3-pip could be broken without possibility to upgrade it. Package has to be removed and installed manually using script [get-pip.py](#):

```
apt remove python3-pip python3-virtualenv; rm -r ~/.local
rm -r ~/.espressif/python_env && python get-pip.py
```

### Python 2 deprecation

Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.

## Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

### 1.5.3 Standard Setup of Toolchain for macOS

#### Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:

```
sudo easy_install pip
```

- install CMake & Ninja build:

- If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.

- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), ␣  
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Installing Python 3** Basing on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

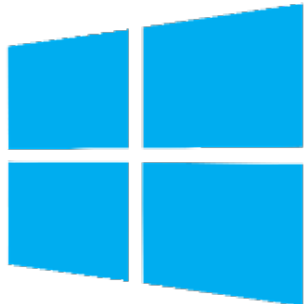

```
sudo port install python38
```

## Python 2 deprecation

Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

## Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

		
Windows	Linux	Mac OS

---

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

---

## 1.6 Step 2. Get ESP-IDF

To build applications for the ESP32-C3, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.3.5 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

### 1.6.2 Windows

In addition to installing the tools, [ESP-IDF Tools Installer](#) for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these [instructions](#).

## 1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

### 1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat esp32c3
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32c3
```

### 1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh esp32c3
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c3
```

---

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32, esp32c3, esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`.

---

### 1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

---

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

---

#### Windows

To prefer the Espressif download server when running the ESP-IDF Tools Installer or installing tools from the command line, open the System control panel, then click on Advanced Settings. Add a new Environment Variable (of type either User or System) with the name `IDF_GITHUB_ASSETS` and value `dl.espressif.com/github_assets`. Click OK once done.

If the command line window or ESP-IDF Tools Installer window was already open before you added the new environment variable, you will need to close and reopen it.

While this environment variable is still set, the ESP-IDF Tools Installer and the command line installer will prefer the Espressif download server.

## Linux and macOS

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

### 1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux and macOS, `%USERPROFILE%\espressif` on Windows. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

## 1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

### 1.8.1 Windows

*ESP-IDF Tools Installer* for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

### 1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
.$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
.$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export .sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

## 1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32-C3. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in IDF.

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

### 1.9.1 Linux and macOS

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

### 1.9.2 Windows

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

## 1.10 Step 6. Connect Your Device

Now connect your ESP32-C3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C3](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

## 1.11 Step 7. Configure

Navigate to your `hello_world` directory from [Step 5. Start a Project](#), set ESP32-C3 chip as the target and run the project configuration utility `menuconfig`.

### 1.11.1 Linux and macOS

```
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

### 1.11.2 Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32c3` should be done once, after opening a new project. If the project contains some existing builds and configuration, they will be cleared and initialized. The target may be saved in environment variable to skip this step at all. See [Selecting the Target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 14: Project configuration - Home window

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello\_word”. This example will run with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

## 1.12 Step 8. Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello-world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

## 1.13 Step 9. Flash onto the Device

Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello-world.bin) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-C3 board's serial port name from [Step 6. Connect Your Device](#).

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

### 1.13.1 Encountered Issues While Flashing?

If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C3](#)). The DTR and RTS control lines are in turn connected to GPIO9 and CHIP\_PU (EN) pins of ESP32-C3, thus changes in the voltage

levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the **Boot** button (`GPIO9`) and press the **EN** button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO9` down.

### 1.13.2 Normal Operation

When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB_
↳0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000_
↳hello-world.bin

Leaving...
```

(continues on next page)

(continued from previous page)

```
Hard resetting via RTS pin...
Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out the [Eclipse guide](#), [VS Code guide](#).

## 1.14 Step 10. Monitor

To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello-world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB_
↪external flash
Minimum free heap size: 337332 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

**That’s all that you need to get started with ESP32-C3!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

---

## 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

## 1.16 Related Documents

### 1.16.1 Establish Serial Connection with ESP32-C3

This section provides guidance how to establish serial connection between ESP32-C3 and PC.

#### Connect ESP32-C3 to PC

Connect the ESP32-C3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-C3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

#### Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

#### Check port on Linux and macOS

To check the device name for the serial port of your ESP32-C3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

Fig. 15: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Fig. 16: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

---

**Note:** macOS users: if you don't see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

---

### Adding user to dialout on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

### Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C3.

**Windows and Linux** In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-C3. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#).

---

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

---

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↪USBtoUART7
```

Fig. 17: Setting Serial Communication in PuTTY on Windows

Fig. 18: Setting Serial Communication in PuTTY on Linux

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#). To exit the **screen** session type `Ctrl-A + \`.

---

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output** An example log by ESP32-C3 is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-C3.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from [Step 6. Connect Your Device](#) when installing s/w for ESP32-C3 development, then you can continue with [Step 7. Configure](#).

## 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [Espressif IDF Eclipse Plugins](#) IDF for further instructions.

---

**Note:** In [Espressif IDF Eclipse Plugins](#), though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

---

### 1.16.3 Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

#### Quick Install Guide

Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from [VS Code Marketplace](#) or following [Quick Installation Guide](#).

Review the *tutorials* <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>> for ESP-IDF Visual Studio Code Extension to learn how to use all features.

#### Supported Features

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the `.svdat` files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

#### Bugs & Feature Requests

If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the [forum](#), or open a [github issue](#) for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, [raise your feature request on github](#).

### 1.16.4 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

For the legacy GNU Make system, run `make monitor`.

#### Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+] ]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+] ]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4\_\_\_\_\_, IDF Monitor uses [addr2line](#) to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```

abort() was called at PC 0x42067cd5 on core 0

Stack dump detected
Core 0 register dump:

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

**Launching GDB with GDBStub** By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with [GDB](#) project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub, open the project configuration menu (`idf.py menuconfig`) and set [CONFIG\\_ESP\\_SYSTEM\\_PANIC](#) to Invoke GDBStub.

In this case, if the panic handler is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex_
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, \*} referring to a level for [logging](#).

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples Of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## Known Issues with IDF Monitor

### Issues Observed on Windows

- If in the Windows environment you receive the error “winpty: command not found”, fix it by running `pacman -S winpty`.
- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

## 1.16.5 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see [Step 3. Set up the tools](#)) you may build the toolchain yourself.

If you can't think of a reason why you need to build it yourself, then probably it's better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don't trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

### Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the [ESP-IDF Tools Installer](#) for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section [Standard Setup of Toolchain for Windows](#).

---

**Note:** The GNU Make based build system requires the [MSYS2](#) Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

---

### Get ESP-IDF

---

**Note:** Previous versions of ESP-IDF used the [MSYS2 bash terminal](#) command line. The current cmake-based build system can run in the regular **Windows Command Prompt** which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

---

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.3.5 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

---

**Note:** The `git clone` option `-b v4.3.5` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

---

---

**Note:** As a fallback, it is also possible to download a zip file of this stable release from the [Releases page](#). Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

---

---

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

---

## Tools

**CMake** Download the latest stable release of [CMake](#) for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user” .

## Ninja build

---

**Note:** Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

---

Download the [Ninja](#) latest stable Windows release from the ([download page](#)).

The Ninja for Windows download is a .zip file containing a single `ninja.exe` file which needs to be unzipped to a directory which is then *added to your Path* (or you can choose a directory which is already on your Path).

**Python** Download the latest [Python](#) for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path” . Change this option to select “Will be installed” .

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

---

**Toolchain Setup** Download the precompiled Windows toolchain:

[https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8\\_4\\_0-esp-2021r2-patch3-win32.zip](https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch3-win32.zip)

Unzip the zip file to C:\Program Files (or some other location). The zip file contains a single directory `riscv32-esp-elf`.

Next, the `bin` subdirectory of this directory must be *added to your Path*. For example, the directory to add may be `C:\Program Files\riscv32-esp-elf\bin`.

---

**Note:** If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory `C:\msys32\opt\riscv32-esp-elf\bin` to the Path instead, as the toolchain is included in the MSYS2 environment.

---

**Adding Directory to Path** To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append  `; <new value>`.

**Next Steps** To carry on with development environment setup, proceed to [Step 3. Set up the tools.](#)

### Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section [Standard Setup of Toolchain for Linux.](#)

---

**Note:** The reason you might need to build your own toolchain is to solve the Y2K38 problem (time\_t expand to 64 bits instead of 32 bits).

---

**Install Prerequisites** To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf_
↳python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
↳pip python3-setuptools python3-serial python3-cryptography python3-future_
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev_
↳libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial_
↳python-cryptography python-future python-pyparsing python-pyelftools cmake_
↳ninja ccache dfu-util libusb
```

---

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .

---

### Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-  
↳devel automake bison flex texinfo help2man libtool make
```

### – Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool make
```

### – Ubuntu 16.04 or newer:

```
sudo apt-get install gawk gperf grep gettext python python-dev automake  
↳bison flex texinfo help2man libtool libtool-bin make
```

### – Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-  
↳dev automake bison flex texinfo help2man libtool libtool-bin make
```

### – Arch:

```
sudo pacman -Sy --needed python-pip
```

Create the working directory and go into it:

```
mkdir -p ~/esp  
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git  
cd crosstool-NG  
git checkout esp-2021r2-patch3  
git submodule update --init  
./bootstrap && ./configure --enable-local && make
```

---

**Note:** To create a toolchain with support for 64-bit `time_t`, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

---

Build the toolchain:

```
./ct-ng riscv32-esp-elf  
./ct-ng build  
chmod -R u+w builds/riscv32-esp-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/riscv32-esp-elf`.

**Add Toolchain to PATH** The custom toolchain needs to be copied to a binary directory and added to the `PATH`.

Choose a directory, for example `~/esp/riscv32-esp-elf/`, and copy the build output to this directory.

To use it, you will need to update your `PATH` environment variable in `~/.profile` file. To make `riscv32-esp-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

```
export PATH="$HOME/esp/riscv32-esp-elf/bin:$PATH"
```

---

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, `alias` should set in `.bashrc`.

---

Log off and log in back to make the `.profile` changes effective. Run the following command to verify if `PATH` is correctly set:

```
printenv PATH
```

You are looking for similar result containing toolchain's path at the beginning of displayed string:

```
$ printenv PATH
/home/user-name/esp/riscv32-esp-elf/bin:/home/user-name/bin:/home/user-name/.local/
↪bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/
↪local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

**Python 2 deprecation** Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.

**Next Steps** To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

### Setup Toolchain for Mac OS from Scratch

**Package Manager** To set up the toolchain from scratch, rather than [downloading a pre-compiled toolchain](#), you will need to install either the [MacPorts](#) or [Homebrew](#) package manager.

MacPorts needs a full XCode installation, while Homebrew only needs XCode command line tools.

See [Customized Setup of Toolchain](#) section for some of the reasons why installing the toolchain from scratch may be necessary.

### Install Prerequisites

- install pip:

```
sudo easy_install pip
```

- install pyserial:

```
pip install --user pyserial
```

- install CMake & Ninja build:
  - If you have Homebrew, you can run:

```
brew install cmake ninja dfu-util
```

- If you have MacPorts, you can run:

```
sudo port install cmake ninja dfu-util
```

### Compile the Toolchain from Source

- Install dependencies:
  - with MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool↵
↪autoconf automake make
```

- with Homebrew:

```
brew install gnu-sed gawk binutils gperftools gettext wget help2man↵
↪libtool autoconf automake make
```

Create a case-sensitive filesystem image:

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_↵  
↵HFS+"
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp  
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git  
cd crosstool-NG  
git checkout esp-2021r2-patch3  
git submodule update --init  
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng riscv32-esp-elf  
./ct-ng build  
chmod -R u+w builds/riscv32-esp-elf
```

Toolchain will be built in `~/esp/ctng-volume/crosstool-NG/builds/riscv32-esp-elf`. To use it, you need to add `~/esp/ctng-volume/crosstool-NG/builds/riscv32-esp-elf/bin` to PATH environment variable.

**Python 2 deprecation** Python 2 reached its [end of life](#) and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

**Next Steps** To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

## Chapter 2

# API Reference

## 2.1 Bluetooth API

### 2.1.1 Controller && VHCI

#### Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - `bluetooth/hci/controller_vhci_ble_adv`.

#### API Reference

##### Header File

- `bt/include/esp32/include/esp_bt.h`

##### Functions

`esp_err_t esp_ble_tx_power_set(esp_ble_power_type_t power_type, esp_power_level_t power_level)`

Set BLE TX power Connection Tx power should only be set after connection created.

**Return** ESP\_OK - success, other - failed

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level`: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get(esp_ble_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

**Return**  $\geq 0$  - Power level,  $< 0$  - Invalid

##### Parameters

- `power_type`: : The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set(esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

**Return** ESP\_OK - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

*esp\_err\_t* **esp\_bredr\_tx\_power\_get** (*esp\_power\_level\_t* \*`min_power_level`, *esp\_power\_level\_t* \*`max_power_level`)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** ESP\_OK - success, other - failed

**Parameters**

- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

*esp\_err\_t* **esp\_bredr\_sco\_datapath\_set** (*esp\_sco\_data\_path\_t* `data_path`)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP\_OK - success, other - failed

**Parameters**

- `data_path`: SCO data path

*esp\_err\_t* **esp\_bt\_controller\_init** (*esp\_bt\_controller\_config\_t* \*`cfg`)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** ESP\_OK - success, other - failed

**Parameters**

- `cfg`: Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

**Return** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* `mode`)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

**Return** ESP\_OK - success, other - failed

**Parameters**

- `mode`: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of `esp_bt_controller_init()`.

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable BT controller.

**Return** ESP\_OK - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

bool **esp\_vhci\_host\_check\_send\_available** (void)

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

**Return** true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*`data`, uint16\_t `len`)

`esp_vhci_host_send_packet` host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- `data`: the packet point
- `len`: the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (*const esp\_vhci\_host\_callback\_t* \*callback)

`esp_vhci_host_register_callback` register the vhci reference callback struct defined by `vhci_host_callback` structure.

**Return** `ESP_OK` - success, `ESP_FAIL` - failed

**Parameters**

- `callback`: *esp\_vhci\_host\_callback* type variable

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

`esp_bt_controller_mem_release` release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

`esp_bt_controller_mem_release(mode)` should be called only before `esp_bt_controller_init()` or after `esp_bt_controller_deinit()`.

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is `ESP_BT_MODE_BTDM`, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `mode`: : the mode want to release memory

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

`esp_bt_mem_release` release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling `esp_bt_controller_mem_release()`. Additionally, if the mode is set to `ESP_BT_MODE_BTDM`, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
```

(continues on next page)

(continued from previous page)

```
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

**Return** `ESP_OK` - success, other - failed

**Parameters**

- `mode`: : the mode whose memory is to be released

*esp\_err\_t* **esp\_bt\_sleep\_enable**(void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

**Return**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_bt\_sleep\_disable**(void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

**Return**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush**(void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in `menuconfig`.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**

- `ESP_OK` : success
- other : failed

void **esp\_wifi\_bt\_power\_domain\_on**(void)

bt Wi-Fi power domain power on

void **esp\_wifi\_bt\_power\_domain\_off**(void)

bt Wi-Fi power domain power off

## Structures

**struct esp\_bt\_controller\_config\_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

- uint16\_t controller\_task\_stack\_size**  
Bluetooth controller task stack size
- uint8\_t controller\_task\_prio**  
Bluetooth controller task priority
- uint8\_t hci\_uart\_no**  
If use UART1/2 as HCI IO interface, indicate UART number
- uint32\_t hci\_uart\_baudrate**  
If use UART1/2 as HCI IO interface, indicate UART baudrate
- uint8\_t scan\_duplicate\_mode**  
scan duplicate mode
- uint8\_t scan\_duplicate\_type**  
scan duplicate type
- uint16\_t normal\_adv\_size**  
Normal adv size for scan duplicate
- uint16\_t mesh\_adv\_size**  
Mesh adv size for scan duplicate
- uint16\_t send\_adv\_reserved\_size**  
Controller minimum memory value
- uint32\_t controller\_debug\_flag**  
Controller debug log flag
- uint8\_t mode**  
Controller mode: BR/EDR, BLE or Dual Mode
- uint8\_t ble\_max\_conn**  
BLE maximum connection numbers
- uint8\_t bt\_max\_acl\_conn**  
BR/EDR maximum ACL connection numbers
- uint8\_t bt\_sco\_datapath**  
SCO data path, i.e. HCI or PCM module
- bool auto\_latency**  
BLE auto latency, used to enhance classic BT performance
- bool bt\_legacy\_auth\_vs\_evt**  
BR/EDR Legacy auth complete event required to protect from BIAS attack
- uint8\_t bt\_max\_sync\_conn**  
BR/EDR maximum ACL connection numbers. Effective in menuconfig
- uint8\_t ble\_sca**  
BLE low power crystal accuracy index
- uint8\_t pcm\_role**  
PCM role (master & slave)
- uint8\_t pcm\_polar**  
PCM polar trig (falling clk edge & rising clk edge)
- bool hli**  
Using high level interrupt or not
- uint16\_t dup\_list\_refresh\_period**  
Duplicate scan list refresh period

`uint32_t magic`  
Magic number  
**struct esp\_vhci\_host\_callback**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

`void (*notify_host_send_available) (void)`  
callback used to notify that the host can send packet to controller  
`int (*notify_host_recv) (uint8_t *data, uint16_t len)`  
callback used to notify that the controller has a packet to send to the host

### Macros

**ESP\_BT\_CONTROLLER\_CONFIG\_MAGIC\_VAL**  
**BT\_CONTROLLER\_INIT\_CONFIG\_DEFAULT ()**

### Type Definitions

**typedef struct esp\_vhci\_host\_callback esp\_vhci\_host\_callback\_t**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Enumerations

**enum esp\_bt\_mode\_t**  
Bluetooth mode for controller enable/disable.

*Values:*

**ESP\_BT\_MODE\_IDLE** = 0x00  
Bluetooth is not running  
**ESP\_BT\_MODE\_BLE** = 0x01  
Run BLE mode  
**ESP\_BT\_MODE\_CLASSIC\_BT** = 0x02  
Run Classic BT mode  
**ESP\_BT\_MODE\_BTDM** = 0x03  
Run dual mode

**enum [anonymous]**

BLE sleep clock accuracy(SCA), values for ble\_sca field in *esp\_bt\_controller\_config\_t*, currently only **ESP\_BLE\_SCA\_500PPM** and **ESP\_BLE\_SCA\_250PPM** are supported.

*Values:*

**ESP\_BLE\_SCA\_500PPM** = 0  
BLE SCA at 500ppm  
**ESP\_BLE\_SCA\_250PPM**  
BLE SCA at 250ppm  
**ESP\_BLE\_SCA\_150PPM**  
BLE SCA at 150ppm  
**ESP\_BLE\_SCA\_100PPM**  
BLE SCA at 100ppm  
**ESP\_BLE\_SCA\_75PPM**  
BLE SCA at 75ppm  
**ESP\_BLE\_SCA\_50PPM**  
BLE SCA at 50ppm

**ESP\_BLE\_SCA\_30PPM**  
BLE SCA at 30ppm

**ESP\_BLE\_SCA\_20PPM**  
BLE SCA at 20ppm

**enum esp\_bt\_controller\_status\_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

**ESP\_BT\_CONTROLLER\_STATUS\_IDLE** = 0

**ESP\_BT\_CONTROLLER\_STATUS\_INITED**

**ESP\_BT\_CONTROLLER\_STATUS\_ENABLED**

**ESP\_BT\_CONTROLLER\_STATUS\_NUM**

**enum esp\_ble\_power\_type\_t**

BLE tx power type ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP\_BLE\_PWR\_TYPE\_ADV : for advertising/scan response. ESP\_BLE\_PWR\_TYPE\_SCAN : for scan. ESP\_BLE\_PWR\_TYPE\_DEFAULT : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP\_PWR\_LVL\_P3 as default for ADV/SCAN/CONN0-9.

*Values:*

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0** = 0  
For connection handle 0

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL1** = 1  
For connection handle 1

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL2** = 2  
For connection handle 2

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL3** = 3  
For connection handle 3

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4** = 4  
For connection handle 4

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5** = 5  
For connection handle 5

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6** = 6  
For connection handle 6

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7** = 7  
For connection handle 7

**ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8** = 8  
For connection handle 8

**ESP\_BLE\_PWR\_TYPE\_ADV** = 9  
For advertising

**ESP\_BLE\_PWR\_TYPE\_SCAN** = 10  
For scan

**ESP\_BLE\_PWR\_TYPE\_DEFAULT** = 11  
For default, if not set other, it will use default value

**ESP\_BLE\_PWR\_TYPE\_NUM** = 12  
TYPE numbers

**enum esp\_power\_level\_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

*Values:*

**ESP\_PWR\_LVL\_N12** = 0  
Corresponding to -12dbm

**ESP\_PWR\_LVL\_N9** = 1  
Corresponding to -9dbm

**ESP\_PWR\_LVL\_N6** = 2  
Corresponding to -6dbm

**ESP\_PWR\_LVL\_N3** = 3  
Corresponding to -3dbm

**ESP\_PWR\_LVL\_N0** = 4  
Corresponding to 0dbm

**ESP\_PWR\_LVL\_P3** = 5  
Corresponding to +3dbm

**ESP\_PWR\_LVL\_P6** = 6  
Corresponding to +6dbm

**ESP\_PWR\_LVL\_P9** = 7  
Corresponding to +9dbm

**ESP\_PWR\_LVL\_N14** = [ESP\\_PWR\\_LVL\\_N12](#)  
Backward compatibility! Setting to -14dbm will actually result to -12dbm

**ESP\_PWR\_LVL\_N11** = [ESP\\_PWR\\_LVL\\_N9](#)  
Backward compatibility! Setting to -11dbm will actually result to -9dbm

**ESP\_PWR\_LVL\_N8** = [ESP\\_PWR\\_LVL\\_N6](#)  
Backward compatibility! Setting to -8dbm will actually result to -6dbm

**ESP\_PWR\_LVL\_N5** = [ESP\\_PWR\\_LVL\\_N3](#)  
Backward compatibility! Setting to -5dbm will actually result to -3dbm

**ESP\_PWR\_LVL\_N2** = [ESP\\_PWR\\_LVL\\_N0](#)  
Backward compatibility! Setting to -2dbm will actually result to 0dbm

**ESP\_PWR\_LVL\_P1** = [ESP\\_PWR\\_LVL\\_P3](#)  
Backward compatibility! Setting to +1dbm will actually result to +3dbm

**ESP\_PWR\_LVL\_P4** = [ESP\\_PWR\\_LVL\\_P6](#)  
Backward compatibility! Setting to +4dbm will actually result to +6dbm

**ESP\_PWR\_LVL\_P7** = [ESP\\_PWR\\_LVL\\_P9](#)  
Backward compatibility! Setting to +7dbm will actually result to +9dbm

**enum esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

**ESP\_SCO\_DATA\_PATH\_HCI** = 0  
data over HCI transport

**ESP\_SCO\_DATA\_PATH\_PCM** = 1  
data over PCM interface

## 2.1.2 BT COMMON

### BT GENERIC DEFINES

## API Reference

### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_defs.h](#)

### Structures

**struct esp\_bt\_uuid\_t**

UUID type.

#### Public Members

**uint16\_t len**

UUID length, 16bit, 32bit or 128bit

**uint16\_t uuid16**

16bit UUID

**uint32\_t uuid32**

32bit UUID

**uint8\_t uuid128[ESP\_UUID\_LEN\_128]**

128bit UUID

**union esp\_bt\_uuid\_t::[anonymous] uuid**

UUID

### Macros

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_STATUS\_BASE\_FOR\_HCI\_ERR**

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTET8\_LEN**

**ESP\_DEFAULT\_GATT\_IF**

Default GATT interface id.

**ESP\_BLE\_PRIM\_ADV\_INT\_MIN**

Minimum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_PRIM\_ADV\_INT\_MAX**

Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_CONN\_INT\_MIN**

relate to BTM\_BLE\_CONN\_INT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_INT\_MAX**

relate to BTM\_BLE\_CONN\_INT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_LATENCY\_MAX**

relate to ESP\_BLE\_CONN\_LATENCY\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**

relate to BTM\_BLE\_CONN\_SUP\_TOUT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**

relate to ESP\_BLE\_CONN\_SUP\_TOUT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_PARAM\_UNDEF**

**ESP\_BLE\_SCAN\_PARAM\_UNDEF**

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)

Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**

Bluetooth address length.

**ESP\_BLE\_ENC\_KEY\_MASK**

Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**

Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**

Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**

Minimum of the application id.

**ESP\_APP\_ID\_MAX**

Maximum of the application id.

**ESP\_BD\_ADDR\_STR**

**ESP\_BD\_ADDR\_HEX** (addr)

### Type Definitions

```
typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
```

```
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]
```

```
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
```

```
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
```

Bluetooth device address.

```
typedef uint8_t esp_ble_key_mask_t
```

### Enumerations

white list address type

*Values:***BLE\_WL\_ADDR\_TYPE\_PUBLIC** = 0x00**BLE\_WL\_ADDR\_TYPE\_RANDOM** = 0x01**BT MAIN API****API Reference****Header File**

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

**Functions*****esp\_bluedroid\_status\_t* esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

**Return** Bluetooth stack status***esp\_err\_t* esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init().

**Return**

- ESP\_OK : Succeed
- Other : Failed

***esp\_err\_t* esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit().

**Return**

- ESP\_OK : Succeed
- Other : Failed

***esp\_err\_t* esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**

- ESP\_OK : Succeed
- Other : Failed

### Enumerations

**enum esp\_bluedroid\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

*Values:*

**ESP\_BLUEDROID\_STATUS\_UNINITIALIZED** = 0

Bluetooth not initialized

**ESP\_BLUEDROID\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

**ESP\_BLUEDROID\_STATUS\_ENABLED**

Bluetooth initialized and enabled

## BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_bt\\_device.h](#)

#### Functions

**const** uint8\_t \***esp\_bt\_dev\_get\_address** (void)

Get bluetooth device address. Must use after “esp\_bluedroid\_enable” .

**Return** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp\_err\_t* **esp\_bt\_dev\_set\_device\_name** (**const** char \**name*)

Set bluetooth device name. This function should be called after esp\_bluedroid\_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

**Parameters**

- [in] name: : device name to be set

### 2.1.3 BT LE

#### GAP API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_client](#)
  - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_server](#)
  - [GATT Security Server Example Walkthrough](#)

## API Reference

### Functions

*esp\_err\_t* **esp\_ble\_gap\_register\_callback** (*esp\_gap\_ble\_cb\_t* callback)

This function is called to occur gap event, such as scan result.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] callback: callback function

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data** (*esp\_ble\_adv\_data\_t* \*adv\_data)

This function is called to override the BTA default ADV parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] adv\_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config\_adv\_data is received.

*esp\_err\_t* **esp\_ble\_gap\_set\_scan\_params** (*esp\_ble\_scan\_params\_t* \*scan\_params)

This function is called to set scan parameters.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] scan\_params: Pointer to User defined scan\_params data structure. This memory space can not be freed until callback of set\_scan\_params

*esp\_err\_t* **esp\_ble\_gap\_start\_scanning** (uint32\_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] duration: Keeping the scanning time, the unit is second.

*esp\_err\_t* **esp\_ble\_gap\_stop\_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

#### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] adv\_params: pointer to User defined adv\_params data structure.

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] params: - connection update parameters

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, uint16\_t tx\_data\_length)

This function is to set maximum LE data packet size.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] rand\_addr: the random address which should be setting

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

**Return**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy on the local device.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] privacy\_enable: - enable/disable privacy on remote device.

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t icon)

set local gap appearance icon

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `icon`: - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml>

`esp_err_t esp_ble_gap_update_whitelist` (bool `add_remove`, `esp_bd_addr_t` `remote_bda`, `esp_ble_wl_addr_type_t` `wl_addr_type`)

Add or remove device from white list.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `add_remove`: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] `remote_bda`: the remote device address add/remove from the white list.
- [in] `wl_addr_type`: whitelist address type

`esp_err_t esp_ble_gap_clear_whitelist` (void)

Clear all white list.

**Return**

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_get_whitelist_size` (uint16\_t \*`length`)

Get the whitelist size in the controller.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [out] `length`: the white list length.

`esp_err_t esp_ble_gap_set_prefer_conn_params` (`esp_bd_addr_t` `bd_addr`, uint16\_t `min_conn_int`, uint16\_t `max_conn_int`, uint16\_t `slave_latency`, uint16\_t `supervision_tout`)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peripheral
- [in] `min_conn_int`: minimum preferred connection interval
- [in] `max_conn_int`: maximum preferred connection interval
- [in] `slave_latency`: preferred slave latency
- [in] `supervision_tout`: preferred supervision timeout

`esp_err_t esp_ble_gap_set_device_name` (const char \*`name`)

Set device name to the local device.

**Return**

- `ESP_OK` : success
- other : failed

**Parameters**

- [in] `name`: - device name.

`esp_err_t esp_ble_gap_get_local_used_addr` (`esp_bd_addr_t` `local_used_addr`, uint8\_t \*`addr_type`)

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] local\_used\_addr: - current local used ble address (six bytes)
- [in] addr\_type: - ble address type

`uint8_t *esp_ble_resolve_adv_data (uint8_t *adv_data, uint8_t type, uint8_t *length)`

This function is called to get ADV data for a specific type.

**Return** pointer of ADV data

**Parameters**

- [in] adv\_data: - pointer of ADV data which to be resolved
- [in] type: - finding ADV data type
- [out] length: - return the length of ADV data not including type

`esp_err_t esp_ble_gap_config_adv_data_raw (uint8_t *raw_data, uint32_t raw_data_len)`

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw advertising data
- [in] raw\_data\_len: : raw advertising data length , less than 31 bytes

`esp_err_t esp_ble_gap_config_scan_rsp_data_raw (uint8_t *raw_data, uint32_t raw_data_len)`

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] raw\_data: : raw scan response data
- [in] raw\_data\_len: : raw scan response data length , less than 31 bytes

`esp_err_t esp_ble_gap_read_rssi (esp_bd_addr_t remote_addr)`

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] remote\_addr: : The remote connection device address.

`esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)`

This function is called to add a device info into the duplicate scan exceptional list.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] type: device info type, it is defined in esp\_ble\_duplicate\_exceptional\_info\_type\_t when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

`esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)`

This function is called to remove a device info from the duplicate scan exceptional list.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] type: device info type, it is defined in `esp_ble_duplicate_exceptional_info_type_t` when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- [in] device\_info: the device information.

*esp\_err\_t esp\_ble\_gap\_clean\_duplicate\_scan\_exceptional\_list (esp\_duplicate\_scan\_exceptional\_list\_type\_t list\_type)*

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

#### Return

- ESP\_OK : success
- other : failed

#### Parameters

- [in] list\_type: duplicate scan exceptional list type, the value can be one or more of `esp_duplicate_scan_exceptional_list_type_t`.

*esp\_err\_t esp\_ble\_gap\_set\_security\_param (esp\_ble\_sm\_param\_t param\_type, void \*value, uint8\_t len)*

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’ .

To accept only secure connection mode, it is necessary do as following:

1. Set bit ESP\_LE\_AUTH\_REQ\_SC\_ONLY (param\_type is ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE), bit ESP\_LE\_AUTH\_BOND and bit ESP\_LE\_AUTH\_REQ\_MITM is optional as required.
2. Set to ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE (param\_type is ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH).

#### Return - ESP\_OK : success

- other : failed

#### Parameters

- [in] param\_type: : the type of the param which to be set
- [in] value: : the param value
- [in] len: : the length of the param value

*esp\_err\_t esp\_ble\_gap\_security\_rsp (esp\_bd\_addr\_t bd\_addr, bool accept)*

Grant security request access.

#### Return - ESP\_OK : success

- other : failed

#### Parameters

- [in] bd\_addr: : BD address of the peer
- [in] accept: : accept the security request or not

*esp\_err\_t esp\_ble\_set\_encryption (esp\_bd\_addr\_t bd\_addr, esp\_ble\_sec\_act\_t sec\_act)*

Set a gap parameter value. Use this function to change the default GAP parameter values.

#### Return - ESP\_OK : success

- other : failed

#### Parameters

- [in] bd\_addr: : the address of the peer device need to encryption
- [in] sec\_act: : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

*esp\_err\_t esp\_ble\_passkey\_reply (esp\_bd\_addr\_t bd\_addr, bool accept, uint32\_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer
- [in] `accept`: : passkey entry successful or declined.
- [in] `passkey`: : passkey value, must be a 6 digit number, can be lead by 0.

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* `bd_addr`, bool `accept`)

Reply the confirm value to the peer device in the secure connection stage.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device
- [in] `accept`: : numbers to compare are the same or different.

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* `bd_addr`)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: : BD address of the peer device

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return** -  $\geq 0$  : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*`dev_num`, *esp\_ble\_bond\_dev\_t* \*`dev_list`)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [inout] `dev_num`: Indicate the `dev_list` array(buffer) size as input. If `dev_num` is large enough, it means the actual number as output. Suggest that `dev_num` value equal to `esp_ble_get_bond_device_num()`.
- [out] `dev_list`: an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* `bd_addr`, uint8\_t \*`TK`, uint8\_t `len`)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] `bd_addr`: BD address of the peer device.
- [in] `TK`: TK value, the TK value shall be a 128-bit random number
- [in] `len`: length of tk, should always be 128-bit

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* `remote_device`)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple `app_id` registered. `esp_ble_gattc_close` (*esp\_gatt\_if\_t* `gattc_if`, uint16\_t `conn_id`) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. `esp_ble_gap_disconnect`(*esp\_bd\_addr\_t* `remote_device`) disconnect the physical connection directly.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] remote\_device: : BD address of the peer device

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] conn\_params: the connection parameters information

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels\_t* channels)

BLE set channels.

**Return** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**

- [in] channels: : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

*esp\_err\_t* **esp\_ble\_gap\_read\_phy** (*esp\_bd\_addr\_t* bd\_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : BD address of the peer device

*esp\_err\_t* **esp\_ble\_gap\_set\_prefered\_default\_phy** (*esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] tx\_phy\_mask: : indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx\_phy\_mask: : indicates the receiver PHYs that the Host prefers the Controller to use

*esp\_err\_t* **esp\_ble\_gap\_set\_prefered\_phy** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_gap\_all\_phys\_t* all\_phys\_mask, *esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask, *esp\_ble\_gap\_prefer\_phy\_options\_t* phy\_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] bd\_addr: : remote address

- [in] `all_phys_mask`: : a bit field that allows the Host to specify
- [in] `tx_phy_mask`: : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] `rx_phy_mask`: : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] `phy_options`: : a bit field that allows the Host to specify options for PHYs

*esp\_err\_t* `esp_ble_gap_ext_adv_set_rand_addr` (uint8\_t *instance*, *esp\_bd\_addr\_t* *rand\_addr*)

This function is used by the Host to set the random device address specified by the `Random_Address` parameter.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] `instance`: : Used to identify an advertising set
- [in] `rand_addr`: : Random Device Address

*esp\_err\_t* `esp_ble_gap_ext_adv_set_params` (uint8\_t *instance*, *esp\_ble\_gap\_ext\_adv\_params\_t* \**params*)

This function is used by the Host to set the advertising parameters.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] `instance`: : identifies the advertising set whose parameters are being configured.
- [in] `params`: : advertising parameters

*esp\_err\_t* `esp_ble_gap_config_ext_adv_data_raw` (uint8\_t *instance*, uint16\_t *length*, *const* uint8\_t \**data*)

This function is used to set the data used in advertising PDUs that have a data field.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] `instance`: : identifies the advertising set whose data are being configured
- [in] `length`: : data length
- [in] `data`: : data information

*esp\_err\_t* `esp_ble_gap_config_ext_scan_rsp_data_raw` (uint8\_t *instance*, uint16\_t *length*, *const* uint8\_t \**scan\_rsp\_data*)

This function is used to provide scan response data used in scanning response PDUs.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] `instance`: : identifies the advertising set whose response data are being configured.
- [in] `length`: : response data length
- [in] `scan_rsp_data`: : response data information

*esp\_err\_t* `esp_ble_gap_ext_adv_start` (uint8\_t *num\_adv*, *const* *esp\_ble\_gap\_ext\_adv\_t* \**ext\_adv*)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the `instance` parameter.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] `num_adv`: : Number of advertising sets to enable or disable
- [in] `ext_adv`: : adv parameters

*esp\_err\_t* `esp_ble_gap_ext_adv_stop` (uint8\_t *num\_adv*, *const* uint8\_t \**ext\_adv\_inst*)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the `instance` parameter.

**Return** - `ESP_OK` : success

- other : failed

**Parameters**

- [in] num\_adv: : Number of advertising sets to enable or disable
- [in] ext\_adv\_inst: : ext adv instance

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_remove** (uint8\_t instance)

This function is used to remove an advertising set from the Controller.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] instance: : Used to identify an advertising set

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

**Return** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_params** (uint8\_t instance, const esp\_ble\_gap\_periodic\_adv\_params\_t \*params)

This function is used by the Host to set the parameters for periodic advertising.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] instance: : identifies the advertising set whose periodic advertising parameters are being configured.
- [in] params: : periodic adv parameters

*esp\_err\_t* **esp\_ble\_gap\_config\_periodic\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in periodic advertising PDUs.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] instance: : identifies the advertising set whose periodic advertising parameters are being configured.
- [in] length: : the length of periodic data
- [in] data: : periodic data information

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_start** (uint8\_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] instance: : Used to identify an advertising set

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_stop** (uint8\_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] instance: : Used to identify an advertising set

*esp\_err\_t* **esp\_ble\_gap\_set\_ext\_scan\_params** (const esp\_ble\_ext\_scan\_params\_t \*params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] params: : scan parameters

*esp\_err\_t* **esp\_ble\_gap\_start\_ext\_scan** (uint32\_t *duration*, uint16\_t *period*)

This function is used to enable scanning.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] *duration*: : Scan duration
- [in] *period*: : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

*esp\_err\_t* **esp\_ble\_gap\_stop\_ext\_scan** (void)

This function is used to disable scanning.

**Return** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_create\_sync** (const *esp\_ble\_gap\_periodic\_adv\_sync\_params\_t* \**params*)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] *params*: : sync parameters

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_cancel** (void)

This function is used to cancel the LE\_Periodic\_Advertising\_Create\_Sync command while it is pending.

**Return** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_terminate** (uint16\_t *sync\_handle*)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] *sync\_handle*: : identify the periodic advertiser

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_add\_dev\_to\_list** (*esp\_ble\_addr\_type\_t* *addr\_type*,  
*esp\_bd\_addr\_t* *addr*, uint8\_t *sid*)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] *addr\_type*: : address type
- [in] *addr*: : Device Address
- [in] *sid*: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_remove\_dev\_from\_list** (*esp\_ble\_addr\_type\_t* *addr\_type*,  
*esp\_bd\_addr\_t* *addr*, uint8\_t *sid*)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Return** - ESP\_OK : success

- other : failed

**Parameters**

- [in] *addr\_type*: : address type
- [in] *addr*: : Device Address
- [in] *sid*: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_clear\_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Return** - ESP\_OK : success  
 • other : failed

```
esp_err_t esp_ble_gap_prefer_ext_connect_params_set (esp_bd_addr_t addr,
                                                    esp_ble_gap_phy_mask_t
                                                    phy_mask, const
                                                    esp_ble_gap_conn_params_t
                                                    *phy_1m_conn_params, const
                                                    esp_ble_gap_conn_params_t
                                                    *phy_2m_conn_params, const
                                                    esp_ble_gap_conn_params_t
                                                    *phy_coded_conn_params)
```

This function is used to set aux connection parameters.

**Return** - ESP\_OK : success  
 • other : failed

#### Parameters

- [in] addr: : device address
- [in] phy\_mask: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] phy\_1m\_conn\_params: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] phy\_2m\_conn\_params: : Connection parameters for the LE 2M PHY are provided.
- [in] phy\_coded\_conn\_params: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

tx phy type

`esp_ble_gap_phy_t rx_phy`  
rx phy type

`struct ble_read_rssi_cmpl_evt_param`  
`#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.`

### Public Members

`esp_bt_status_t status`  
Indicate the read adv tx power operation success status

`int8_t rssi`

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

`esp_bd_addr_t remote_addr`

The remote device address

**struct ble\_remove\_bond\_dev\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT.

### Public Members

`esp_bt_status_t status`

Indicate the remove bond device operation success status

`esp_bd_addr_t bd_addr`

The device address which has been remove from the bond list

**struct ble\_scan\_param\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_PARAM\_SET\_COMPLETE\_EVT.

### Public Members

`esp_bt_status_t status`

Indicate the set scan param operation success status

**struct ble\_scan\_req\_received\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_REQ\_RECEIVED\_EVT.

### Public Members

`uint8_t adv_instance`

extend advertising handle

`esp_ble_addr_type_t scan_addr_type`

scanner address type

`esp_bd_addr_t scan_addr`

scanner address

**struct ble\_scan\_result\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

### Public Members

`esp_gap_search_evt_t search_evt`

Search event type

`esp_bd_addr_t bda`

Bluetooth device address which has been searched

`esp_bt_dev_type_t dev_type`

Device type

`esp_ble_addr_type_t ble_addr_type`

Ble device address type

`esp_ble_evt_type_t ble_evt_type`

Ble scan result event type

**int rssi**  
Searched device' s RSSI

**uint8\_t ble\_adv[ESP\_BLE\_ADV\_DATA\_LEN\_MAX + ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX]**  
Received EIR

**int flag**  
Advertising data flag bit

**int num\_resps**  
Scan result number

**uint8\_t adv\_data\_len**  
Adv data length

**uint8\_t scan\_rsp\_len**  
Scan response length

**uint32\_t num\_dis**  
The number of discard packets

**struct ble\_scan\_rsp\_data\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate the set scan response data operation success status

**struct ble\_scan\_rsp\_data\_raw\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate the set raw advertising data operation success status

**struct ble\_scan\_start\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate scan start operation success status

**struct ble\_scan\_stop\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate scan stop operation success status

**struct ble\_set\_channels\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT.

### Public Members

*esp\_bt\_status\_t* **stat**  
BLE set channel status

**struct ble\_set\_ext\_scan\_params\_cmpl\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate extend advertising parameters set status

**struct ble\_set\_perf\_def\_phy\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_PREFERED\_DEFAULT\_PHY\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate perf default phy set status

**struct ble\_set\_perf\_phy\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_PREFERED\_PHY\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate perf phy set status

**struct ble\_set\_rand\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate set static rand address operation success status

**struct ble\_update\_conn\_params\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate update connection parameters success status

*esp\_bd\_addr\_t* **bda**  
Bluetooth device address

**uint16\_t min\_int**  
Min connection interval

**uint16\_t max\_int**  
Max connection interval

**uint16\_t latency**  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t conn\_int**  
Current connection interval

**uint16\_t timeout**  
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec

**struct ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate update duplicate scan exceptional list operation success status

**uint8\_t subcode**  
Define in *esp\_bt\_duplicate\_exceptional\_subcode\_type\_t*

**uint16\_t length**  
The length of *device\_info*

*esp\_duplicate\_info\_t* **device\_info**  
device information, when subcode is ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN, the value is invalid

**struct ble\_update\_whitelist\_cmpl\_evt\_param**  
*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT.

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate the add or remove whitelist operation success status

*esp\_ble\_wl\_opration\_t* **wl\_opration**  
The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

## Structures

**struct esp\_ble\_adv\_params\_t**  
Advertising parameters.

### Public Members

**uint16\_t adv\_int\_min**  
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

**uint16\_t adv\_int\_max**  
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

*esp\_ble\_adv\_type\_t* **adv\_type**  
Advertising type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
Owner bluetooth device address type

*esp\_bd\_addr\_t* **peer\_addr**  
Peer device bluetooth device address

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**

Peer device bluetooth device address type, only support public address type and random address type

*esp\_ble\_adv\_channel\_t* **channel\_map**

Advertising channel map

*esp\_ble\_adv\_filter\_t* **adv\_filter\_policy**

Advertising filter policy

**struct esp\_ble\_adv\_data\_t**

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

### Public Members

bool **set\_scan\_rsp**

Set this advertising data as scan response or not

bool **include\_name**

Advertising data include device name or not

bool **include\_txpower**

Advertising data include TX power

int **min\_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$  Conn\_Interval\_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max\_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$  Conn\_Interval\_Max range: 0x0006 to 0x0C80 Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**

External appearance of device

uint16\_t **manufacturer\_len**

Manufacturer data length

uint8\_t \***p\_manufacturer\_data**

Manufacturer data point

uint16\_t **service\_data\_len**

Service data length

uint8\_t \***p\_service\_data**

Service data point

uint16\_t **service\_uuid\_len**

Service uuid length

uint8\_t \***p\_service\_uuid**

Service uuid array point

uint8\_t **flag**

Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

**struct esp\_ble\_scan\_params\_t**

Ble scan parameters.

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**

Scan type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner address type

*esp\_ble\_scan\_filter\_t* **scan\_filter\_policy**

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

**struct esp\_gap\_conn\_params\_t**

connection parameters information

### Public Members

uint16\_t **interval**

connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_conn\_update\_params\_t**

Connection update parameters.

### Public Members

*esp\_bd\_addr\_t* **bda**

Bluetooth device address

uint16\_t **min\_int**

Min connection interval

uint16\_t **max\_int**

Max connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_ble\_pkt\_data\_length\_params\_t**

BLE pkt data length keys.

**Public Members**

`uint16_t rx_len`  
pkt rx data length value

`uint16_t tx_len`  
pkt tx data length value

**struct esp\_ble\_penc\_keys\_t**  
BLE encryption keys.

**Public Members**

`esp_bt_octet16_t ltk`  
The long term key

`esp_bt_octet8_t rand`  
The random number

`uint16_t ediv`  
The ediv value

`uint8_t sec_level`  
The security level of the security link

`uint8_t key_size`  
The key size(7~16) of the security link

**struct esp\_ble\_pcsrkeys\_t**  
BLE CSRK keys.

**Public Members**

`uint32_t counter`  
The counter

`esp_bt_octet16_t csrkey`  
The csrkey

`uint8_t sec_level`  
The security level

**struct esp\_ble\_pidkeys\_t**  
BLE pid keys.

**Public Members**

`esp_bt_octet16_t irk`  
The irk value

`esp_ble_addr_type_t addr_type`  
The address type

`esp_bd_addr_t static_addr`  
The static address

**struct esp\_ble\_lenc\_keys\_t**  
BLE Encryption reproduction keys.

**Public Members***esp\_bt\_octet16\_t* **ltk**

The long term key

*uint16\_t* **div**

The div value

*uint8\_t* **key\_size**

The key size of the security link

*uint8\_t* **sec\_level**

The security level of the security link

**struct esp\_ble\_lcsrkeys**

BLE SRK keys.

**Public Members***uint32\_t* **counter**

The counter value

*uint16\_t* **div**

The div value

*uint8\_t* **sec\_level**

The security level of the security link

*esp\_bt\_octet16\_t* **csrkey**

The csrkey value

**struct esp\_ble\_sec\_key\_notif\_t**

Structure associated with ESP\_KEY\_NOTIF\_EVT.

**Public Members***esp\_bd\_addr\_t* **bd\_addr**

peer address

*uint32\_t* **passkey**the numeric value for comparison. If `just_works`, do not show this number to UI**struct esp\_ble\_sec\_req\_t**

Structure of the security request.

**Public Members***esp\_bd\_addr\_t* **bd\_addr**

peer address

**struct esp\_ble\_bond\_key\_info\_t**

struct type of the bond key information value

**Public Members***esp\_ble\_key\_mask\_t* **key\_mask**

the key mask to indicate which key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**

received peer encryption key

*esp\_ble\_pcsr\_key\_t* **pcsr\_key**  
received peer device SRK

*esp\_ble\_pid\_key\_t* **pid\_key**  
peer device ID key

**struct esp\_ble\_bond\_dev\_t**  
struct type of the bond device value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**  
the bond key information

**struct esp\_ble\_key\_t**  
union type of the security key value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
peer address

*esp\_ble\_key\_type\_t* **key\_type**  
key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**  
the pointer to the key value

**struct esp\_ble\_local\_id\_keys\_t**  
structure type of the ble local id keys value

### Public Members

*esp\_bt\_octet16\_t* **ir**  
the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**  
the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**  
the 16 bits of the dh key value

**struct esp\_ble\_auth\_cmpl\_t**  
Structure associated with ESP\_AUTH\_CMPL\_EVT.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**  
BD address peer device.

bool **key\_present**  
Valid link key value in key element

*esp\_link\_key* **key**  
Link key associated with peer device.

uint8\_t **key\_type**  
The type of Link Key

bool **success**  
TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**  
The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**  
Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**  
Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**  
authentication mode

**struct esp\_ble\_gap\_ext\_adv\_params\_t**  
ext adv parameters

### Public Members

*esp\_ble\_ext\_adv\_type\_mask\_t* **type**  
ext adv type

```

```
typedef void (*esp_gap_ble_cb_t) (esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t  
    *param)
```

GAP callback function type.

**Parameters**

- event: : Event type
- param: : Point to callback parameter, currently is union type

**Enumerations**

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

*Values:*

```
ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
```

When advertising data set complete, the event comes

```
ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
```

When scan response data set complete, the event comes

```
ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
```

When scan parameters set complete, the event comes

```
ESP_GAP_BLE_SCAN_RESULT_EVT
```

When one scan result ready, the event comes each time

```
ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
```

When raw advertising data set complete, the event comes

```
ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
```

When raw advertising data set complete, the event comes

**ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT**  
When start advertising complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT**  
When start scan complete, the event comes

**ESP\_GAP\_BLE\_AUTH\_CMPL\_EVT = 8**

**ESP\_GAP\_BLE\_KEY\_EVT**

**ESP\_GAP\_BLE\_SEC\_REQ\_EVT**

**ESP\_GAP\_BLE\_PASSKEY\_NOTIF\_EVT**

**ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**

**ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**

**ESP\_GAP\_BLE\_NC\_REQ\_EVT**

**ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**  
When stop adv complete, the event comes

**ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**  
When stop scan complete, the event comes

**ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT = 19**  
When set the static rand address complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**  
When update connection parameters complete, the event comes

**ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**  
When set pkt length complete, the event comes

**ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**  
When Enable/disable privacy on the local device complete, the event comes

**ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**  
When remove the bond device complete, the event comes

**ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**  
When clear the bond device clear complete, the event comes

**ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**  
When get the bond device list complete, the event comes

**ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**  
When read the rssi complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**  
When add or remove whitelist complete, the event comes

**ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**  
When update duplicate exceptional list complete, the event comes

**ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT = 29**  
When setting BLE channels complete, the event comes

**ESP\_GAP\_BLE\_READ\_PHY\_COMPLETE\_EVT**

**ESP\_GAP\_BLE\_SET\_PREFERED\_DEFAULT\_PHY\_COMPLETE\_EVT**

**ESP\_GAP\_BLE\_SET\_PREFERED\_PHY\_COMPLETE\_EVT**

**ESP\_GAP\_BLE\_EXT\_ADV\_SET\_RAND\_ADDR\_COMPLETE\_EVT**

**enum esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

**BLE\_SCAN\_TYPE\_PASSIVE** = 0x0

Passive scan

**BLE\_SCAN\_TYPE\_ACTIVE** = 0x1

Active scan

**enum esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:***BLE\_SCAN\_FILTER\_ALLOW\_ALL** = 0x0

Accept all :

1. advertisement packets except directed advertising packets not addressed to this device (default).

**BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST** = 0x1

Accept only :

1. advertisement packets from devices where the advertiser' s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

**BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR** = 0x2

Accept all :

1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_RPA\_DIR** = 0x3

Accept all :

1. advertisement packets from devices where the advertiser' s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

**enum esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:***BLE\_SCAN\_DUPLICATE\_DISABLE** = 0x0

the Link Layer should generate advertising reports to the host for each packet received

**BLE\_SCAN\_DUPLICATE\_ENABLE** = 0x1

the Link Layer should filter out duplicate advertising reports to the Host

**BLE\_SCAN\_DUPLICATE\_MAX** = 0x2

0x02 –0xFF, Reserved for future use

**enum esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:***ESP\_GAP\_SEARCH\_INQ\_RES\_EVT** = 0

Inquiry result for a peer device.

**ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT** = 1

Inquiry complete.

**ESP\_GAP\_SEARCH\_DISC\_RES\_EVT** = 2

Discovery result for a peer device.

**ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT** = 3

Discovery result for BLE GATT based service on a peer device.

**ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT** = 4

Discovery complete.

**ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT** = 5

Discovery complete.

**ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT** = 6

Search cancelled

**ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT = 7**

The number of pkt discarded by flow control

**enum esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

**ESP\_BLE\_EVT\_CONN\_ADV = 0x00**

Connectable undirected advertising (ADV\_IND)

**ESP\_BLE\_EVT\_CONN\_DIR\_ADV = 0x01**

Connectable directed advertising (ADV\_DIRECT\_IND)

**ESP\_BLE\_EVT\_DISC\_ADV = 0x02**

Scannable undirected advertising (ADV\_SCAN\_IND)

**ESP\_BLE\_EVT\_NON\_CONN\_ADV = 0x03**

Non connectable undirected advertising (ADV\_NONCONN\_IND)

**ESP\_BLE\_EVT\_SCAN\_RSP = 0x04**

Scan Response (SCAN\_RSP)

**enum esp\_ble\_wl\_opration\_t**

*Values:*

**ESP\_BLE\_WHITELIST\_REMOVE = 0X00**

remove mac from whitelist

**ESP\_BLE\_WHITELIST\_ADD = 0X01**

add address to whitelist

**enum esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

**ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD = 0**

Add device info into duplicate scan exceptional list

**ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**

Remove device info from duplicate scan exceptional list

**ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**

Clean duplicate scan exceptional list

**enum esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR = 0**

BLE advertising address, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

**enum esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST = BLE\_BIT(0)**

duplicate scan exceptional addr list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST** = BLE\_BIT(1)  
duplicate scan exceptional mesh link ID list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST** = BLE\_BIT(2)  
duplicate scan exceptional mesh beacon type list

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST** = BLE\_BIT(3)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST** = BLE\_BIT(4)  
duplicate scan exceptional mesh adv with provisioning service uuid

**ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST** = 0xFFFF  
duplicate scan exceptional all list

## GATT DEFINES

### API Reference

#### Header File

- [bt/host/bluedroid/api/include/api/esp\\_gatt\\_defs.h](#)

#### Unions

**union esp\_gatt\_rsp\_t**  
*#include <esp\_gatt\_defs.h>* GATT remote read request response type.

#### Public Members

*esp\_gatt\_value\_t* **attr\_value**  
Gatt attribute structure

uint16\_t **handle**  
Gatt attribute handle

#### Structures

**struct esp\_gatt\_id\_t**  
Gatt id, include uuid and instance id.

#### Public Members

*esp\_bt\_uuid\_t* **uuid**  
UUID

uint8\_t **inst\_id**  
Instance id

**struct esp\_gatt\_srvc\_id\_t**  
Gatt service id, include id (uuid and instance id) and primary flag.

#### Public Members

*esp\_gatt\_id\_t* **id**  
Gatt id, include uuid and instance

bool **is\_primary**  
This service is primary or not

**struct esp\_attr\_desc\_t**

Attribute description (used to create database)

**Public Members****uint16\_t uuid\_length**

UUID length

**uint8\_t \*uuid\_p**

UUID value

**uint16\_t perm**

Attribute permission

**uint16\_t max\_length**

Maximum length of the element

**uint16\_t length**

Current length of the element

**uint8\_t \*value**

Element value array

**struct esp\_attr\_control\_t**

attribute auto response flag

**Public Members****uint8\_t auto\_rsp**

if auto\_rsp set to ESP\_GATT\_RSP\_BY\_APP, means the response of Write/Read operation will be replied by application. if auto\_rsp set to ESP\_GATT\_AUTO\_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

**struct esp\_gatts\_attr\_db\_t**

attribute type added to the gatt server database

**Public Members***esp\_attr\_control\_t* **attr\_control**

The attribute control type

*esp\_attr\_desc\_t* **att\_desc**

The attribute type

**struct esp\_attr\_value\_t**

set the attribute value type

**Public Members****uint16\_t attr\_max\_len**

attribute max value length

**uint16\_t attr\_len**

attribute current value length

**uint8\_t \*attr\_value**

the pointer to attribute value

**struct esp\_gatts\_incl\_svc\_desc\_t**

Gatt include service entry element.

**Public Members**

`uint16_t start_hdl`  
Gatt start handle value of included service

`uint16_t end_hdl`  
Gatt end handle value of included service

`uint16_t uuid`  
Gatt attribute value UUID of included service

**struct esp\_gatts\_incl128\_svc\_desc\_t**  
Gatt include 128 bit service entry element.

**Public Members**

`uint16_t start_hdl`  
Gatt start handle value of included 128 bit service

`uint16_t end_hdl`  
Gatt end handle value of included 128 bit service

**struct esp\_gatt\_value\_t**  
Gatt attribute value.

**Public Members**

`uint8_t value[ESP_GATT_MAX_ATTR_LEN]`  
Gatt attribute value

`uint16_t handle`  
Gatt attribute handle

`uint16_t offset`  
Gatt attribute value offset

`uint16_t len`  
Gatt attribute value length

`uint8_t auth_req`  
Gatt authentication request

**struct esp\_gatt\_conn\_params\_t**  
Connection parameters information.

**Public Members**

`uint16_t interval`  
connection interval

`uint16_t latency`  
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`  
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

**struct esp\_gattc\_multi\_t**  
read multiple attribute

**Public Members****uint8\_t num\_attr**

The number of the attribute

**uint16\_t handles[ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES]**

The handles list

**struct esp\_gattc\_db\_elem\_t**

data base attribute element

**Public Members***esp\_gatt\_db\_attr\_type\_t* **type**

The attribute type

**uint16\_t attribute\_handle**

The attribute handle, it' s valid for all of the type

**uint16\_t start\_handle**

The service start handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

**uint16\_t end\_handle**

The service end handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties, it' s valid only when the type = ESP\_GATT\_DB\_CHARACTERISTIC

*esp\_bt\_uuid\_t* **uuid**

The attribute uuid, it' s valid for all of the type

**struct esp\_gattc\_service\_elem\_t**

service element

**Public Members****bool is\_primary**

The service flag, true if the service is primary service, else is secondary service

**uint16\_t start\_handle**

The start handle of the service

**uint16\_t end\_handle**

The end handle of the service

*esp\_bt\_uuid\_t* **uuid**

The uuid of the service

**struct esp\_gattc\_char\_elem\_t**

characteristic element

**Public Members****uint16\_t char\_handle**

The characteristic handle

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties

*esp\_bt\_uuid\_t* **uuid**

The characteristic uuid

**struct esp\_gattc\_descr\_elem\_t**  
descriptor element

### Public Members

**uint16\_t handle**  
The characteristic descriptor handle

*esp\_bt\_uuid\_t* **uuid**  
The characteristic descriptor uuid

**struct esp\_gattc\_incl\_svc\_elem\_t**  
include service element

### Public Members

**uint16\_t handle**  
The include service current attribute handle

**uint16\_t incl\_srvc\_s\_handle**  
The start handle of the service which has been included

**uint16\_t incl\_srvc\_e\_handle**  
The end handle of the service which has been included

*esp\_bt\_uuid\_t* **uuid**  
The include service uuid

### Macros

**ESP\_GATT\_UUID\_IMMEDIATE\_ALERT\_SVC**  
All “ESP\_GATT\_UUID\_XXX” is attribute types

**ESP\_GATT\_UUID\_LINK\_LOSS\_SVC**

**ESP\_GATT\_UUID\_TX\_POWER\_SVC**

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

**ESP\_GATT\_MAX\_ATTR\_LEN**  
GATT maximum attribute length.

**ESP\_GATT\_RSP\_BY\_APP**

**ESP\_GATT\_AUTO\_RSP**

**ESP\_GATT\_IF\_NONE**

If callback report `gatt_if/gatts_if` as this macro, means this event is not correspond to any app

### Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different `gatt_if`

**Enumerations****enum esp\_gatt\_prep\_write\_type**

Attribute write data type from the client.

*Values:***ESP\_GATT\_PREP\_WRITE\_CANCEL** = 0x00  
Prepare write cancel**ESP\_GATT\_PREP\_WRITE\_EXEC** = 0x01  
Prepare write execute**enum esp\_gatt\_status\_t**

GATT success code and error codes.

*Values:***ESP\_GATT\_OK** = 0x0**ESP\_GATT\_INVALID\_HANDLE** = 0x01**ESP\_GATT\_READ\_NOT\_PERMIT** = 0x02**ESP\_GATT\_WRITE\_NOT\_PERMIT** = 0x03**ESP\_GATT\_INVALID\_PDU** = 0x04**ESP\_GATT\_INSUF\_AUTHENTICATION** = 0x05**ESP\_GATT\_REQ\_NOT\_SUPPORTED** = 0x06**ESP\_GATT\_INVALID\_OFFSET** = 0x07**ESP\_GATT\_INSUF\_AUTHORIZATION** = 0x08**ESP\_GATT\_PREPARE\_Q\_FULL** = 0x09**ESP\_GATT\_NOT\_FOUND** = 0x0a**ESP\_GATT\_NOT\_LONG** = 0x0b**ESP\_GATT\_INSUF\_KEY\_SIZE** = 0x0c**ESP\_GATT\_INVALID\_ATTR\_LEN** = 0x0d**ESP\_GATT\_ERR\_UNLIKELY** = 0x0e**ESP\_GATT\_INSUF\_ENCRYPTION** = 0x0f**ESP\_GATT\_UNSUPPORT\_GRP\_TYPE** = 0x10**ESP\_GATT\_INSUF\_RESOURCE** = 0x11**ESP\_GATT\_NO\_RESOURCES** = 0x80**ESP\_GATT\_INTERNAL\_ERROR** = 0x81**ESP\_GATT\_WRONG\_STATE** = 0x82**ESP\_GATT\_DB\_FULL** = 0x83**ESP\_GATT\_BUSY** = 0x84**ESP\_GATT\_ERROR** = 0x85**ESP\_GATT\_CMD\_STARTED** = 0x86**ESP\_GATT\_ILLEGAL\_PARAMETER** = 0x87**ESP\_GATT\_PENDING** = 0x88**ESP\_GATT\_AUTH\_FAIL** = 0x89**ESP\_GATT\_MORE** = 0x8a**ESP\_GATT\_INVALID\_CFG** = 0x8b

```
ESP_GATT_SERVICE_STARTED = 0x8c
ESP_GATT_ENCRYPED_MITM = ESP_GATT_OK
ESP_GATT_ENCRYPED_NO_MITM = 0x8d
ESP_GATT_NOT_ENCRYPTED = 0x8e
ESP_GATT_CONGESTED = 0x8f
ESP_GATT_DUP_REG = 0x90
ESP_GATT_ALREADY_OPEN = 0x91
ESP_GATT_CANCEL = 0x92
ESP_GATT_STACK_RSP = 0xe0
ESP_GATT_APP_RSP = 0xe1
ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff
```

```
enum esp_gatt_conn_reason_t
```

Gatt Connection reason enum.

*Values:*

```
ESP_GATT_CONN_UNKNOWN = 0
    Gatt connection unknown
ESP_GATT_CONN_L2C_FAILURE = 1
    General L2cap failure
ESP_GATT_CONN_TIMEOUT = 0x08
    Connection timeout
ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
    Connection terminate by peer user
ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
    Connection terminated by local host
ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
    Connection fail to establish
ESP_GATT_CONN_LMP_TIMEOUT = 0x22
    Connection fail for LMP response tout
ESP_GATT_CONN_CONN_CANCEL = 0x0100
    L2CAP connection cancelled
ESP_GATT_CONN_NONE = 0x0101
    No connection to cancel
```

```
enum esp_gatt_auth_req_t
```

Gatt authentication request type.

*Values:*

```
ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4
```

**enum esp\_service\_source\_t**

*Values:*

**ESP\_GATT\_SERVICE\_FROM\_REMOTE\_DEVICE** = 0

**ESP\_GATT\_SERVICE\_FROM\_NVS\_FLASH** = 1

**ESP\_GATT\_SERVICE\_FROM\_UNKNOWN** = 2

**enum esp\_gatt\_write\_type\_t**

Gatt write type.

*Values:*

**ESP\_GATT\_WRITE\_TYPE\_NO\_RSP** = 1

Gatt write attribute need no response

**ESP\_GATT\_WRITE\_TYPE\_RSP**

Gatt write attribute need remote response

**enum esp\_gatt\_db\_attr\_type\_t**

the type of attribute element

*Values:*

**ESP\_GATT\_DB\_PRIMARY\_SERVICE**

Gattc primary service attribute type in the cache

**ESP\_GATT\_DB\_SECONDARY\_SERVICE**

Gattc secondary service attribute type in the cache

**ESP\_GATT\_DB\_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

**ESP\_GATT\_DB\_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

**ESP\_GATT\_DB\_INCLUDED\_SERVICE**

Gattc include service attribute type in the cache

**ESP\_GATT\_DB\_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

## GATT SERVER API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - [bluetooth/bluedroid/ble/gatt\\_server](#)
  - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

## Header File

- `bt/host/bluedroid/api/include/api/esp_gatts_api.h`

## Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

### Return

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

### Return

- ESP\_OK : success
- other : failed

### Parameters

- [in] gatts\_if: GATT server access interface

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srv\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

### Return

- ESP\_OK : success
- other : failed

### Parameters

- [in] gatts\_if: GATT server access interface
- [in] service\_id: service ID.
- [in] num\_handle: number of handle requested for this service.

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint16\_t max\_nb\_attr, uint8\_t svc\_inst\_id)

Create a service attribute tab.

### Return

- ESP\_OK : success
- other : failed

### Parameters

- [in] gatts\_attr\_db: the pointer to the service attr tab
- [in] gatts\_if: GATT server access interface
- [in] max\_nb\_attr: the number of attribute to be added to the service database.
- [in] svc\_inst\_id: the instance id of the service

*esp\_err\_t* **esp\_ble\_gatts\_add\_included\_service** (uint16\_t service\_handle, uint16\_t included\_service\_handle)

This function is called to add an included service. This function have to be called between 'esp\_ble\_gatts\_create\_service' and 'esp\_ble\_gatts\_add\_char'. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

### Return

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `included_service_handle`: the service ID to be included.

*esp\_err\_t* **esp\_ble\_gatts\_add\_char** (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**char\_uuid*,  
*esp\_gatt\_perm\_t* *perm*, *esp\_gatt\_char\_prop\_t* *property*,  
*esp\_attr\_value\_t* \**char\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add a characteristic into a service.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `char_uuid`: : Characteristic UUID.
- [in] `perm`: : Characteristic value declaration attribute permission.
- [in] `property`: : Characteristic Properties
- [in] `char_val`: : Characteristic value
- [in] `control`: : attribute response control byte

*esp\_err\_t* **esp\_ble\_gatts\_add\_char\_descr** (uint16\_t *service\_handle*, *esp\_bt\_uuid\_t* \**descr\_uuid*,  
*esp\_gatt\_perm\_t* *perm*, *esp\_attr\_value\_t*  
\**char\_descr\_val*, *esp\_attr\_control\_t* \**control*)

This function is called to add characteristic descriptor. When it's done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: service handle to which this characteristic descriptor is to be added.
- [in] `perm`: descriptor access permission.
- [in] `descr_uuid`: descriptor UUID.
- [in] `char_descr_val`: : Characteristic descriptor value
- [in] `control`: : attribute response control byte

*esp\_err\_t* **esp\_ble\_gatts\_delete\_service** (uint16\_t *service\_handle*)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: service\_handle to be deleted.

*esp\_err\_t* **esp\_ble\_gatts\_start\_service** (uint16\_t *service\_handle*)

This function is called to start a service.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: the service handle to be started.

*esp\_err\_t* **esp\_ble\_gatts\_stop\_service** (uint16\_t *service\_handle*)

This function is called to stop a service.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `service_handle`: - service to be topped.

*esp\_err\_t* **esp\_ble\_gatts\_send\_indicate** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint16\_t attr\_handle, uint16\_t value\_len, uint8\_t \*value, bool need\_confirm)

Send indicate or notify to GATT client. Set param need\_confirm as false will send notification, otherwise indication.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: - connection id to indicate.
- [in] attr\_handle: - attribute handle to indicate.
- [in] value\_len: - indicate value length.
- [in] value: value to indicate.
- [in] need\_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

*esp\_err\_t* **esp\_ble\_gatts\_send\_response** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint32\_t trans\_id, *esp\_gatt\_status\_t* status, *esp\_gatt\_rsp\_t* \*rsp)

This function is called to send a response to a request.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] gatts\_if: GATT server access interface
- [in] conn\_id: - connection identifier.
- [in] trans\_id: - transfer id
- [in] status: - response status
- [in] rsp: - response data.

*esp\_err\_t* **esp\_ble\_gatts\_set\_attr\_value** (uint16\_t attr\_handle, uint16\_t length, const uint8\_t \*value)

This function is called to set the attribute value by the application.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] attr\_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

*esp\_gatt\_status\_t* **esp\_ble\_gatts\_get\_attr\_value** (uint16\_t attr\_handle, uint16\_t \*length, const uint8\_t \*\*value)

Retrieve attribute value.

**Return**

- ESP\_GATT\_OK : success
- other : failed

**Parameters**

- [in] attr\_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Open a direct open connection or add a background auto connection.

**Return**

- ESP\_OK : success
- other : failed

**Parameters**

- [in] `gatts_if`: GATT server access interface
- [in] `remote_bda`: remote device bluetooth device address.
- [in] `is_direct`: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `conn_id`: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

#### Return

- `ESP_OK` : success
- other : failed

#### Parameters

- [in] `gatts_if`: GATT server access interface
- [in] `remote_bda`: remote device bluetooth device address. If `remote_bda` is NULL then it will send service change indication to all the connected devices and if not then to a specific device

## Unions

`union esp_ble_gatts_cb_param_t`

`#include <esp_gatts_api.h>` Gatt server callback parameters union.

### Public Members

`struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`

Gatt server callback param of `ESP_GATTS_REG_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read`

Gatt server callback param of `ESP_GATTS_READ_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write`

Gatt server callback param of `ESP_GATTS_WRITE_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write`

Gatt server callback param of `ESP_GATTS_EXEC_WRITE_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu`

Gatt server callback param of `ESP_GATTS_MTU_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf`

Gatt server callback param of `ESP_GATTS_CONF_EVT` (confirm)

`struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create`

Gatt server callback param of `ESP_GATTS_CREATE_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc`

Gatt server callback param of `ESP_GATTS_ADD_INCL_SRVC_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char`

Gatt server callback param of `ESP_GATTS_ADD_CHAR_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr`

Gatt server callback param of `ESP_GATTS_ADD_CHAR_DESCR_EVT`

`struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del`

Gatt server callback param of `ESP_GATTS_DELETE_EVT`

```
struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start  
    Gatt server callback param of ESP_GATTS_START_EVT  
struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop  
    Gatt server callback param of ESP_GATTS_STOP_EVT  
struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect  
    Gatt server callback param of ESP_GATTS_CONNECT_EVT  
struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect  
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT  
struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open  
    Gatt server callback param of ESP_GATTS_OPEN_EVT

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_READ\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been read

uint16\_t **handle**

The attribute handle

uint16\_t **offset**

Offset of the value, if the value is too long

bool **is\_long**

The value is too long or not

bool **need\_rsp**

The read operation need to do response

**struct gatts\_reg\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_REG\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **app\_id**

Application id which input in register API

**struct gatts\_rsp\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_RESPONSE\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **handle**

Attribute handle which send response

**struct gatts\_send\_service\_change\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT.

Service attribute handle

**struct gatts\_stop\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_STOP\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**  
Operation status

uint16\_t **service\_handle**  
Service attribute handle

**struct gatts\_write\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_WRITE\_EVT.

### Public Members

uint16\_t **conn\_id**  
Connection id

uint32\_t **trans\_id**  
Transfer id

*esp\_bd\_addr\_t* **bda**  
The bluetooth device address which been written

uint16\_t **handle**  
The attribute handle

uint16\_t **offset**  
Offset of the value, if the value is too long

bool **need\_rsp**  
The write operation need to do response

bool **is\_prep**  
This write operation is prepare write

uint16\_t **len**  
The write attribute value length

uint8\_t \***value**  
The write attribute value

### Macros

**ESP\_GATT\_PREP\_WRITE\_CANCEL**  
Prepare write flag to indicate cancel prepare write

**ESP\_GATT\_PREP\_WRITE\_EXEC**  
Prepare write flag to indicate execute prepare write

### Type Definitions

```
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
                               esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

#### Parameters

- `event`: : Event type
- `gatts_if`: : GATT server access interface, normally different `gatts_if` correspond to different profile
- `param`: : Point to callback parameter, currently is union type

### Enumerations

**enum esp\_gatts\_cb\_event\_t**  
GATT Server callback function events.

*Values:*

**ESP\_GATTS\_REG\_EVT = 0**  
When register application id, the event comes

**ESP\_GATTS\_READ\_EVT = 1**  
When gatt client request read operation, the event comes

**ESP\_GATTS\_WRITE\_EVT = 2**  
When gatt client request write operation, the event comes

**ESP\_GATTS\_EXEC\_WRITE\_EVT = 3**  
When gatt client request execute write, the event comes

**ESP\_GATTS\_MTU\_EVT = 4**  
When set mtu complete, the event comes

**ESP\_GATTS\_CONF\_EVT = 5**  
When receive confirm, the event comes

**ESP\_GATTS\_UNREG\_EVT = 6**  
When unregister application id, the event comes

**ESP\_GATTS\_CREATE\_EVT = 7**  
When create service complete, the event comes

**ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT = 8**  
When add included service complete, the event comes

**ESP\_GATTS\_ADD\_CHAR\_EVT = 9**  
When add characteristic complete, the event comes

- ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT = 10**  
When add descriptor complete, the event comes
- ESP\_GATTS\_DELETE\_EVT = 11**  
When delete service complete, the event comes
- ESP\_GATTS\_START\_EVT = 12**  
When start service complete, the event comes
- ESP\_GATTS\_STOP\_EVT = 13**  
When stop service complete, the event comes
- ESP\_GATTS\_CONNECT\_EVT = 14**  
When gatt client connect, the event comes
- ESP\_GATTS\_DISCONNECT\_EVT = 15**  
When gatt client disconnect, the event comes
- ESP\_GATTS\_OPEN\_EVT = 16**  
When connect to peer, the event comes
- ESP\_GATTS\_CANCEL\_OPEN\_EVT = 17**  
When disconnect from peer, the event comes
- ESP\_GATTS\_CLOSE\_EVT = 18**  
When gatt server close, the event comes
- ESP\_GATTS\_LISTEN\_EVT = 19**  
When gatt listen to be connected the event comes
- ESP\_GATTS\_CONGEST\_EVT = 20**  
When congest happen, the event comes
- ESP\_GATTS\_RESPONSE\_EVT = 21**  
When gatt send response complete, the event comes
- ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT = 22**  
When gatt create table complete, the event comes
- ESP\_GATTS\_SET\_ATTR\_VAL\_EVT = 23**  
When gatt set attr value complete, the event comes
- ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT = 24**  
When gatt send service change indication complete, the event comes

## GATT CLIENT API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - [bluetooth/bluedroid/ble/gatt\\_client](#)
  - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - [bluetooth/bluedroid/ble/gattc\\_multi\\_connect](#)
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_client](#)

## API Reference

**Header File**

- `bt/host/bluedroid/api/include/api/esp_gattc_api.h`

**Functions**

*esp\_err\_t* **esp\_ble\_gattc\_register\_callback** (*esp\_gattc\_cb\_t* callback)

This function is called to register application callbacks with GATTC module.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] callback: : pointer to the application callback function.

*esp\_err\_t* **esp\_ble\_gattc\_app\_register** (uint16\_t app\_id)

This function is called to register application callbacks with GATTC module.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] app\_id: : Application Identify (UUID), for different application

*esp\_err\_t* **esp\_ble\_gattc\_app\_unregister** (*esp\_gatt\_if\_t* gattc\_if)

This function is called to unregister an application from GATTC module.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.

*esp\_err\_t* **esp\_ble\_gattc\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

Open a direct connection or add a background auto connection.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] remote\_bda: remote device bluetooth device address.
- [in] remote\_addr\_type: remote device bluetooth device the address type.
- [in] is\_direct: direct connection or background auto connection (by now, background auto connection is not supported).

*esp\_err\_t* **esp\_ble\_gattc\_aux\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app\_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use `esp_ble_gap_disconnect(esp_bd_addr_t remote_device)`.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID to be closed.

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use

`esp_ble_gatt_set_local_mtu()` to configure the local MTU size.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *esp\_bt\_uuid\_t* `*filter_uuid`)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `filter_uuid`: a UUID of the service application is interested in. If Null, discover for all services.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_service** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *esp\_bt\_uuid\_t* `*svc_uuid`, *esp\_gattc\_service\_elem\_t* `*result`, *uint16\_t* `*count`, *uint16\_t* `offset`)

Find all the service with the given service uuid in the gattc cache, if the `svc_uuid` is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the `esp_ble_gattc_cache_refresh`, then call `esp_ble_gattc_get_service` again.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `svc_uuid`: the pointer to the service uuid.
- [out] `result`: The pointer to the service which has been found in the gattc cache.
- [inout] `count`: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] `offset`: Offset of the service position to get.

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_char** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *uint16\_t* `start_handle`, *uint16\_t* `end_handle`, *esp\_gattc\_char\_elem\_t* `*result`, *uint16\_t* `*count`, *uint16\_t* `offset`)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle.
- [in] `end_handle`: the attribute end handle
- [out] `result`: The pointer to the characteristic in the service.
- [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] `offset`: Offset of the characteristic position to get.

```
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
char_handle, esp_gattc_descr_elem_t *result,
uint16_t *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] char\_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t
end_handle, esp_bt_uuid_t char_uuid,
esp_gattc_char_elem_t *result, uint16_t
*count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] char\_uuid: the characteristic uuid
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t
conn_id, uint16_t start_handle,
uint16_t end_handle, esp_bt_uuid_t
char_uuid, esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result, uint16_t
*count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] char\_uuid: the characteristic uuid.
- [in] descr\_uuid: the descriptor uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle,
esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result,
uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] char\_handle: the characteristic handle.
- [in] descr\_uuid: the descriptor uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t
end_handle, esp_bt_uuid_t *incl_uuid,
esp_gattc_incl_svc_elem_t *result,
uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] incl\_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id,
esp_gatt_db_attr_type_t type, uint16_t
start_handle, uint16_t end_handle, uint16_t
char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: connection ID which identify the server.
- [in] type: the attribute type.
- [in] start\_handle: the attribute start handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- [in] end\_handle: the attribute end handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- [in] char\_handle: the characteristic handle, this parameter valid when the type is ESP\_GATT\_DB\_DESCRIPTOR. If the type isn't ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore.

- [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_gattc_db_elem_t
*db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] start\_handle: the attribute start handle
- [in] end\_handle: the attribute end handle
- [in] conn\_id: connection ID which identify the server.
- [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] count: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] handle: : characteritic handle to read.
- [in] auth\_req: : authenticate request type

```
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid,
esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic UUID.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] start\_handle: : the attribute start handle.
- [in] end\_handle: : the attribute end handle
- [in] uuid: : The UUID of attribute which will be read.
- [in] auth\_req: : authenticate request type

```
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id,
esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t
auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] conn\_id: : connection ID.
- [in] read\_multi: : pointer to the read multiple parameter.
- [in] auth\_req: : authenticate request type

*esp\_err\_t esp\_ble\_gattc\_read\_char\_descr* (*esp\_gatt\_if\_t gattc\_if*, *uint16\_t conn\_id*, *uint16\_t handle*, *esp\_gatt\_auth\_req\_t auth\_req*)

This function is called to read a characteristics descriptor.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *handle*: : descriptor handle to read.
- [in] *auth\_req*: : authenticate request type

*esp\_err\_t esp\_ble\_gattc\_write\_char* (*esp\_gatt\_if\_t gattc\_if*, *uint16\_t conn\_id*, *uint16\_t handle*, *uint16\_t value\_len*, *uint8\_t \*value*, *esp\_gatt\_write\_type\_t write\_type*, *esp\_gatt\_auth\_req\_t auth\_req*)

This function is called to write characteristic value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *handle*: : characteristic handle to write.
- [in] *value\_len*: length of the value to be written.
- [in] *value*: : the value to be written.
- [in] *write\_type*: : the type of attribute write operation.
- [in] *auth\_req*: : authentication request.

*esp\_err\_t esp\_ble\_gattc\_write\_char\_descr* (*esp\_gatt\_if\_t gattc\_if*, *uint16\_t conn\_id*, *uint16\_t handle*, *uint16\_t value\_len*, *uint8\_t \*value*, *esp\_gatt\_write\_type\_t write\_type*, *esp\_gatt\_auth\_req\_t auth\_req*)

This function is called to write characteristic descriptor value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID
- [in] *handle*: : descriptor handle to write.
- [in] *value\_len*: length of the value to be written.
- [in] *value*: : the value to be written.
- [in] *write\_type*: : the type of attribute write operation.
- [in] *auth\_req*: : authentication request.

*esp\_err\_t esp\_ble\_gattc\_prepare\_write* (*esp\_gatt\_if\_t gattc\_if*, *uint16\_t conn\_id*, *uint16\_t handle*, *uint16\_t offset*, *uint16\_t value\_len*, *uint8\_t \*value*, *esp\_gatt\_auth\_req\_t auth\_req*)

This function is called to prepare write a characteristic value.

**Return**

- ESP\_OK: success
- other: failed

**Parameters**

- [in] *gattc\_if*: Gatt client access interface.
- [in] *conn\_id*: : connection ID.
- [in] *handle*: : characteristic handle to prepare write.
- [in] *offset*: : offset of the write value.
- [in] *value\_len*: length of the value to be written.

- [in] `value`: : the value to be written.
- [in] `auth_req`: : authentication request.

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write\_char\_descr** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *uint16\_t* `handle`, *uint16\_t* `offset`, *uint16\_t* `value_len`, *uint8\_t* `*value`, *esp\_gatt\_auth\_req\_t* `auth_req`)

This function is called to prepare write a characteristic descriptor value.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID.
- [in] `handle`: : characteristic descriptor handle to prepare write.
- [in] `offset`: : offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: : the value to be written.
- [in] `auth_req`: : authentication request.

*esp\_err\_t* **esp\_ble\_gattc\_execute\_write** (*esp\_gatt\_if\_t* `gattc_if`, *uint16\_t* `conn_id`, *bool* `is_execute`)

This function is called to execute write a prepare write sequence.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: : connection ID.
- [in] `is_execute`: : execute or cancel.

*esp\_err\_t* **esp\_ble\_gattc\_register\_for\_notify** (*esp\_gatt\_if\_t* `gattc_if`, *esp\_bd\_addr\_t* `server_bda`, *uint16\_t* `handle`)

This function is called to register for notification of a service.

#### Return

- ESP\_OK: registration succeeds
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* `gattc_if`, *esp\_bd\_addr\_t* `server_bda`, *uint16\_t* `handle`)

This function is called to de-register for notification of a service.

#### Return

- ESP\_OK: unregister succeeds
- other: failed

#### Parameters

- [in] `gattc_if`: Gatt client access interface.
- [in] `server_bda`: : target GATT server.
- [in] `handle`: : GATT characteristic handle.

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* `remote_bda`)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] remote\_bda: remote device BD address.

*esp\_err\_t esp\_ble\_gattc\_cache\_assoc* (*esp\_gatt\_if\_t gattc\_if*, *esp\_bd\_addr\_t src\_addr*, *esp\_bd\_addr\_t assoc\_addr*, bool *is\_assoc*)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device wants to use the database has stored in the local cache. The source address means that device wants to share the database to the associated address device.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.
- [in] src\_addr: the source address which provides the attribute table.
- [in] assoc\_addr: the associated device address which went to share the attribute table with the source address.
- [in] is\_assoc: true add the associated device address, false remove the associated device address.

*esp\_err\_t esp\_ble\_gattc\_cache\_get\_addr\_list* (*esp\_gatt\_if\_t gattc\_if*)

Get the address list which has stored the attribute table in the gattc cache. There will be a callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when the address list is complete.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] gattc\_if: Gatt client access interface.

*esp\_err\_t esp\_ble\_gattc\_cache\_clean* (*esp\_bd\_addr\_t remote\_bda*)

Clean the service cache of this device in the gattc stack.

#### Return

- ESP\_OK: success
- other: failed

#### Parameters

- [in] remote\_bda: remote device BD address.

## Unions

**union esp\_ble\_gattc\_cb\_param\_t**

#include <esp\_gattc\_api.h> Gatt client callback parameters union.

### Public Members

### Type Definitions

```
typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,  
esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

#### Parameters

- **event**: : Event type
- **gattc\_if**: : GATT client access interface, normally different gattc\_if correspond to different profile
- **param**: : Point to callback parameter, currently is union type

### Enumerations

```
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

*Values:*

**ESP\_GATTC\_REG\_EVT** = 0

When GATT client is registered, the event comes

**ESP\_GATTC\_UNREG\_EVT** = 1

When GATT client is unregistered, the event comes

**ESP\_GATTC\_OPEN\_EVT** = 2

When GATT virtual connection is set up, the event comes

**ESP\_GATTC\_READ\_CHAR\_EVT** = 3

When GATT characteristic is read, the event comes

**ESP\_GATTC\_WRITE\_CHAR\_EVT** = 4

When GATT characteristic write operation completes, the event comes

**ESP\_GATTC\_CLOSE\_EVT** = 5

When GATT virtual connection is closed, the event comes

**ESP\_GATTC\_SEARCH\_CMPL\_EVT** = 6

When GATT service discovery is completed, the event comes

- ESP\_GATTC\_SEARCH\_RES\_EVT = 7**  
When GATT service discovery result is got, the event comes
- ESP\_GATTC\_READ\_DESCR\_EVT = 8**  
When GATT characteristic descriptor read completes, the event comes
- ESP\_GATTC\_WRITE\_DESCR\_EVT = 9**  
When GATT characteristic descriptor write completes, the event comes
- ESP\_GATTC\_NOTIFY\_EVT = 10**  
When GATT notification or indication arrives, the event comes
- ESP\_GATTC\_PREP\_WRITE\_EVT = 11**  
When GATT prepare-write operation completes, the event comes
- ESP\_GATTC\_EXEC\_EVT = 12**  
When write execution completes, the event comes
- ESP\_GATTC\_ACL\_EVT = 13**  
When ACL connection is up, the event comes
- ESP\_GATTC\_CANCEL\_OPEN\_EVT = 14**  
When GATT client ongoing connection is cancelled, the event comes
- ESP\_GATTC\_SRVC\_CHG\_EVT = 15**  
When “service changed” occurs, the event comes
- ESP\_GATTC\_ENC\_CMPL\_CB\_EVT = 17**  
When encryption procedure completes, the event comes
- ESP\_GATTC\_CFG\_MTU\_EVT = 18**  
When configuration of MTU completes, the event comes
- ESP\_GATTC\_ADV\_DATA\_EVT = 19**  
When advertising of data, the event comes
- ESP\_GATTC\_MULT\_ADV\_ENB\_EVT = 20**

When Batch scan parameters are set, the event comes
- ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT = 30**  
When Batch scan is disabled, the event comes

**ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT = 31**

When Scan filter configuration completes, the event comes

**ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT = 32**

When Scan filter parameters are set, the event comes

**ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT = 33**

When Scan filter status is reported, the event comes

**ESP\_GATTC\_ADV\_VSC\_EVT = 34**

When advertising vendor spec content event is reported, the event comes

**ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT = 38**

When register for notification of a service completes, the event comes

**ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT = 39**

When unregister for notification of a service completes, the event comes

**ESP\_GATTC\_CONNECT\_EVT = 40**

When the ble physical connection is set up, the event comes

**ESP\_GATTC\_DISCONNECT\_EVT = 41**

When the ble physical connection disconnected, the event comes

**ESP\_GATTC\_READ\_MULTIPLE\_EVT = 42**

When the ble characteristic or descriptor multiple complete, the event comes

**ESP\_GATTC\_QUEUE\_FULL\_EVT = 43**

When the gattc command queue full, the event comes

**ESP\_GATTC\_SET\_ASSOC\_EVT = 44**

When the ble gattc set the associated address complete, the event comes

**ESP\_GATTC\_GET\_ADDR\_LIST\_EVT = 45**

When the ble get gattc address list in cache finish, the event comes

**ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT = 46**

When the ble discover service complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example** Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’ s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

## API Reference

### Header File

- [bt/common/api/include/api/esp\\_blufi\\_api.h](#)

## Functions

*esp\_err\_t* **esp\_blufi\_register\_callbacks** (*esp\_blufi\_callbacks\_t* \*callbacks)

This function is called to receive blufi callback event.

**Return** ESP\_OK - success, other - failed

### Parameters

- [in] *callbacks*: callback functions

*esp\_err\_t* **esp\_blufi\_profile\_init** (void)

This function is called to initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_deinit** (void)

This function is called to de-initialize blufi\_profile.

**Return** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_conn\_report** (*wifi\_mode\_t* *opmode*, *esp\_blufi\_sta\_conn\_state\_t* *sta\_conn\_state*, *uint8\_t* *softap\_conn\_num*, *esp\_blufi\_extra\_info\_t* \**extra\_info*)

This function is called to send wifi connection report.

**Return** ESP\_OK - success, other - failed

### Parameters

- *opmode*: : wifi opmode
- *sta\_conn\_state*: : station is already in connection or not
- *softap\_conn\_num*: : softap connection number
- *extra\_info*: : extra information, such as *sta\_ssid*, *softap\_ssid* and etc.

*esp\_err\_t* **esp\_blufi\_send\_wifi\_list** (*uint16\_t* *apCount*, *esp\_blufi\_ap\_record\_t* \**list*)

This function is called to send wifi list.

**Return** ESP\_OK - success, other - failed

### Parameters

- *apCount*: : wifi list count
- *list*: : wifi list

*uint16\_t* **esp\_blufi\_get\_version** (void)

Get BLUFI profile version.

**Return** Most 8bit significant is Great version, Least 8bit is Sub version

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* *state*)

This function is called to send blufi error information.

**Return** ESP\_OK - success, other - failed

### Parameters

- *state*: : error state

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (*uint8\_t* \**data*, *uint32\_t* *data\_len*)

This function is called to custom data.

**Return** ESP\_OK - success, other - failed

### Parameters

- *data*: : custom data value
- *data\_len*: : the length of custom data

## Unions

**union** **esp\_blufi\_cb\_param\_t**

*#include* <*esp\_blufi\_api.h*> BLUFI callback parameters union.

**Public Members**

BLUFI check sum function (FCS)

## Macros

**ESP\_BLUFI\_BD\_ADDR\_LEN**  
Bluetooth address length.

## Type Definitions

**typedef** uint8\_t **esp\_blufi\_bd\_addr\_t**[ESP\_BLUFI\_BD\_ADDR\_LEN]  
Bluetooth device address.

**typedef** void (\***esp\_blufi\_event\_cb\_t**) (*esp\_blufi\_cb\_event\_t* event, *esp\_blufi\_cb\_param\_t* \*param)  
BLUFI event callback function type.

### Parameters

- event: : Event type
- param: : Point to callback parameter, currently is union type

**typedef** void (\***esp\_blufi\_negotiate\_data\_handler\_t**) (uint8\_t \*data, int len, uint8\_t \*\*output\_data, int \*output\_len, bool \*need\_free)

BLUFI negotiate data handler.

### Parameters

- data: : data from phone
- len: : length of data from phone
- output\_data: : data want to send to phone
- output\_len: : length of data want to send to phone
- need\_free: : output reporting if memory needs to be freed or not \*

**typedef** int (\***esp\_blufi\_encrypt\_func\_t**) (uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)  
BLUFI encrypt the data after negotiate a share key.

**Return** Nonnegative number is encrypted length, if error, return negative number;

### Parameters

- iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
- crypt\_data: : plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt\_len: : length of plain text

**typedef** int (\***esp\_blufi\_decrypt\_func\_t**) (uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)  
BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

### Parameters

- iv8: : initial vector(8bit), normally, blufi core will input packet sequence number
- crypt\_data: : encrypted data and plain text, the encrypt function must support autochthonous decrypt
- crypt\_len: : length of encrypted text

```
typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
    BLUFI checksum.
```

**Parameters**

- `iv8`: : initial vector(8bit), normally, blufi core will input packet sequence number
- `data`: : data need to checksum
- `len`: : length of data

**Enumerations**

```
enum esp_blufi_cb_event_t
```

*Values:*

```
ESP_BLUFI_EVENT_INIT_FINISH = 0
ESP_BLUFI_EVENT_DEINIT_FINISH
ESP_BLUFI_EVENT_SET_WIFI_OPMODE

```

## 2.1.4 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for

maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

### Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

## API Reference

### Header File

- `bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

### Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

#### Return

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init` (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

#### Return

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

#### *esp\_err\_t* `esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

#### Return

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

#### *esp\_err\_t* `esp_nimble_hci_and_controller_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with
        ↪error: %d", ret);
    }
}
```

If `nimble_port_freertos_init()` is used during initialization, then `nimble_port_freertos_deinit()` should be called in the host task after `nimble_port_run()`.

#### Return

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from esp\_err\_t in case of an error

## 2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [Getting Started with ESP-BLE-MESH](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH Architecture](#).

### Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH Examples](#) and [ESP-BLE-MESH Demo Videos](#).

### API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

### ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

### Header File

- [bt/esp\\_ble\\_mesh/api/esp\\_ble\\_mesh\\_defs.h](#)

**struct ble\_mesh\_friend\_friendship\_terminate\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT.

### Public Types

**enum [anonymous]**

This enum value is the reason of friendship termination on the friend node side

*Values:*

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_ESTABLISH\_FAIL**  
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_POLL\_TIMEOUT**  
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_REQ**  
Receive Friend Request from existing Low Power Node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_CLEAR**  
Receive Friend Clear from other friend node

**ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_DISABLE**  
Friend feature disabled or corresponding NetKey is deleted

### Public Members

**uint16\_t lpn\_addr**  
Low Power Node unicast address

*esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::***[anonymous] reason**  
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

**int16\_t delta\_uv**

The value of the Light CTL Delta UV state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_ctl\_temp\_delta\_uv**

The Light CTL Temperature & Delta UV states

**uint16\_t hue**

The value of the Light HSL Hue state

**uint16\_t saturation**

The value of the Light HSL Saturation state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_hsl**

The Light HSL composite state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_hsl\_lightness**

The Light HSL Lightness state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_hsl\_hue**

The Light HSL Hue state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_hsl\_saturation**

The Light HSL Saturation state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_xyl\_lightness**

The Light xyL Lightness state

**struct esp\_ble\_mesh\_server\_state\_value\_t::[anonymous] light\_lc\_light\_onoff**

The Light LC Light OnOff state

**union esp\_ble\_mesh\_model\_cb\_param\_t**

*#include <esp\_ble\_mesh\_defs.h>* BLE Mesh model callback parameters union.

### Public Members

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_model\_operation\_evt\_param model\_operation**

Event parameter of ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_model\_send\_comp\_param model\_send\_comp**

Event parameter of ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_model\_publish\_comp\_param model\_publish\_comp**

Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_mod\_rcv\_publish\_msg\_param client\_rcv\_publish\_msg**

Event parameter of ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_client\_model\_send\_timeout\_param client\_send\_timeout**

Event parameter of ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_model\_publish\_update\_evt\_param model\_publish\_update**

Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT

**struct esp\_ble\_mesh\_model\_cb\_param\_t::ble\_mesh\_server\_model\_update\_state\_comp\_param server\_model\_update**

Event parameter of ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT

**struct ble\_mesh\_client\_model\_send\_timeout\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT.

### Public Members

**uint32\_t opcode**

Opcode of the previously sent message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which sends the previous message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**  
Pointer to the context of the previous message

**struct ble\_mesh\_mod\_rcv\_publish\_msg\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT.

### Public Members

uint32\_t **opcode**  
Opcode of the unsolicited received message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**  
Pointer to the context of the message

uint16\_t **length**  
Length of the received message

uint8\_t \***msg**  
Value of the received message

**struct ble\_mesh\_model\_operation\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT.

### Public Members

uint32\_t **opcode**  
Opcode of the received message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**  
Pointer to the context of the received message

uint16\_t **length**  
Length of the received message

uint8\_t \***msg**  
Value of the received message

**struct ble\_mesh\_model\_publish\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT.

### Public Members

int **err\_code**  
Indicate the result of publishing a message

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the model which publishes the message

**struct ble\_mesh\_model\_publish\_update\_evt\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which is going to update its publish message

**struct ble\_mesh\_model\_send\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of sending a message

uint32\_t **opcode**

Opcode of the message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which sends the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Context of the message

**struct ble\_mesh\_server\_model\_update\_state\_comp\_param**  
*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of updating server model state

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the server model which state value is updated

*esp\_ble\_mesh\_server\_state\_type\_t* **type**

Type of the updated server state

### Structures

**struct esp\_ble\_mesh\_deinit\_param\_t**  
BLE Mesh deinit parameters

### Public Members

bool **erase\_flash**

Indicate if erasing flash when deinit mesh stack

**struct esp\_ble\_mesh\_elem\_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

### Public Members

uint16\_t **element\_addr**

Element Address, assigned during provisioning.

**const** uint16\_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

**const** uint8\_t **sig\_model\_count**

SIG Model count

**const uint8\_t vnd\_model\_count**

Vendor Model count

*esp\_ble\_mesh\_model\_t* \***sig\_models**

SIG Models

*esp\_ble\_mesh\_model\_t* \***vnd\_models**

Vendor Models

**struct esp\_ble\_mesh\_model\_pub\_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16\_t **publish\_addr**

Publish Address.

uint16\_t **app\_idx** : 12

Publish AppKey Index.

uint16\_t **cred** : 1

Friendship Credentials Flag.

uint16\_t **send\_rel** : 1

Force reliable sending (segment acks)

uint8\_t **tvl**

Publish Time to Live.

uint8\_t **retransmit**

Retransmit Count & Interval Steps.

uint8\_t **period**

Publish Period.

uint8\_t **period\_div** : 4

Divisor for the Period.

uint8\_t **fast\_period** : 1

Use FastPeriodDivisor

uint8\_t **count** : 3

Retransmissions left.

uint32\_t **period\_start**

Start of the current period.

**struct net\_buf\_simple \*msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

*esp\_ble\_mesh\_cb\_t* **update**

Callback used to update publish message. Initialized by the stack.

**struct k\_delayed\_work timer**

Publish Period Timer. Initialized by the stack.

uint8\_t **dev\_role**

Role of the device that is going to publish messages

**struct esp\_ble\_mesh\_model\_op\_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

**Public Members****const uint32\_t opcode**

Message opcode

**const size\_t min\_len**

Message minimum length

*esp\_ble\_mesh\_cb\_t param\_cb*

Callback used to handle message. Initialized by the stack.

**struct esp\_ble\_mesh\_model\_cbs\_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

**Public Members***esp\_ble\_mesh\_cb\_t init\_cb*

Callback used during model initialization. Initialized by the stack.

**struct esp\_ble\_mesh\_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`

**Public Members****const uint16\_t model\_id**

16-bit model identifier

**uint16\_t company\_id**

16-bit company identifier

**uint16\_t vnd\_model\_id**

16-bit vendor model identifier

**struct esp\_ble\_mesh\_model::[anonymous]::[anonymous] vnd**

Structure encapsulating a model ID with a company ID

**union esp\_ble\_mesh\_model::[anonymous] [anonymous]**

Model ID

**uint8\_t element\_idx**

Internal information, mainly for persistent storage Belongs to Nth element

**uint8\_t model\_idx**

Is the Nth model in the element

**uint16\_t flags**

Information about what has changed

*esp\_ble\_mesh\_elem\_t \*element*

The Element to which this Model belongs

*esp\_ble\_mesh\_model\_pub\_t \*const pub*

Model Publication

**uint16\_t keys[CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT]**

AppKey List

uint16\_t **groups**[**CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**]  
Subscription List (group or virtual addresses)

*esp\_ble\_mesh\_model\_op\_t* \***op**  
Model operation context

*esp\_ble\_mesh\_model\_cbs\_t* \***cb**  
Model callback structure

void \***user\_data**  
Model-specific user data

**struct esp\_ble\_mesh\_msg\_ctx\_t**  
Message sending context. This structure is associated with struct bt\_mesh\_msg\_ctx in mesh\_access.h

### Public Members

uint16\_t **net\_idx**  
NetKey Index of the subnet through which to send the message.

uint16\_t **app\_idx**  
AppKey Index for message encryption.

uint16\_t **addr**  
Remote address.

uint16\_t **recv\_dst**  
Destination address of a received message. Not used for sending.

int8\_t **recv\_rssi**  
RSSI of received packet. Not used for sending.

uint8\_t **recv\_ttl** : 7  
Received TTL value. Not used for sending.

uint8\_t **send\_rel** : 1  
Force sending reliably by using segment acknowledgement

uint8\_t **send\_ttl**  
TTL, or ESP\_BLE\_MESH\_TTL\_DEFAULT for default TTL.

uint32\_t **recv\_op**  
Opcode of a received message. Not used for sending message.

*esp\_ble\_mesh\_model\_t* \***model**  
Model corresponding to the message, no need to be initialized before sending message

bool **srv\_send**  
Indicate if the message is sent by a node server model, no need to be initialized before sending message

**struct esp\_ble\_mesh\_prov\_t**  
Provisioning properties & capabilities. This structure is associated with struct bt\_mesh\_prov in mesh\_access.h

**struct esp\_ble\_mesh\_comp\_t**  
Node Composition data context. This structure is associated with struct bt\_mesh\_comp in mesh\_access.h

### Public Members

uint16\_t **cid**  
16-bit SIG-assigned company identifier

uint16\_t **pid**  
16-bit vendor-assigned product identifier

uint16\_t **vid**  
16-bit vendor-assigned product version identifier

`size_t element_count`  
Element count

`esp_ble_mesh_elem_t *elements`  
A sequence of elements

**struct esp\_ble\_mesh\_unprov\_dev\_add\_t**  
Information of the device which is going to be added for provisioning.

### Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

`esp_ble_mesh_addr_type_t addr_type`  
Device address type

`uint8_t uuid[16]`  
Device UUID

`uint16_t oob_info`  
Device OOB Info ADD\_DEV\_START\_PROV\_NOW\_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

`esp_ble_mesh_prov_bearer_t bearer`  
Provisioning Bearer

**struct esp\_ble\_mesh\_device\_delete\_t**  
Information of the device which is going to be deleted.

### Public Members

`esp_ble_mesh_bd_addr_t addr`  
Device address

`esp_ble_mesh_addr_type_t addr_type`  
Device address type

`uint8_t uuid[16]`  
Device UUID

`uint8_t flag`  
BIT0: device address; BIT1: device UUID

**struct esp\_ble\_mesh\_prov\_data\_info\_t**  
Information of the provisioner which is going to be updated.

### Public Members

`uint16_t net_idx`  
NetKey Index

`uint8_t flags`  
Flags

`uint32_t iv_index`  
IV Index

`uint8_t flag`  
BIT0: net\_idx; BIT1: flags; BIT2: iv\_index

**struct esp\_ble\_mesh\_node\_t**  
Information of the provisioned node

**Public Members**

*esp\_ble\_mesh\_bd\_addr\_t* **addr**  
Node device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**  
Node device address type

uint8\_t **dev\_uuid**[16]  
Device UUID

uint16\_t **oob\_info**  
Node OOB information

uint16\_t **unicast\_addr**  
Node unicast address

uint8\_t **element\_num**  
Node element number

uint16\_t **net\_idx**  
Node NetKey Index

uint8\_t **flags**  
Node key refresh flag and iv update flag

uint32\_t **iv\_index**  
Node IV Index

uint8\_t **dev\_key**[16]  
Node device key

char **name**[ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN + 1]  
Node name

uint16\_t **comp\_length**  
Length of Composition Data

uint8\_t \***comp\_data**  
Value of Composition Data

**struct esp\_ble\_mesh\_fast\_prov\_info\_t**  
Context of fast provisioning which need to be set.

**Public Members**

uint16\_t **unicast\_min**  
Minimum unicast address used for fast provisioning

uint16\_t **unicast\_max**  
Maximum unicast address used for fast provisioning

uint16\_t **net\_idx**  
Netkey index used for fast provisioning

uint8\_t **flags**  
Flags used for fast provisioning

uint32\_t **iv\_index**  
IV Index used for fast provisioning

uint8\_t **offset**  
Offset of the UUID to be compared

uint8\_t **match\_len**  
Length of the UUID to be compared

`uint8_t match_val[16]`  
Value of UUID to be compared

**struct esp\_ble\_mesh\_heartbeat\_filter\_info\_t**  
Context of Provisioner heartbeat filter information to be set

### Public Members

`uint16_t hb_src`  
Heartbeat source address (unicast address)

`uint16_t hb_dst`  
Heartbeat destination address (unicast address or group address)

**struct esp\_ble\_mesh\_client\_op\_pair\_t**  
BLE Mesh client models related definitions.  
Client model Get/Set message opcode and corresponding Status message opcode

### Public Members

`uint32_t cli_op`  
The client message opcode

`uint32_t status_op`  
The server status opcode corresponding to the client message opcode

**struct esp\_ble\_mesh\_client\_t**  
Client Model user data context.

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the client model. Initialized by the stack.

`int op_pair_size`  
Size of the op\_pair

`const esp_ble_mesh_client_op_pair_t *op_pair`  
Table containing get/set message opcode and corresponding status message opcode

`uint32_t publish_status`  
Callback used to handle the received unsolicited message. Initialized by the stack.

`void *internal_data`  
Pointer to the internal data of client model

`uint8_t msg_role`  
Role of the device (Node/Provisioner) that is going to send messages

**struct esp\_ble\_mesh\_client\_common\_param\_t**  
Common parameters of the messages sent by Client Model.

### Public Members

`esp_ble_mesh_opcode_t opcode`  
Message opcode

`esp_ble_mesh_model_t *model`  
Pointer to the client model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

The context used to send message

*int32\_t* **msg\_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

*uint8\_t* **msg\_role**

Role of the device - Node/Provisioner

**struct esp\_ble\_mesh\_state\_transition\_t**

Parameters of the server model state transition

### Public Functions

**BLE\_MESH\_ATOMIC\_DEFINE** (flag, *ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp\_ble\_mesh\_state\_transition\_t* sets “set\_auto\_rsp” to *ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

*bool* **just\_started**

Indicate if the state transition has just started

*uint8\_t* **trans\_time**

State transition time

*uint8\_t* **remain\_time**

Remaining time of state transition

*uint8\_t* **delay**

Delay before starting state transition

*uint32\_t* **quo\_tt**

Duration of each divided transition step

*uint32\_t* **counter**

Number of steps which the transition duration is divided

*uint32\_t* **total\_duration**

State transition total duration

*int64\_t* **start\_timestamp**

Time when the state transition is started

**struct k\_delayed\_work timer**

Timer used for state transition

**struct esp\_ble\_mesh\_last\_msg\_info\_t**

Parameters of the server model received last same set message.

### Public Members

*uint8\_t* **tid**

Transaction number of the last message

*uint16\_t* **src**

Source address of the last message

**uint16\_t dst**  
Destination address of the last message

**int64\_t timestamp**  
Time when the last message is received

**struct esp\_ble\_mesh\_server\_rsp\_ctrl\_t**  
Parameters of the Server Model response control

### Public Members

**uint8\_t get\_auto\_rsp** : 1  
BLE Mesh Server Response Option.

1. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;

**uint8\_t set\_auto\_rsp** : 1  
Response control for Client Set messages

**uint8\_t status\_auto\_rsp** : 1  
Response control for Server Status messages

### Macros

**ESP\_BLE\_MESH\_SDU\_MAX\_LEN**  
< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_SHORT**  
Length of a long Mesh MIC.

**ESP\_BLE\_MESH\_MIC\_LONG**  
The maximum length of a BLE Mesh provisioned node name

**ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN**  
The maximum length of a BLE Mesh unprovisioned device name

**ESP\_BLE\_MESH\_DEVICE\_NAME\_MAX\_LEN**  
The maximum length of settings user id

**ESP\_BLE\_MESH\_SETTINGS\_UID\_SIZE**  
Invalid settings index

**ESP\_BLE\_MESH\_INVALID\_SETTINGS\_IDX**  
Define the BLE Mesh octet 16 bytes size

**ESP\_BLE\_MESH\_OCTET16\_LEN**

**ESP\_BLE\_MESH\_OCTET8\_LEN**

**ESP\_BLE\_MESH\_CID\_NVAL**  
Special TTL value to request using configured default TTL

**ESP\_BLE\_MESH\_TTL\_DEFAULT**  
Maximum allowed TTL value

**ESP\_BLE\_MESH\_TTL\_MAX**  
**ESP\_BLE\_MESH\_ADDR\_UNASSIGNED**  
**ESP\_BLE\_MESH\_ADDR\_ALL\_NODES**  
**ESP\_BLE\_MESH\_ADDR\_PROXIES**  
**ESP\_BLE\_MESH\_ADDR\_FRIENDS**  
**ESP\_BLE\_MESH\_ADDR\_RELAYS**  
**ESP\_BLE\_MESH\_KEY\_UNUSED**  
**ESP\_BLE\_MESH\_KEY\_DEV**  
**ESP\_BLE\_MESH\_KEY\_PRIMARY**  
**ESP\_BLE\_MESH\_KEY\_ANY**  
Primary Network Key index  
**ESP\_BLE\_MESH\_NET\_PRIMARY**  
Relay state value  
**ESP\_BLE\_MESH\_RELAY\_DISABLED**  
**ESP\_BLE\_MESH\_RELAY\_ENABLED**  
**ESP\_BLE\_MESH\_RELAY\_NOT\_SUPPORTED**  
Beacon state value  
**ESP\_BLE\_MESH\_BEACON\_DISABLED**  
**ESP\_BLE\_MESH\_BEACON\_ENABLED**  
GATT Proxy state value  
**ESP\_BLE\_MESH\_GATT\_PROXY\_DISABLED**  
**ESP\_BLE\_MESH\_GATT\_PROXY\_ENABLED**  
**ESP\_BLE\_MESH\_GATT\_PROXY\_NOT\_SUPPORTED**  
Friend state value  
**ESP\_BLE\_MESH\_FRIEND\_DISABLED**  
**ESP\_BLE\_MESH\_FRIEND\_ENABLED**  
**ESP\_BLE\_MESH\_FRIEND\_NOT\_SUPPORTED**  
Node identity state value  
**ESP\_BLE\_MESH\_NODE\_IDENTITY\_STOPPED**  
**ESP\_BLE\_MESH\_NODE\_IDENTITY\_RUNNING**  
**ESP\_BLE\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED**  
Supported features  
**ESP\_BLE\_MESH\_FEATURE\_RELAY**  
**ESP\_BLE\_MESH\_FEATURE\_PROXY**  
**ESP\_BLE\_MESH\_FEATURE\_FRIEND**  
**ESP\_BLE\_MESH\_FEATURE\_LOW\_POWER**  
**ESP\_BLE\_MESH\_FEATURE\_ALL\_SUPPORTED**  
**ESP\_BLE\_MESH\_ADDR\_IS\_UNICAST** (addr)  
**ESP\_BLE\_MESH\_ADDR\_IS\_GROUP** (addr)  
**ESP\_BLE\_MESH\_ADDR\_IS\_VIRTUAL** (addr)  
**ESP\_BLE\_MESH\_ADDR\_IS\_RFU** (addr)

**ESP\_BLE\_MESH\_INVALID\_NODE\_INDEX****ESP\_BLE\_MESH\_TRANSMIT** (count, int\_ms)

Encode transmission count & interval steps.

**Note** For example, ESP\_BLE\_MESH\_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- **count**: Number of retransmissions (first transmission is excluded).
- **int\_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_COUNT** (transmit)

Decode transmit count from a transmit value.

**Return** Transmission count (actual transmissions equal to N + 1).

**Parameters**

- **transmit**: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Return** Transmission interval in milliseconds.

**Parameters**

- **transmit**: Encoded transmit count & interval value.

**ESP\_BLE\_MESH\_PUBLISH\_TRANSMIT** (count, int\_ms)

Encode Publish Retransmit count & interval steps.

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**

- **count**: Number of retransmissions (first transmission is excluded).
- **int\_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Return** Retransmission count (actual transmissions equal to N + 1).

**Parameters**

- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Return** Transmission interval in milliseconds.

**Parameters**

- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP\_BLE\_MESH\_PROV\_STATIC\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_OUTPUT\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_INPUT\_OOB\_MAX\_LEN**

Macros used to define message opcode

**ESP\_BLE\_MESH\_MODEL\_OP\_1** (b0)**ESP\_BLE\_MESH\_MODEL\_OP\_2** (b0, b1)**ESP\_BLE\_MESH\_MODEL\_OP\_3** (b0, cid)

This macro is associated with BLE\_MESH\_MODEL\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_SIG\_MODEL** (\_id, \_op, \_pub, \_user\_data)

This macro is associated with BLE\_MESH\_MODEL\_VND\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_VENDOR\_MODEL** (\_company, \_id, \_op, \_pub, \_user\_data)

**ESP\_BLE\_MESH\_ELEMENT** (\_loc, \_mods, \_vnd\_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP\_BLE\_MESH\_MODEL\_NONE can be given instead.

**Note** This macro is associated with BLE\_MESH\_ELEM in mesh\_access.h

**Parameters**

- `_loc`: Location Descriptor.
- `_mods`: Array of SIG models.
- `_vnd_mods`: Array of vendor models.

**ESP\_BLE\_MESH\_PROV** (uuid, sta\_val, sta\_val\_len, out\_size, out\_act, in\_size, in\_act)

**BT\_OCTET32\_LEN**

**BD\_ADDR\_LEN**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RANDOM**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_PUBLIC**

**ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_RANDOM**

**ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE** (\_name, \_msg\_len, \_role)

Define a model publication context.

**Parameters**

- `_name`: Variable name given to the context.
- `_msg_len`: Length of the publication message.
- `_role`: Role of the device which contains the model.

**ESP\_BLE\_MESH\_MODEL\_OP** (\_opcode, \_min\_len)

Define a model operation context.

**Parameters**

- `_opcode`: Message opcode.
- `_min_len`: Message minimum length.

**ESP\_BLE\_MESH\_MODEL\_OP\_END**

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

**ESP\_BLE\_MESH\_MODEL\_NONE**

Helper to define an empty model array. This structure is associated with BLE\_MESH\_MODEL\_NONE in mesh\_access.h

**ADD\_DEV\_RM\_AFTER\_PROV\_FLAG**

Device will be removed from queue after provisioned successfully

**ADD\_DEV\_START\_PROV\_NOW\_FLAG**

Start provisioning device immediately

**ADD\_DEV\_FLUSHABLE\_DEV\_FLAG**

Device can be remove when queue is full and new device is going to added

**ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP**  
Response will be sent internally

### Type Definitions

**typedef** uint8\_t **esp\_ble\_mesh\_octet16\_t**[ESP\_BLE\_MESH\_OCTET16\_LEN]

Define the BLE Mesh octet 8 bytes size

**typedef** uint8\_t **esp\_ble\_mesh\_octet8\_t**[ESP\_BLE\_MESH\_OCTET8\_LEN]

Invalid Company ID

**typedef** uint32\_t **esp\_ble\_mesh\_cb\_t**

**typedef** uint8\_t **UINT8**

**typedef** uint16\_t **UINT16**

**typedef** uint32\_t **UINT32**

**typedef** uint64\_t **UINT64**

**typedef** *UINT8* **BT\_OCTET32**[BT\_OCTET32\_LEN]

**typedef** uint8\_t **BD\_ADDR**[BD\_ADDR\_LEN]

**typedef** uint8\_t **esp\_ble\_mesh\_bd\_addr\_t**[BD\_ADDR\_LEN]

**typedef** uint8\_t **esp\_ble\_mesh\_addr\_type\_t**

BLE device address type.

**typedef** struct *esp\_ble\_mesh\_model* **esp\_ble\_mesh\_model\_t**

**typedef** uint8\_t **esp\_ble\_mesh\_dev\_add\_flag\_t**

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_get\_t**

**esp\_ble\_mesh\_opcode\_config\_client\_get\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by **esp\_ble\_mesh\_config\_client\_get\_state**. The following opcodes will only be used in the **esp\_ble\_mesh\_config\_client\_get\_state** function.

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_set\_t**

**esp\_ble\_mesh\_opcode\_config\_client\_set\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by **esp\_ble\_mesh\_config\_client\_set\_state**. The following opcodes will only be used in the **esp\_ble\_mesh\_config\_client\_set\_state** function.

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_config\_status\_t**

**esp\_ble\_mesh\_opcode\_config\_status\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

**typedef** uint8\_t **esp\_ble\_mesh\_cfg\_status\_t**

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_get\_t**

**esp\_ble\_mesh\_opcode\_health\_client\_get\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by **esp\_ble\_mesh\_health\_client\_get\_state**. The following opcodes will only be used in the **esp\_ble\_mesh\_health\_client\_get\_state** function.

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_set\_t**

**esp\_ble\_mesh\_opcode\_health\_client\_set\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by **esp\_ble\_mesh\_health\_client\_set\_state**. The following opcodes will only be used in the **esp\_ble\_mesh\_health\_client\_set\_state** function.

**typedef** uint32\_t **esp\_ble\_mesh\_health\_model\_status\_t**

**esp\_ble\_mesh\_health\_model\_status\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

**typedef** uint32\_t **esp\_ble\_mesh\_generic\_message\_opcode\_t**

**esp\_ble\_mesh\_generic\_message\_opcode\_t** belongs to **esp\_ble\_mesh\_opcode\_t**, this typedef is only used to locate the opcodes used by functions **esp\_ble\_mesh\_generic\_client\_get\_state** & **esp\_ble\_mesh\_generic\_client\_set\_state**. Generic OnOff Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_sensor\_message\_opcode\_t**

esp\_ble\_mesh\_sensor\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_sensor\_client\_get\_state & esp\_ble\_mesh\_sensor\_client\_set\_state.Sensor Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_time\_scene\_message\_opcode\_t**

esp\_ble\_mesh\_time\_scene\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_time\_scene\_client\_get\_state & esp\_ble\_mesh\_time\_scene\_client\_set\_state.Time Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_light\_message\_opcode\_t**

esp\_ble\_mesh\_light\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_light\_client\_get\_state & esp\_ble\_mesh\_light\_client\_set\_state.Light Lightness Message Opcode

**typedef** uint32\_t **esp\_ble\_mesh\_opcode\_t**

End of defines of esp\_ble\_mesh\_opcode\_t

**typedef** uint8\_t **esp\_ble\_mesh\_model\_status\_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

### Enumerations

**enum** **esp\_ble\_mesh\_cb\_type\_t**

*Values:*

**ESP\_BLE\_MESH\_TYPE\_PROV\_CB**

**ESP\_BLE\_MESH\_TYPE\_OUTPUT\_NUM\_CB**

**ESP\_BLE\_MESH\_TYPE\_OUTPUT\_STR\_CB**

**ESP\_BLE\_MESH\_TYPE\_INTPUT\_CB**

**ESP\_BLE\_MESH\_TYPE\_LINK\_OPEN\_CB**

**ESP\_BLE\_MESH\_TYPE\_LINK\_CLOSE\_CB**

**ESP\_BLE\_MESH\_TYPE\_COMPLETE\_CB**

**ESP\_BLE\_MESH\_TYPE\_RESET\_CB**

**enum** **esp\_ble\_mesh\_oob\_method\_t**

*Values:*

**ESP\_BLE\_MESH\_NO\_OOB**

**ESP\_BLE\_MESH\_STATIC\_OOB**

**ESP\_BLE\_MESH\_OUTPUT\_OOB**

**ESP\_BLE\_MESH\_INPUT\_OOB**

**enum** **esp\_ble\_mesh\_output\_action\_t**

*Values:*

**ESP\_BLE\_MESH\_NO\_OUTPUT = 0**

**ESP\_BLE\_MESH\_BLINK = BIT(0)**

**ESP\_BLE\_MESH\_BEEP = BIT(1)**

**ESP\_BLE\_MESH\_VIBRATE = BIT(2)**

**ESP\_BLE\_MESH\_DISPLAY\_NUMBER = BIT(3)**

**ESP\_BLE\_MESH\_DISPLAY\_STRING = BIT(4)**

**enum** **esp\_ble\_mesh\_input\_action\_t**

*Values:*

**ESP\_BLE\_MESH\_NO\_INPUT** = 0

**ESP\_BLE\_MESH\_PUSH** = BIT(0)

**ESP\_BLE\_MESH\_TWIST** = BIT(1)

**ESP\_BLE\_MESH\_ENTER\_NUMBER** = BIT(2)

**ESP\_BLE\_MESH\_ENTER\_STRING** = BIT(3)

**enum esp\_ble\_mesh\_prov\_bearer\_t**

*Values:*

**ESP\_BLE\_MESH\_PROV\_ADV** = BIT(0)

**ESP\_BLE\_MESH\_PROV\_GATT** = BIT(1)

**enum esp\_ble\_mesh\_prov\_oob\_info\_t**

*Values:*

**ESP\_BLE\_MESH\_PROV\_OOB\_OTHER** = BIT(0)

**ESP\_BLE\_MESH\_PROV\_OOB\_URI** = BIT(1)

**ESP\_BLE\_MESH\_PROV\_OOB\_2D\_CODE** = BIT(2)

**ESP\_BLE\_MESH\_PROV\_OOB\_BAR\_CODE** = BIT(3)

**ESP\_BLE\_MESH\_PROV\_OOB\_NFC** = BIT(4)

**ESP\_BLE\_MESH\_PROV\_OOB\_NUMBER** = BIT(5)

**ESP\_BLE\_MESH\_PROV\_OOB\_STRING** = BIT(6)

**ESP\_BLE\_MESH\_PROV\_OOB\_ON\_BOX** = BIT(11)

**ESP\_BLE\_MESH\_PROV\_OOB\_IN\_BOX** = BIT(12)

**ESP\_BLE\_MESH\_PROV\_OOB\_ON\_PAPER** = BIT(13)

**ESP\_BLE\_MESH\_PROV\_OOB\_IN\_MANUAL** = BIT(14)

**ESP\_BLE\_MESH\_PROV\_OOB\_ON\_DEV** = BIT(15)

**enum esp\_ble\_mesh\_dev\_role\_t**

*Values:*

**ROLE\_NODE** = 0

**ROLE\_PROVISIONER**

**ROLE\_FAST\_PROV**

**enum esp\_ble\_mesh\_fast\_prov\_action\_t**

*Values:*

**FAST\_PROV\_ACT\_NONE**

**FAST\_PROV\_ACT\_ENTER**

**FAST\_PROV\_ACT\_SUSPEND**

**FAST\_PROV\_ACT\_EXIT**

**FAST\_PROV\_ACT\_MAX**

**enum esp\_ble\_mesh\_proxy\_filter\_type\_t**

*Values:*

**PROXY\_FILTER\_WHITELIST**

**PROXY\_FILTER\_BLACKLIST**

**enum esp\_ble\_mesh\_prov\_cb\_event\_t**

*Values:*

- ESP\_BLE\_MESH\_PROV\_REGISTER\_COMP\_EVT**  
Initialize BLE Mesh provisioning capabilities and internal data information completion event
- ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT**  
Set the unprovisioned device name completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_ENABLE\_COMP\_EVT**  
Enable node provisioning functionality completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_DISABLE\_COMP\_EVT**  
Disable node provisioning functionality completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_OPEN\_EVT**  
Establish a BLE Mesh link event
- ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_CLOSE\_EVT**  
Close a BLE Mesh link event
- ESP\_BLE\_MESH\_NODE\_PROV\_OOB\_PUB\_KEY\_EVT**  
Generate Node input OOB public key event
- ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_NUMBER\_EVT**  
Generate Node Output Number event
- ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_STRING\_EVT**  
Generate Node Output String event
- ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT**  
Event requiring the user to input a number or string
- ESP\_BLE\_MESH\_NODE\_PROV\_COMPLETE\_EVT**  
Provisioning done event
- ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT**  
Provisioning reset event
- ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT**  
Node set oob public key completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Node input number completion event
- ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Node input string completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_IDENTITY\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh Proxy Identity advertising completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh GATT Proxy Service completion event
- ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_DISABLE\_COMP\_EVT**  
Disable BLE Mesh GATT Proxy Service completion event
- ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Node add NetKey locally completion event
- ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Node add AppKey locally completion event
- ESP\_BLE\_MESH\_NODE\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Node bind AppKey to model locally completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_ENABLE\_COMP\_EVT**  
Provisioner enable provisioning functionality completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DISABLE\_COMP\_EVT**  
Provisioner disable provisioning functionality completion event

- ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT**  
Provisioner receives unprovisioned device beacon event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT**  
Provisioner read unprovisioned device OOB public key event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_EVT**  
Provisioner input value for provisioning procedure event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_OUTPUT\_EVT**  
Provisioner output value for provisioning procedure event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_OPEN\_EVT**  
Provisioner establish a BLE Mesh link event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_CLOSE\_EVT**  
Provisioner close a BLE Mesh link event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT**  
Provisioner provisioning done event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_UNPROV\_DEV\_COMP\_EVT**  
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DEV\_WITH\_ADDR\_COMP\_EVT**  
Provisioner start to provision an unprovisioned device completion event
- ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_DEV\_COMP\_EVT**  
Provisioner delete a device from the list, close provisioning link with the device completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_DEV\_UUID\_MATCH\_COMP\_EVT**  
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_PROV\_DATA\_INFO\_COMP\_EVT**  
Provisioner set net\_idx/flags/iv\_index used for provisioning completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_STATIC\_OOB\_VALUE\_COMP\_EVT**  
Provisioner set static oob value used for provisioning completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_PRIMARY\_ELEM\_ADDR\_COMP\_EVT**  
Provisioner set unicast address of primary element completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_COMP\_EVT**  
Provisioner read unprovisioned device OOB public key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Provisioner input number completion event
- ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Provisioner input string completion event
- ESP\_BLE\_MESH\_PROVISIONER\_SET\_NODE\_NAME\_COMP\_EVT**  
Provisioner set node name completion event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner add local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner update local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Provisioner bind local model with local app key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner add local network key completion event
- ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner update local network key completion event

**ESP\_BLE\_MESH\_PROVISIONER\_STORE\_NODE\_COMP\_DATA\_COMP\_EVT**  
Provisioner store node composition data completion event

**ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT**  
Provisioner delete node with uuid completion event

**ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT**  
Provisioner delete node with unicast address completion event

**ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT**  
Provisioner start to receive heartbeat message completion event

**ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT**  
Provisioner set the heartbeat filter type completion event

**ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT**  
Provisioner set the heartbeat filter information completion event

**ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT**  
Provisioner receive heartbeat message event

**ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT**  
Provisioner directly erase settings completion event

**ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner open settings with index completion event

**ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner open settings with user id completion event

**ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner close settings with index completion event

**ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner close settings with user id completion event

**ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**  
Provisioner delete settings with index completion event

**ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_UID\_COMP\_EVT**  
Provisioner delete settings with user id completion event

**ESP\_BLE\_MESH\_SET\_FAST\_PROV\_INFO\_COMP\_EVT**  
Set fast provisioning information (e.g. unicast address range, net\_idx, etc.) completion event

**ESP\_BLE\_MESH\_SET\_FAST\_PROV\_ACTION\_COMP\_EVT**  
Set fast provisioning action completion event

**ESP\_BLE\_MESH\_HEARTBEAT\_MESSAGE\_RECV\_EVT**  
Receive Heartbeat message event

**ESP\_BLE\_MESH\_LPN\_ENABLE\_COMP\_EVT**  
Enable Low Power Node completion event

**ESP\_BLE\_MESH\_LPN\_DISABLE\_COMP\_EVT**  
Disable Low Power Node completion event

**ESP\_BLE\_MESH\_LPN\_POLL\_COMP\_EVT**  
Low Power Node send Friend Poll completion event

**ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_ESTABLISH\_EVT**  
Low Power Node establishes friendship event

**ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_TERMINATE\_EVT**  
Low Power Node terminates friendship event

**ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_ESTABLISH\_EVT**  
Friend Node establishes friendship event

**ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT**  
Friend Node terminates friendship event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_ADV\_PKT\_EVT**  
Proxy Client receives Network ID advertising packet event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECTED\_EVT**  
Proxy Client establishes connection successfully event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECTED\_EVT**  
Proxy Client terminates connection successfully event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_FILTER\_STATUS\_EVT**  
Proxy Client receives Proxy Filter Status event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECT\_COMP\_EVT**  
Proxy Client connect completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECT\_COMP\_EVT**  
Proxy Client disconnect completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_SET\_FILTER\_TYPE\_COMP\_EVT**  
Proxy Client set filter type completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_ADD\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client add filter address completion event

**ESP\_BLE\_MESH\_PROXY\_CLIENT\_REMOVE\_FILTER\_ADDR\_COMP\_EVT**  
Proxy Client remove filter address completion event

**ESP\_BLE\_MESH\_PROXY\_SERVER\_CONNECTED\_EVT**  
Proxy Server establishes connection successfully event

**ESP\_BLE\_MESH\_PROXY\_SERVER\_DISCONNECTED\_EVT**  
Proxy Server terminates connection successfully event

**ESP\_BLE\_MESH\_MODEL\_SUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model subscribes group address completion event

**ESP\_BLE\_MESH\_MODEL\_UNSUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**  
Local model unsubscribes group address completion event

**ESP\_BLE\_MESH\_DEINIT\_MESH\_COMP\_EVT**  
De-initialize BLE Mesh stack completion event

**ESP\_BLE\_MESH\_PROV\_EVT\_MAX**

**enum [anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

**ESP\_BLE\_MESH\_SERVER\_TRANS\_TIMER\_START**

**ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX**

**enum esp\_ble\_mesh\_server\_state\_type\_t**

This enum value is the type of server model states

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_ONOFF\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_LEVEL\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_ONPOWERUP\_STATE**

**ESP\_BLE\_MESH\_GENERIC\_POWER\_ACTUAL\_STATE**

**ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_ACTUAL\_STATE**

```
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX
```

```
enum esp_ble_mesh_model_cb_event_t
```

*Values:*

```
ESP_BLE_MESH_MODEL_OPERATION_EVT
    User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
ESP_BLE_MESH_MODEL_SEND_COMP_EVT
    User-defined models send messages completion event
ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
    User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
    User-defined client models receive publish messages event
ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
    Timeout event for the user-defined client models that failed to receive response from peer server models
ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
    When a model is configured to publish messages periodically, this event will occur during every publish
    period
ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
    Server models update state value completion event
ESP_BLE_MESH_MODEL_EVT_MAX
```

## ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- [ESP-BLE-MESH Stack Initialization](#)
- [Reading of Local Data Information](#)
- [Low Power Operation \(Updating\)](#)
- [Send/Publish Messages, add Local AppKey, etc.](#)
- [ESP-BLE-MESH Node/Provisioner Provisioning](#)
- [ESP-BLE-MESH GATT Proxy Server](#)

## ESP-BLE-MESH Stack Initialization

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_common\\_api.h](#)

## Functions

*esp\_err\_t* **esp\_ble\_mesh\_init** (*esp\_ble\_mesh\_prov\_t* \*prov, *esp\_ble\_mesh\_comp\_t* \*comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

**Return** ESP\_OK on success or error code otherwise.

### Parameters

- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

*esp\_err\_t* **esp\_ble\_mesh\_deinit** (*esp\_ble\_mesh\_deinit\_param\_t* \*param)

De-initialize BLE Mesh module.

**Note** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

**Return** ESP\_OK on success or error code otherwise.

### Parameters

- [in] param: Pointer to the structure of BLE Mesh deinit parameters.

## Reading of Local Data Information

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_local\\_data\\_operation\\_api.h](#)

## Functions

*int32\_t* **esp\_ble\_mesh\_get\_model\_publish\_period** (*esp\_ble\_mesh\_model\_t* \*model)

Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

### Parameters

- [in] model: Model instance pointer.

*uint16\_t* **esp\_ble\_mesh\_get\_primary\_element\_address** (void)

Get the address of the primary element.

**Return** Address of the primary element on success, or ESP\_BLE\_MESH\_ADDR\_UNASSIGNED on failure which means the device has not been provisioned.

*uint16\_t* \***esp\_ble\_mesh\_is\_model\_subscribed\_to\_group** (*esp\_ble\_mesh\_model\_t* \*model, *uint16\_t* group\_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

### Parameters

- [in] model: Pointer to the model.
- [in] group\_addr: Group address.

*esp\_ble\_mesh\_elem\_t* \***esp\_ble\_mesh\_find\_element** (*uint16\_t* element\_addr)

Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or NULL on failure.

### Parameters

- [in] element\_addr: Element address.

`uint8_t esp_ble_mesh_get_element_count` (void)

Get the number of elements that have been registered.

**Return** Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model` (const `esp_ble_mesh_elem_t` \*element, `uint16_t` company\_id, `uint16_t` model\_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.
- [in] company\_id: A 16-bit company identifier assigned by the Bluetooth SIG.
- [in] model\_id: A 16-bit vendor-assigned model identifier.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model` (const `esp_ble_mesh_elem_t` \*element, `uint16_t` model\_id)

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.
- [in] model\_id: SIG model identifier.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data` (void)

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

`esp_err_t esp_ble_mesh_model_subscribe_group_addr` (`uint16_t` element\_addr, `uint16_t` company\_id, `uint16_t` model\_id, `uint16_t` group\_addr)

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] element\_addr: Unicast address of the element to which the model belongs.
- [in] company\_id: A 16-bit company identifier.
- [in] model\_id: A 16-bit model identifier.
- [in] group\_addr: The group address to be subscribed.

`esp_err_t esp_ble_mesh_model_unsubscribe_group_addr` (`uint16_t` element\_addr, `uint16_t` company\_id, `uint16_t` model\_id, `uint16_t` group\_addr)

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] element\_addr: Unicast address of the element to which the model belongs.
- [in] company\_id: A 16-bit company identifier.
- [in] model\_id: A 16-bit model identifier.
- [in] group\_addr: The subscribed group address.

`const uint8_t *esp_ble_mesh_node_get_local_net_key` (`uint16_t` net\_idx)

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- [in] net\_idx: NetKey index.

**const** uint8\_t \***esp\_ble\_mesh\_node\_get\_local\_app\_key** (uint16\_t *app\_idx*)

This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**

- [in] *app\_idx*: AppKey index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_net\_key** (**const** uint8\_t *net\_key*[16], uint16\_t *net\_idx*)

This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *net\_key*: NetKey to be added.
- [in] *net\_idx*: NetKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_app\_key** (**const** uint8\_t *app\_key*[16], uint16\_t *net\_idx*, uint16\_t *app\_idx*)

This function is called by Node to add a local AppKey.

**Note** The *net\_idx* must be an existing one. This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *app\_key*: AppKey to be added.
- [in] *net\_idx*: NetKey Index.
- [in] *app\_idx*: AppKey Index.

*esp\_err\_t* **esp\_ble\_mesh\_node\_bind\_app\_key\_to\_local\_model** (uint16\_t *element\_addr*,  
uint16\_t *company\_id*,  
uint16\_t *model\_id*, uint16\_t *app\_idx*)

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind *app\_key* with local vendor model, the *company\_id* shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *element\_addr*: Node local element address
- [in] *company\_id*: Node local company id
- [in] *model\_id*: Node local model id
- [in] *app\_idx*: Node local appkey index

## Low Power Operation (Updating)

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_low\\_power\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_enable** (void)

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_disable** (bool *force*)

Disable BLE Mesh device LPN functionality.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- `[in] force`: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_poll** (void)

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP\_OK on success or error code otherwise.

## Send/Publish Messages, add Local AppKey, etc.

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_networking\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_custom\_model\_callback** (*esp\_ble\_mesh\_model\_cb\_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- `[in] callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_model\_msg\_opcode\_init** (uint8\_t \*data, uint32\_t opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- `[in] data`: Pointer to the message data.
- `[in] opcode`: The message opcode.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_init** (*esp\_ble\_mesh\_model\_t* \*model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Note: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- `[in] model`: BLE Mesh Client model to which the message belongs.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_deinit** (*esp\_ble\_mesh\_model\_t* \*model)

De-initialize the user-defined client model.

**Note** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: Pointer of the Client model.

*esp\_err\_t* **esp\_ble\_mesh\_server\_model\_send\_msg** (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_msg\_ctx\_t* \*ctx, uint32\_t  
opcode, uint16\_t length, uint8\_t \*data)

Send server model messages(such as server model status messages).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: BLE Mesh Server Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_send\_msg** (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_msg\_ctx\_t* \*ctx, uint32\_t  
opcode, uint16\_t length, uint8\_t \*data,  
int32\_t msg\_timeout, bool need\_rsp,  
*esp\_ble\_mesh\_dev\_role\_t* device\_role)

Send client model message (such as model get, set, etc).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: BLE Mesh Client Model to which the message belongs.
- [in] ctx: Message context, includes keys, TTL, etc.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] msg\_timeout: Time to get response to the message (in milliseconds).
- [in] need\_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] device\_role: Role of the device (Node/Provisioner) that sends the message.

*esp\_err\_t* **esp\_ble\_mesh\_model\_publish** (*esp\_ble\_mesh\_model\_t* \*model, uint32\_t opcode, uint16\_t  
length, uint8\_t \*data, *esp\_ble\_mesh\_dev\_role\_t* de-  
vice\_role)

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publica-  
tion message (*esp\_ble\_mesh\_model\_pub\_t:msg*) contains a valid message to be sent.  
And if users want to update the publishing message, this API should be called in  
ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT with the message updated.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: Mesh (client) Model publishing the message.
- [in] opcode: Message opcode.
- [in] length: Message length (exclude the message opcode).
- [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] device\_role: Role of the device (node/provisioner) publishing the message of the type  
*esp\_ble\_mesh\_dev\_role\_t*.

*esp\_err\_t* **esp\_ble\_mesh\_server\_model\_update\_state** (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_server\_state\_type\_t* type,  
*esp\_ble\_mesh\_server\_state\_value\_t*  
\*value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] model: Server model which is going to update the state.
- [in] type: Server model state type.
- [in] value: Server model state value.

*esp\_err\_t* **esp\_ble\_mesh\_node\_local\_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_node\_name** (uint16\_t *index*, const char \**name*)

This function is called to set the node (provisioned device) name.

**Note** *index* is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Index of the node in the node queue.
- [in] name: Name (end by '\0') to be set for the node.

const char \***esp\_ble\_mesh\_provisioner\_get\_node\_name** (uint16\_t *index*)

This function is called to get the node (provisioned device) name.

**Note** *index* is obtained from the parameters of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**

- [in] index: Index of the node in the node queue.

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_node\_index** (const char \**name*)

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**

- [in] name: Name of the node (end by '\0').

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_store\_node\_comp\_data** (uint16\_t *unicast\_addr*,  
uint8\_t \**data*, uint16\_t  
*length*)

This function is called to store the Composition Data of the node.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] unicast\_addr: Element address of the node
- [in] data: Pointer of Composition Data
- [in] length: Length of Composition Data

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_uuid** (const uint8\_t  
*uuid*[16])

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] uuid: Device UUID of the node

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_addr** (uint16\_t *uni-*  
*cast\_addr*)

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] unicast\_addr: Unicast address of the node

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_name**(const char \*name)

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**

- [in] name: Name of the node (end by '\0').

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_prov\_node\_count**(void)

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

const *esp\_ble\_mesh\_node\_t* \*\***esp\_ble\_mesh\_provisioner\_get\_node\_table\_entry**(void)

This function is called by Provisioner to get the entry of the node table.

**Note** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp\_ble\_mesh\_node\_t \*\*node)* is NULL. For example: `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { …… } }`

**Return** Pointer to the start of the node table.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_node\_with\_uuid**(const uint8\_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uuid: Device UUID of the node

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_node\_with\_addr**(uint16\_t unicast\_addr)

This function is called to delete the provisioned node information with the node unicast address.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] unicast\_addr: Unicast address of the node

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_local\_app\_key**(const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is called to add a local AppKey for Provisioner.

**Note** app\_key: If set to NULL, app\_key will be generated internally. net\_idx: Should be an existing one. app\_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app\_idx will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] app\_key: The app key to be set for the local BLE Mesh stack.
- [in] net\_idx: The network key index.
- [in] app\_idx: The app key index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_update\_local\_app\_key**(const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is used to update a local AppKey for Provisioner.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] app\_key: Value of the AppKey.
- [in] net\_idx: Corresponding NetKey Index.
- [in] app\_idx: The AppKey Index

```
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

**Return** App key on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: Network key index.
- [in] *app\_idx*: Application key index.

```
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr,  
uint16_t app_idx,  
uint16_t model_id,  
uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

**Note** *company\_id*: If going to bind *app\_key* with local vendor model, *company\_id* should be set to 0xFFFF.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *element\_addr*: Provisioner local element address
- [in] *app\_idx*: Provisioner local appkey index
- [in] *model\_id*: Provisioner local model id
- [in] *company\_id*: Provisioner local company id

```
esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16],  
uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

**Note** *net\_key*: If set to NULL, *net\_key* will be generated internally. *net\_idx*: If it is going to be generated internally, it should be set to 0xFFFF, and the new *net\_idx* will be reported via an event.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *net\_key*: The network key to be added to the Provisioner local BLE Mesh stack.
- [in] *net\_idx*: The network key index.

```
esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16],  
uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *net\_key*: Value of the NetKey.
- [in] *net\_idx*: The NetKey Index.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: Network key index.

```
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *enable*: Enable or disable receiving heartbeat messages.

```
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type (uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

- Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] type: Heartbeat filter type (acceptlist or rejectlist).

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_heartbeat\_filter\_info** (uint8\_t *op*,  
*esp\_ble\_mesh\_heartbeat\_filter\_info\_t*  
*\*info*)

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
  - The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] op: Add or REMOVE
- [in] info: Heartbeat filter entry information, including: hb\_src - Heartbeat source address; hb\_dst - Heartbeat destination address;

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_direct\_erase\_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_index** (uint8\_t *index*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_uid** (const char \**uid*)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_index** (uint8\_t *index*, bool  
*erase*)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note** 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,

- nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
  - The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_uid**(const char \*uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note** 1. Before closing the nvs namespace, it must be open.

- When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
- The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_index**(uint8\_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_uid**(const char \*uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.

const char \***esp\_ble\_mesh\_provisioner\_get\_settings\_uid**(uint8\_t index)

This function is called by Provisioner to get settings user id.

**Return** Setting user id on success or NULL on failure.

**Parameters**

- [in] index: Settings index.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_settings\_index**(const char \*uid)

This function is called by Provisioner to get settings index.

**Return** Settings index.

**Parameters**

- [in] uid: Settings user id.

`uint8_t esp_ble_mesh_provisioner_get_free_settings_count` (void)

This function is called by Provisioner to get the number of free settings user id.

**Return** Number of free settings user id.

`const uint8_t *esp_ble_mesh_get_fast_prov_app_key` (uint16\_t *net\_idx*, uint16\_t *app\_idx*)

This function is called to get fast provisioning application key.

**Return** Application key on success, or NULL on failure.

**Parameters**

- [in] *net\_idx*: Network key index.
- [in] *app\_idx*: Application key index.

### Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t          event,  
                                         esp_ble_mesh_model_cb_param_t *param)  
: event, event code of user-defined model events; param, parameters of user-defined model events
```

## ESP-BLE-MESH Node/Provisioner Provisioning

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_provisioning\\_api.h](#)

### Functions

`esp_err_t esp_ble_mesh_register_prov_callback` (*esp\_ble\_mesh\_prov\_cb\_t* *callback*)

Register BLE Mesh provisioning callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *callback*: Pointer to the callback function.

`bool esp_ble_mesh_node_is_provisioned` (void)

Check if a device has been provisioned.

**Return** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

`esp_err_t esp_ble_mesh_node_prov_enable` (*esp\_ble\_mesh\_prov\_bearer\_t* *bearers*)

Enable specific provisioning bearers to get the device ready for provisioning.

**Note** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- *bearers*: Bit-wise OR of provisioning bearers.

`esp_err_t esp_ble_mesh_node_prov_disable` (*esp\_ble\_mesh\_prov\_bearer\_t* *bearers*)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- *bearers*: Bit-wise OR of provisioning bearers.

`esp_err_t esp_ble_mesh_node_set_oob_pub_key` (uint8\_t *pub\_key\_x*[32], uint8\_t *pub\_key\_y*[32],  
 uint8\_t *private\_key*[32])

Unprovisioned device set own oob public key & private key pair.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *pub\_key\_x*: Unprovisioned device's Public Key X

- [in] `pub_key_y`: Unprovisioned device' s Public Key Y
- [in] `private_key`: Unprovisioned device' s Private Key

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_number** (uint32\_t *number*)

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received `ESP_BLE_MESH_NODE_PROV_INPUT_EVT` with `ESP_BLE_MESH_ENTER_NUMBER` as the action.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `number`: Number input by device.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_string** (const char \**string*)

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received `ESP_BLE_MESH_NODE_PROV_INPUT_EVT` with `ESP_BLE_MESH_ENTER_STRING` as the action.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `string`: String input by device.

*esp\_err\_t* **esp\_ble\_mesh\_set\_unprovisioned\_device\_name** (const char \**name*)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn' t apply to PB-ADV mode.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `name`: Unprovisioned device name

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_read\_oob\_pub\_key** (uint8\_t *link\_idx*, uint8\_t *pub\_key\_x*[32], uint8\_t *pub\_key\_y*[32])

Provisioner inputs unprovisioned device' s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `link_idx`: The provisioning link index
- [in] `pub_key_x`: Unprovisioned device' s Public Key X
- [in] `pub_key_y`: Unprovisioned device' s Public Key Y

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_string** (const char \**string*, uint8\_t *link\_idx*)

Provide provisioning input OOB string.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* `prov_input_num` callback has been called with `ESP_BLE_MESH_ENTER_STRING` as the action.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `string`: String input by Provisioner.
- [in] `link_idx`: The provisioning link index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_number** (uint32\_t *number*, uint8\_t *link\_idx*)

Provide provisioning input OOB number.

This is intended to be called after the *esp\_ble\_mesh\_prov\_t* `prov_input_num` callback has been called with `ESP_BLE_MESH_ENTER_NUMBER` as the action.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `number`: Number input by Provisioner.
- [in] `link_idx`: The provisioning link index.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] bearers: Bit-wise OR of provisioning bearers.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_unprov\_dev** (*esp\_ble\_mesh\_unprov\_dev\_add\_t* \*add\_dev,  
*esp\_ble\_mesh\_dev\_add\_flag\_t* flags)

Add unprovisioned device info to the unprov\_dev queue.

**Return** ESP\_OK on success or error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device' s advertising packets, it will start provisioning the device internally.
  - In this situation, the Provisioner can set bearers with each one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled, and cannot set flags with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
3. Another example is when the Provisioner receives the unprovisioned device' s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp\_ble\_mesh\_register\_prov\_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
  - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_ADV enabled and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_GATT enabled, and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - Note: ESP\_BLE\_MESH\_PROV\_ADV, ESP\_BLE\_MESH\_PROV\_GATT and ADD\_DEV\_START\_PROV\_NOW\_FLAG can not be enabled at the same time.

**Parameters**

- [in] add\_dev: Pointer to a struct containing the device information
- [in] flags: Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr (const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t
                                                         addr,
                                                         esp_ble_mesh_addr_type_t
                                                         addr_type,
                                                         esp_ble_mesh_prov_bearer_t
                                                         bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note** : 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP\_BLE\_MESH\_PROV\_ADV or ESP\_BLE\_MESH\_PROV\_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
3. Recommend to use only one of the functions “esp\_ble\_mesh\_provisioner\_add\_unprov\_dev” and “esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr” by a Provisioner.

#### Parameters

- [in] *uuid*: Device UUID of the unprovisioned device
- [in] *addr*: Device address of the unprovisioned device
- [in] *addr\_type*: Device address type of the unprovisioned device
- [in] *bearer*: Provisioning bearer going to be used by Provisioner
- [in] *oob\_info*: OOB info of the unprovisioned device
- [in] *unicast\_addr*: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev (esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *del\_dev*: Pointer to a struct containing the device information.

```
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match (const uint8_t *match_val,
                                                       uint8_t match_len, uint8_t
                                                       offset, bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *match\_val*: Value to be compared with the part of the device UUID.
- [in] *match\_len*: Length of the compared match value.
- [in] *offset*: Offset of the device UUID to be compared (based on zero).
- [in] *prov\_after\_match*: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info (esp_ble_mesh_prov_data_info_t
                                                       *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *prov\_data\_info*: Pointer to a struct containing net\_idx or flags or iv\_index.

```
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value (const uint8_t *value,
                                                         uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *value*: Pointer to the static oob value.
- [in] *length*: Length of the static oob value.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_primary\_elem\_addr** (uint16\_t *addr*)

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the *prov\_unicast\_addr* value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *addr*: Unicast address of the Primary element of Provisioner.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_info** (*esp\_ble\_mesh\_fast\_prov\_info\_t* \**fast\_prov\_info*)

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *fast\_prov\_info*: Pointer to a struct containing unicast address range, *net\_idx*, etc.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_action** (*esp\_ble\_mesh\_fast\_prov\_action\_t* *action*)

This function is called to start/suspend/exit fast provisioning.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] *action*: fast provisioning action (i.e. enter, suspend, exit).

## Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t          event,
                                        esp_ble_mesh_prov_cb_param_t *param)
: event, event code of provisioning events; param, parameters of provisioning events
typedef void (*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t      addr,
                                           const esp_ble_mesh_addr_type_t    addr_type,
                                           const uint8_t                    adv_type,
                                           const uint8_t                    *dev_uuid,
                                           uint16_t                          oob_info,
                                           esp_ble_mesh_prov_bearer_t        bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**

- [in] *addr*: Pointer to the unprovisioned device address.
- [in] *addr\_type*: Unprovisioned device address type.
- [in] *adv\_type*: Adv packet type (ADV\_IND or ADV\_NONCONN\_IND).
- [in] *dev\_uuid*: Unprovisioned device UUID pointer.
- [in] *oob\_info*: OOB information of the unprovisioned device.

- [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

## ESP-BLE-MESH GATT Proxy Server

### Header File

- [bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_proxy\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_identity\_enable** (void)

Enable advertising with Node Identity.

**Note** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_enable** (void)

Enable BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_connect** (*esp\_ble\_mesh\_bd\_addr\_t* *addr*,  
*esp\_ble\_mesh\_addr\_type\_t* *addr\_type*, *uint16\_t*  
*net\_idx*)

Proxy Client creates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *addr*: Device address of the Proxy Server.
- [in] *addr\_type*: Device address type(public or static random).
- [in] *net\_idx*: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_disconnect** (*uint8\_t* *conn\_handle*)

Proxy Client terminates a connection with the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *conn\_handle*: Proxy connection handle.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_set\_filter\_type** (*uint8\_t* *conn\_handle*,  
*uint16\_t* *net\_idx*,  
*esp\_ble\_mesh\_proxy\_filter\_type\_t*  
*filter\_type*)

Proxy Client sets the filter type of the Proxy Server.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] *conn\_handle*: Proxy connection handle.
- [in] *net\_idx*: Corresponding NetKey Index.
- [in] *filter\_type*: whitelist or blacklist.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_add\_filter\_addr** (*uint8\_t* *conn\_handle*, *uint16\_t*  
*net\_idx*, *uint16\_t* *\*addr*, *uint16\_t*  
*addr\_num*)

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `conn_handle`: Proxy connection handle.
- [in] `net_idx`: Corresponding NetKey Index.
- [in] `addr`: Pointer to the filter address.
- [in] `addr_num`: Number of the filter address.

`esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr` (`uint8_t conn_handle`, `uint16_t net_idx`, `uint16_t *addr`, `uint16_t addr_num`)

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `conn_handle`: Proxy connection handle.
- [in] `net_idx`: Corresponding NetKey Index.
- [in] `addr`: Pointer to the filter address.
- [in] `addr_num`: Number of the filter address.

## ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

---

**Note:** Definitions related to Server Models are being updated, and will be released soon.

---

### Configuration Client/Server Models

#### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_config\\_model\\_api.h](#)

#### Functions

`esp_err_t esp_ble_mesh_register_config_client_callback` (`esp_ble_mesh_cfg_client_cb_t callback`)

Register BLE Mesh Config Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

`esp_err_t esp_ble_mesh_register_config_server_callback` (`esp_ble_mesh_cfg_server_cb_t callback`)

Register BLE Mesh Config Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_get\_state\_t* \*get\_state)

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_config\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_cfg\_client\_set\_state\_t* \*set\_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

## Unions

**union** `esp_ble_mesh_cfg_client_get_state_t`

```
#include <esp_ble_mesh_config_model_api.h> For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
the get_state parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.
```

Configuration Server Model context

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Configuration Server Model

uint8\_t **net\_transmit**  
Network Transmit state

uint8\_t **relay**  
Relay Mode state

uint8\_t **relay\_retransmit**  
Relay Retransmit state

uint8\_t **beacon**  
Secure Network Beacon state

uint8\_t **gatt\_proxy**  
GATT Proxy state

uint8\_t **friend\_state**  
Friend state

uint8\_t **default\_ttl**  
Default TTL

**struct k\_delayed\_work timer**  
Heartbeat Publication timer

uint16\_t **dst**  
Destination address for Heartbeat messages

uint16\_t **count**  
Number of Heartbeat messages to be sent  
Number of Heartbeat messages received

uint8\_t **period**  
Period for sending Heartbeat messages

uint8\_t **ttl**  
TTL to be used when sending Heartbeat messages

uint16\_t **feature**  
Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
NetKey Index used by Heartbeat Publication

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_pub**  
Heartbeat Publication

**int64\_t expiry**  
Timestamp when Heartbeat subscription period is expired

**uint16\_t src**  
Source address for Heartbeat messages

**uint8\_t min\_hops**  
Minimum hops when receiving Heartbeat messages

**uint8\_t max\_hops**  
Maximum hops when receiving Heartbeat messages

**esp\_ble\_mesh\_cb\_t heartbeat\_recv\_cb**  
Optional heartbeat subscription tracking function

**struct esp\_ble\_mesh\_cfg\_srv::[anonymous] heartbeat\_sub**  
Heartbeat Subscription

**struct esp\_ble\_mesh\_cfg\_composition\_data\_get\_t**  
Parameters of Config Composition Data Get.

### Public Members

**uint8\_t page**  
Page number of the Composition Data.

**struct esp\_ble\_mesh\_cfg\_model\_pub\_get\_t**  
Parameters of Config Model Publication Get.

### Public Members

**uint16\_t element\_addr**  
The element address

**uint16\_t model\_id**  
The model id

**uint16\_t company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t**  
Parameters of Config SIG Model Subscription Get.

### Public Members

**uint16\_t element\_addr**  
The element address

**uint16\_t model\_id**  
The model id

**struct esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t**  
Parameters of Config Vendor Model Subscription Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_app\_key\_get\_t**

Parameters of Config AppKey Get.

**Public Members****uint16\_t net\_idx**

The network key index

**struct esp\_ble\_mesh\_cfg\_node\_identity\_get\_t**

Parameters of Config Node Identity Get.

**Public Members****uint16\_t net\_idx**

The network key index

**struct esp\_ble\_mesh\_cfg\_sig\_model\_app\_get\_t**

Parameters of Config SIG Model App Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**struct esp\_ble\_mesh\_cfg\_vnd\_model\_app\_get\_t**

Parameters of Config Vendor Model App Get.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_get\_t**

Parameters of Config Key Refresh Phase Get.

**Public Members**

`uint16_t net_idx`  
The network key index

`struct esp_ble_mesh_cfg_lpn_polltimeout_get_t`  
Parameters of Config Low Power Node PollTimeout Get.

**Public Members**

`uint16_t lpn_addr`  
The unicast address of the Low Power node

`struct esp_ble_mesh_cfg_beacon_set_t`  
Parameters of Config Beacon Set.

**Public Members**

`uint8_t beacon`  
New Secure Network Beacon state

`struct esp_ble_mesh_cfg_default_ttl_set_t`  
Parameters of Config Default TTL Set.

**Public Members**

`uint8_t ttl`  
The default TTL state value

`struct esp_ble_mesh_cfg_friend_set_t`  
Parameters of Config Friend Set.

**Public Members**

`uint8_t friend_state`  
The friend state value

`struct esp_ble_mesh_cfg_gatt_proxy_set_t`  
Parameters of Config GATT Proxy Set.

**Public Members**

`uint8_t gatt_proxy`  
The GATT Proxy state value

`struct esp_ble_mesh_cfg_relay_set_t`  
Parameters of Config Relay Set.

**Public Members**

`uint8_t relay`  
The relay value

`uint8_t relay_retransmit`  
The relay retransmit value

`struct esp_ble_mesh_cfg_net_key_add_t`  
Parameters of Config NetKey Add.

**Public Members**

`uint16_t net_idx`  
The network key index

`uint8_t net_key[16]`  
The network key value

**struct esp\_ble\_mesh\_cfg\_app\_key\_add\_t**  
Parameters of Config AppKey Add.

**Public Members**

`uint16_t net_idx`  
The network key index

`uint16_t app_idx`  
The app key index

`uint8_t app_key[16]`  
The app key value

**struct esp\_ble\_mesh\_cfg\_model\_app\_bind\_t**  
Parameters of Config Model App Bind.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t model_app_idx`  
Index of the app key to bind with the model

`uint16_t model_id`  
The model id

`uint16_t company_id`  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_pub\_set\_t**  
Parameters of Config Model Publication Set.

**Public Members**

`uint16_t element_addr`  
The element address

`uint16_t publish_addr`  
Value of the publish address

`uint16_t publish_app_idx`  
Index of the application key

`bool cred_flag`  
Value of the Friendship Credential Flag

`uint8_t publish_ttl`  
Default TTL value for the publishing messages

`uint8_t publish_period`  
Period for periodic status publishing

`uint8_t publish_retransmit`

Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add.

### Public Members

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete.

### Public Members

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be removed from the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_overwrite\_t**

Parameters of Config Model Subscription Overwrite.

### Public Members

`uint16_t element_addr`

The element address

`uint16_t sub_addr`

The address to be added to the Subscription List

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_add\_t**

Parameters of Config Model Subscription Virtual Address Add.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

The Label UUID of the virtual address to be added to the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_delete\_t**

Parameters of Config Model Subscription Virtual Address Delete.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

The Label UUID of the virtual address to be removed from the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

The Label UUID of the virtual address to be added to the Subscription List

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t**

Parameters of Config Model Publication Virtual Address Set.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

Value of the Label UUID publish address

**uint16\_t publish\_app\_idx**

Index of the application key

bool **cred\_flag**  
Value of the Friendship Credential Flag

uint8\_t **publish\_ttl**  
Default TTL value for the publishing messages

uint8\_t **publish\_period**  
Period for periodic status publishing

uint8\_t **publish\_retransmit**  
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **model\_id**  
The model id

uint16\_t **company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t**  
Parameters of Config Model Subscription Delete All.

### Public Members

uint16\_t **element\_addr**  
The element address

uint16\_t **model\_id**  
The model id

uint16\_t **company\_id**  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_net\_key\_update\_t**  
Parameters of Config NetKey Update.

### Public Members

uint16\_t **net\_idx**  
The network key index

uint8\_t **net\_key**[16]  
The network key value

**struct esp\_ble\_mesh\_cfg\_net\_key\_delete\_t**  
Parameters of Config NetKey Delete.

### Public Members

uint16\_t **net\_idx**  
The network key index

**struct esp\_ble\_mesh\_cfg\_app\_key\_update\_t**  
Parameters of Config AppKey Update.

### Public Members

uint16\_t **net\_idx**  
The network key index

uint16\_t **app\_idx**  
The app key index

`uint8_t app_key[16]`  
The app key value

**struct esp\_ble\_mesh\_cfg\_app\_key\_delete\_t**  
Parameters of Config AppKey Delete.

### Public Members

`uint16_t net_idx`  
The network key index

`uint16_t app_idx`  
The app key index

**struct esp\_ble\_mesh\_cfg\_node\_identity\_set\_t**  
Parameters of Config Node Identity Set.

### Public Members

`uint16_t net_idx`  
The network key index

`uint8_t identity`  
New Node Identity state

**struct esp\_ble\_mesh\_cfg\_model\_app\_unbind\_t**  
Parameters of Config Model App Unbind.

### Public Members

`uint16_t element_addr`  
The element address

`uint16_t model_app_idx`  
Index of the app key to bind with the model

`uint16_t model_id`  
The model id

`uint16_t company_id`  
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t**  
Parameters of Config Key Refresh Phase Set.

### Public Members

`uint16_t net_idx`  
The network key index

`uint8_t transition`  
New Key Refresh Phase Transition

**struct esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t**  
Parameters of Config Network Transmit Set.

**Public Members**

**uint8\_t net\_transmit**  
Network Transmit State

**struct esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t**  
Parameters of Config Model Heartbeat Publication Set.

**Public Members**

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t count**  
Number of Heartbeat messages to be sent

**uint8\_t period**  
Period for sending Heartbeat messages

**uint8\_t ttl**  
TTL to be used when sending Heartbeat messages

**uint16\_t feature**  
Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**  
NetKey Index

**struct esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t**  
Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

**uint16\_t src**  
Source address for Heartbeat messages

**uint16\_t dst**  
Destination address for Heartbeat messages

**uint8\_t period**  
Period for receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t**  
Parameter of Config Beacon Status

**Public Members**

**uint8\_t beacon**  
Secure Network Beacon state value

**struct esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t**  
Parameters of Config Composition Data Status

**Public Members**

**uint8\_t page**  
Page number of the Composition Data

**struct net\_buf\_simple \*composition\_data**  
Pointer to Composition Data for the identified page

**struct esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t**  
Parameter of Config Default TTL Status

#### Public Members

**uint8\_t default\_ttl**  
Default TTL state value

**struct esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t**  
Parameter of Config GATT Proxy Status

#### Public Members

**uint8\_t gatt\_proxy**  
GATT Proxy state value

**struct esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t**  
Parameters of Config Relay Status

#### Public Members

**uint8\_t relay**  
Relay state value

**uint8\_t retransmit**  
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

**struct esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t**  
Parameters of Config Model Publication Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t publish\_addr**  
Value of the publish address

**uint16\_t app\_idx**  
Index of the application key

**bool cred\_flag**  
Value of the Friendship Credential Flag

**uint8\_t ttl**  
Default TTL value for the outgoing messages

**uint8\_t period**  
Period for periodic status publishing

**uint8\_t transmit**  
Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_model\_sub\_status\_cb\_t**  
Parameters of Config Model Subscription Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t sub\_addr**  
Value of the address

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t**  
Parameters of Config NetKey Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**struct esp\_ble\_mesh\_cfg\_app\_key\_status\_cb\_t**  
Parameters of Config AppKey Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint16\_t app\_idx**  
Index of the application key

**struct esp\_ble\_mesh\_cfg\_mod\_app\_status\_cb\_t**  
Parameters of Config Model App Status

#### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t app\_idx**  
Index of the application key

**uint16\_t company\_id**  
Company ID

`uint16_t model_id`  
Model ID

`struct esp_ble_mesh_cfg_friend_status_cb_t`  
Parameter of Config Friend Status

### Public Members

`uint8_t friend_state`  
Friend state value

`struct esp_ble_mesh_cfg_hb_pub_status_cb_t`  
Parameters of Config Heartbeat Publication Status

### Public Members

`uint8_t status`  
Status Code for the request message

`uint16_t dst`  
Destination address for Heartbeat messages

`uint8_t count`  
Number of Heartbeat messages remaining to be sent

`uint8_t period`  
Period for sending Heartbeat messages

`uint8_t ttl`  
TTL to be used when sending Heartbeat messages

`uint16_t features`  
Features that trigger Heartbeat messages when changed

`uint16_t net_idx`  
Index of the NetKey

`struct esp_ble_mesh_cfg_hb_sub_status_cb_t`  
Parameters of Config Heartbeat Subscription Status

### Public Members

`uint8_t status`  
Status Code for the request message

`uint16_t src`  
Source address for Heartbeat messages

`uint16_t dst`  
Destination address for Heartbeat messages

`uint8_t period`  
Remaining Period for processing Heartbeat messages

`uint8_t count`  
Number of Heartbeat messages received

`uint8_t min_hops`  
Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t**  
Parameters of Config Network Transmit Status

### Public Members

**uint8\_t net\_trans\_count** : 3  
Number of transmissions for each Network PDU originating from the node

**uint8\_t net\_trans\_step** : 5  
Maximum hops when receiving Heartbeat messages

**struct esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t**  
Parameters of Config SIG/Vendor Subscription List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct net\_buf\_simple \*sub\_addr**  
A block of all addresses from the Subscription List

**struct esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t**  
Parameter of Config NetKey List

### Public Members

**struct net\_buf\_simple \*net\_idx**  
A list of NetKey Indexes known to the node

**struct esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t**  
Parameters of Config AppKey List

### Public Members

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
NetKey Index of the NetKey that the AppKeys are bound to

**struct net\_buf\_simple \*app\_idx**  
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

**struct esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t**  
Parameters of Config Node Identity Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint8\_t identity**  
Node Identity state

**struct esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t**  
Parameters of Config SIG/Vendor Model App List

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t element\_addr**  
Address of the element

**uint16\_t company\_id**  
Company ID

**uint16\_t model\_id**  
Model ID

**struct net\_buf\_simple \*app\_idx**  
All AppKey indexes bound to the Model

**struct esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t**  
Parameters of Config Key Refresh Phase Status

**Public Members**

**uint8\_t status**  
Status Code for the request message

**uint16\_t net\_idx**  
Index of the NetKey

**uint8\_t phase**  
Key Refresh Phase state

**struct esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t**  
Parameters of Config Low Power Node PollTimeout Status

**Public Members**

**uint16\_t lpn\_addr**  
The unicast address of the Low Power node

**int32\_t poll\_timeout**  
The current value of the PollTimeout timer of the Low Power node

**struct esp\_ble\_mesh\_cfg\_client\_cb\_param\_t**  
Configuration Client Model callback parameters

**Public Members****int error\_code**

Appropriate error code

***esp\_ble\_mesh\_client\_common\_param\_t* \*params**

The client common parameters

***esp\_ble\_mesh\_cfg\_client\_common\_cb\_param\_t* status\_cb**

The config status message callback values

**struct esp\_ble\_mesh\_state\_change\_cfg\_mod\_pub\_set\_t**

Configuration Server model related context.

**Public Members****uint16\_t element\_addr**

Element Address

**uint16\_t pub\_addr**

Publish Address

**uint16\_t app\_idx**

AppKey Index

**bool cred\_flag**

Friendship Credential Flag

**uint8\_t pub\_ttl**

Publish TTL

**uint8\_t pub\_period**

Publish Period

**uint8\_t pub\_retransmit**

Publish Retransmit

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add

**Public Members****uint16\_t element\_addr**

Element Address

**uint16\_t sub\_addr**

Subscription Address

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete

**Public Members**

`uint16_t element_addr`  
Element Address

`uint16_t sub_addr`  
Subscription Address

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

`struct esp_ble_mesh_state_change_cfg_netkey_add_t`  
Parameters of Config NetKey Add

**Public Members**

`uint16_t net_idx`  
NetKey Index

`uint8_t net_key[16]`  
NetKey

`struct esp_ble_mesh_state_change_cfg_netkey_update_t`  
Parameters of Config NetKey Update

**Public Members**

`uint16_t net_idx`  
NetKey Index

`uint8_t net_key[16]`  
NetKey

`struct esp_ble_mesh_state_change_cfg_netkey_delete_t`  
Parameter of Config NetKey Delete

**Public Members**

`uint16_t net_idx`  
NetKey Index

`struct esp_ble_mesh_state_change_cfg_appkey_add_t`  
Parameters of Config AppKey Add

**Public Members**

`uint16_t net_idx`  
NetKey Index

`uint16_t app_idx`  
AppKey Index

`uint8_t app_key[16]`  
AppKey

`struct esp_ble_mesh_state_change_cfg_appkey_update_t`  
Parameters of Config AppKey Update

**Public Members**

`uint16_t net_idx`  
NetKey Index

`uint16_t app_idx`  
AppKey Index

`uint8_t app_key[16]`  
AppKey

**struct esp\_ble\_mesh\_state\_change\_cfg\_appkey\_delete\_t**  
Parameters of Config AppKey Delete

**Public Members**

`uint16_t net_idx`  
NetKey Index

`uint16_t app_idx`  
AppKey Index

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_bind\_t**  
Parameters of Config Model App Bind

**Public Members**

`uint16_t element_addr`  
Element Address

`uint16_t app_idx`  
AppKey Index

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_unbind\_t**  
Parameters of Config Model App Unbind

**Public Members**

`uint16_t element_addr`  
Element Address

`uint16_t app_idx`  
AppKey Index

`uint16_t company_id`  
Company ID

`uint16_t model_id`  
Model ID

**struct esp\_ble\_mesh\_state\_change\_cfg\_kr\_phase\_set\_t**  
Parameters of Config Key Refresh Phase Set

### Public Members

`uint16_t net_idx`

NetKey Index

`uint8_t kr_phase`

New Key Refresh Phase Transition

**struct** `esp_ble_mesh_cfg_server_cb_param_t`

Configuration Server model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the server model structure

`esp_ble_mesh_msg_ctx_t ctx`

Context of the received message

`esp_ble_mesh_cfg_server_cb_value_t value`

Value of the received configuration messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_CFG\_SRV** (`srv_data`)

Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

#### Parameters

- `srv_data`: Pointer to a unique Config Server Model `user_data`.

**ESP\_BLE\_MESH\_MODEL\_CFG\_CLI** (`cli_data`)

Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

#### Parameters

- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

### Type Definitions

**typedef struct** `esp_ble_mesh_cfg_srv` `esp_ble_mesh_cfg_srv_t`

Configuration Server Model context

**typedef void** (`*esp_ble_mesh_cfg_client_cb_t`) (`esp_ble_mesh_cfg_client_cb_event_t` `event`,  
`esp_ble_mesh_cfg_client_cb_param_t`  
`*param`)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

#### Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

**typedef void** (`*esp_ble_mesh_cfg_server_cb_t`) (`esp_ble_mesh_cfg_server_cb_event_t` `event`,  
`esp_ble_mesh_cfg_server_cb_param_t`  
`*param`)

Configuration Server Model callback function type.

#### Parameters

- `event`: Event type
- `param`: Pointer to callback parameter

## Enumerations

**enum esp\_ble\_mesh\_cfg\_client\_cb\_event\_t**  
This enum value is the event of Configuration Client Model

Values:

**ESP\_BLE\_MESH\_CFG\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_CFG\_CLIENT\_EVT\_MAX**

**enum esp\_ble\_mesh\_cfg\_server\_cb\_event\_t**  
This enum value is the event of Configuration Server model

Values:

**ESP\_BLE\_MESH\_CFG\_SERVER\_STATE\_CHANGE\_EVT**

**ESP\_BLE\_MESH\_CFG\_SERVER\_EVT\_MAX**

## Health Client/Server Models

### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_health\\_model\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_client\_callback** (*esp\_ble\_mesh\_health\_client\_cb\_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_server\_callback** (*esp\_ble\_mesh\_health\_server\_cb\_t* callback)

Register BLE Mesh Health Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] callback: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_get\_state\_t* \*get\_state)

This function is called to get the Health Server states using the Health Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_opcode\_health\_client\_get\_t in esp\_ble\_mesh\_defs.h

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] params: Pointer to BLE Mesh common client parameters.
- [in] get\_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_set\_state\_t* \*set\_state)

This function is called to set the Health Server states using the Health Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

*esp\_err\_t* `esp_ble_mesh_health_server_fault_update` (*esp\_ble\_mesh\_elem\_t* \**element*)

This function is called by the Health Server Model to update the context of its Health Current status.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `element`: The element to which the Health Server Model belongs.

## Unions

**union** `esp_ble_mesh_health_client_get_state_t`

`#include <esp_ble_mesh_health_model_api.h>` For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

## Public Members

*esp\_ble\_mesh\_health\_fault\_get\_t* `fault_get`

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET.

**union** `esp_ble_mesh_health_client_set_state_t`

`#include <esp_ble_mesh_health_model_api.h>` For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK the `set_state` parameter in the `esp_ble_mesh_health_client_set_state` function should not be set to NULL.

## Public Members

*esp\_ble\_mesh\_health\_attention\_set\_t* `attention_set`

For ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK.

*esp\_ble\_mesh\_health\_period\_set\_t* `period_set`

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK.

*esp\_ble\_mesh\_health\_fault\_test\_t* `fault_test`

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK.

*esp\_ble\_mesh\_health\_fault\_clear\_t* `fault_clear`

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK.

**union** `esp_ble_mesh_health_client_common_cb_param_t`

`#include <esp_ble_mesh_health_model_api.h>` Health Client Model received message union.

## Public Members

*esp\_ble\_mesh\_health\_current\_status\_cb\_t* `current_status`

The health current status value

*esp\_ble\_mesh\_health\_fault\_status\_cb\_t* **fault\_status**

The health fault status value

*esp\_ble\_mesh\_health\_period\_status\_cb\_t* **period\_status**

The health period status value

*esp\_ble\_mesh\_health\_attention\_status\_cb\_t* **attention\_status**

The health attention status value

**union esp\_ble\_mesh\_health\_server\_cb\_param\_t**

*#include <esp\_ble\_mesh\_health\_model\_api.h>* Health Server Model callback parameters union.

### Public Members

*esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t* **fault\_update\_comp**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT

*esp\_ble\_mesh\_health\_fault\_clear\_cb\_t* **fault\_clear**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT

*esp\_ble\_mesh\_health\_fault\_test\_cb\_t* **fault\_test**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT

*esp\_ble\_mesh\_health\_attention\_on\_cb\_t* **attention\_on**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT

*esp\_ble\_mesh\_health\_attention\_off\_cb\_t* **attention\_off**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT

### Structures

**struct esp\_ble\_mesh\_health\_srv\_cb\_t**

ESP BLE Mesh Health Server callback

### Public Members

*esp\_ble\_mesh\_cb\_t* **fault\_clear**

Clear health registered faults. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **fault\_test**

Run a specific health test. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_on**

Health attention on callback. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_off**

Health attention off callback. Initialized by the stack.

**struct esp\_ble\_mesh\_health\_test\_t**

ESP BLE Mesh Health Server test Context

### Public Members

uint8\_t **id\_count**

Number of Health self-test ID

const uint8\_t \***test\_ids**

Array of Health self-test IDs

uint16\_t **company\_id**

Company ID used to identify the Health Fault state

uint8\_t **prev\_test\_id**

Current test ID of the health fault test

`uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`  
Array of current faults

`uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`  
Array of registered faults

**struct esp\_ble\_mesh\_health\_srv\_t**  
ESP BLE Mesh Health Server Model Context

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Health Server Model

`esp_ble_mesh_health_srv_cb_t health_cb`  
Health callback struct

**struct k\_delayed\_work attention\_timer**  
Attention Timer state

`bool attention_timer_start`  
Attention Timer start flag

`esp_ble_mesh_health_test_t health_test`  
Health Server fault test

**struct esp\_ble\_mesh\_health\_fault\_get\_t**  
Parameter of Health Fault Get

### Public Members

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_attention\_set\_t**  
Parameter of Health Attention Set

### Public Members

`uint8_t attention`  
Value of the Attention Timer state

**struct esp\_ble\_mesh\_health\_period\_set\_t**  
Parameter of Health Period Set

### Public Members

`uint8_t fast_period_divisor`  
Divider for the Publish Period

**struct esp\_ble\_mesh\_health\_fault\_test\_t**  
Parameter of Health Fault Test

### Public Members

`uint16_t company_id`  
Bluetooth assigned 16-bit Company ID

`uint8_t test_id`  
ID of a specific test to be performed

**struct esp\_ble\_mesh\_health\_fault\_clear\_t**  
Parameter of Health Fault Clear

#### Public Members

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_current\_status\_cb\_t**  
Parameters of Health Current Status

#### Public Members

uint8\_t **test\_id**  
ID of a most recently performed test

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_fault\_status\_cb\_t**  
Parameters of Health Fault Status

#### Public Members

uint8\_t **test\_id**  
ID of a most recently performed test

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct net\_buf\_simple \*fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

**struct esp\_ble\_mesh\_health\_period\_status\_cb\_t**  
Parameter of Health Period Status

#### Public Members

uint8\_t **fast\_period\_divisor**  
Divider for the Publish Period

**struct esp\_ble\_mesh\_health\_attention\_status\_cb\_t**  
Parameter of Health Attention Status

#### Public Members

uint8\_t **attention**  
Value of the Attention Timer state

**struct esp\_ble\_mesh\_health\_client\_cb\_param\_t**  
Health Client Model callback parameters

**Public Members**

int **error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**  
The client common parameters.

*esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t* **status\_cb**  
The health message status callback values

**struct esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t**  
Parameter of publishing Health Current Status completion event

**Public Members**

int **error\_code**  
The result of publishing Health Current Status

*esp\_ble\_mesh\_elem\_t* \***element**  
Pointer to the element which contains the Health Server Model

**struct esp\_ble\_mesh\_health\_fault\_clear\_cb\_t**  
Parameters of Health Fault Clear event

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Health Server Model

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_fault\_test\_cb\_t**  
Parameters of Health Fault Test event

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Health Server Model

uint8\_t **test\_id**  
ID of a specific test to be performed

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

**struct esp\_ble\_mesh\_health\_attention\_on\_cb\_t**  
Parameter of Health Attention On event

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Health Server Model

uint8\_t **time**  
Duration of attention timer on (in seconds)

**struct esp\_ble\_mesh\_health\_attention\_off\_cb\_t**  
Parameter of Health Attention Off event

## Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Health Server Model

## Macros

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV** (srv, pub)  
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

### Parameters

- *srv*: Pointer to the unique struct *esp\_ble\_mesh\_health\_srv\_t*.
- *pub*: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI** (cli\_data)  
Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

### Parameters

- *cli\_data*: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE** (*\_name*, *\_max*, *\_role*)  
A helper to define a health publication context

### Parameters

- *\_name*: Name given to the publication context variable.
- *\_max*: Maximum number of faults the element can have.
- *\_role*: Role of the device which contains the model.

**ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST**  
SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP\_BLE\_MESH\_NO\_FAULT**  
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

**ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING**

**ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_ERROR**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_WARNING**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_ERROR**

**ESP\_BLE\_MESH\_NO\_LOAD\_WARNING**

**ESP\_BLE\_MESH\_NO\_LOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERLOAD\_WARNING**

**ESP\_BLE\_MESH\_OVERLOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERHEAT\_WARNING**

**ESP\_BLE\_MESH\_OVERHEAT\_ERROR**

**ESP\_BLE\_MESH\_CONDENSATION\_WARNING**

ESP\_BLE\_MESH\_CONDENSATION\_ERROR  
ESP\_BLE\_MESH\_VIBRATION\_WARNING  
ESP\_BLE\_MESH\_VIBRATION\_ERROR  
ESP\_BLE\_MESH\_CONFIGURATION\_WARNING  
ESP\_BLE\_MESH\_CONFIGURATION\_ERROR  
ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_WARNING  
ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_ERROR  
ESP\_BLE\_MESH\_MEMORY\_WARNING  
ESP\_BLE\_MESH\_MEMORY\_ERROR  
ESP\_BLE\_MESH\_SELF\_TEST\_WARNING  
ESP\_BLE\_MESH\_SELF\_TEST\_ERROR  
ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_WARNING  
ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_ERROR  
ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_WARNING  
ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_ERROR  
ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_WARNING  
ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_ERROR  
ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_WARNING  
ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_ERROR  
ESP\_BLE\_MESH\_HOUSING\_OPENED\_WARNING  
ESP\_BLE\_MESH\_HOUSING\_OPENED\_ERROR  
ESP\_BLE\_MESH\_TAMPER\_WARNING  
ESP\_BLE\_MESH\_TAMPER\_ERROR  
ESP\_BLE\_MESH\_DEVICE\_MOVED\_WARNING  
ESP\_BLE\_MESH\_DEVICE\_MOVED\_ERROR  
ESP\_BLE\_MESH\_DEVICE\_DROPPED\_WARNING  
ESP\_BLE\_MESH\_DEVICE\_DROPPED\_ERROR  
ESP\_BLE\_MESH\_OVERFLOW\_WARNING  
ESP\_BLE\_MESH\_OVERFLOW\_ERROR  
ESP\_BLE\_MESH\_EMPTY\_WARNING  
ESP\_BLE\_MESH\_EMPTY\_ERROR  
ESP\_BLE\_MESH\_INTERNAL\_BUS\_WARNING  
ESP\_BLE\_MESH\_INTERNAL\_BUS\_ERROR  
ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_WARNING  
ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_ERROR  
ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE

### Type Definitions

**typedef** void (\***esp\_ble\_mesh\_health\_client\_cb\_t**) (*esp\_ble\_mesh\_health\_client\_cb\_event\_t* event, *esp\_ble\_mesh\_health\_client\_cb\_param\_t* \*param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

**typedef** void (\***esp\_ble\_mesh\_health\_server\_cb\_t**) (*esp\_ble\_mesh\_health\_server\_cb\_event\_t* event, *esp\_ble\_mesh\_health\_server\_cb\_param\_t* \*param)

Health Server Model callback function type.

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

**enum** **esp\_ble\_mesh\_health\_client\_cb\_event\_t**

This enum value is the event of Health Client Model

*Values:*

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_CLIENT\_EVT\_MAX**

**enum** **esp\_ble\_mesh\_health\_server\_cb\_event\_t**

This enum value is the event of Health Server Model

*Values:*

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT**

**ESP\_BLE\_MESH\_HEALTH\_SERVER\_EVT\_MAX**

### Generic Client/Server Models

#### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_generic\\_model\\_api.h](#)

#### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_generic\_client\_callback** (*esp\_ble\_mesh\_generic\_client\_cb\_t* callback)

Register BLE Mesh Generic Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_get\_state\_t* \*get\_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to generic get message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_set\_state\_t* \*set\_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to generic set message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_register\_generic\_server\_callback** (*esp\_ble\_mesh\_generic\_server\_cb\_t* callback)

Register BLE Mesh Generic Server Model callback.

**Return** `ESP_OK` on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

## Unions

### Structures

**struct esp\_ble\_mesh\_gen\_onoff\_set\_t**  
Bluetooth Mesh Generic Client Model Get and Set parameters structure.  
Parameters of Generic OnOff Set.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint8\_t **onoff**  
Target value of Generic OnOff state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_level\_set\_t**  
Parameters of Generic Level Set.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

**int16\_t level**  
Target value of Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_delta\_set\_t**  
Parameters of Generic Delta Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**int32\_t level**  
Delta change of Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_move\_set\_t**  
Parameters of Generic Move Set.

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**int16\_t delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_set\_t**  
Parameter of Generic Default Transition Time Set.

### Public Members

**uint8\_t trans\_time**  
The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set.

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_set\_t**

Parameters of Generic Power Level Set.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set.

**Public Members****uint16\_t power**

The value of the Generic Power Default state

**struct esp\_ble\_mesh\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set.

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set.

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_set\_t**

Parameters of Generic Location Local Set.

**Public Members**

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_property\_get\_t**  
Parameter of Generic User Property Get.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**struct esp\_ble\_mesh\_gen\_user\_property\_set\_t**  
Parameters of Generic User Property Set.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property

**struct esp\_ble\_mesh\_gen\_admin\_property\_get\_t**  
Parameter of Generic Admin Property Get.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic Admin Property

**struct esp\_ble\_mesh\_gen\_admin\_property\_set\_t**  
Parameters of Generic Admin Property Set.

**Public Members**

**uint16\_t property\_id**  
Property ID identifying a Generic Admin Property

**uint8\_t user\_access**  
Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**  
Raw value for the Admin Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_get\_t**  
Parameter of Generic Manufacturer Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_set\_t**  
Parameters of Generic Manufacturer Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

**struct esp\_ble\_mesh\_gen\_client\_properties\_get\_t**  
Parameter of Generic Client Properties Get.

**Public Members**

`uint16_t property_id`  
A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_gen\_onoff\_status\_cb\_t**  
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.  
Parameters of Generic OnOff Status.

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint8_t present_onoff`  
Current value of Generic OnOff state

`uint8_t target_onoff`  
Target value of Generic OnOff state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_level\_status\_cb\_t**  
Parameters of Generic Level Status.

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`int16_t present_level`  
Current value of Generic Level state

`int16_t target_level`  
Target value of the Generic Level state (optional)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_status\_cb\_t**  
Parameter of Generic Default Transition Time Status.

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_status\_cb\_t**

Parameter of Generic OnPowerUp Status.

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_status\_cb\_t**

Parameters of Generic Power Level Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_power**

Current value of Generic Power Actual state

**uint16\_t target\_power**

Target value of Generic Power Actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_gen\_power\_last\_status\_cb\_t**

Parameter of Generic Power Last Status.

**Public Members****uint16\_t power**

The value of the Generic Power Last state

**struct esp\_ble\_mesh\_gen\_power\_default\_status\_cb\_t**

Parameter of Generic Power Default Status.

**Public Members****uint16\_t power**

The value of the Generic Default Last state

**struct esp\_ble\_mesh\_gen\_power\_range\_status\_cb\_t**

Parameters of Generic Power Range Status.

**Public Members****uint8\_t status\_code**

Status Code for the request message

**uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_gen\_battery\_status\_cb\_t**  
Parameters of Generic Battery Status.

### Public Members

**uint32\_t battery\_level** : 8  
Value of Generic Battery Level state

**uint32\_t time\_to\_discharge** : 24  
Value of Generic Battery Time to Discharge state

**uint32\_t time\_to\_charge** : 24  
Value of Generic Battery Time to Charge state

**uint32\_t flags** : 8  
Value of Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t**  
Parameters of Generic Location Global Status.

### Public Members

**int32\_t global\_latitude**  
Global Coordinates (Latitude)

**int32\_t global\_longitude**  
Global Coordinates (Longitude)

**int16\_t global\_altitude**  
Global Altitude

**struct esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t**  
Parameters of Generic Location Local Status.

### Public Members

**int16\_t local\_north**  
Local Coordinates (North)

**int16\_t local\_east**  
Local Coordinates (East)

**int16\_t local\_altitude**  
Local Altitude

**uint8\_t floor\_number**  
Floor Number

**uint16\_t uncertainty**  
Uncertainty

**struct esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t**  
Parameter of Generic User Properties Status.

### Public Members

**struct net\_buf\_simple \*property\_ids**  
Buffer contains a sequence of N User Property IDs

**struct esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t**  
Parameters of Generic User Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic User Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**

Raw value for the User Property (C.1)

**struct esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t**

Parameter of Generic Admin Properties Status.

**Public Members****struct net\_buf\_simple \*property\_ids**

Buffer contains a sequence of N Admin Property IDs

**struct esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t**

Parameters of Generic Admin Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic Admin Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**

Raw value for the Admin Property (C.1)

**struct esp\_ble\_mesh\_gen\_manufacturer\_properties\_status\_cb\_t**

Parameter of Generic Manufacturer Properties Status.

**Public Members****struct net\_buf\_simple \*property\_ids**

Buffer contains a sequence of N Manufacturer Property IDs

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_status\_cb\_t**

Parameters of Generic Manufacturer Property Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**uint8\_t user\_access**

Enumeration indicating user access (optional)

**struct net\_buf\_simple \*property\_value**  
Raw value for the Manufacturer Property (C.1)

**struct esp\_ble\_mesh\_gen\_client\_properties\_status\_cb\_t**  
Parameter of Generic Client Properties Status.

### Public Members

**struct net\_buf\_simple \*property\_ids**  
Buffer contains a sequence of N Client Property IDs

**struct esp\_ble\_mesh\_generic\_client\_cb\_param\_t**  
Generic Client Model callback parameters

### Public Members

**int error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \*params  
The client common parameters.

*esp\_ble\_mesh\_gen\_client\_status\_cb\_t* status\_cb  
The generic status message callback values

**struct esp\_ble\_mesh\_gen\_onoff\_state\_t**  
Parameters of Generic OnOff state

### Public Members

**uint8\_t onoff**  
The present value of the Generic OnOff state

**uint8\_t target\_onoff**  
The target value of the Generic OnOff state

**struct esp\_ble\_mesh\_gen\_onoff\_srv\_t**  
User data of Generic OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Generic OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl  
Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onoff\_state\_t* state  
Parameters of the Generic OnOff state

*esp\_ble\_mesh\_last\_msg\_info\_t* last  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* transition  
Parameters of state transition

**struct esp\_ble\_mesh\_gen\_level\_state\_t**  
Parameters of Generic Level state

### Public Members

`int16_t level`

The present value of the Generic Level state

`int16_t target_level`

The target value of the Generic Level state

`int16_t last_level`

When a new transaction starts, level should be set to last\_last, and use “level + incoming delta” to calculate the target level. In another word, “last\_level” is used to record “level” of the last transaction, and “last\_delta” is used to record the previously received delta\_level value. The last value of the Generic Level state

`int32_t last_delta`

The last delta change of the Generic Level state

`bool move_start`

Indicate if the transition of the Generic Level state has been started

`bool positive`

Indicate if the transition is positive or negative

**struct esp\_ble\_mesh\_gen\_level\_srv\_t**

User data of Generic Level Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_gen_level_state_t state`

Parameters of the Generic Level state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`int32_t tt_delta_level`

Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t**

Parameter of Generic Default Transition Time state

### Public Members

`uint8_t trans_time`

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t**

User data of Generic Default Transition Time Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t* **state**

Parameters of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_gen\_onpowerup\_state\_t**

Parameter of Generic OnPowerUp state

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t**

User data of Generic Power OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t**

User data of Generic Power OnOff Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_gen\_power\_level\_state\_t**

Parameters of Generic Power Level state

### Public Members

uint16\_t **power\_actual**

The present value of the Generic Power Actual state

uint16\_t **target\_power\_actual**

The target value of the Generic Power Actual state

uint16\_t **power\_last**

The value of the Generic Power Last state

uint16\_t **power\_default**

The value of the Generic Power Default state

uint8\_t **status\_code**

The status code of setting Generic Power Range state

`uint16_t power_range_min`  
The minimum value of the Generic Power Range state

`uint16_t power_range_max`  
The maximum value of the Generic Power Range state

**struct esp\_ble\_mesh\_gen\_power\_level\_srv\_t**  
User data of Generic Power Level Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`  
Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_level`  
Delta change value of level state transition

**struct esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t**  
User data of Generic Power Level Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`  
Parameters of the Generic Power Level state

**struct esp\_ble\_mesh\_gen\_battery\_state\_t**  
Parameters of Generic Battery state

### Public Members

`uint32_t battery_level : 8`  
The value of the Generic Battery Level state

`uint32_t time_to_discharge : 24`  
The value of the Generic Battery Time to Discharge state

`uint32_t time_to_charge : 24`  
The value of the Generic Battery Time to Charge state

`uint32_t battery_flags : 8`  
The value of the Generic Battery Flags state

**struct esp\_ble\_mesh\_gen\_battery\_srv\_t**  
User data of Generic Battery Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Battery Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_battery\_state\_t* **state**

Parameters of the Generic Battery state

**struct esp\_ble\_mesh\_gen\_location\_state\_t**

Parameters of Generic Location state

**Public Members**

int32\_t **global\_latitude**

The value of the Global Latitude field

int32\_t **global\_longitude**

The value of the Global Longitude field

int16\_t **global\_altitude**

The value of the Global Altitude field

int16\_t **local\_north**

The value of the Local North field

int16\_t **local\_east**

The value of the Local East field

int16\_t **local\_altitude**

The value of the Local Altitude field

uint8\_t **floor\_number**

The value of the Floor Number field

uint16\_t **uncertainty**

The value of the Uncertainty field

**struct esp\_ble\_mesh\_gen\_location\_srv\_t**

User data of Generic Location Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

**struct esp\_ble\_mesh\_gen\_location\_setup\_srv\_t**

User data of Generic Location Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

**struct esp\_ble\_mesh\_generic\_property\_t**

Parameters of Generic Property states

### Public Members

uint16\_t **id**

The value of User/Admin/Manufacturer Property ID

uint8\_t **user\_access**

The value of User Access field

uint8\_t **admin\_access**

The value of Admin Access field

uint8\_t **manu\_access**

The value of Manufacturer Access field

**struct** net\_buf\_simple \***val**

The value of User/Admin/Manufacturer Property

**struct esp\_ble\_mesh\_gen\_user\_prop\_srv\_t**

User data of Generic User Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic User Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic User Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic User Property state

**struct esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t**

User data of Generic Admin Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic Admin Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic Admin Property state

**struct esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t**

User data of Generic Manufacturer Property Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic Manufacturer Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic Manufacturer Property state

**struct esp\_ble\_mesh\_gen\_client\_prop\_srv\_t**

User data of Generic Client Property Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **id\_count**

Generic Client Property ID count

uint16\_t \***property\_ids**

Parameters of the Generic Client Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_onoff\_set\_t**

Parameter of Generic OnOff Set state change event

**Public Members**

uint8\_t **onoff**

The value of Generic OnOff state

**struct esp\_ble\_mesh\_state\_change\_gen\_level\_set\_t**

Parameter of Generic Level Set state change event

**Public Members**

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_delta\_set\_t**

Parameter of Generic Delta Set state change event

**Public Members**

int16\_t **level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_move\_set\_t**

Parameter of Generic Move Set state change event

**Public Members****int16\_t level**

The value of Generic Level state

**struct esp\_ble\_mesh\_state\_change\_gen\_def\_trans\_time\_set\_t**

Parameter of Generic Default Transition Time Set state change event

**Public Members****uint8\_t trans\_time**

The value of Generic Default Transition Time state

**struct esp\_ble\_mesh\_state\_change\_gen\_onpowerup\_set\_t**

Parameter of Generic OnPowerUp Set state change event

**Public Members****uint8\_t onpowerup**

The value of Generic OnPowerUp state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_level\_set\_t**

Parameter of Generic Power Level Set state change event

**Public Members****uint16\_t power**

The value of Generic Power Actual state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set state change event

**Public Members****uint16\_t power**

The value of Generic Power Default state

**struct esp\_ble\_mesh\_state\_change\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set state change event

**Public Members****uint16\_t range\_min**

The minimum value of Generic Power Range state

**uint16\_t range\_max**

The maximum value of Generic Power Range state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set state change event

**Public Members****int32\_t latitude**

The Global Latitude value of Generic Location state

**int32\_t longitude**  
The Global Longitude value of Generic Location state

**int16\_t altitude**  
The Global Altitude value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_loc\_local\_set\_t**  
Parameters of Generic Location Local Set state change event

### Public Members

**int16\_t north**  
The Local North value of Generic Location state

**int16\_t east**  
The Local East value of Generic Location state

**int16\_t altitude**  
The Local Altitude value of Generic Location state

**uint8\_t floor\_number**  
The Floor Number value of Generic Location state

**uint16\_t uncertainty**  
The Uncertainty value of Generic Location state

**struct esp\_ble\_mesh\_state\_change\_gen\_user\_property\_set\_t**  
Parameters of Generic User Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic User Property state

**struct net\_buf\_simple \*value**  
The property value of Generic User Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_admin\_property\_set\_t**  
Parameters of Generic Admin Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic Admin Property state

**uint8\_t access**  
The property access of Generic Admin Property state

**struct net\_buf\_simple \*value**  
The property value of Generic Admin Property state

**struct esp\_ble\_mesh\_state\_change\_gen\_manu\_property\_set\_t**  
Parameters of Generic Manufacturer Property Set state change event

### Public Members

**uint16\_t id**  
The property id of Generic Manufacturer Property state

**uint8\_t access**  
The property value of Generic Manufacturer Property state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_get\_t**  
Context of the received Generic User Property Get message

#### Public Members

**uint16\_t property\_id**  
Property ID identifying a Generic User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_get\_t**  
Context of the received Generic Admin Property Get message

#### Public Members

**uint16\_t property\_id**  
Property ID identifying a Generic Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_get\_t**  
Context of the received Generic Manufacturer Property message

#### Public Members

**uint16\_t property\_id**  
Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_client\_properties\_get\_t**  
Context of the received Generic Client Properties Get message

#### Public Members

**uint16\_t property\_id**  
A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onoff\_set\_t**  
Context of the received Generic OnOff Set message

#### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint8\_t onoff**  
Target value of Generic OnOff state

**uint8\_t tid**  
Transaction ID

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_level\_set\_t**  
Context of the received Generic Level Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_delta\_set\_t**  
Context of the received Generic Delta Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int32\_t **delta\_level**  
Delta change of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_move\_set\_t**  
Context of the received Generic Move Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **delta\_level**  
Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_def\_trans\_time\_set\_t**  
Context of the received Generic Default Transition Time Set message

**Public Members****uint8\_t trans\_time**

The value of the Generic Default Transition Time state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_onpowerup\_set\_t**

Context of the received Generic OnPowerUp Set message

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t**

Context of the received Generic Power Level Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t**

Context of the received Generic Power Default Set message

**Public Members****uint16\_t power**

The value of the Generic Power Default state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t**

Context of the received Generic Power Range Set message

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t**

Context of the received Generic Location Global Set message

**Public Members**

`int32_t global_latitude`  
Global Coordinates (Latitude)

`int32_t global_longitude`  
Global Coordinates (Longitude)

`int16_t global_altitude`  
Global Altitude

**struct esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t**  
Context of the received Generic Location Local Set message

**Public Members**

`int16_t local_north`  
Local Coordinates (North)

`int16_t local_east`  
Local Coordinates (East)

`int16_t local_altitude`  
Local Altitude

`uint8_t floor_number`  
Floor Number

`uint16_t uncertainty`  
Uncertainty

**struct esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t**  
Context of the received Generic User Property Set message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the User Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t**  
Context of the received Generic Admin Property Set message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`uint8_t user_access`  
Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**  
Raw value for the Admin Property

**struct esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t**  
Context of the received Generic Manufacturer Property Set message

### Public Members

`uint16_t property_id`  
Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`  
Enumeration indicating user access

`struct esp_ble_mesh_generic_server_cb_param_t`  
Generic Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Generic Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_generic_server_cb_value_t value`  
Value of the received Generic Messages

### Macros

`ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Return** New Generic Level Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI` (`cli_pub`, `cli_data`)  
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

#### Parameters

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_CLI** (cli\_pub, cli\_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_PROPERTY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_SRV** (srv\_pub, srv\_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_gen\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_gen\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_SRV** (srv\_pub, srv\_data)

Define a new Generic Default Transition Time Server Model.

**Note** 1. The Generic Default Transition Time Server Model is a root model.  
1. This model shall support model publication and model subscription.

**Return** New Generic Default Transition Time Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Server Model.

**Note** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.

2. This model shall support model publication and model subscription.

**Return** New Generic Power OnOff Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power OnOff Setup Server Model.

**Note** 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.

**Return** New Generic Power OnOff Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power Level Server Model.

**Note** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Generic Power Level Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Power Level Setup Server Model.

**Note** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Generic Power Level Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- `srv_data`: Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Battery Server Model.

**Note** 1. The Generic Battery Server Model is a root model.

1. This model shall support model publication and model subscription.

2. The model may be used to represent an element that is powered by a battery.

**Return** New Generic Battery Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_battery\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Location Server Model.

**Note** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_location\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Location Setup Server Model.

**Note** 1. The Generic Location Setup Server model extends the Generic Location Server model.

1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_location\\_setup\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_USER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic User Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_user\\_prop\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_ADMIN\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Admin Property Server Model.

**Note** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_admin\\_prop\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_MANUFACTURER\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic Manufacturer Property Server Model.

**Note** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_manu\\_prop\\_srv\\_t\*](#).

**ESP\_BLE\_MESH\_MODEL\_GEN\_CLIENT\_PROP\_SRV** (`srv_pub`, `srv_data`)

Define a new Generic User Property Server Model.

**Note** 1. The Generic Client Property Server model is a root model.

1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_model\\_pub\\_t\*](#).
- `srv_data`: Pointer to the unique struct [\*esp\\_ble\\_mesh\\_gen\\_client\\_prop\\_srv\\_t\*](#).

### Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t) (esp_ble_mesh_generic_client_cb_event_t  
event,  
esp_ble_mesh_generic_client_cb_param_t  
*param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t) (esp_ble_mesh_generic_server_cb_event_t  
event,  
esp_ble_mesh_generic_server_cb_param_t  
*param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t  
This enum value is the event of Generic Client Model
```

*Values:*

```
ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
```

```
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_gen_user_prop_access_t  
This enum value is the access value of Generic User Property
```

*Values:*

```
ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_READ
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
```

```
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE
```

```
enum esp_ble_mesh_gen_admin_prop_access_t  
This enum value is the access value of Generic Admin Property
```

*Values:*

```
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
```

```
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE
```

```
enum esp_ble_mesh_gen_manu_prop_access_t  
This enum value is the access value of Generic Manufacturer Property
```

*Values:*

**ESP\_BLE\_MESH\_GEN\_MANU\_NOT\_USER\_PROP**

**ESP\_BLE\_MESH\_GEN\_MANU\_ACCESS\_READ**

**enum esp\_ble\_mesh\_generic\_server\_cb\_event\_t**

This enum value is the event of Generic Server Model

*Values:*

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_GENERIC\_SERVER\_EVT\_MAX**

## Sensor Client/Server Models

### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_sensor\\_model\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_sensor\_client\_callback** (*esp\_ble\_mesh\_sensor\_client\_cb\_t* callback)

Register BLE Mesh Sensor Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_get\_state\_t* \*get\_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to sensor get message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_set\_state\_t* \*set\_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_sensor_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to sensor set message value. Shall not be set to NULL.

*esp\_err\_t* **esp\_ble\_mesh\_register\_sensor\_server\_callback** (*esp\_ble\_mesh\_sensor\_server\_cb\_t* callback)

Register BLE Mesh Sensor Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

## Unions

**union esp\_ble\_mesh\_sensor\_client\_get\_state\_t**  
#include <esp\_ble\_mesh\_sensor\_model\_api.h> Sensor Client Model get message union.

### Public Members

*esp\_ble\_mesh\_sensor\_descriptor\_get\_t* **descriptor\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_DESCRIPTOR\_GET

*esp\_ble\_mesh\_sensor\_cadence\_get\_t* **cadence\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_CADENCE\_GET

*esp\_ble\_mesh\_sensor\_settings\_get\_t* **settings\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_SETTINGS\_GET

*esp\_ble\_mesh\_sensor\_setting\_get\_t* **setting\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_SETTING\_GET

*esp\_ble\_mesh\_sensor\_get\_t* **sensor\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_GET

*esp\_ble\_mesh\_sensor\_column\_get\_t* **column\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_COLUMN\_GET

*esp\_ble\_mesh\_sensor\_series\_get\_t* **series\_get**  
For ESP\_BLE\_MESH\_MODEL\_OP\_SENSOR\_SERIES\_GET

ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_GET\_MSG\_EVT

*esp\_ble\_mesh\_sensor\_server\_rcv\_set\_msg\_t* **set**  
ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_SET\_MSG\_EVT

### Structures

**struct esp\_ble\_mesh\_sensor\_descriptor\_get\_t**  
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.  
Parameters of Sensor Descriptor Get

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID of a sensor (optional)

**struct esp\_ble\_mesh\_sensor\_cadence\_get\_t**  
Parameter of Sensor Cadence Get

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_cadence\_set\_t**  
Parameters of Sensor Cadence Set

### Public Members

uint16\_t **property\_id**  
Property ID for the sensor

uint8\_t **fast\_cadence\_period\_divisor** : 7  
Divisor for the publish period

uint8\_t **status\_trigger\_type** : 1  
The unit and format of the Status Trigger Delta fields

**struct net\_buf\_simple \*status\_trigger\_delta\_down**  
Delta down value that triggers a status message

**struct net\_buf\_simple \*status\_trigger\_delta\_up**  
Delta up value that triggers a status message

uint8\_t **status\_min\_interval**  
Minimum interval between two consecutive Status messages

**struct net\_buf\_simple \*fast\_cadence\_low**  
Low value for the fast cadence range

**struct net\_buf\_simple \*fast\_cadence\_high**  
Fast value for the fast cadence range

**struct esp\_ble\_mesh\_sensor\_settings\_get\_t**  
Parameter of Sensor Settings Get

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_get\_t**  
Parameters of Sensor Setting Get

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID of a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_set\_t**  
Parameters of Sensor Setting Set

#### Public Members

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

**struct net\_buf\_simple \*sensor\_setting\_raw**  
Raw value for the setting

**struct esp\_ble\_mesh\_sensor\_get\_t**  
Parameters of Sensor Get

#### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID for the sensor (optional)

**struct esp\_ble\_mesh\_sensor\_column\_get\_t**  
Parameters of Sensor Column Get

#### Public Members

uint16\_t **property\_id**  
Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**  
Raw value identifying a column

**struct esp\_ble\_mesh\_sensor\_series\_get\_t**  
Parameters of Sensor Series Get

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x1**  
Raw value identifying a starting column (optional)

struct net\_buf\_simple \***raw\_value\_x2**  
Raw value identifying an ending column (C.1)

struct **esp\_ble\_mesh\_sensor\_descriptor\_status\_cb\_t**  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

Parameter of Sensor Descriptor Status

**Public Members**

struct net\_buf\_simple \***descriptor**  
Sequence of 8-octet sensor descriptors (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_status\_cb\_t**  
Parameters of Sensor Cadence Status

**Public Members**

uint16\_t **property\_id**  
Property for the sensor

struct net\_buf\_simple \***sensor\_cadence\_value**  
Value of sensor cadence state

struct **esp\_ble\_mesh\_sensor\_settings\_status\_cb\_t**  
Parameters of Sensor Settings Status

**Public Members**

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

struct net\_buf\_simple \***sensor\_setting\_property\_ids**  
A sequence of N sensor setting property IDs (optional)

struct **esp\_ble\_mesh\_sensor\_setting\_status\_cb\_t**  
Parameters of Sensor Setting Status

**Public Members**

bool **op\_en**  
Indicate id optional parameters are included

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

`uint8_t sensor_setting_access`  
Read/Write access rights for the setting (optional)

`struct net_buf_simple *sensor_setting_raw`  
Raw value for the setting

`struct esp_ble_mesh_sensor_status_cb_t`  
Parameter of Sensor Status

### Public Members

`struct net_buf_simple *marshalled_sensor_data`  
Value of sensor data state (optional)

`struct esp_ble_mesh_sensor_column_status_cb_t`  
Parameters of Sensor Column Status

### Public Members

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_column_value`  
Left values of sensor column status

`struct esp_ble_mesh_sensor_series_status_cb_t`  
Parameters of Sensor Series Status

### Public Members

`uint16_t property_id`  
Property identifying a sensor and the Y axis

`struct net_buf_simple *sensor_series_value`  
Left values of sensor series status

`struct esp_ble_mesh_sensor_client_cb_param_t`  
Sensor Client Model callback parameters

### Public Members

`int error_code`  
0: success, otherwise failure. For the error code values please refer to `errno.h` file. A negative sign is added to the standard error codes in `errno.h`.

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_sensor_client_status_cb_t status_cb`  
The sensor status message callback values

`struct esp_ble_mesh_sensor_descriptor_t`  
Parameters of Sensor Descriptor state

### Public Members

`uint32_t positive_tolerance : 12`  
The value of Sensor Positive Tolerance field

**uint32\_t negative\_tolerance** : 12  
The value of Sensor Negative Tolerance field

**uint32\_t sampling\_function** : 8  
The value of Sensor Sampling Function field

**uint8\_t measure\_period**  
The value of Sensor Measurement Period field

**uint8\_t update\_interval**  
The value of Sensor Update Interval field

**struct esp\_ble\_mesh\_sensor\_setting\_t**  
Parameters of Sensor Setting state

### Public Members

**uint16\_t property\_id**  
The value of Sensor Setting Property ID field

**uint8\_t access**  
The value of Sensor Setting Access field

**struct net\_buf\_simple \*raw**  
The value of Sensor Setting Raw field

**struct esp\_ble\_mesh\_sensor\_cadence\_t**  
Parameters of Sensor Cadence state

### Public Members

**uint8\_t period\_divisor** : 7  
The value of Fast Cadence Period Divisor field

**uint8\_t trigger\_type** : 1  
The value of Status Trigger Type field

**struct net\_buf\_simple \*trigger\_delta\_down**  
Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

**struct net\_buf\_simple \*trigger\_delta\_up**  
The value of Status Trigger Delta Up field

**uint8\_t min\_interval**  
The value of Status Min Interval field

**struct net\_buf\_simple \*fast\_cadence\_low**  
The value of Fast Cadence Low field

**struct net\_buf\_simple \*fast\_cadence\_high**  
The value of Fast Cadence High field

**struct esp\_ble\_mesh\_sensor\_data\_t**  
Parameters of Sensor Data state

### Public Members

**uint8\_t format** : 1  
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).

Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

**uint8\_t length** : 7  
The value of the Sensor Data length

**struct net\_buf\_simple \*raw\_value**  
The value of Sensor Data raw value

**struct esp\_ble\_mesh\_sensor\_series\_column\_t**  
Parameters of Sensor Series Column state

### Public Members

**struct net\_buf\_simple \*raw\_value\_x**  
The value of Sensor Raw Value X field

**struct net\_buf\_simple \*column\_width**  
The value of Sensor Column Width field

**struct net\_buf\_simple \*raw\_value\_y**  
The value of Sensor Raw Value Y field

**struct esp\_ble\_mesh\_sensor\_state\_t**  
Parameters of Sensor states

### Public Members

**uint16\_t sensor\_property\_id**  
The value of Sensor Property ID field

*esp\_ble\_mesh\_sensor\_descriptor\_t* **descriptor**  
Parameters of the Sensor Descriptor state

**const uint8\_t setting\_count**  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

*esp\_ble\_mesh\_sensor\_setting\_t* \***settings**  
Parameters of the Sensor Setting state

*esp\_ble\_mesh\_sensor\_cadence\_t* \***cadence**  
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

*esp\_ble\_mesh\_sensor\_data\_t* **sensor\_data**  
Parameters of the Sensor Data state

*esp\_ble\_mesh\_sensor\_series\_column\_t* **series\_column**  
Parameters of the Sensor Series Column state

**struct esp\_ble\_mesh\_sensor\_srv\_t**  
User data of Sensor Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Sensor Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

**const uint8\_t state\_count**  
Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \*states  
Parameters of the Sensor states

**struct esp\_ble\_mesh\_sensor\_setup\_srv\_t**  
User data of Sensor Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \*model  
Pointer to the Sensor Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl  
Response control of the server model received messages

**const uint8\_t state\_count**  
Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \*states  
Parameters of the Sensor states

**struct esp\_ble\_mesh\_state\_change\_sensor\_cadence\_set\_t**  
Parameters of Sensor Cadence Set state change event

### Public Members

uint16\_t **property\_id**  
The value of Sensor Property ID state

uint8\_t **period\_divisor** : 7  
The value of Fast Cadence Period Divisor state

uint8\_t **trigger\_type** : 1  
The value of Status Trigger Type state

**struct** net\_buf\_simple \***trigger\_delta\_down**  
The value of Status Trigger Delta Down state

**struct** net\_buf\_simple \***trigger\_delta\_up**  
The value of Status Trigger Delta Up state

uint8\_t **min\_interval**  
The value of Status Min Interval state

**struct** net\_buf\_simple \***fast\_cadence\_low**  
The value of Fast Cadence Low state

**struct** net\_buf\_simple \***fast\_cadence\_high**  
The value of Fast Cadence High state

**struct esp\_ble\_mesh\_state\_change\_sensor\_setting\_set\_t**  
Parameters of Sensor Setting Set state change event

### Public Members

uint16\_t **property\_id**  
The value of Sensor Property ID state

uint16\_t **setting\_property\_id**  
The value of Sensor Setting Property ID state

**struct** net\_buf\_simple \***setting\_value**

The value of Sensor Property Value state

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_descriptor\_get\_t

Context of the received Sensor Descriptor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_get\_t

Context of the received Sensor Cadence Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_settings\_get\_t

Context of the received Sensor Settings Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_get\_t

Context of the received Sensor Setting Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

uint16\_t **setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_get\_t

Context of the received Sensor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID for the sensor (optional)

**struct** esp\_ble\_mesh\_server\_rcv\_sensor\_column\_get\_t

Context of the received Sensor Column Get message

**Public Members****uint16\_t property\_id**

Property identifying a sensor

**struct net\_buf\_simple \*raw\_value\_x**

Raw value identifying a column

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_series\_get\_t**

Context of the received Sensor Series Get message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t property\_id**

Property identifying a sensor

**struct net\_buf\_simple \*raw\_value**

Raw value containing X1 and X2 (optional)

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_set\_t**

Context of the received Sensor Cadence Set message

**Public Members****uint16\_t property\_id**

Property ID for the sensor

**struct net\_buf\_simple \*cadence**

Value of Sensor Cadence state

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_set\_t**

Context of the received Sensor Setting Set message

**Public Members****uint16\_t property\_id**

Property ID identifying a sensor

**uint16\_t setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct net\_buf\_simple \*setting\_raw**

Raw value for the setting

**struct esp\_ble\_mesh\_sensor\_server\_cb\_param\_t**

Sensor Server Model callback parameters

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to Sensor Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_sensor\_server\_cb\_value\_t* **value**

Value of the received Sensor Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_SENSOR\_CLI** (cli\_pub, cli\_data)

Define a new Sensor Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Sensor Client Model.**Return** New Sensor Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SRV** (srv\_pub, srv\_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

**Note** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_sensor\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Sensor Setup Server Model.

**Note** 1. The Sensor Setup Server model extends the Sensor Server model.

1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_sensor\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_PROPERTY\_ID**

Invalid Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_PROPERTY\_ID\_LEN**

Length of Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_DESCRIPTOR\_LEN**

Length of Sensor Descriptor state

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_POS\_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_NEG\_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_MEASURE\_PERIOD**

Not applicable Sensor Measurement Period

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_UPDATE\_INTERVAL**

Not applicable Sensor Update Interval

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_SETTING\_PROPERTY\_ID**

Invalid Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_PROPERTY\_ID\_LEN**

Length of Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_LEN**

Length of Sensor Setting Access

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ**

Sensor Setting Access - Read

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ\_WRITE**

Sensor Setting Access - Read &amp; Write

**ESP\_BLE\_MESH\_SENSOR\_DIVISOR\_TRIGGER\_TYPE\_LEN**

Length of Sensor Divisor Trigger Type

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_LEN**

Length of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_PERIOD\_DIVISOR\_MAX\_VALUE**

Maximum value of Sensor Period Divisor

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_MAX**

Maximum value of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_CHAR**

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_UINT16**

Sensor Status Trigger Type - Format Type “uint16”

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A**

Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B**

Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MP\_ID\_LEN**

MPID length of Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MP\_ID\_LEN**

MPID length of Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_ZERO\_LEN**

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_FORMAT** (\_data)

Get format of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the format of the corresponding sensor data.

**Return** Format of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_LENGTH** (\_data, \_fmt)

Get length of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the length of the corresponding sensor data.

**Return** Length (zero-based) of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.
- \_fmt: Format of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_PROPERTY\_ID** (\_data, \_fmt)

Get Sensor Property ID of the sensor data.

**Note** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**

- \_data: Pointer to the start of the sensor data.
- \_fmt: Format of the sensor data.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID** (*\_len*, *\_id*)

Generate a MPID value for sensor data with Format A.

**Note** 1. The Format field is 0b0 and indicates that Format A is used.

1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return** 2-octet MPID value for sensor data with Format A.

**Parameters**

- *\_len*: Length of Sensor Raw value.
- *\_id*: Sensor Property ID.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID** (*\_len*, *\_id*)

Generate a MPID value for sensor data with Format B.

**Note** 1. The Format field is 0b1 and indicates Format B is used.

1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
2. The Property ID is a 16-bit bit field representing a Property ID.
3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return** 3-octet MPID value for sensor data with Format B.

**Parameters**

- *\_len*: Length of Sensor Raw value.
- *\_id*: Sensor Property ID.

**Type Definitions**

```
typedef void (*esp_ble_mesh_sensor_client_cb_t) (esp_ble_mesh_sensor_client_cb_event_t
                                                event, esp_ble_mesh_sensor_client_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Parameters**

- *event*: Event type
- *param*: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t) (esp_ble_mesh_sensor_server_cb_event_t
                                                event, esp_ble_mesh_sensor_server_cb_param_t
                                                *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Parameters**

- *event*: Event type
- *param*: Pointer to callback parameter

**Enumerations**

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

*Values:*

```
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
```

```
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
```

**ESP\_BLE\_MESH\_SENSOR\_CLIENT\_EVT\_MAX**  
**enum esp\_ble\_mesh\_sensor\_sample\_func**  
 This enum value is value of Sensor Sampling Function

*Values:*

**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_UNSPECIFIED**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_INSTANTANEOUS**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ARITHMETIC\_MEAN**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_RMS**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MAXIMUM**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MINIMUM**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ACCUMULATED**  
**ESP\_BLE\_MESH\_SAMPLE\_FUNC\_COUNT**

**enum esp\_ble\_mesh\_sensor\_server\_cb\_event\_t**  
 This enum value is the event of Sensor Server Model

*Values:*

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_SENSOR\_SERVER\_EVT\_MAX**

## Time and Scenes Client/Server Models

### Header File

- [bt/esp\\_ble\\_mesh/api/models/include/esp\\_ble\\_mesh\\_time\\_scene\\_model\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_time\_scene\_client\_callback** (*esp\_ble\_mesh\_time\_scene\_client\_cb\_t* callback)

Register BLE Mesh Time Scene Client Model callback.

**Return** ESP\_OK on success or error code otherwise.

#### Parameters

- [in] `callback`: Pointer to the callback function.

*esp\_err\_t* **esp\_ble\_mesh\_time\_scene\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_time\_scene\_client\_get\_state\_t* \*get\_state)

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer to time scene get message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                *params,
                                                esp_ble_mesh_time_scene_client_set_state_t
                                                *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer to time scene set message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                         callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP\_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

## Unions

```

## Structures

### **struct esp\_ble\_mesh\_time\_set\_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

#### **Public Members**

**uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t sub\_second**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority : 1**

0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta : 15**

Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**

The local time zone offset in 15-minute increments

### **struct esp\_ble\_mesh\_time\_zone\_set\_t**

Parameters of Time Zone Set

#### **Public Members**

**uint8\_t time\_zone\_offset\_new**

Upcoming local time zone offset

**uint8\_t tai\_zone\_change[5]**

TAI Seconds time of the upcoming Time Zone Offset change

### **struct esp\_ble\_mesh\_tai\_utc\_delta\_set\_t**

Parameters of TAI-UTC Delta Set

#### **Public Members**

**uint16\_t tai\_utc\_delta\_new : 15**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding : 1**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

### **struct esp\_ble\_mesh\_time\_role\_set\_t**

Parameter of Time Role Set

#### **Public Members**

**uint8\_t time\_role**

The Time Role for the element

### **struct esp\_ble\_mesh\_scene\_store\_t**

Parameter of Scene Store

**Public Members**

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_scene\_recall\_t**  
Parameters of Scene Recall

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t scene_number`  
The number of scenes to be recalled

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_scene\_delete\_t**  
Parameter of Scene Delete

**Public Members**

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_scheduler\_act\_get\_t**  
Parameter of Scheduler Action Get

**Public Members**

`uint8_t index`  
Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_scheduler\_act\_set\_t**  
Parameters of Scheduler Action Set

**Public Members**

`uint64_t index : 4`  
Index of the Schedule Register entry to set

`uint64_t year : 7`  
Scheduled year for the action

`uint64_t month : 12`  
Scheduled month for the action

`uint64_t day : 5`  
Scheduled day of the month for the action

`uint64_t hour : 5`  
Scheduled hour for the action

`uint64_t minute` : 6  
Scheduled minute for the action

`uint64_t second` : 6  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Transition time for this action

**struct esp\_ble\_mesh\_time\_status\_cb\_t**  
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.  
Parameters of Time Status

### Public Members

`uint8_t tai_seconds`[5]  
The current TAI time in seconds

`uint8_t sub_second`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta` : 15  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_zone\_status\_cb\_t**  
Parameters of Time Zone Status

### Public Members

`uint8_t time_zone_offset_curr`  
Current local time zone offset

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change`[5]  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t**  
Parameters of TAI-UTC Delta Status

### Public Members

`uint16_t tai_utc_delta_curr` : 15  
Current difference between TAI and UTC in seconds

**uint16\_t padding\_1** : 1  
Always 0b0. Other values are Prohibited.

**uint16\_t tai\_utc\_delta\_new** : 15  
Upcoming difference between TAI and UTC in seconds

**uint16\_t padding\_2** : 1  
Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change**[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_time\_role\_status\_cb\_t**  
Parameter of Time Role Status

### Public Members

**uint8\_t time\_role**  
The Time Role for the element

**struct esp\_ble\_mesh\_scene\_status\_cb\_t**  
Parameters of Scene Status

### Public Members

**bool op\_en**  
Indicate if optional parameters are included

**uint8\_t status\_code**  
Status code of the last operation

**uint16\_t current\_scene**  
Scene Number of the current scene

**uint16\_t target\_scene**  
Scene Number of the target scene (optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_scene\_register\_status\_cb\_t**  
Parameters of Scene Register Status

### Public Members

**uint8\_t status\_code**  
Status code for the previous operation

**uint16\_t current\_scene**  
Scene Number of the current scene

**struct net\_buf\_simple \*scenes**  
A list of scenes stored within an element

**struct esp\_ble\_mesh\_scheduler\_status\_cb\_t**  
Parameter of Scheduler Status

### Public Members

**uint16\_t schedules**  
Bit field indicating defined Actions in the Schedule Register

**struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t**  
Parameters of Scheduler Action Status

### Public Members

uint64\_t **index** : 4  
Enumerates (selects) a Schedule Register entry

uint64\_t **year** : 7  
Scheduled year for the action

uint64\_t **month** : 12  
Scheduled month for the action

uint64\_t **day** : 5  
Scheduled day of the month for the action

uint64\_t **hour** : 5  
Scheduled hour for the action

uint64\_t **minute** : 6  
Scheduled minute for the action

uint64\_t **second** : 6  
Scheduled second for the action

uint64\_t **day\_of\_week** : 7  
Schedule days of the week for the action

uint64\_t **action** : 4  
Action to be performed at the scheduled time

uint64\_t **trans\_time** : 8  
Transition time for this action

uint16\_t **scene\_number**  
Transition time for this action

**struct esp\_ble\_mesh\_time\_scene\_client\_cb\_param\_t**  
Time Scene Client Model callback parameters

### Public Members

int **error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**  
The client common parameters.

*esp\_ble\_mesh\_time\_scene\_client\_status\_cb\_t* **status\_cb**  
The scene status message callback values

**struct esp\_ble\_mesh\_time\_state\_t**  
Parameters of Time state

### Public Members

uint8\_t **tai\_seconds**[5]  
The value of the TAI Seconds state

uint8\_t **subsecond**  
The value of the Subsecond field

**uint8\_t uncertainty**  
The value of the Uncertainty field

**uint8\_t time\_zone\_offset\_curr**  
The value of the Time Zone Offset Current field

**uint8\_t time\_zone\_offset\_new**  
The value of the Time Zone Offset New state

**uint8\_t tai\_zone\_change[5]**  
The value of the TAI of Zone Chaneg field

**uint16\_t time\_authority : 1**  
The value of the Time Authority bit

**uint16\_t tai\_utc\_delta\_curr : 15**  
The value of the TAI-UTC Delta Current state

**uint16\_t tai\_utc\_delta\_new : 15**  
The value of the TAI-UTC Delta New state

**uint8\_t tai\_delta\_change[5]**  
The value of the TAI of Delta Change field

**struct esp\_ble\_mesh\_time\_state\_t::[anonymous] time**  
Parameters of the Time state

**uint8\_t time\_role**  
The value of the Time Role state

**struct esp\_ble\_mesh\_time\_srv\_t**  
User data of Time Server Model

### Public Members

**esp\_ble\_mesh\_model\_t \*model**  
Pointer to the Time Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**  
Response control of the server model received messages

**esp\_ble\_mesh\_time\_state\_t \*state**  
Parameters of the Time state

**struct esp\_ble\_mesh\_time\_setup\_srv\_t**  
User data of Time Setup Server Model

### Public Members

**esp\_ble\_mesh\_model\_t \*model**  
Pointer to the Time Setup Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**  
Response control of the server model received messages

**esp\_ble\_mesh\_time\_state\_t \*state**  
Parameters of the Time state

**struct esp\_ble\_mesh\_scene\_register\_t**

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.

4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

`uint16_t scene_number`

The value of the Scene Number

`uint8_t scene_type`

The value of the Scene Type

`struct net_buf_simple *scene_value`

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

`struct esp_ble_mesh_scenes_state_t`

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

`const uint16_t scene_count`

The Scenes state's scene count

`esp_ble_mesh_scene_register_t *scenes`

Parameters of the Scenes state

`uint16_t current_scene`

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

`uint16_t target_scene`

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

`uint8_t status_code`

The status code of the last scene operation

`bool in_progress`

Indicate if the scene transition is in progress

`struct esp_ble_mesh_scene_srv_t`

User data of Scene Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scene Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`

Parameters of the Scenes state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`struct esp_ble_mesh_scene_setup_srv_t`

User data of Scene Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`

Parameters of the Scenes state

`struct esp_ble_mesh_schedule_register_t`

Parameters of Scheduler Register state

### Public Members

`bool in_use`

Indicate if the registered schedule is in use

`uint64_t year : 7`

The value of Scheduled year for the action

`uint64_t month : 12`

The value of Scheduled month for the action

`uint64_t day : 5`

The value of Scheduled day of the month for the action

`uint64_t hour : 5`

The value of Scheduled hour for the action

`uint64_t minute` : 6  
The value of Scheduled minute for the action

`uint64_t second` : 6  
The value of Scheduled second for the action

`uint64_t day_of_week` : 7  
The value of Schedule days of the week for the action

`uint64_t action` : 4  
The value of Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
The value of Transition time for this action

`uint16_t scene_number`  
The value of Scene Number to be used for some actions

**struct esp\_ble\_mesh\_scheduler\_state\_t**  
Parameters of Scheduler state

### Public Members

`const uint8_t schedule_count`  
Scheduler count

`esp_ble_mesh_schedule_register_t *schedules`  
Up to 16 scheduled entries

**struct esp\_ble\_mesh\_scheduler\_srv\_t**  
User data of Scheduler Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Scheduler Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`  
Parameters of the Scheduler state

**struct esp\_ble\_mesh\_scheduler\_setup\_srv\_t**  
User data of Scheduler Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Scheduler Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`  
Parameters of the Scheduler state

**struct esp\_ble\_mesh\_state\_change\_time\_set\_t**  
Parameters of Time Set state change event

**Public Members**

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_status\_t**  
Parameters of Time Status state change event

**Public Members**

`uint8_t tai_seconds[5]`  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority : 1`  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr : 15`  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_state\_change\_time\_zone\_set\_t**  
Parameters of Time Zone Set state change event

**Public Members**

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change[5]`  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t**  
Parameters of TAI UTC Delta Set state change event

**Public Members**

`uint16_t tai_utc_delta_new : 15`  
Upcoming difference between TAI and UTC in seconds

`uint8_t tai_delta_change[5]`  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_state\_change\_time\_role\_set\_t**  
Parameter of Time Role Set state change event

### Public Members

`uint8_t time_role`  
The Time Role for the element

**struct esp\_ble\_mesh\_state\_change\_scene\_store\_t**  
Parameter of Scene Store state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_state\_change\_scene\_recall\_t**  
Parameter of Scene Recall state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be recalled

**struct esp\_ble\_mesh\_state\_change\_scene\_delete\_t**  
Parameter of Scene Delete state change event

### Public Members

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_state\_change\_scheduler\_act\_set\_t**  
Parameter of Scheduler Action Set state change event

### Public Members

`uint64_t index : 4`  
Index of the Schedule Register entry to set

`uint64_t year : 7`  
Scheduled year for the action

`uint64_t month : 12`  
Scheduled month for the action

`uint64_t day : 5`  
Scheduled day of the month for the action

`uint64_t hour : 5`  
Scheduled hour for the action

`uint64_t minute : 6`  
Scheduled minute for the action

`uint64_t second : 6`  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_get\_t**  
Context of the received Scheduler Action Get message

### Public Members

`uint8_t index`  
Index of the Schedule Register entry to get

**struct esp\_ble\_mesh\_server\_rcv\_time\_set\_t**  
Context of the received Time Set message

### Public Members

`uint8_t tai_seconds`[5]  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta` : 15  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_server\_rcv\_time\_zone\_set\_t**  
Context of the received Time Zone Set message

### Public Members

`uint8_t time_zone_offset_new`  
Upcoming local time zone offset

`uint8_t tai_zone_change`[5]  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp\_ble\_mesh\_server\_rcv\_tai\_utc\_delta\_set\_t**  
Context of the received TAI UTC Delta Set message

### Public Members

`uint16_t tai_utc_delta_new` : 15  
Upcoming difference between TAI and UTC in seconds

`uint16_t padding` : 1  
Always 0b0. Other values are Prohibited.

`uint8_t tai_delta_change`[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp\_ble\_mesh\_server\_rcv\_time\_role\_set\_t**  
Context of the received Time Role Set message

### Public Members

`uint8_t time_role`  
The Time Role for the element

**struct esp\_ble\_mesh\_server\_rcv\_scene\_store\_t**  
Context of the received Scene Store message

### Public Members

`uint16_t scene_number`  
The number of scenes to be stored

**struct esp\_ble\_mesh\_server\_rcv\_scene\_recall\_t**  
Context of the received Scene Recall message

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t scene_number`  
The number of scenes to be recalled

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_scene\_delete\_t**  
Context of the received Scene Delete message

### Public Members

`uint16_t scene_number`  
The number of scenes to be deleted

**struct esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_set\_t**  
Context of the received Scheduler Action Set message

### Public Members

`uint64_t index` : 4  
Index of the Schedule Register entry to set

`uint64_t year` : 7  
Scheduled year for the action

`uint64_t month` : 12  
Scheduled month for the action

`uint64_t day` : 5  
Scheduled day of the month for the action

`uint64_t hour` : 5  
Scheduled hour for the action

`uint64_t minute` : 6  
Scheduled minute for the action

`uint64_t second` : 6  
Scheduled second for the action

`uint64_t day_of_week` : 7  
Schedule days of the week for the action

`uint64_t action` : 4  
Action to be performed at the scheduled time

`uint64_t trans_time` : 8  
Transition time for this action

`uint16_t scene_number`  
Scene number to be used for some actions

**struct esp\_ble\_mesh\_server\_rcv\_time\_status\_t**  
Context of the received Time Status message

### Public Members

`uint8_t tai_seconds`[5]  
The current TAI time in seconds

`uint8_t subsecond`  
The sub-second time in units of 1/256 second

`uint8_t uncertainty`  
The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority` : 1  
0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta` : 15  
Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset`  
The local time zone offset in 15-minute increments

**struct esp\_ble\_mesh\_time\_scene\_server\_cb\_param\_t**  
Time Scene Server Model callback parameters

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t ctx`  
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t value`  
Value of the received Time and Scenes Messages

**Macros****ESP\_BLE\_MESH\_MODEL\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Time Client Model.**Return** New Time Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI** (cli\_pub, cli\_data)

Define a new Scene Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.**Return** New Scene Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI** (cli\_pub, cli\_data)

Define a new Scheduler Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.**Return** New Scheduler Client Model instance.**Parameters**

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SRV** (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

**Note** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Time Server Model instance.**Parameters**

- srv\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_time\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SETUP\_SRV** (srv\_data)

Define a new Time Setup Server Model.

**Note** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
2. This model does not support subscribing nor publishing.

**Return** New Time Setup Server Model instance.**Parameters**

- srv\_data: Pointer to the unique struct *esp\_ble\_mesh\_time\_setup\_srv\_t*.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SRV** (srv\_pub, srv\_data)

Define a new Scene Server Model.

**Note** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Scene Setup Server Model.

**Note** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scene Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV** (`srv_pub`, `srv_data`)

Define a new Scheduler Server Model.

**Note** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.
3. The model requires the Time Server model shall be present on the element.

**Return** New Scheduler Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS**

Unknown TAI Seconds

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE**

Unknown TAI of Zone Change

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE**

Unknown TAI of Delta Change

**ESP\_BLE\_MESH\_TAI\_UTC\_DELTA\_MAX\_VALUE**

Maximum TAI-UTC Delta value

**ESP\_BLE\_MESH\_TAI\_SECONDS\_LEN**

Length of TAI Seconds

**ESP\_BLE\_MESH\_TAI\_OF\_ZONE\_CHANGE\_LEN**

Length of TAI of Zone Change

**ESP\_BLE\_MESH\_TAI\_OF\_DELTA\_CHANGE\_LEN**

Length of TAI of Delta Change

**ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER**

Invalid Scene Number

**ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN**

Length of the Scene Number

**ESP\_BLE\_MESH\_SCHEDULE\_YEAR\_ANY\_YEAR**  
Any year of the Scheduled year

**ESP\_BLE\_MESH\_SCHEDULE\_DAY\_ANY\_DAY**  
Any day of the Scheduled day

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ANY\_HOUR**  
Any hour of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_HOUR\_ONCE\_A\_DAY**  
Any hour of the Scheduled Day

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ANY\_OF\_HOUR**  
Any minute of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_15\_MIN**  
Every 15 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_MIN**  
Every 20 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ONCE\_AN\_HOUR**  
Once of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ANY\_OF\_MIN**  
Any second of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_15\_SEC**  
Every 15 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_SEC**  
Every 20 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC\_ONCE\_AN\_MIN**  
Once of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_OFF**  
Scheduled Action - Turn Off

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_ON**  
Scheduled Action - Turn On

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_SCENE\_RECALL**  
Scheduled Action - Scene Recall

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_NO\_ACTION**  
Scheduled Action - No Action

**ESP\_BLE\_MESH\_SCHEDULE\_SCENE\_NO\_SCENE**  
Scheduled Scene - No Scene

**ESP\_BLE\_MESH\_SCHEDULE\_ENTRY\_MAX\_INDEX**  
Maximum number of Scheduled entries

**ESP\_BLE\_MESH\_TIME\_NONE**  
Time Role - None

**ESP\_BLE\_MESH\_TIME\_AUTHORITY**  
Time Role - Mesh Time Authority

**ESP\_BLE\_MESH\_TIME\_RELAY**  
Time Role - Mesh Time Relay

**ESP\_BLE\_MESH\_TIME\_CLINET**  
Time Role - Mesh Time Client

**ESP\_BLE\_MESH\_SCENE\_SUCCESS**  
Scene operation - Success

**ESP\_BLE\_MESH\_SCENE\_REG\_FULL**  
Scene operation - Scene Register Full

**ESP\_BLE\_MESH\_SCENE\_NOT\_FOUND**  
Scene operation - Scene Not Found

### Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t) (esp_ble_mesh_time_scene_client_cb_event_t  
event,  
esp_ble_mesh_time_scene_client_cb_param_t  
*param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t) (esp_ble_mesh_time_scene_server_cb_event_t  
event,  
esp_ble_mesh_time_scene_server_cb_param_t  
*param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

#### Parameters

- event: Event type
- param: Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t  
This enum value is the event of Time Scene Client Model
```

Values:

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_GET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_SET\_STATE\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_PUBLISH\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_TIMEOUT\_EVT**

**ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t  
This enum value is the event of Time Scene Server Model
```

Values:

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

**ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX****Lighting Client/Server Models****Header File**

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h`

**Functions**

`esp_err_t esp_ble_mesh_register_light_client_callback` (*esp\_ble\_mesh\_light\_client\_cb\_t callback*)

Register BLE Mesh Light Client Model callback.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `callback`: pointer to the callback function.

`esp_err_t esp_ble_mesh_light_client_get_state` (*esp\_ble\_mesh\_client\_common\_param\_t \*params, esp\_ble\_mesh\_light\_client\_get\_state\_t \*get\_state*)

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `get_state`: Pointer of light get message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_light_client_set_state` (*esp\_ble\_mesh\_client\_common\_param\_t \*params, esp\_ble\_mesh\_light\_client\_set\_state\_t \*set\_state*)

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_light_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `params`: Pointer to BLE Mesh common client parameters.
- [in] `set_state`: Pointer of light set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_lighting_server_callback` (*esp\_ble\_mesh\_lighting\_server\_cb\_t callback*)

Register BLE Mesh Lighting Server Model callback.

**Return** `ESP_OK` on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

**Unions**

**uint16\_t xy1\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode Set

**Public Members****uint8\_t mode**

The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_set\_t**

Parameter of Light LC OM Set

**Public Members****uint8\_t mode**

The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t**

Parameters of Light LC Light OnOff Set

**Public Members****bool op\_en**

Indicate whether optional parameters included

**uint8\_t light\_onoff**

The target value of the Light LC Light OnOff state

**uint8\_t tid**

Transaction Identifier

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_get\_t**

Parameter of Light LC Property Get

### Public Members

**uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct esp\_ble\_mesh\_light\_lc\_property\_set\_t**

Parameters of Light LC Property Set

### Public Members

**uint16\_t property\_id**

Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**

Raw value for the Light LC Property

**struct esp\_ble\_mesh\_light\_lightness\_status\_cb\_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_lightness**

Current value of light lightness actual state

**uint16\_t target\_lightness**

Target value of light lightness actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_linear\_status\_cb\_t**

Parameters of Light Lightness Linear Status

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_lightness**

Current value of light lightness linear state

**uint16\_t target\_lightness**

Target value of light lightness linear state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t**

Parameter of Light Lightness Last Status

**Public Members**

`uint16_t lightness`  
The value of the Light Lightness Last state

`struct esp_ble_mesh_light_lightness_default_status_cb_t`  
Parameter of Light Lightness Default Status

**Public Members**

`uint16_t lightness`  
The value of the Light Lightness default State

`struct esp_ble_mesh_light_lightness_range_status_cb_t`  
Parameters of Light Lightness Range Status

**Public Members**

`uint8_t status_code`  
Status Code for the request message

`uint16_t range_min`  
Value of range min field of light lightness range state

`uint16_t range_max`  
Value of range max field of light lightness range state

`struct esp_ble_mesh_light_ctl_status_cb_t`  
Parameters of Light CTL Status

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t present_ctl_lightness`  
Current value of light ctl lightness state

`uint16_t present_ctl_temperature`  
Current value of light ctl temperature state

`uint16_t target_ctl_lightness`  
Target value of light ctl lightness state (optional)

`uint16_t target_ctl_temperature`  
Target value of light ctl temperature state (C.1)

`uint8_t remain_time`  
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_ctl_temperature_status_cb_t`  
Parameters of Light CTL Temperature Status

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t present_ctl_temperature`  
Current value of light ctl temperature state

`uint16_t present_ctl_delta_uv`  
Current value of light ctl delta UV state

`uint16_t target_ctl_temperature`  
Target value of light ctl temperature state (optional)

`uint16_t target_ctl_delta_uv`  
Target value of light ctl delta UV state (C.1)

`uint8_t remain_time`  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_ctl\_temperature\_range\_status\_cb\_t**  
Parameters of Light CTL Temperature Range Status

### Public Members

`uint8_t status_code`  
Status code for the request message

`uint16_t range_min`  
Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`  
Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_light\_ctl\_default\_status\_cb\_t**  
Parameters of Light CTL Default Status

### Public Members

`uint16_t lightness`  
Value of light lightness default state

`uint16_t temperature`  
Value of light temperature default state

`int16_t delta_uv`  
Value of light delta UV default state

**struct esp\_ble\_mesh\_light\_hsl\_status\_cb\_t**  
Parameters of Light HSL Status

### Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t hsl_lightness`  
Current value of light hsl lightness state

`uint16_t hsl_hue`  
Current value of light hsl hue state

`uint16_t hsl_saturation`  
Current value of light hsl saturation state

`uint8_t remain_time`  
Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_hsl\_target\_status\_cb\_t**  
Parameters of Light HSL Target Status

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **hsl\_lightness\_target**  
Target value of light hsl lightness state

uint16\_t **hsl\_hue\_target**  
Target value of light hsl hue state

uint16\_t **hsl\_saturation\_target**  
Target value of light hsl saturation state

uint8\_t **remain\_time**  
Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_hsl\_hue\_status\_cb\_t**  
Parameters of Light HSL Hue Status

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **present\_hue**  
Current value of light hsl hue state

uint16\_t **target\_hue**  
Target value of light hsl hue state (optional)

uint8\_t **remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_saturation\_status\_cb\_t**  
Parameters of Light HSL Saturation Status

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **present\_saturation**  
Current value of light hsl saturation state

uint16\_t **target\_saturation**  
Target value of light hsl saturation state (optional)

uint8\_t **remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_hsl\_default\_status\_cb\_t**  
Parameters of Light HSL Default Status

**Public Members**

uint16\_t **lightness**  
Value of light lightness default state

uint16\_t **hue**  
Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

**struct esp\_ble\_mesh\_light\_hsl\_range\_status\_cb\_t**

Parameters of Light HSL Range Status

### Public Members

`uint8_t status_code`

Status code for the request message

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_light\_xyl\_status\_cb\_t**

Parameters of Light xyL Status

### Public Members

`bool op_en`

Indicate whether optional parameters included

`uint16_t xyl_lightness`

The present value of the Light xyL Lightness state

`uint16_t xyl_x`

The present value of the Light xyL x state

`uint16_t xyl_y`

The present value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_target\_status\_cb\_t**

Parameters of Light xyL Target Status

### Public Members

`bool op_en`

Indicate whether optional parameters included

`uint16_t target_xyl_lightness`

The target value of the Light xyL Lightness state

`uint16_t target_xyl_x`

The target value of the Light xyL x state

`uint16_t target_xyl_y`

The target value of the Light xyL y state

`uint8_t remain_time`

Time to complete state transition (optional)

**struct esp\_ble\_mesh\_light\_xyl\_default\_status\_cb\_t**  
Parameters of Light xyL Default Status

#### Public Members

uint16\_t **lightness**  
The value of the Light Lightness Default state

uint16\_t **xy1\_x**  
The value of the Light xyL x Default state

uint16\_t **xy1\_y**  
The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_light\_xyl\_range\_status\_cb\_t**  
Parameters of Light xyL Range Status

#### Public Members

uint8\_t **status\_code**  
Status Code for the requesting message

uint16\_t **xy1\_x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **xy1\_x\_range\_max**  
The value of the xyL x Range Max field of the Light xyL x Range state

uint16\_t **xy1\_y\_range\_min**  
The value of the xyL y Range Min field of the Light xyL y Range state

uint16\_t **xy1\_y\_range\_max**  
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t**  
Parameter of Light LC Mode Status

#### Public Members

uint8\_t **mode**  
The present value of the Light LC Mode state

**struct esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t**  
Parameter of Light LC OM Status

#### Public Members

uint8\_t **mode**  
The present value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t**  
Parameters of Light LC Light OnOff Status

#### Public Members

bool **op\_en**  
Indicate whether optional parameters included

uint8\_t **present\_light\_onoff**  
The present value of the Light LC Light OnOff state

**uint8\_t target\_light\_onoff**  
The target value of the Light LC Light OnOff state (Optional)

**uint8\_t remain\_time**  
Time to complete state transition (C.1)

**struct esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t**  
Parameters of Light LC Property Status

### Public Members

**uint16\_t property\_id**  
Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the Light LC Property

**struct esp\_ble\_mesh\_light\_client\_cb\_param\_t**  
Lighting Client Model callback parameters

### Public Members

**int error\_code**  
Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**  
The client common parameters.

*esp\_ble\_mesh\_light\_client\_status\_cb\_t* **status\_cb**  
The light status message callback values

**struct esp\_ble\_mesh\_light\_lightness\_state\_t**  
Parameters of Light Lightness state

### Public Members

**uint16\_t lightness\_linear**  
The present value of Light Lightness Linear state

**uint16\_t target\_lightness\_linear**  
The target value of Light Lightness Linear state

**uint16\_t lightness\_actual**  
The present value of Light Lightness Actual state

**uint16\_t target\_lightness\_actual**  
The target value of Light Lightness Actual state

**uint16\_t lightness\_last**  
The value of Light Lightness Last state

**uint16\_t lightness\_default**  
The value of Light Lightness Default state

**uint8\_t status\_code**  
The status code of setting Light Lightness Range state

**uint16\_t lightness\_range\_min**  
The minimum value of Light Lightness Range state

**uint16\_t lightness\_range\_max**  
The maximum value of Light Lightness Range state

**struct esp\_ble\_mesh\_light\_lightness\_srv\_t**

User data of Light Lightness Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \***state**

Parameters of the Light Lightness state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **actual\_transition**

Parameters of state transition

*esp\_ble\_mesh\_state\_transition\_t* **linear\_transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness\_actual**

Delta change value of lightness actual state transition

int32\_t **tt\_delta\_lightness\_linear**

Delta change value of lightness linear state transition

**struct esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t**

User data of Light Lightness Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \***state**

Parameters of the Light Lightness state

**struct esp\_ble\_mesh\_light\_ctl\_state\_t**

Parameters of Light CTL state

### Public Members

uint16\_t **lightness**

The present value of Light CTL Lightness state

uint16\_t **target\_lightness**

The target value of Light CTL Lightness state

uint16\_t **temperature**

The present value of Light CTL Temperature state

uint16\_t **target\_temperature**

The target value of Light CTL Temperature state

int16\_t **delta\_uv**

The present value of Light CTL Delta UV state

**int16\_t target\_delta\_uv**  
The target value of Light CTL Delta UV state

**uint8\_t status\_code**  
The statue code of setting Light CTL Temperature Range state

**uint16\_t temperature\_range\_min**  
The minimum value of Light CTL Temperature Range state

**uint16\_t temperature\_range\_max**  
The maximum value of Light CTL Temperature Range state

**uint16\_t lightness\_default**  
The value of Light Lightness Default state

**uint16\_t temperature\_default**  
The value of Light CTL Temperature Default state

**int16\_t delta\_uv\_default**  
The value of Light CTL Delta UV Default state

**struct esp\_ble\_mesh\_light\_ctl\_srv\_t**  
User data of Light CTL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting CTL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**  
Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**  
Parameters of state transition

**int32\_t tt\_delta\_lightness**  
Delta change value of lightness state transition

**int32\_t tt\_delta\_temperature**  
Delta change value of temperature state transition

**int32\_t tt\_delta\_delta\_uv**  
Delta change value of delta uv state transition

**struct esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t**  
User data of Light CTL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**  
Parameters of the Light CTL state

**struct esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t**  
User data of Light CTL Temperature Server Model

**Public Members*****esp\_ble\_mesh\_model\_t* \*model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

***esp\_ble\_mesh\_server\_rsp\_ctrl\_t* rsp\_ctrl**

Response control of the server model received messages

***esp\_ble\_mesh\_light\_ctl\_state\_t* \*state**

Parameters of the Light CTL state

***esp\_ble\_mesh\_last\_msg\_info\_t* last**

Parameters of the last received set message

***esp\_ble\_mesh\_state\_transition\_t* transition**

Parameters of state transition

**int32\_t tt\_delta\_temperature**

Delta change value of temperature state transition

**int32\_t tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

**struct esp\_ble\_mesh\_light\_hsl\_state\_t**

Parameters of Light HSL state

**Public Members****uint16\_t lightness**

The present value of Light HSL Lightness state

**uint16\_t target\_lightness**

The target value of Light HSL Lightness state

**uint16\_t hue**

The present value of Light HSL Hue state

**uint16\_t target\_hue**

The target value of Light HSL Hue state

**uint16\_t saturation**

The present value of Light HSL Saturation state

**uint16\_t target\_saturation**

The target value of Light HSL Saturation state

**uint16\_t lightness\_default**

The value of Light Lightness Default state

**uint16\_t hue\_default**

The value of Light HSL Hue Default state

**uint16\_t saturation\_default**

The value of Light HSL Saturation Default state

**uint8\_t status\_code**

The status code of setting Light HSL Hue &amp; Saturation Range state

**uint16\_t hue\_range\_min**

The minimum value of Light HSL Hue Range state

**uint16\_t hue\_range\_max**

The maximum value of Light HSL Hue Range state

**uint16\_t saturation\_range\_min**

The minimum value of Light HSL Saturation state

`uint16_t saturation_range_max`  
The maximum value of Light HSL Saturation state

**struct esp\_ble\_mesh\_light\_hsl\_srv\_t**  
User data of Light HSL Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_lightness`  
Delta change value of lightness state transition

`int32_t tt_delta_hue`  
Delta change value of hue state transition

`int32_t tt_delta_saturation`  
Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t**  
User data of Light HSL Setup Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

**struct esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t**  
User data of Light HSL Hue Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_hue**

Delta change value of hue state transition

**struct esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t**

User data of Light HSL Saturation Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

**struct esp\_ble\_mesh\_light\_xyl\_state\_t**

Parameters of Light xyL state

### Public Members

uint16\_t **lightness**

The present value of Light xyL Lightness state

uint16\_t **target\_lightness**

The target value of Light xyL Lightness state

uint16\_t **x**

The present value of Light xyL x state

uint16\_t **target\_x**

The target value of Light xyL x state

uint16\_t **y**

The present value of Light xyL y state

uint16\_t **target\_y**

The target value of Light xyL y state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **x\_default**

The value of Light xyL x Default state

uint16\_t **y\_default**

The value of Light xyL y Default state

uint8\_t **status\_code**

The status code of setting Light xyL x & y Range state

uint16\_t **x\_range\_min**

The minimum value of Light xyL x Range state

`uint16_t x_range_max`

The maximum value of Light xyL x Range state

`uint16_t y_range_min`

The minimum value of Light xyL y Range state

`uint16_t y_range_max`

The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_light\_xyl\_srv\_t**

User data of Light xyL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

`int32_t tt_delta_lightness`

Delta change value of lightness state transition

`int32_t tt_delta_x`

Delta change value of x state transition

`int32_t tt_delta_y`

Delta change value of y state transition

**struct esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t**

User data of Light xyL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

**struct esp\_ble\_mesh\_light\_lc\_state\_t**

Parameters of Light LC states

### Public Members

`uint32_t mode` : 1

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

`uint32_t occupancy_mode : 1`

The value of Light LC Occupancy Mode state

`uint32_t light_onoff : 1`

The present value of Light LC Light OnOff state

`uint32_t target_light_onoff : 1`

The target value of Light LC Light OnOff state

`uint32_t occupancy : 1`

The value of Light LC Occupancy state

`uint32_t ambient_luxlevel : 24`

The value of Light LC Ambient LuxLevel state

`uint16_t linear_output`

1. Light LC Linear Output =  $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed).The value of Light LC Linear Output state

**struct esp\_ble\_mesh\_light\_lc\_property\_state\_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

### Public Members

`uint32_t time_occupancy_delay`

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor.The value of Light LC Time Occupancy Delay state

`uint32_t time_fade_on`

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state.The value of Light LC Time Fade On state

`uint32_t time_run_on`

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state.The value of Light LC Time Run On state

`uint32_t time_fade`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state.The value of Light LC Time Fade state

`uint32_t time_prolong`

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state.The value of Light LC Time Prolong state

`uint32_t time_fade_standby_auto`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic.The value of Light LC Time Fade Standby Auto state

`uint32_t time_fade_standby_manual`

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state.The value of Light LC Time Fade Standby Manual state

**uint16\_t lightness\_on**

A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16\_t lightness\_prolong**

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16\_t lightness\_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16\_t ambient\_luxlevel\_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16\_t ambient\_luxlevel\_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16\_t ambient\_luxlevel\_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**float regulator\_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**float regulator\_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**float regulator\_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**float regulator\_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**int8\_t regulator\_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**uint32\_t set\_occupancy\_to\_1\_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t**

Parameters of Light LC state machine

**Public Members****uint8\_t fade\_on**

The value of transition time of Light LC Time Fade On

**uint8\_t fade**

The value of transition time of Light LC Time Fade

**uint8\_t fade\_standby\_auto**

The value of transition time of Light LC Time Fade Standby Auto

**uint8\_t fade\_standby\_manual**

The value of transition time of Light LC Time Fade Standby Manual

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t::[anonymous] trans\_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

**esp\_ble\_mesh\_lc\_state\_t state**

The value of Light LC state machine state

**struct k\_delayed\_work timer**

Timer of Light LC state machine

**struct esp\_ble\_mesh\_light\_control\_t**

Parameters of Light Lightness controller

**Public Members****esp\_ble\_mesh\_light\_lc\_state\_t state**

Parameters of Light LC state

**esp\_ble\_mesh\_light\_lc\_property\_state\_t prop\_state**

Parameters of Light LC Property state

**esp\_ble\_mesh\_light\_lc\_state\_machine\_t state\_machine**

Parameters of Light LC state machine

**struct esp\_ble\_mesh\_light\_lc\_srv\_t**

User data of Light LC Server Model

**Public Members****esp\_ble\_mesh\_model\_t \*model**

Pointer to the Lighting LC Server Model. Initialized internally.

**esp\_ble\_mesh\_server\_rsp\_ctrl\_t rsp\_ctrl**

Response control of the server model received messages

**esp\_ble\_mesh\_light\_control\_t \*lc**

Parameters of the Light controller

**esp\_ble\_mesh\_last\_msg\_info\_t last**

Parameters of the last received set message

**esp\_ble\_mesh\_state\_transition\_t transition**

Parameters of state transition

**struct esp\_ble\_mesh\_light\_lc\_setup\_srv\_t**

User data of Light LC Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**

Parameters of the Light controller

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t**

Parameter of Light Lightness Actual state change event

**Public Members**

uint16\_t **lightness**

The value of Light Lightness Actual state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t**

Parameter of Light Lightness Linear state change event

**Public Members**

uint16\_t **lightness**

The value of Light Lightness Linear state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default state change event

**Public Members**

uint16\_t **lightness**

The value of Light Lightness Default state

**struct esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range state change event

**Public Members**

uint16\_t **range\_min**

The minimum value of Light Lightness Range state

uint16\_t **range\_max**

The maximum value of Light Lightness Range state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_set\_t**

Parameters of Light CTL state change event

**Public Members**

uint16\_t **lightness**

The value of Light CTL Lightness state

uint16\_t **temperature**

The value of Light CTL Temperature state

int16\_t **delta\_uv**

The value of Light CTL Delta UV state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_set\_t**  
Parameters of Light CTL Temperature state change event

#### Public Members

**uint16\_t temperature**  
The value of Light CTL Temperature state

**int16\_t delta\_uv**  
The value of Light CTL Delta UV state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_range\_set\_t**  
Parameters of Light CTL Temperature Range state change event

#### Public Members

**uint16\_t range\_min**  
The minimum value of Light CTL Temperature Range state

**uint16\_t range\_max**  
The maximum value of Light CTL Temperature Range state

**struct esp\_ble\_mesh\_state\_change\_light\_ctl\_default\_set\_t**  
Parameters of Light CTL Default state change event

#### Public Members

**uint16\_t lightness**  
The value of Light Lightness Default state

**uint16\_t temperature**  
The value of Light CTL Temperature Default state

**int16\_t delta\_uv**  
The value of Light CTL Delta UV Default state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_set\_t**  
Parameters of Light HSL state change event

#### Public Members

**uint16\_t lightness**  
The value of Light HSL Lightness state

**uint16\_t hue**  
The value of Light HSL Hue state

**uint16\_t saturation**  
The value of Light HSL Saturation state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_hue\_set\_t**  
Parameter of Light HSL Hue state change event

#### Public Members

**uint16\_t hue**  
The value of Light HSL Hue state

**struct esp\_ble\_mesh\_state\_change\_light\_hsl\_saturation\_set\_t**  
Parameter of Light HSL Saturation state change event

**Public Members**

`uint16_t saturation`  
The value of Light HSL Saturation state

`struct esp_ble_mesh_state_change_light_hsl_default_set_t`  
Parameters of Light HSL Default state change event

**Public Members**

`uint16_t lightness`  
The value of Light HSL Lightness Default state

`uint16_t hue`  
The value of Light HSL Hue Default state

`uint16_t saturation`  
The value of Light HSL Saturation Default state

`struct esp_ble_mesh_state_change_light_hsl_range_set_t`  
Parameters of Light HSL Range state change event

**Public Members**

`uint16_t hue_range_min`  
The minimum hue value of Light HSL Range state

`uint16_t hue_range_max`  
The maximum hue value of Light HSL Range state

`uint16_t saturation_range_min`  
The minimum saturation value of Light HSL Range state

`uint16_t saturation_range_max`  
The maximum saturation value of Light HSL Range state

`struct esp_ble_mesh_state_change_light_xyl_set_t`  
Parameters of Light xyL state change event

**Public Members**

`uint16_t lightness`  
The value of Light xyL Lightness state

`uint16_t x`  
The value of Light xyL x state

`uint16_t y`  
The value of Light xyL y state

`struct esp_ble_mesh_state_change_light_xyl_default_set_t`  
Parameters of Light xyL Default state change event

**Public Members**

`uint16_t lightness`  
The value of Light Lightness Default state

`uint16_t x`  
The value of Light xyL x Default state

`uint16_t y`  
The value of Light xyL y Default state

**struct esp\_ble\_mesh\_state\_change\_light\_xyl\_range\_set\_t**  
Parameters of Light xyL Range state change event

### Public Members

`uint16_t x_range_min`  
The minimum value of Light xyL x Range state

`uint16_t x_range_max`  
The maximum value of Light xyL x Range state

`uint16_t y_range_min`  
The minimum value of Light xyL y Range state

`uint16_t y_range_max`  
The maximum value of Light xyL y Range state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_mode\_set\_t**  
Parameter of Light LC Mode state change event

### Public Members

`uint8_t mode`  
The value of Light LC Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_om\_set\_t**  
Parameter of Light LC Occupancy Mode state change event

### Public Members

`uint8_t mode`  
The value of Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_light\_onoff\_set\_t**  
Parameter of Light LC Light OnOff state change event

### Public Members

`uint8_t onoff`  
The value of Light LC Light OnOff state

**struct esp\_ble\_mesh\_state\_change\_light\_lc\_property\_set\_t**  
Parameters of Light LC Property state change event

### Public Members

`uint16_t property_id`  
The property id of Light LC Property state

**struct net\_buf\_simple \*property\_value**  
The property value of Light LC Property state

**struct esp\_ble\_mesh\_state\_change\_sensor\_status\_t**  
Parameters of Sensor Status state change event

**Public Members**

`uint16_t property_id`  
The value of Sensor Property ID

`uint8_t occupancy`  
The value of Light LC Occupancy state

`uint32_t set_occupancy_to_1_delay`  
The value of Light LC Set Occupancy to 1 Delay state

`uint32_t ambient_luxlevel`  
The value of Light LC Ambient Luxlevel state

`union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state`  
Parameters of Sensor Status related state

`struct esp_ble_mesh_server_rcv_light_lc_property_get_t`  
Context of the received Light LC Property Get message

**Public Members**

`uint16_t property_id`  
Property ID identifying a Light LC Property

`struct esp_ble_mesh_server_rcv_light_lightness_set_t`  
Context of the received Light Lightness Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t lightness`  
Target value of light lightness actual state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_rcv_light_lightness_linear_set_t`  
Context of the received Light Lightness Linear Set message

**Public Members**

`bool op_en`  
Indicate if optional parameters are included

`uint16_t lightness`  
Target value of light lightness linear state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_rcv_light_lightness_default_set_t`

Context of the received Light Lightness Default Set message

### Public Members

`uint16_t lightness`

The value of the Light Lightness Default state

`struct esp_ble_mesh_server_rcv_light_lightness_range_set_t`

Context of the received Light Lightness Range Set message

### Public Members

`uint16_t range_min`

Value of range min field of light lightness range state

`uint16_t range_max`

Value of range max field of light lightness range state

`struct esp_ble_mesh_server_rcv_light_ctl_set_t`

Context of the received Light CTL Set message

### Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t lightness`

Target value of light ctl lightness state

`uint16_t temperature`

Target value of light ctl temperature state

`int16_t delta_uv`

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_rcv_light_ctl_temperature_set_t`

Context of the received Light CTL Temperature Set message

### Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t temperature`

Target value of light ctl temperature state

`int16_t delta_uv`

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_range\_set\_t**

Context of the received Light CTL Temperature Range Set message

### Public Members

**uint16\_t range\_min**

Value of temperature range min field of light ctl temperature range state

**uint16\_t range\_max**

Value of temperature range max field of light ctl temperature range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_ctl\_default\_set\_t**

Context of the received Light CTL Default Set message

### Public Members

**uint16\_t lightness**

Value of light lightness default state

**uint16\_t temperature**

Value of light temperature default state

**int16\_t delta\_uv**

Value of light delta UV default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_set\_t**

Context of the received Light HSL Set message

### Public Members

**bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light hsl lightness state

**uint16\_t hue**

Target value of light hsl hue state

**uint16\_t saturation**

Target value of light hsl saturation state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_hue\_set\_t**

Context of the received Light HSL Hue Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **hue**  
Target value of light hsl hue state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_saturation\_set\_t**  
Context of the received Light HSL Saturation Set message

**Public Members**

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **saturation**  
Target value of light hsl hue state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_default\_set\_t**  
Context of the received Light HSL Default Set message

**Public Members**

uint16\_t **lightness**  
Value of light lightness default state

uint16\_t **hue**  
Value of light hue default state

uint16\_t **saturation**  
Value of light saturation default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_hsl\_range\_set\_t**  
Context of the received Light HSL Range Set message

**Public Members**

uint16\_t **hue\_range\_min**  
Value of hue range min field of light hsl hue range state

uint16\_t **hue\_range\_max**  
Value of hue range max field of light hsl hue range state

**uint16\_t saturation\_range\_min**  
Value of saturation range min field of light hsl saturation range state

**uint16\_t saturation\_range\_max**  
Value of saturation range max field of light hsl saturation range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_set\_t**  
Context of the received Light xyL Set message

### Public Members

**bool op\_en**  
Indicate whether optional parameters included

**uint16\_t lightness**  
The target value of the Light xyL Lightness state

**uint16\_t x**  
The target value of the Light xyL x state

**uint16\_t y**  
The target value of the Light xyL y state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_default\_set\_t**  
Context of the received Light xyL Default Set message

### Public Members

**uint16\_t lightness**  
The value of the Light Lightness Default state

**uint16\_t x**  
The value of the Light xyL x Default state

**uint16\_t y**  
The value of the Light xyL y Default state

**struct esp\_ble\_mesh\_server\_rcv\_light\_xyl\_range\_set\_t**  
Context of the received Light xyL Range Set message

### Public Members

**uint16\_t x\_range\_min**  
The value of the xyL x Range Min field of the Light xyL x Range state

**uint16\_t x\_range\_max**  
The value of the xyL x Range Max field of the Light xyL x Range state

**uint16\_t y\_range\_min**  
The value of the xyL y Range Min field of the Light xyL y Range state

**uint16\_t y\_range\_max**  
The value of the xyL y Range Max field of the Light xyL y Range state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_mode\_set\_t**  
Context of the received Light LC Mode Set message

#### Public Members

**uint8\_t mode**  
The target value of the Light LC Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_om\_set\_t**  
Context of the received Light OM Set message

#### Public Members

**uint8\_t mode**  
The target value of the Light LC Occupancy Mode state

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_light\_onoff\_set\_t**  
Context of the received Light LC Light OnOff Set message

#### Public Members

**bool op\_en**  
Indicate whether optional parameters included

**uint8\_t light\_onoff**  
The target value of the Light LC Light OnOff state

**uint8\_t tid**  
Transaction Identifier

**uint8\_t trans\_time**  
Time to complete state transition (optional)

**uint8\_t delay**  
Indicate message execution delay (C.1)

**struct esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_set\_t**  
Context of the received Light LC Property Set message

#### Public Members

**uint16\_t property\_id**  
Property ID identifying a Light LC Property

**struct net\_buf\_simple \*property\_value**  
Raw value for the Light LC Property

**struct esp\_ble\_mesh\_server\_rcv\_sensor\_status\_t**  
Context of the received Sensor Status message

#### Public Members

**struct net\_buf\_simple \*data**  
Value of sensor data state (optional)

**struct esp\_ble\_mesh\_lighting\_server\_cb\_param\_t**  
Lighting Server Model callback parameters

## Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to Lighting Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**  
Context of the received messages

*esp\_ble\_mesh\_lighting\_server\_cb\_value\_t* **value**  
Value of the received Lighting Messages

## Macros

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_CLI** (cli\_pub, cli\_data)  
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_CLI** (cli\_pub, cli\_data)  
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_CLI** (cli\_pub, cli\_data)  
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_CLI** (cli\_pub, cli\_data)  
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_CLI** (cli\_pub, cli\_data)  
Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

### Parameters

- cli\_pub: Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- cli\_data: Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SRV** (srv\_pub, srv\_data)  
Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_TEMP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Server Model.

**Note** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**Return** New Light HSL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Setup Server Model.

**Note** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light HSL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_HUE\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Hue Server Model.

**Note** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Hue Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SAT\_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Saturation Server Model.

**Note** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

**Return** New Light HSL Saturation Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Server Model.

**Note** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light xyL Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light xyL Setup Server Model.

**Note** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.  
1. This model shall support model subscription.

**Return** New Light xyL Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Server Model.

**Note** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

**Return** New Light LC Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SETUP\_SRV** (`srv_pub`, `srv_data`)

Define a new Light LC Setup Server Model.

**Note** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

**Return** New Light LC Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

## Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t) (esp_ble_mesh_light_client_cb_event_t
                                              event, esp_ble_mesh_light_client_cb_param_t
                                              *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t) (esp_ble_mesh_lighting_server_cb_event_t
                                                  event,
                                                  esp_ble_mesh_lighting_server_cb_param_t
                                                  *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

*Values:*

```
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
```

```

ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

```

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

*Values:*

```

ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

```

```
enum esp_ble_mesh_lighting_server_cb_event_t
```

This enum value is the event of Lighting Server Model

*Values:*

```
ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
```

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
```

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
```

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

```
ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
```

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

```
ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX
```

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)
- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

## 2.2 Networking APIs

### 2.2.1 Wi-Fi

#### Wi-Fi

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C3.
- Combined AP-STA mode (ESP32-C3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** The `wifi` directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the `wifi` directory of ESP-IDF examples.

In addition, there is a simple `esp-idf-template` application to demonstrate a minimal IDF project structure.

#### API Reference

##### Header File

- `esp_wifi/include/esp_wifi.h`

##### Functions

`esp_err_t esp_wifi_init (const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

##### Return

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

##### Parameters

- `config`: pointer to WiFi initialized configuration structure; can point to a temporary variable.

`esp_err_t esp_wifi_deinit (void)`

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

##### Return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_mode (wifi_mode_t mode)`

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error code in esp\_err.h

**Parameters**

- mode: WiFi operating mode

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] mode: store current WiFi mode

*esp\_err\_t* **esp\_wifi\_start** (void)

Start WiFi according to current configuration. If mode is WIFI\_MODE\_STA, it create station control block and start station. If mode is WIFI\_MODE\_AP, it create soft-AP control block and start soft-AP. If mode is WIFI\_MODE\_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_stop** (void)

Stop WiFi. If mode is WIFI\_MODE\_STA, it stop station and free station control block. If mode is WIFI\_MODE\_AP, it stop soft-AP and free soft-AP control block. If mode is WIFI\_MODE\_APSTA, it stop station/soft-AP and free station/soft-AP control block.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_connect** (void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If the ESP32 is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_scan\_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise

the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code `WIFI_REASON_NO_AP_FOUND`.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_ERR_WIFI_SSID`: SSID of AP which station connects is invalid

*esp\_err\_t* **esp\_wifi\_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi was not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_FAIL`: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

**Return**

- `ESP_OK`: succeed
- others: fail

*esp\_err\_t* **esp\_wifi\_deauth\_sta** (uint16\_t *aid*)

deauthenticate all stations or associated id equals to *aid*

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

**Parameters**

- *aid*: when *aid* is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is *aid*

*esp\_err\_t* **esp\_wifi\_scan\_start** (const *wifi\_scan\_config\_t* \**config*, bool *block*)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in `esp_wifi_scan_get_ap_records`, so generally, call `esp_wifi_scan_get_ap_records` to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_WIFI_TIMEOUT`: blocking scan is timeout
- `ESP_ERR_WIFI_STATE`: wifi still connecting when invoke `esp_wifi_scan_start`
- others: refer to error code in `esp_err.h`

**Parameters**

- *config*: configuration of scanning
- *block*: if *block* is true, this API will block the caller until the scan is done, otherwise it will return immediately

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

**Return**

- `ESP_OK`: succeed

- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* esp\_wifi\_scan\_get\_ap\_num (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] number: store number of APIs found in last scan

*esp\_err\_t* esp\_wifi\_scan\_get\_ap\_records (uint16\_t \*number, wifi\_ap\_record\_t \*ap\_records)

Get AP list found in last scan.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

**Parameters**

- [inout] number: As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- ap\_records: *wifi\_ap\_record\_t* array to hold the found APs

*esp\_err\_t* esp\_wifi\_clear\_ap\_list (void)

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* esp\_wifi\_sta\_get\_ap\_info (wifi\_ap\_record\_t \*ap\_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

**Parameters**

- ap\_info: the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

*esp\_err\_t* esp\_wifi\_set\_ps (wifi\_ps\_type\_t type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Return** ESP\_OK: succeed

**Parameters**

- type: power save type

*esp\_err\_t* esp\_wifi\_get\_ps (wifi\_ps\_type\_t \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Return** ESP\_OK: succeed

**Parameters**

- [out] type: store current power save type

*esp\_err\_t esp\_wifi\_set\_protocol (wifi\_interface\_t ifx, uint8\_t protocol\_bitmap)*

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROT

**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interfaces
- protocol\_bitmap: WiFi protocol bitmap

*esp\_err\_t esp\_wifi\_get\_protocol (wifi\_interface\_t ifx, uint8\_t \*protocol\_bitmap)*

Get the current protocol bitmap of the specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface
- [out] protocol\_bitmap: store current WiFi protocol bitmap of interface ifx

*esp\_err\_t esp\_wifi\_set\_bandwidth (wifi\_interface\_t ifx, wifi\_bandwidth\_t bw)*

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface to be configured
- bw: bandwidth

*esp\_err\_t esp\_wifi\_get\_bandwidth (wifi\_interface\_t ifx, wifi\_bandwidth\_t \*bw)*

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

*esp\_err\_t esp\_wifi\_set\_channel (uint8\_t primary, wifi\_second\_chan\_t second)*

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp\_wifi\_start()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So if you want to remember the channel used before wifi stop, you need to call this API again after wifi start, or you can call `esp_wifi_set_config()` to store the channel info in NVS.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- `primary`: for HT20, primary is the channel number, for HT40, primary is the primary channel
- `second`: for HT20, second is ignored, for HT40, second is the second channel

`esp_err_t esp_wifi_get_channel (uint8_t *primary, wifi_second_chan_t *second)`

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- `primary`: store current primary channel
- `[out] second`: store current second channel

`esp_err_t esp_wifi_set_country (const wifi_country_t *country)`

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

**Attention** 2. The default country is CHINA `{.cc="CN", .schan=1, .nchan=13, .policy=WIFI_COUNTRY_POLICY_AUTO}`.

**Attention** 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

**Attention** 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc="US", .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc="JP", .schan=1, .nchan=14}` then the country info that will be used is `{.cc="JP", .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back to the country info of the station automatically, `{.cc="US", .schan=1, .nchan=11}` in the example.

**Attention** 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- `country`: the configured country info

`esp_err_t esp_wifi_get_country (wifi_country_t *country)`

get the current country info

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- country: country info

*esp\_err\_t* **esp\_wifi\_set\_mac** (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MAC: invalid mac address
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- others: refer to error codes in esp\_err.h

**Parameters**

- ifx: interface
- mac: the MAC address

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

**Parameters**

- ifx: interface
- [out] mac: store mac of the interface ifx

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- cb: callback

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- en: false - disable, true - enable

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] en: store the current status of promiscuous mode

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI\_PKT\_MISC

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- filter: the packet type filtered in promiscuous mode.

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of promiscuous filter

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**Parameters**

- filter: the subtype of the control packet filtered in promiscuous mode.

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

**Parameters**

- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Attention** 4. The configuration will be stored in NVS

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the erro code in esp\_err.h

**Parameters**

- `interface`: interface
- `conf`: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface

**Parameters**

- `interface`: interface
- [out] `conf`: station or soft-AP configuration

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_list** (*wifi\_sta\_list\_t* \*sta)

Get STAs associated with soft-AP.

**Attention** SSC only API

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- [out] `sta`: station list ap can get the connected sta's phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_1r` in the *wifi\_sta\_info\_t* struct. For example, `phy_11b = 1` imply that sta support 802.11b mode

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_aid** (const uint8\_t mac[6], uint16\_t \*aid)

Get AID of STA connected with soft-AP.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: Requested resource not found
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- `mac`: STA's mac address
- [out] `aid`: Store the AID corresponding to STA mac

*esp\_err\_t* **esp\_wifi\_set\_storage** (*wifi\_storage\_t* storage)

Set the WiFi API configuration storage type.

**Attention** 1. The default value is `WIFI_STORAGE_FLASH`

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters**

- `storage`: : storage type

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie** (bool enable, *wifi\_vendor\_ie\_type\_t* type, *wifi\_vendor\_ie\_id\_t* idx, const void \*vnd\_ie)

Set 802.11 Vendor-Specific Information Element.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init()`

- `ESP_ERR_INVALID_ARG`: Invalid argument, including if first byte of `vnd_ie` is not `WIFI_VENDOR_IE_ELEMENT_ID` (0xDD) or second byte is an invalid length.
- `ESP_ERR_NO_MEM`: Out of memory

**Parameters**

- `enable`: If true, specified IE is enabled. If false, specified IE is removed.
- `type`: Information Element type. Determines the frame type to associate with the IE.
- `idx`: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie`: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If `enable` is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

`esp_err_t esp_wifi_set_vendor_ie_cb` (`esp_vendor_ie_cb_t cb`, `void *ctx`)

Register Vendor-Specific Information Element monitoring callback.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `cb`: Callback function
- `ctx`: Context argument, passed to callback function.

`esp_err_t esp_wifi_set_max_tx_power` (`int8_t power`)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the `max_tx_power` of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is out of range

**Parameters**

- `power`: Maximum WiFi transmitting power.

`esp_err_t esp_wifi_get_max_tx_power` (`int8_t *power`)

Get maximum transmitting power after WiFi start.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `power`: Maximum WiFi transmitting power, unit is 0.25dBm.

`esp_err_t esp_wifi_set_event_mask` (`uint32_t mask`)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRCVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Return**

- `ESP_OK`: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `mask`: WiFi event mask.

*esp\_err\_t* `esp_wifi_get_event_mask` (`uint32_t *mask`)

Get mask of WiFi events.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

**Parameters**

- `mask`: WiFi event mask.

*esp\_err\_t* `esp_wifi_80211_tx` (`wifi_interface_t ifx`, `const void *buffer`, `int len`, `bool en_sys_seq`)

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**

- `ESP_OK`: success
- `ESP_ERR_WIFI_IF`: Invalid interface
- `ESP_ERR_INVALID_ARG`: Invalid parameter
- `ESP_ERR_WIFI_NO_MEM`: out of memory

**Parameters**

- `ifx`: interface if the Wi-Fi mode is Station, the `ifx` should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the `ifx` should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the `ifx` should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the `ifx` is wrong, the API returns `ESP_ERR_WIFI_IF`.
- `buffer`: raw ieee80211 buffer
- `len`: the length of raw buffer, the `len` must be `<= 1500` Bytes and `>= 24` Bytes
- `en_sys_seq`: indicate whether use the internal sequence number. If `en_sys_seq` is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both `en_sys_seq==true` and `en_sys_seq==false` are fine. However, if the API is called after the Wi-Fi connection has been set up, `en_sys_seq` must be true, otherwise `ESP_ERR_WIFI_ARG` is returned.

*esp\_err\_t* `esp_wifi_set_csi_rx_cb` (`wifi_csi_cb_t cb`, `void *ctx`)

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Return**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

**Parameters**

- `cb`: callback
- `ctx`: context argument, passed to callback function

*esp\_err\_t* `esp_wifi_set_csi_config` (`const wifi_csi_config_t *config`)

Set CSI data configuration.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters**

- `config`: configuration

*esp\_err\_t* **esp\_wifi\_set\_csi** (bool *en*)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

#### Parameters

- *en*: true - enable, false - disable

*esp\_err\_t* **esp\_wifi\_set\_ant\_gpio** (const *wifi\_ant\_gpio\_config\_t* \**config*)

Set antenna GPIO configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

#### Parameters

- *config*: Antenna GPIO configuration.

*esp\_err\_t* **esp\_wifi\_get\_ant\_gpio** (*wifi\_ant\_gpio\_config\_t* \**config*)

Get current antenna GPIO configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

#### Parameters

- *config*: Antenna GPIO configuration.

*esp\_err\_t* **esp\_wifi\_set\_ant** (const *wifi\_ant\_config\_t* \**config*)

Set antenna configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

#### Parameters

- *config*: Antenna configuration.

*esp\_err\_t* **esp\_wifi\_get\_ant** (*wifi\_ant\_config\_t* \**config*)

Get current antenna configuration.

#### Return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

#### Parameters

- *config*: Antenna configuration.

int64\_t **esp\_wifi\_get\_tsf\_time** (*wifi\_interface\_t* *interface*)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Return** 0 or the TSF time

#### Parameters

- *interface*: The interface whose tsf\_time is to be retrieved.

*esp\_err\_t* **esp\_wifi\_set\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t sec)

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

**Parameters**

- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t \*sec)

Get inactive time of specified interface.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

**Parameters**

- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

*esp\_err\_t* **esp\_wifi\_stats\_dump** (uint32\_t modules)

Dump WiFi statistics.

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- modules: statistic modules to be dumped

*esp\_err\_t* **esp\_wifi\_set\_rssi\_threshold** (int32\_t rssi)

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event is received.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

**Parameters**

- rssi: threshold value in dbm between -100 to 0

*esp\_err\_t* **esp\_wifi\_ftm\_initiate\_session** (*wifi\_ftm\_initiator\_cfg\_t* \*cfg)

Start an FTM Initiator session by sending FTM request. If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- cfg: FTM Initiator session configuration

*esp\_err\_t* **esp\_wifi\_ftm\_end\_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Return**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_resp\_set\_offset** (int16\_t *offset\_cm*)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- *offset\_cm*: T1 Offset to be added in centimeters

*esp\_err\_t* **esp\_wifi\_config\_11b\_rate** (*wifi\_interface\_t* *ifx*, bool *disable*)

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Attention** 2. Only when really need to disable 11b rate call this API otherwise don't call this.

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- *ifx*: Interface to be configured.
- *disable*: true means disable 11b rate while false means enable 11b rate.

*esp\_err\_t* **esp\_wifi\_set\_connectionless\_wake\_interval** (uint16\_t *interval*)

Set interval for station to wake up periodically at disconnected.

**Attention** 1. Only when ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. This configuration would influence nothing until some module configure `wake_window`

**Attention** 4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**

- *interval*: how much milliseconds would the chip wake up, from 1 to 65535.

*esp\_err\_t* **esp\_wifi\_set\_country\_code** (const char \**country*, bool *ieee80211d\_enabled*)

configure country

**Attention** 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention** 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 4. The country configuration is stored into flash.

**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention** 6. Supported country codes are "01" (world safe mode) "AT" ," AU" ," BE" ," BG" ," BR" ," CA" ," CH" ," CN" ," CY" ," CZ" ," DE" ," DK" ," EE" ," ES" ," FI" ," FR" ," GB" ," GR" ," HK" ," HR" ," HU" ," IE" ," IN" ," IS" ," IT" ," JP" ," KR" ," LI" ," LT" ," LU" ," LV" ," MT" ," MX" ," NL" ," NO" ," NZ" ," PL" ," PT" ," RO" ," SE" ," SI" ," SK" ," TW" ," US"

**Attention** 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention** 8. The default country is "CN" and `ieee80211d_enabled` is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `country`: the configured country ISO code
- `ieee80211d_enabled`: 802.11d is enabled or not

*esp\_err\_t* **esp\_wifi\_get\_country\_code** (char \*country)

get the current country code

**Return**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters**

- `country`: country code

*esp\_err\_t* **esp\_wifi\_config\_80211\_tx\_rate** (wifi\_interface\_t ifx, wifi\_phy\_rate\_t rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp\_wifi\_init() and before esp\_wifi\_start().

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- `ifx`: Interface to be configured.
- `rate`: Phy rate to be configured.

*esp\_err\_t* **esp\_wifi\_disable\_pmf\_config** (wifi\_interface\_t ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after esp\_wifi\_set\_config() and before esp\_wifi\_start().

**Return**

- ESP\_OK: succeed
- others: failed

**Parameters**

- `ifx`: Interface to be configured.

## Structures

**struct** **wifi\_init\_config\_t**

WiFi stack configuration parameters passed to esp\_wifi\_init call.

## Public Members

*system\_event\_handler\_t* **event\_handler**

WiFi event handler

wifi\_osi\_funcs\_t \***osi\_funcs**

WiFi OS functions

### Type Definitions

**typedef** void (\***wifi\_promiscuous\_cb\_t**) (void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

#### Parameters

- **buf**: Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.
- **type**: promiscuous packet type.

**typedef** void (\***esp\_vendor\_ie\_cb\_t**) (void \*ctx, *wifi\_vendor\_ie\_type\_t* type, **const** uint8\_t sa[6], **const** *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

#### Parameters

- **ctx**: Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- **type**: Information element type, based on frame type received.
- **sa**: Source 802.11 address.
- **vnd\_ie**: Pointer to the vendor specific element data received.
- **rssi**: Received signal strength indication.

**typedef** void (\***wifi\_csi\_cb\_t**) (void \*ctx, *wifi\_csi\_info\_t* \*data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

#### Parameters

- **ctx**: context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.
- **data**: CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- [esp\\_wifi/include/esp\\_wifi\\_types.h](#)

### Unions

**union** **wifi\_config\_t**

*#include <esp\_wifi\_types.h>* Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

#### Public Members

*wifi\_ap\_config\_t* **ap**  
configuration of AP

*wifi\_sta\_config\_t* **sta**  
configuration of STA

## Structures

### **struct wifi\_country\_t**

Structure describing WiFi country-based regional restrictions.

#### **Public Members**

char **cc**[3]

country code string

uint8\_t **schan**

start channel

uint8\_t **nchan**

total channel number

int8\_t **max\_tx\_power**

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**

country policy

### **struct wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

#### **Public Members**

uint32\_t **min**

minimum active scan time per channel, units: millisecond

uint32\_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

### **struct wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

#### **Public Members**

*wifi\_active\_scan\_time\_t* **active**

active scan time per channel, units: millisecond.

uint32\_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

### **struct wifi\_scan\_config\_t**

Parameters for an SSID scan.

#### **Public Members**

uint8\_t \***ssid**

SSID of AP

uint8\_t \***bssid**

MAC address of AP

uint8\_t **channel**

channel, scan the specific channel

bool **show\_hidden**

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**  
scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**  
scan time per channel

**struct wifi\_ap\_record\_t**  
Description of a WiFi AP.

### Public Members

uint8\_t **bssid**[6]  
MAC address of AP

uint8\_t **ssid**[33]  
SSID of AP

uint8\_t **primary**  
channel of AP

*wifi\_second\_chan\_t* **second**  
secondary channel of AP

int8\_t **rssi**  
signal strength of AP

*wifi\_auth\_mode\_t* **authmode**  
authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**  
pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**  
group cipher of AP

*wifi\_ant\_t* **ant**  
antenna used to receive beacon from AP

uint32\_t **phy\_11b** : 1  
bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g** : 1  
bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n** : 1  
bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r** : 1  
bit: 3 flag to identify if low rate is enabled or not

uint32\_t **wps** : 1  
bit: 4 flag to identify if WPS is supported or not

uint32\_t **ftm\_responder** : 1  
bit: 5 flag to identify if FTM is supported in responder mode

uint32\_t **ftm\_initiator** : 1  
bit: 6 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved** : 25  
bit: 7..31 reserved

*wifi\_country\_t* **country**  
country information of AP

**struct wifi\_scan\_threshold\_t**  
Structure describing parameters for a WiFi fast scan.

**Public Members****int8\_t rssi**

The minimum rssi to accept in the fast scan mode

**wifi\_auth\_mode\_t authmode**

The weakest authmode to accept in the fast scan mode

**struct wifi\_pmf\_config\_t**

Configuration structure for Protected Management Frame

**Public Members****bool capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

**bool required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi\_ap\_config\_t**

Soft-AP configuration settings for the ESP32.

**Public Members****uint8\_t ssid[32]**

SSID of ESP32 soft-AP. If ssid\_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid\_len.

**uint8\_t password[64]**

Password of ESP32 soft-AP.

**uint8\_t ssid\_len**

Optional length of SSID field.

**uint8\_t channel**

Channel of ESP32 soft-AP

**wifi\_auth\_mode\_t authmode**

Auth mode of ESP32 soft-AP. Do not support AUTH\_WEP in soft-AP mode

**uint8\_t ssid\_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

**uint8\_t max\_connection**

Max number of stations allowed to connect in, default 4, max 10

**uint16\_t beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**wifi\_cipher\_type\_t pairwise\_cipher**

pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

**bool ftm\_responder**

Enable FTM Responder mode

**struct wifi\_sta\_config\_t**

STA configuration settings for the ESP32.

### Public Members

`uint8_t ssid[32]`

SSID of target AP.

`uint8_t password[64]`

Password of target AP.

`wifi_scan_method_t scan_method`

do all channel scan or fast scan

bool `bssid_set`

whether set MAC address of target AP or not. Generally, `station_config.bssid_set` needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

`uint8_t bssid[6]`

MAC address of target AP

`uint8_t channel`

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

`uint16_t listen_interval`

Listen interval for ESP32 station to receive beacon when `WIFI_PS_MAX_MODEM` is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

`wifi_sort_method_t sort_method`

sort the connect AP in the list by rssi or security mode

`wifi_scan_threshold_t threshold`

When `sort_method` is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

`wifi_pmf_config_t pmf_cfg`

Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

`uint32_t rm_enabled : 1`

Whether Radio Measurements are enabled for the connection

`uint32_t btm_enabled : 1`

Whether BSS Transition Management is enabled for the connection

`uint32_t transition_disable : 1`

Whether to enable transition disable feature

`uint32_t reserved : 29`

Reserved for future feature set

`wifi_sae_pwe_method_t sae_pwe_h2e`

Whether SAE hash to element is enabled

`uint8_t failure_retry_cnt`

Number of connection retries station will do before moving to next AP. `scan_method` should be set as `WIFI_ALL_CHANNEL_SCAN` to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

**struct `wifi_sta_info_t`**

Description of STA associated with AP.

### Public Members

`uint8_t mac[6]`

mac address

`int8_t rssi`

current average rssi of sta connected

uint32\_t **phy\_11b** : 1  
bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g** : 1  
bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n** : 1  
bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_lr** : 1  
bit: 3 flag to identify if low rate is enabled or not

uint32\_t **is\_mesh\_child** : 1  
bit: 4 flag to identify mesh child

uint32\_t **reserved** : 27  
bit: 5..31 reserved

### **struct wifi\_sta\_list\_t**

List of stations associated with the ESP32 Soft-AP.

#### **Public Members**

*wifi\_sta\_info\_t* **sta**[ESP\_WIFI\_MAX\_CONN\_NUM]  
station list

int **num**  
number of stations in the list (other entries are invalid)

### **struct vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

#### **Public Members**

uint8\_t **element\_id**  
Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**  
Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]  
Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**  
Vendor-specific OUI type.

uint8\_t **payload**[0]  
Payload. Length is equal to value in 'length' field, minus 4.

### **struct wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

#### **Public Members**

signed **rss\_i** : 8  
Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate** : 5  
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_** : 1  
reserved

unsigned **sig\_mode** : 2  
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_** : 16  
reserved

unsigned **mcs** : 7  
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb** : 1  
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_** : 16  
reserved

unsigned **smoothing** : 1  
reserved

unsigned **not\_sounding** : 1  
reserved

unsigned **\_\_pad3\_\_** : 1  
reserved

unsigned **aggregation** : 1  
Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc** : 2  
Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding** : 1  
Flag is set for 11n packets which are LDPC

unsigned **sgi** : 1  
Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **\_\_pad4\_\_** : 8  
reserved

unsigned **ampdu\_cnt** : 8  
ampdu cnt

unsigned **channel** : 4  
primary channel on which this packet is received

unsigned **secondary\_channel** : 4  
secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad5\_\_** : 8  
reserved

unsigned **timestamp** : 32  
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad6\_\_** : 32  
reserved

signed **noise\_floor** : 8  
noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **\_\_pad7\_\_** : 24  
reserved

unsigned **\_\_pad8\_\_** : 32  
reserved

unsigned **\_\_pad9\_\_** : 31  
reserved

unsigned **ant** : 1  
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **\_\_pad10\_\_** : 32  
reserved

unsigned **\_\_pad11\_\_** : 32  
reserved

unsigned **\_\_pad12\_\_** : 32  
reserved

unsigned **sig\_len** : 12  
length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad13\_\_** : 12  
reserved

unsigned **rx\_state** : 8  
state of the packet. 0: no error; others: error numbers which are not public

**struct wifi\_promiscuous\_pkt\_t**

Payload passed to 'buf' parameter of promiscuous mode RX callback.

**Public Members**

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**  
metadata header

uint8\_t **payload**[0]  
Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

**struct wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

**Public Members**

uint32\_t **filter\_mask**  
OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

**struct wifi\_csi\_config\_t**

Channel state information(CSI) configuration type.

**Public Members**

bool **lltf\_en**  
enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf\_en**  
enable to receive HT long training field(htltf) data. Default enabled

bool **stbc\_htltf2\_en**  
enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf\_merge\_en**  
enable to generate htlft data by averaging lltf and ht\_ltf data when receiving HT packet. Otherwise, use ht\_ltf data directly. Default enabled

bool **channel\_filter\_en**  
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**  
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**  
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi\_csi\_info\_t**  
CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t rx\_ctrl*  
received packet radio metadata header of the CSI data

uint8\_t **mac**[6]  
source MAC address of the CSI data

bool **first\_word\_invalid**  
first four bytes of the CSI data is invalid or not

int8\_t \***buf**  
buffer of CSI data

uint16\_t **len**  
length of CSI data

**struct wifi\_ant\_gpio\_t**  
WiFi GPIO configuration for antenna selection.

### Public Members

uint8\_t **gpio\_select** : 1  
Whether this GPIO is connected to external antenna switch

uint8\_t **gpio\_num** : 7  
The GPIO number that connects to external antenna switch

**struct wifi\_ant\_gpio\_config\_t**  
WiFi GPIOs configuration for antenna selection.

### Public Members

*wifi\_ant\_gpio\_t gpio\_cfg*[4]  
The configurations of GPIOs that connect to external antenna switch

**struct wifi\_ant\_config\_t**  
WiFi antenna configuration.

### Public Members

*wifi\_ant\_mode\_t rx\_ant\_mode*  
WiFi antenna mode for receiving

**wifi\_ant\_t rx\_ant\_default**

Default antenna mode for receiving, it's ignored if rx\_ant\_mode is not WIFI\_ANT\_MODE\_AUTO

**wifi\_ant\_mode\_t tx\_ant\_mode**

WiFi antenna mode for transmission, it can be set to WIFI\_ANT\_MODE\_AUTO only if rx\_ant\_mode is set to WIFI\_ANT\_MODE\_AUTO

uint8\_t **enabled\_ant0** : 4

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT0

uint8\_t **enabled\_ant1** : 4

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT1

**struct wifi\_action\_tx\_req\_t**

Action Frame Tx Request.

**Public Members****wifi\_interface\_t ifx**

WiFi interface to send request to

uint8\_t **dest\_mac**[6]

Destination MAC address

bool **no\_ack**

Indicates no ack required

**wifi\_action\_rx\_cb\_t rx\_cb**

Rx Callback to receive any response

uint32\_t **data\_len**

Length of the appended Data

uint8\_t **data**[0]

Appended Data payload

**struct wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

**Public Members**

uint8\_t **resp\_mac**[6]

MAC address of the FTM Responder

uint8\_t **channel**

Primary channel of the FTM Responder

uint8\_t **frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested time period between consecutive FTM bursts in 100's of milliseconds (0 - No pref)

**struct wifi\_event\_sta\_scan\_done\_t**

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

**Public Members**

uint32\_t **status**

status of scanning APs: 0 — success, 1 - failure

uint8\_t **number**

number of scan results

`uint8_t scan_id`  
scan sequence number, used for block scan

**struct `wifi_event_sta_connected_t`**  
Argument structure for `WIFI_EVENT_STA_CONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of connected AP

`uint8_t ssid_len`  
SSID length of connected AP

`uint8_t bssid[6]`  
BSSID of connected AP

`uint8_t channel`  
channel of connected AP

*wifi\_auth\_mode\_t* `authmode`  
authentication mode used by AP

**struct `wifi_event_sta_disconnected_t`**  
Argument structure for `WIFI_EVENT_STA_DISCONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of disconnected AP

`uint8_t ssid_len`  
SSID length of disconnected AP

`uint8_t bssid[6]`  
BSSID of disconnected AP

`uint8_t reason`  
reason of disconnection

`int8_t rssi`  
rssi of disconnection

**struct `wifi_event_sta_authmode_change_t`**  
Argument structure for `WIFI_EVENT_STA_AUTHMODE_CHANGE` event

### Public Members

*wifi\_auth\_mode\_t* `old_mode`  
the old auth mode of AP

*wifi\_auth\_mode\_t* `new_mode`  
the new auth mode of AP

**struct `wifi_event_sta_wps_er_pin_t`**  
Argument structure for `WIFI_EVENT_STA_WPS_ER_PIN` event

### Public Members

`uint8_t pin_code[8]`  
PIN code of station in enrollee mode

**struct wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

**Public Members****uint8\_t ap\_cred\_cnt**

Number of AP credentials received

**uint8\_t ssid[MAX\_SSID\_LEN]**

SSID of AP

**uint8\_t passphrase[MAX\_PASSPHRASE\_LEN]**

Passphrase for the AP

**struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] ap\_cred[MAX\_WPS\_AP\_CRED]**

All AP credentials received from WPS handshake

**struct wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members****uint8\_t mac[6]**

MAC address of the station connected to ESP32 soft-AP

**uint8\_t aid**

the aid that ESP32 soft-AP gives to the station connected to

**bool is\_mesh\_child**

flag to identify mesh child

**struct wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

**Public Members****uint8\_t mac[6]**

MAC address of the station disconnects to ESP32 soft-AP

**uint8\_t aid**

the aid that ESP32 soft-AP gave to the station disconnects to

**bool is\_mesh\_child**

flag to identify mesh child

**struct wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

**Public Members****int rssi**

Received probe request signal strength

**uint8\_t mac[6]**

MAC address of the station which send probe request

**struct wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event

**Public Members**

`int32_t rssi`  
RSSI value of bss

**struct wifi\_ftm\_report\_entry\_t**  
Argument structure for

**Public Members**

`uint8_t dlog_token`  
Dialog Token of the FTM frame

`int8_t rssi`  
RSSI of the FTM frame received

`uint32_t rtt`  
Round Trip Time in pSec with a peer

`uint64_t t1`  
Time of departure of FTM frame from FTM Responder in pSec

`uint64_t t2`  
Time of arrival of FTM frame at FTM Initiator in pSec

`uint64_t t3`  
Time of departure of ACK from FTM Initiator in pSec

`uint64_t t4`  
Time of arrival of ACK at FTM Responder in pSec

**struct wifi\_event\_ftm\_report\_t**  
Argument structure for WIFI\_EVENT\_FTM\_REPORT event

**Public Members**

`uint8_t peer_mac[6]`  
MAC address of the FTM Peer

`wifi_ftm_status_t status`  
Status of the FTM operation

`uint32_t rtt_raw`  
Raw average Round-Trip-Time with peer in Nano-Seconds

`uint32_t rtt_est`  
Estimated Round-Trip-Time with peer in Nano-Seconds

`uint32_t dist_est`  
Estimated one-way distance in Centi-Meters

`wifi_ftm_report_entry_t *ftm_report_data`  
Pointer to FTM Report with multiple entries, should be freed after use

`uint8_t ftm_report_num_entries`  
Number of entries in the FTM Report data

**struct wifi\_event\_action\_tx\_status\_t**  
Argument structure for WIFI\_EVENT\_ACTION\_TX\_STATUS event

**Public Members**

*wifi\_interface\_t* **ifx**  
WiFi interface to send request to

uint32\_t **context**  
Context to identify the request

uint8\_t **da**[6]  
Destination MAC address

uint8\_t **status**  
Status of the operation

**struct wifi\_event\_roc\_done\_t**  
Argument structure for WIFI\_EVENT\_ROC\_DONE event

**Public Members**

uint32\_t **context**  
Context to identify the request

**Macros**

**WIFI\_OFFCHAN\_TX\_REQ**

**WIFI\_OFFCHAN\_TX\_CANCEL**

**WIFI\_ROC\_REQ**

**WIFI\_ROC\_CANCEL**

**WIFI\_PROTOCOL\_11B**

**WIFI\_PROTOCOL\_11G**

**WIFI\_PROTOCOL\_11N**

**WIFI\_PROTOCOL\_LR**

**ESP\_WIFI\_MAX\_CONN\_NUM**

max number of stations which can connect to ESP32 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**  
filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**  
filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**  
filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**  
filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**  
filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**  
filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**  
filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**  
filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**  
filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**  
filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**  
mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**  
mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVD**  
mask SYSTEM\_EVENT\_AP\_PROBEREQRECVD event

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATIS\_RXTX**

**WIFI\_STATIS\_HW**

**WIFI\_STATIS\_DIAG**

**WIFI\_STATIS\_PS**

**WIFI\_STATIS\_ALL**

### Type Definitions

**typedef** int (\***wifi\_action\_rx\_cb\_t**) (uint8\_t \*hdr, uint8\_t \*payload, size\_t len, uint8\_t channel)  
The Rx callback function of Action Tx operations.

#### Parameters

- **hdr**: pointer to the IEEE 802.11 Header structure
- **payload**: pointer to the Payload following 802.11 Header
- **len**: length of the Payload
- **channel**: channel number the frame is received on

**Enumerations****enum wifi\_mode\_t***Values:***WIFI\_MODE\_NULL** = 0  
null mode**WIFI\_MODE\_STA**  
WiFi station mode**WIFI\_MODE\_AP**  
WiFi soft-AP mode**WIFI\_MODE\_APSTA**

*Values:*

**WIFI\_SCAN\_TYPE\_ACTIVE** = 0  
active scan  
**WIFI\_SCAN\_TYPE\_PASSIVE**  
passive scan

**enum wifi\_cipher\_type\_t**

*Values:*

**WIFI\_CIPHER\_TYPE\_NONE** = 0  
the cipher type is none  
**WIFI\_CIPHER\_TYPE\_WEP40**  
the cipher type is WEP40  
**WIFI\_CIPHER\_TYPE\_WEP104**  
the cipher type is WEP104  
**WIFI\_CIPHER\_TYPE\_TKIP**  
the cipher type is TKIP  
**WIFI\_CIPHER\_TYPE\_CCMP**  
the cipher type is CCMP  
**WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**  
the cipher type is TKIP and CCMP

**WIFI\_CIPHER\_TYPE\_AES\_CMAC128**  
the cipher type is AES-CMAC-128

**WIFI\_CIPHER\_TYPE\_SMS4**  
the cipher type is SMS4

**WIFI\_CIPHER\_TYPE\_UNKNOWN**  
the cipher type is unknown

**enum wifi\_ant\_t**  
WiFi antenna.

*Values:*

**WIFI\_ANT\_ANT0**  
WiFi antenna 0

**WIFI\_ANT\_ANT1**  
WiFi antenna 1

**WIFI\_ANT\_MAX**  
Invalid WiFi antenna

**enum wifi\_scan\_method\_t**  
*Values:*

**WIFI\_FAST\_SCAN = 0**  
Do fast scan, scan will end after find SSID match AP

**WIFI\_ALL\_CHANNEL\_SCAN**  
All channel scan, scan will end after scan all the channel

**enum wifi\_sort\_method\_t**  
*Values:*

**WIFI\_CONNECT\_AP\_BY\_SIGNAL = 0**  
Sort match AP in scan list by RSSI

**WIFI\_CONNECT\_AP\_BY\_SECURITY**  
Sort match AP in scan list by security mode

**enum wifi\_ps\_type\_t**  
*Values:*

**WIFI\_PS\_NONE**  
No power save

**WIFI\_PS\_MIN\_MODEM**  
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

**WIFI\_PS\_MAX\_MODEM**  
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen\_interval parameter in *wifi\_sta\_config\_t*

**enum wifi\_bandwidth\_t**  
*Values:*

**WIFI\_BW\_HT20 = 1**

**WIFI\_BW\_HT40**

**enum wifi\_sae\_pwe\_method\_t**  
Configuration for SAE PWE derivation

*Values:*

**WPA3\_SAE\_PWE\_UNSPECIFIED**

**WPA3\_SAE\_PWE\_HUNT\_AND\_PECK**

**WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT**

**WPA3\_SAE\_PWE\_BOTH**

**enum wifi\_storage\_t**

*Values:*

**WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

**WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

**enum wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

**WIFI\_VND\_IE\_TYPE\_BEACON**

**WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

**WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

**WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

**WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

**enum wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

**WIFI\_VND\_IE\_ID\_0**

**WIFI\_VND\_IE\_ID\_1**

**enum wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

**WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

**WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

**enum wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:*

**WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

**WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

**WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

**WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

**enum wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:***WIFI\_PHY\_RATE\_1M\_L** = 0x00

**WIFI\_PHY\_RATE\_LORA\_250K** = 0x29  
250 Kbps

**WIFI\_PHY\_RATE\_LORA\_500K** = 0x2A  
500 Kbps

**WIFI\_PHY\_RATE\_MAX**

**enum wifi\_event\_t**

WiFi event declarations

*Values:*

**WIFI\_EVENT\_WIFI\_READY** = 0  
ESP32 WiFi ready

**WIFI\_EVENT\_SCAN\_DONE**  
ESP32 finish scanning AP

**WIFI\_EVENT\_STA\_START**  
ESP32 station start

**WIFI\_EVENT\_STA\_STOP**  
ESP32 station stop

**WIFI\_EVENT\_STA\_CONNECTED**  
ESP32 station connected to AP

**WIFI\_EVENT\_STA\_DISCONNECTED**  
ESP32 station disconnected from AP

**WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**  
the auth mode of AP connected by ESP32 station changed

**WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**  
ESP32 station wps succeeds in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**  
ESP32 station wps fails in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

ESP32 station wps timeout in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

ESP32 station wps pin code in enrollee mode

**WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

ESP32 station wps overlap in enrollee mode

**WIFI\_EVENT\_AP\_START**

ESP32 soft-AP start

**WIFI\_EVENT\_AP\_STOP**

ESP32 soft-AP stop

**WIFI\_EVENT\_AP\_STA\_CONNECTED**

a station connected to ESP32 soft-AP

**WIFI\_EVENT\_AP\_STA\_DISCONNECTED**

a station disconnected from ESP32 soft-AP

**WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

**WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

**WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP's RSSI crossed configured threshold

**WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

**WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

**WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

ESP32 station beacon timeout

**WIFI\_EVENT\_MAX**

Invalid WiFi event ID

**enum wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

**WPS\_FAIL\_REASON\_NORMAL = 0**

ESP32 WPS normal fail reason

**WPS\_FAIL\_REASON\_RECV\_M2D**

ESP32 WPS receive M2D frame

**WPS\_FAIL\_REASON\_MAX**

**enum wifi\_ftm\_status\_t**

FTM operation status types.

*Values:*

**FTM\_STATUS\_SUCCESS = 0**

FTM exchange is successful

**FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

**FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

**FTM\_STATUS\_NO\_RESPONSE**  
Peer did not respond to FTM Requests

**FTM\_STATUS\_FAIL**  
Unknown error during FTM exchange

## SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check [Provisioning API](#).

**Application Example** Connect ESP32-C3 to target AP using SmartConfig: [wifi/smart\\_config](#).

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_smartconfig.h](#)

### Functions

**const** char \***esp\_smartconfig\_get\_version** (void)

Get the version of SmartConfig.

#### Return

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (**const** *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

#### Return

- ESP\_OK: succeed
- others: fail

#### Parameters

- config: pointer to smartconfig start configure structure

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

#### Return

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

#### Return

- ESP\_OK: succeed

- others: fail

**Parameters**

- `time_s`: range 15s~255s, offset:45s.

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- `type`: Choose from the `smartconfig_type_t`.

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool *enable*)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- `enable`: false-disable(default); true-enable;

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \**rvd\_data*, uint8\_t *len*)

Get reserved data of ESPTouch v2.

**Return**

- ESP\_OK: succeed
- others: fail

**Parameters**

- `rvd_data`: reserved data
- `len`: length of reserved data

**Structures**

**struct smartconfig\_event\_got\_ssid\_pswd\_t**

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

**Public Members**

uint8\_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8\_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid\_set**

whether set MAC address of target AP or not.

uint8\_t **bssid**[6]

MAC address of target AP.

*smartconfig\_type\_t* **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]

IP address of cellphone.

**struct smartconfig\_start\_config\_t**  
Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**  
Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**  
Enable ESPTouch v2 crypt.

char \***esp\_touch\_v2\_key**  
ESPTouch v2 crypt key, len should be 16.

### Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT()**

### Enumerations

**enum smartconfig\_type\_t**

*Values:*

**SC\_TYPE\_ESPTOUCH** = 0  
protocol: ESPTouch

**SC\_TYPE\_AIRKISS**  
protocol: AirKiss

**SC\_TYPE\_ESPTOUCH\_AIRKISS**  
protocol: ESPTouch and AirKiss

**SC\_TYPE\_ESPTOUCH\_V2**  
protocol: ESPTouch v2

**enum smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

**SC\_EVENT\_SCAN\_DONE**  
ESP32 station smartconfig has finished to scan for APs

**SC\_EVENT\_FOUND\_CHANNEL**  
ESP32 station smartconfig has found the channel of the target AP

**SC\_EVENT\_GOT\_SSID\_PSWD**  
ESP32 station smartconfig got the SSID and password

**SC\_EVENT\_SEND\_ACK\_DONE**  
ESP32 station smartconfig has sent ACK to cellphone

### ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff).

## Security

**ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.**

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 10, the default is 6.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_now.h](#)

### Functions

`esp_err_t esp_now_init` (void)  
Initialize ESPNOW function.

#### Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_INTERNAL` : Internal error

`esp_err_t esp_now_deinit` (void)  
De-initialize ESPNOW function.

#### Return

- `ESP_OK` : succeed

`esp_err_t esp_now_get_version` (uint32\_t \*version)  
Get the version of ESPNOW.

#### Return

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_ARG` : invalid argument

#### Parameters

- `version`: ESPNOW version

*esp\_err\_t* **esp\_now\_register\_recv\_cb** (*esp\_now\_recv\_cb\_t* cb)

Register callback function of receiving ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

**Parameters**

- cb: callback function of receiving ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_recv\_cb** (void)

Unregister callback function of receiving ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* cb)

Register callback function of sending ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

**Parameters**

- cb: callback function of sending ESPNOW data

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (**const** uint8\_t \*peer\_addr, **const** uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If peer\_addr is not NULL, send data to the peer whose MAC address matches peer\_addr

**Attention** 2. If peer\_addr is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than ESP\_NOW\_MAX\_DATA\_LEN

**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp\_now\_send returns

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory, when this happens, you can delay a while before sending the next data
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found
- ESP\_ERR\_ESPNOW\_IF : current WiFi interface doesn't match that of peer

**Parameters**

- peer\_addr: peer MAC address
- data: data to send
- len: length of data

*esp\_err\_t* **esp\_now\_add\_peer** (**const** *esp\_now\_peer\_info\_t* \*peer)

Add a peer to peer list.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory

- `ESP_ERR_ESPNOW_EXIST` : peer has existed

**Parameters**

- `peer`: peer information

*esp\_err\_t* **esp\_now\_del\_peer** (**const** uint8\_t \**peer\_addr*)

Delete a peer from peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `peer_addr`: peer MAC address

*esp\_err\_t* **esp\_now\_mod\_peer** (**const** *esp\_now\_peer\_info\_t* \**peer*)

Modify a peer.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

**Parameters**

- `peer`: peer information

*esp\_err\_t* **esp\_wifi\_config\_espnow\_rate** (*wifi\_interface\_t* *ifx*, *wifi\_phy\_rate\_t* *rate*)

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_start()`.

**Return**

- `ESP_OK`: succeed
- others: failed

**Parameters**

- `ifx`: Interface to be configured.
- `rate`: Phy rate to be configured.

*esp\_err\_t* **esp\_now\_get\_peer** (**const** uint8\_t \**peer\_addr*, *esp\_now\_peer\_info\_t* \**peer*)

Get a peer whose MAC address matches `peer_addr` from peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `peer_addr`: peer MAC address
- `peer`: peer information

*esp\_err\_t* **esp\_now\_fetch\_peer** (**bool** *from\_head*, *esp\_now\_peer\_info\_t* \**peer*)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Return**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

**Parameters**

- `from_head`: fetch from head of list or not
- `peer`: peer information

**bool** **esp\_now\_is\_peer\_exist** (**const** uint8\_t \**peer\_addr*)

Peer exists or not.

**Return**

- true : peer exists
- false : peer not exists

**Parameters**

- peer\_addr: peer MAC address

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \*num)

Get the number of peers.

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

**Parameters**

- num: number of peers

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

**Parameters**

- pmk: primary master key

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set esp\_now wake window for sta\_disconnected power management.

**Attention** 1. Only when ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. If more than one module has configured its wake\_window, chip would choose the largest one to stay waked

**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

**Attention** 5. If never configured wake\_window, the chip would keep waked at disconnected once it uses esp\_now

**Return**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

**Parameters**

- window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

**struct esp\_now\_peer\_info**

ESPNOW peer information parameters.

**Public Members**

uint8\_t peer\_addr[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t lmk[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t channel

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

**struct esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

### Macros

**ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**

ESPNOW peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**

ESPNOW peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**

Internal error

**ESP\_ERR\_ESPNOW\_EXIST**

ESPNOW peer has existed

**ESP\_ERR\_ESPNOW\_IF**

Interface error

**ESP\_NOW\_ETH\_ALEN**

Length of ESPNOW peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

### Type Definitions

```
typedef struct esp_now_peer_info esp_now_peer_info_t
```

ESPNow peer information parameters.

```
typedef struct esp_now_peer_num esp_now_peer_num_t
```

Number of ESPNow peers which exist currently.

```
typedef void (*esp_now_recv_cb_t) (const uint8_t *mac_addr, const uint8_t *data, int  
data_len)
```

Callback function of receiving ESPNow data.

#### Parameters

- `mac_addr`: peer MAC address
- `data`: received data
- `data_len`: length of received data

```
typedef void (*esp_now_send_cb_t) (const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNow data.

#### Parameters

- `mac_addr`: peer MAC address
- `status`: status of sending ESPNow data (succeed or fail)

### Enumerations

```
enum esp_now_send_status_t
```

Status of sending ESPNow data .

*Values:*

```
ESP_NOW_SEND_SUCCESS = 0
```

Send ESPNow data successfully

```
ESP_NOW_SEND_FAIL
```

Send ESPNow data fail

## ESP-MESH Programming Guide

This is a programming guide for ESP-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. [ESP-MESH Programming Model](#)
2. [Writing an ESP-MESH Application](#)
3. [Self Organized Networking](#)
4. [Application Examples](#)
5. [API Reference](#)

For documentation regarding the ESP-MESH protocol, please see the [ESP-MESH API Guide](#). For more information about ESP-MESH Development Framework, please see [ESP-MESH Development Framework](#).

### ESP-MESH Programming Model

**Software Stack** The ESP-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-MESH software stack.

**System Events** An application interfaces with ESP-MESH via **ESP-MESH Events**. Since ESP-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-MESH application.

The `mesh_event_id_t` defines all possible ESP-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-MESH events can be used, the application must register a **Mesh**

Fig. 2: ESP-MESH Software Stack

Fig. 3: ESP-MESH System Events Delivery

**Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-MESH's self-organizing behavior.** Therefore, user's should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-MESH** The application can access the ESP-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node is required to initialize LwIP by calling** `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-MESH applications.

```

/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));

```

**Note:** ESP-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-MESH Application** The prerequisites for starting ESP-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-MESH itself can be initialized.

```

tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↳event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());

```

After initializing LwIP and Wi-Fi, the process of getting an ESP-MESH network up and running can be summarized into the following three steps:

1. *Initialize Mesh*
2. *Configuring an ESP-MESH Network*
3. *Start Mesh*

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-MESH

```

/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↳event_handler, NULL));

```

**Configuring an ESP-MESH Network** ESP-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-MESH Network, see <a href="#">mesh_addr_t</a>
Router	Router Configuration, see <a href="#">mesh_router_t</a>
Mesh AP	Mesh AP Configuration, see <a href="#">mesh_ap_cfg_t</a>
Crypto Functions	Crypto Functions for Mesh IE, see <a href="#">mesh_crypto_funcs_t</a>

The following code snippet demonstrates how to configure ESP-MESH.

```

/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
        strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
        strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

**Start Mesh** The following code snippet demonstrates how to start ESP-MESH.

```

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

```

After starting ESP-MESH, the application should check for ESP-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-MESH network using [esp\\_mesh\\_send\(\)](#) and [esp\\_mesh\\_recv\(\)](#).

**Self Organized Networking** Self organized networking is a feature of ESP-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in [Building a Network](#))
- Selection of a preferred parent node (see **Parent Node Selection** in [Building a Network](#))
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in [Managing a Network](#))

When self organized networking is enabled, the ESP-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-MESH.**

**Toggle Self Organized Networking** Self organized networking can be enabled or disabled by the application at runtime by calling the [esp\\_mesh\\_set\\_self\\_organized\(\)](#) function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking** The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking** ESP-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> <li>• Nodes already connected to a parent node will remain connected.</li> <li>• Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• A root node already connected to router will stay connected.</li> <li>• A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.</li> </ul>
Y	N	<ul style="list-style-type: none"> <li>• Nodes without a parent node will automatically select a preferred parent and connect.</li> <li>• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.</li> </ul>

The following code snippet demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
```

(continues on next page)

(continued from previous page)

```

...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();

```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-MESH.

```

//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router

```

**Application Examples** ESP-IDF contains these ESP-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

## API Reference

### Header File

- [esp\\_wifi/include/esp\\_mesh.h](#)

## Functions

*esp\_err\_t* **esp\_mesh\_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

### Return

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI\_PS\_NONE.

### Return

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

### Return

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT

- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

#### Parameters

- [in] `to`: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- [in] `data`: pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- [in] `flag`: bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ( “to” parameter isn’ t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-blocking, MESH\_DATA\_NONBLOCK should be set. Otherwise, may use `esp_mesh_send_block_time()` to specify a blocking time.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by `esp_mesh_rcv_toDS()`. Generally, we suggest `esp_mesh_rcv_toDS()` is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading `esp_mesh_rcv_toDS()` which avoids unnecessary memory copy.
- [in] `opt`: options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- [in] `opt_count`: option count
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

*esp\_err\_t* **esp\_mesh\_send\_block\_time** (uint32\_t *time\_ms*)  
Set blocking time of `esp_mesh_send()`

**Attention** This API shall be called before mesh is started.

#### Return

- ESP\_OK

#### Parameters

- [in] `time_ms`: blocking time of `esp_mesh_send()`, unit:ms

*esp\_err\_t* **esp\_mesh\_rcv** (*mesh\_addr\_t* \**from*, *mesh\_data\_t* \**data*, int *timeout\_ms*, int \**flag*, *mesh\_opt\_t* *opt*[], int *opt\_count*)

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

**Parameters**

- [out] `from`: the address of the original source of the packet
- [out] `data`: pointer to the received mesh packet
  - Field `proto` is the data protocol in use. Should follow it to parse the received data.
  - Field `tos` is the transmission tos (type of service) in use.
- [in] `timeout_ms`: wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] `flag`: bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network

**Parameters**

- [out] `opt`: options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- [in] `opt_count`: option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

**Parameters**

- [out] `from`: the address of the original source of the packet
- [out] `to`: the address contains remote IP address and port (IPv4:PORT)
- [out] `data`: pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- [in] `timeout_ms`: wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- [out] `flag`: bitmap for data received

- MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

**Parameters**

- [out] opt: options desired to receive
- [in] opt\_count: option count desired to receive

*esp\_err\_t* **esp\_mesh\_set\_config**(const *mesh\_cfg\_t* \*config)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max\_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] config: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_get\_config**(*mesh\_cfg\_t* \*config)

Get mesh stack configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] config: pointer to mesh stack configuration

*esp\_err\_t* **esp\_mesh\_set\_router**(const *mesh\_router\_t* \*router)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] router: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_get\_router**(*mesh\_router\_t* \*router)

Get router configuration.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] router: pointer to router configuration

*esp\_err\_t* **esp\_mesh\_set\_id** (const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

**Parameters**

- [in] id: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_get\_id** (*mesh\_addr\_t* \*id)

Get mesh network ID.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] id: pointer to mesh network ID

*esp\_err\_t* **esp\_mesh\_set\_type** (*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] type: device type

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int max\_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] max\_layer: max layer value

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

**Return** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK

- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] pwd: pointer to the password
- [in] len: password length

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] authmode: authentication mode

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Return** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] connections: the number of max connections

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh max connection configuration.

**Return** the number of mesh max connections

int **esp\_mesh\_get\_non\_mesh\_connections** (void)

Get non-mesh max connection configuration.

**Return** the number of non-mesh max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] bssid: pointer to parent BSSID

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool *enable*, bool *select\_parent*)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *enable*: enable or disable self-organized networking
- [in] *select\_parent*: Only valid when self-organized networking is enabled.
  - if *select\_parent* is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool **esp\_mesh\_get\_self\_organized** (void)

Return whether enable self-organized networking or not.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_waive\_root** (const *mesh\_vote\_t* \**vote*, int *reason*)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

**Parameters**

- [in] *vote*: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field *is\_rc\_specified* shall be false.
  - Field *attempts* shall be at least 15 times.
- [in] *reason*: only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float *percentage*)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *percentage*: vote percentage threshold

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

**Return** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int *seconds*)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *seconds*: the expired time

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Return** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Return** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Return** the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \**mac*, int *len*, int \**size*)

Get routing table of this device's sub-network (including itself)

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [out] *mac*: pointer to routing table
- [in] *len*: routing table size(in bytes)
- [out] *size*: pointer to the number of devices in routing table (including itself)

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool *reachable*)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *reachable*: this state represents whether the root is able to access external IP network

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \**pending*)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] *pending*: pointer to the TX pending

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \**pending*)

Return the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [out] pending: pointer to the RX pending

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**Return** the number of upQ for a certain address

**Parameters**

- [in] addr: self address or an associate children address
- [out] xseqno\_in: sequence number of the last received packet from the specified address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of queue.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] qsize: default:32 (min:16)

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Return** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

**Return**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

**Parameters**

- [in] allowed: allow or not

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to new group ID addresses
- [in] num: the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] addr: pointer to deleted group ID address
- [in] num: the number of group ID addresses

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

**Return** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \**addr*, int *num*)

Get group ID addresses.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] *addr*: pointer to group ID addresses
- [in] *num*: the number of group ID addresses

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \**addr*)

Check whether the specified group address is my group.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int *num*)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] *num*: mesh network capacity

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

**Return** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const *mesh\_crypto\_funcs\_t* \**crypto\_funcs*)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK

**Parameters**

- [in] *crypto\_funcs*: crypto functions for mesh IE
  - If *crypto\_funcs* is set to NULL, mesh IE is no longer encrypted.

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \**key*, int *len*)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [in] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \**key*, int *len*)

Get mesh IE crypto key.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

**Parameters**

- [out] *key*: ASCII crypto key
- [in] *len*: length in bytes, range:8~64

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int *delay\_ms*)

Set delay time before starting root healing.

**Return**

- ESP\_OK

**Parameters**

- [in] `delay_ms`: delay time in milliseconds

int `esp_mesh_get_root_healing_delay` (void)

Get delay time before network starts root healing.

**Return** delay time in milliseconds

*esp\_err\_t* `esp_mesh_fix_root` (bool *enable*)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Return**

- ESP\_OK

**Parameters**

- [in] `enable`: enable or not

bool `esp_mesh_is_root_fixed` (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root`().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Return** true/false

*esp\_err\_t* `esp_mesh_set_parent` (const *wifi\_config\_t* \**parent*, const *mesh\_addr\_t* \**parent\_mesh\_id*, *mesh\_type\_t* *my\_type*, int *my\_layer*)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Return**

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

**Parameters**

- [in] `parent`: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] `parent_mesh_id`: parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- [in] `my_type`: mesh type
  - MESH\_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then `my_type` shall set MESH\_ROOT and `my_layer` shall set MESH\_ROOT\_LAYER.
- [in] `my_layer`: mesh layer
  - `my_layer` of the device may change after joining the network.
  - If `my_type` is set MESH\_NODE, `my_layer` shall be greater than MESH\_ROOT\_LAYER.
  - If `my_type` is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

*esp\_err\_t* `esp_mesh_scan_get_ap_ie_len` (int \**len*)

Get mesh networking IE length of one AP.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] len: mesh networking IE length

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t* \*ap\_record, void \*buffer)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time.

See “manual\_networking” example.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

**Parameters**

- [out] ap\_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (const *mesh\_addr\_t* \*child\_mac, int \*nodes\_num)

Get the number of nodes in the subnet of a specific child.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] child\_mac: an associated child address of this device
- [out] nodes\_num: pointer to the number of nodes in the subnet of a specific child

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_list** (const *mesh\_addr\_t* \*child\_mac, *mesh\_addr\_t* \*nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

**Return**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

**Parameters**

- [in] child\_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes\_num: the number of nodes in the subnet of a specific child

*esp\_err\_t* **esp\_mesh\_disconnect** (void)

Disconnect from current parent.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_connect** (void)

Connect to current parent.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**Return**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*new\_bssid, int csa\_newchan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**

- ESP\_OK

**Parameters**

- [in] `new_bssid`: the new router BSSID if the router changes
- [in] `csa_newchan`: the new channel number to which the whole network is moving
- [in] `csa_count`: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

*esp\_err\_t* **esp\_mesh\_get\_router\_bssid** (uint8\_t \**router\_bssid*)

Get the router BSSID.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG

**Parameters**

- [out] `router_bssid`: pointer to the router BSSID

int64\_t **esp\_mesh\_get\_tsf\_time** (void)

Get the TSF time.

**Return** the TSF time

*esp\_err\_t* **esp\_mesh\_set\_topology** (*esp\_mesh\_topology\_t* *topo*)

Set mesh topology. The default value is MESH\_TOPO\_TREE.

- MESH\_TOPO\_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

**Parameters**

- [in] `topo`: MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_mesh\_topology\_t* **esp\_mesh\_get\_topology** (void)

Get mesh topology.

**Return** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_err\_t* **esp\_mesh\_enable\_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_disable\_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

bool **esp\_mesh\_is\_ps\_enabled** (void)

Check whether the mesh Power Save function is enabled.

**Return** true/false

bool **esp\_mesh\_is\_device\_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Return** true/false

*esp\_err\_t* **esp\_mesh\_set\_active\_duty\_cycle** (int *dev\_duty*, int *dev\_duty\_type*)

Set the device duty cycle and type.

- The range of *dev\_duty* values is 1 to 100. The default value is 10.
- *dev\_duty* = 100, the PS will be stopped.
- *dev\_duty* is better to not less than 5.
- *dev\_duty\_type* could be MESH\_PS\_DEVICE\_DUTY\_REQUEST or MESH\_PS\_DEVICE\_DUTY\_DEMAND.
- If *dev\_duty\_type* is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the device will use a *nwk\_duty* provided by the network.
- If *dev\_duty\_type* is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the device will use the specified *dev\_duty*.

**Attention** This API can be called at any time after mesh is started.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *dev\_duty*: device duty cycle
- [in] *dev\_duty\_type*: device PS duty cycle type, not accept MESH\_PS\_NETWORK\_DUTY\_MASTER

*esp\_err\_t* **esp\_mesh\_get\_active\_duty\_cycle** (int \**dev\_duty*, int \**dev\_duty\_type*)

Get device duty cycle and type.

**Return**

- ESP\_OK

**Parameters**

- [out] *dev\_duty*: device duty cycle
- [out] *dev\_duty\_type*: device PS duty cycle type

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int *nwk\_duty*, int *duration\_mins*, int *applied\_rule*)

Set the network duty cycle, duration and rule.

- The range of *nwk\_duty* values is 1 to 100. The default value is 10.
- *nwk\_duty* is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the *nwk\_duty* is known as a NWK-DUTY-MASTER.
- *duration\_mins* specifies how long the specified *nwk\_duty* will be used. Once *duration\_mins* expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- *duration\_mins* = (-1) represents *nwk\_duty* will be used until a new NWK-DUTY-MASTER with a different *nwk\_duty* appears.
- Only the root can set *duration\_mins* to (-1).
- If *applied\_rule* is set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE, the *nwk\_duty* will be used by the entire network.
- If *applied\_rule* is set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK, the *nwk\_duty* will only be used by the up-link path nodes.
- The root does not accept MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK.
- A *nwk\_duty* with *duration\_mins*(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)*nwk\_duty* shall be set to the same value for all devices; (2)*duration\_mins* shall be set to (-1); (3)*applied\_rule* shall be set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE; after the voted root appears,

the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.

- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

#### Return

- ESP\_OK
- ESP\_FAIL

#### Parameters

- [in] `nwk_duty`: network duty cycle
- [in] `duration_mins`: duration (unit: minutes)
- [in] `applied_rule`: only support MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE

*esp\_err\_t* **esp\_mesh\_get\_network\_duty\_cycle** (int \*`nwk_duty`, int \*`duration_mins`, int \*`dev_duty_type`, int \*`applied_rule`)

Get the network duty cycle, duration, type and rule.

#### Return

- ESP\_OK

#### Parameters

- [out] `nwk_duty`: current network duty cycle
- [out] `duration_mins`: the duration of current `nwk_duty`
- [out] `dev_duty_type`: if it includes MESH\_PS\_DEVICE\_DUTY\_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] `applied_rule`: MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE

int **esp\_mesh\_get\_running\_active\_duty\_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Return** the running active duty cycle

*esp\_err\_t* **esp\_mesh\_ps\_duty\_signaling** (int  `fwd_times`)

Duty signaling.

#### Return

- ESP\_OK

#### Parameters

- [in]  `fwd_times`: the times of forwarding duty signaling packets

## Unions

**union mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

## Public Members

uint8\_t **addr**[6]

mac address

*mip\_t* **mip**  
mip address  
**union mesh\_event\_info\_t**  
*#include <esp\_mesh.h>* Mesh event information.

### Public Members

*mesh\_event\_channel\_switch\_t* **channel\_switch**  
channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**  
child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**  
child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**  
routing table change

*mesh\_event\_connected\_t* **connected**  
parent connected

*mesh\_event\_disconnected\_t* **disconnected**  
parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**  
no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**  
layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**  
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**  
vote started

*mesh\_event\_root\_address\_t* **root\_addr**  
root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**  
root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**  
other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**  
fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**  
scan done

*mesh\_event\_network\_state\_t* **network\_state**  
network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**  
network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**  
new router information

*mesh\_event\_ps\_duty\_t* **ps\_duty**  
PS duty information

**union mesh\_rc\_config\_t**

*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

**struct mip\_t**

IP address and port.

### Public Members

ip4\_addr\_t **ip4**

IP address

uint16\_t **port**

port

**struct mesh\_event\_channel\_switch\_t**

Channel switch information.

### Public Members

uint8\_t **channel**

new channel

**struct mesh\_event\_connected\_t**

Parent connected information.

### Public Members

*wifi\_event\_sta\_connected\_t* **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16\_t **self\_layer**

layer

uint8\_t **duty**

parent duty

**struct mesh\_event\_no\_parent\_found\_t**

No parent found information.

### Public Members

int **scan\_times**

scan times being through

**struct mesh\_event\_layer\_change\_t**

Layer change information.

**Public Members**

`uint16_t new_layer`  
new layer

**struct mesh\_event\_vote\_started\_t**  
vote started information

**Public Members**

int **reason**  
vote reason, vote could be initiated by children or by the root itself

int **attempts**  
max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**  
root address specified by users via API `esp_mesh_waive_root()`

**struct mesh\_event\_find\_network\_t**  
find a mesh network that this device can join

**Public Members**

`uint8_t channel`  
channel number of the new found network

`uint8_t router_bssid[6]`  
router BSSID

**struct mesh\_event\_root\_switch\_req\_t**  
Root switch request information.

**Public Members**

int **reason**  
root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**  
the address of root switch requester

**struct mesh\_event\_root\_conflict\_t**  
Other powerful root address.

**Public Members**

`int8_t rssi`  
rssi with router

`uint16_t capacity`  
the number of devices in current network

`uint8_t addr[6]`  
other powerful root address

**struct mesh\_event\_routing\_table\_change\_t**  
Routing table change.

**Public Members**

`uint16_t rt_size_new`  
the new value

`uint16_t rt_size_change`  
the changed value

**struct mesh\_event\_root\_fixed\_t**  
Root fixed.

**Public Members**

`bool is_fixed`  
status

**struct mesh\_event\_scan\_done\_t**  
Scan done event information.

**Public Members**

`uint8_t number`  
the number of APs scanned

**struct mesh\_event\_network\_state\_t**  
Network state information.

**Public Members**

`bool is_rootless`  
whether current mesh network has a root

**struct mesh\_event\_ps\_duty\_t**  
PS duty information.

**Public Members**

`uint8_t duty`  
parent or child duty

`mesh\_event\_child\_connected\_t child_connected`  
child info

**struct mesh\_opt\_t**  
Mesh option.

**Public Members**

`uint8_t type`  
option type

`uint16_t len`  
option length

`uint8_t *val`  
option value

**struct mesh\_data\_t**  
Mesh data for `esp_mesh_send()` and `esp_mesh_rcv()`

**Public Members**

`uint8_t *data`  
data

`uint16_t size`  
data size

`mesh_proto_t proto`  
data protocol

`mesh_tos_t tos`  
data type of service

**struct mesh\_router\_t**  
Router configuration.

**Public Members**

`uint8_t ssid[32]`  
SSID

`uint8_t ssid_len`  
length of SSID

`uint8_t bssid[6]`  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

`uint8_t password[64]`  
password

**bool allow\_router\_switch**  
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

**Public Members**

`uint8_t password[64]`  
mesh softAP password

`uint8_t max_connection`  
max number of stations allowed to connect in, default 6, max 10 = max\_connection + non-mesh\_max\_connectionmax mesh connections

`uint8_t nonmesh_max_connection`  
max non-mesh connections

**struct mesh\_cfg\_t**  
Mesh initialization configuration.

**Public Members**

`uint8_t channel`  
channel, the mesh network on

bool **allow\_channel\_switch**  
if this value is set, when “fail” (`mesh_attempts_t`) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**  
mesh network identification

*mesh\_router\_t* **router**  
router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**  
mesh softAP configuration

**const** `mesh_crypto_funcs_t` \***crypto\_funcs**  
crypto functions

**struct mesh\_vote\_t**  
Vote.

### Public Members

float **percentage**  
vote percentage threshold for approval of being a root

bool **is\_rc\_specified**  
if true, `rc_addr` shall be specified (Unimplemented). if false, `attempts` value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**  
vote address configuration

**struct mesh\_tx\_pending\_t**  
The number of packets pending in the queue waiting to be sent by the mesh stack.

### Public Members

int **to\_parent**  
to parent queue

int **to\_parent\_p2p**  
to parent (P2P) queue

int **to\_child**  
to child queue

int **to\_child\_p2p**  
to child (P2P) queue

int **mgmt**  
management queue

int **broadcast**  
broadcast and multicast queue

**struct mesh\_rx\_pending\_t**  
The number of packets available in the queue waiting to be received by applications.

### Public Members

int **toDS**  
to external DS

`int toSelf`  
to self

### Macros

**MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**

mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**

mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_PS**

mesh PS is not specified as enable or disable

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_recv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_recv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_recv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_recv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_PS\_DEVICE\_DUTY\_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH\_PS\_DEVICE\_DUTY\_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH\_PS\_NETWORK\_DUTY\_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK****MESH\_INIT\_CONFIG\_DEFAULT ()****Type Definitions**

```
typedef mesh_addr_t mesh_event_root_address_t
```

Root address.

```
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
```

Parent disconnected information.

```
typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
```

Child connected information.

```
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
```

Child disconnected information.

```
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
```

New router information.

**Enumerations**

```
enum mesh_event_id_t
```

Enumerated list of mesh event id.

*Values:*

```
MESH_EVENT_STARTED
```

mesh is started

```
MESH_EVENT_STOPPED
```

mesh is stopped

```
MESH_EVENT_CHANNEL_SWITCH
```

channel switch

```
MESH_EVENT_CHILD_CONNECTED
```

a child is connected on softAP interface

```
MESH_EVENT_CHILD_DISCONNECTED
```

a child is disconnected on softAP interface

```
MESH_EVENT_ROUTING_TABLE_ADD
```

routing table is changed by adding newly joined children

```
MESH_EVENT_ROUTING_TABLE_REMOVE
```

routing table is changed by removing leave children

```
MESH_EVENT_PARENT_CONNECTED
```

parent is connected on station interface

```
MESH_EVENT_PARENT_DISCONNECTED
```

parent is disconnected on station interface

**MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

**MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

**MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network

**MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

**MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

**MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

**MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

**MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

**MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

**MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

**MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH\_EVENT\_PS\_PARENT\_DUTY**

parent duty

**MESH\_EVENT\_PS\_CHILD\_DUTY**

child duty

**MESH\_EVENT\_PS\_DEVICE\_DUTY**

device duty

**MESH\_EVENT\_MAX**

**enum mesh\_type\_t**

Device type.

*Values:*

**MESH\_IDLE**

hasn't joined the mesh network yet

**MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**MESH\_LEAF**

has no forwarding ability

**MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

**enum mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

**MESH\_PROTO\_BIN**

binary

**MESH\_PROTO\_HTTP**

HTTP protocol

**MESH\_PROTO\_JSON**

JSON format

**MESH\_PROTO\_MQTT**

MQTT protocol

**MESH\_PROTO\_AP**

IP network mesh communication of node's AP interface

**MESH\_PROTO\_STA**

IP network mesh communication of node's STA interface

**enum mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

**MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

**MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

**MESH\_TOS\_DEF**

no retransmission on mesh stack

**enum mesh\_vote\_reason\_t**

Vote reason.

*Values:*

**MESH\_VOTE\_REASON\_ROOT\_INITIATED = 1**

vote is initiated by the root

**MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

**enum mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

**MESH\_REASON\_CYCLIC = 100**

cyclic is detected

**MESH\_REASON\_PARENT\_IDLE**

parent is idle

**MESH\_REASON\_LEAF**

the connected device is changed to a leaf

**MESH\_REASON\_DIFF\_ID**

in different mesh ID

**MESH\_REASON\_ROOTS**

root conflict is detected

**MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

**MESH\_REASON\_SCAN\_FAIL**

scan fail

**MESH\_REASON\_IE\_UNKNOWN**

unknown IE

**MESH\_REASON\_WAIVE\_ROOT**

waive root

**MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

**MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

**MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

**enum esp\_mesh\_topology\_t**

Mesh topology.

*Values:***MESH\_TOPO\_TREE**

tree topology

**MESH\_TOPO\_CHAIN**

chain topology

**enum mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:***MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

**MESH\_TODS\_REACHABLE**

the root is able to access external IP network

### Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned

- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-C3 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

## API Reference

### Header File

- [wpa\\_supplicant/include/esp\\_supplicant/esp\\_dpp.h](#)

### Functions

*esp\_err\_t* **esp\_supp\_dpp\_init** (*esp\_supp\_dpp\_event\_cb\_t* evt\_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

#### Parameters

- evt\_cb: Callback function to receive DPP related events

void **esp\_supp\_dpp\_deinit** (void)

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

*esp\_err\_t* **esp\_supp\_dpp\_bootstrap\_gen** (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

#### Return

- ESP\_OK: Success
- ESP\_FAIL: Failure

#### Parameters

- chan\_list: List of channels device will be available on for listening
- type: Bootstrap method type, only QR Code method is supported for now.
- key: (Optional) Private Key used to generate a Bootstrapping Public Key
- info: (Optional) Ancilliary Device Information like Serial Number

*esp\_err\_t* **esp\_supp\_dpp\_start\_listen** (void)

Start listening on Channels provided during esp\_supp\_dpp\_bootstrap\_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

#### Return

- ESP\_OK: Success

- `ESP_FAIL`: Generic Failure
- `ESP_ERR_INVALID_STATE`: ROC attempted before WiFi is started
- `ESP_ERR_NO_MEM`: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)  
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

### Macros

`ESP_ERR_DPP_FAILURE`  
Generic failure during DPP Operation

`ESP_ERR_DPP_TX_FAILURE`  
DPP Frame Tx failed OR not Acked

`ESP_ERR_DPP_INVALID_ATTR`  
Encountered invalid DPP Attribute

### Type Definitions

`typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t`  
Types of Bootstrap Methods for DPP.

`typedef void (*esp_supp_dpp_event_cb_t) (esp_supp_dpp_event_t evt, void *data)`  
Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

#### Parameters

- `evt`: DPP event ID
- `data`: Event data payload

### Enumerations

`enum dpp_bootstrap_type`  
Types of Bootstrap Methods for DPP.

*Values:*

`DPP_BOOTSTRAP_QR_CODE`  
QR Code Method

`DPP_BOOTSTRAP_PKEX`  
Proof of Knowledge Method

`DPP_BOOTSTRAP_NFC_URI`  
NFC URI record Method

`enum esp_supp_dpp_event_t`  
Types of Callback Events received from DPP Supplicant.

*Values:*

`ESP_SUPP_DPP_URI_READY`  
URI is ready through Bootstrapping

`ESP_SUPP_DPP_CFG_RECVD`  
Config received via DPP Authentication

`ESP_SUPP_DPP_FAIL`  
DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.

Code examples for ESP-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

## 2.2.2 Ethernet

### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc control of Ethernet driver*

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

Fig. 4: Ethernet Data Frame Format

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence

10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length** The type/length field is a 2-byte field, if the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They're not supported in ESP-IDF.

---

**Configure MAC and PHY** Ethernet driver is composed of two parts: MAC and PHY. The communication between MAC and PHY can have diverse choices: **MII** (Media Independent Interface), **RMI** (Reduced Media Independent Interface) and etc.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `rx_task_stack_size` and `rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `smi_mdc_gpio_num` and `smi_mdio_gpio_num`: the GPIO number used to connect the SMI signals.
- `flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC_
↳configuration
mac_config.smi_mdc_gpio_num = 23; // alter the GPIO used for MDC signal
mac_config.smi_mdio_gpio_num = 18; // alter the GPIO used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY_
↳configuration
phy_config.phy_addr = 1; // alter the PHY address according to your board_
↳design
phy_config.reset_gpio_num = 5; // alter the GPIO used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
// ESP-IDF officially supports several different Ethernet PHY
// esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);
```

Fig. 5: Ethernet RMI Interface

**Note:** Care should be taken, when creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don't have other choices but the integrated PHY. Besides that, we have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to *SPI Master*.

**Install Driver** Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to *ESP Event*.

```

/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4],
↪mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that running in
↪background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↪// register Ethernet event handler (to deal with user specific stuffs when event
↪like link up/down happened)

```

To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `on_lowlevel_init_done` and `on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver
↳configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the
↳handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can't obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to [LwIP](#).

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Register IP event handlers
3. Attach the network interface to Ethernet driver

More information about network interface, please refer to [Network Interface](#).

```
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver
esp_eth_set_default_handlers(eth_netif); // set default handlers to process TCP/IP
↳stuffs
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** User's Ethernet/IP event handlers need to be registered after registration of default handlers (i.e. after `esp_eth_set_default_handlers()`). General recommendation is to fully initialize Ethernet driver and network interface prior registering user's Ethernet/IP event handlers, i.e. register the user event handlers as the

last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user' s handlers.

**Misc control of Ethernet driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
→addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by invoking `esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, true)`. One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

### Application Example

- Ethernet basic example: [ethernet/basic](#).
- Ethernet iperf example: [ethernet/iperf](#).
- Ethernet to Wi-Fi AP “router” : [ethernet/eth2ap](#).
- Most of protocol examples should also work for Ethernet: [protocols](#).

### API Reference

#### Header File

- [esp\\_eth/include/esp\\_eth.h](#)

**Functions**

*esp\_err\_t* **esp\_eth\_driver\_install** (const *esp\_eth\_config\_t* \*config, *esp\_eth\_handle\_t* \*out\_hdl)

Install Ethernet driver.

**Return**

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

**Parameters**

- [in] config: configuration of the Ethernet driver
- [out] out\_hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* hdl)

Uninstall Ethernet driver.

**Note** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- ESP\_OK: start esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: start esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: start esp\_eth driver failed because driver has started already
- ESP\_FAIL: start esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

**Note** This function does the opposite operation of esp\_eth\_start.

**Return**

- ESP\_OK: stop esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: stop esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: stop esp\_eth driver failed because driver has not started yet
- ESP\_FAIL: stop esp\_eth driver failed because some other error occurred

**Parameters**

- [in] hdl: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)) *esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv, void \*priv) Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**

- ESP\_OK: update input path successfully
- ESP\_ERR\_INVALID\_ARG: update input path failed because of some invalid argument
- ESP\_FAIL: update input path failed because some other error occurred

**Parameters**

- [in] `hdl`: handle of Ethernet driver
- [in] `stack_input`: function pointer, which does the actual process on incoming packets
- [in] `priv`: private resource, which gets passed to `stack_input` callback without any modification

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* *hdl*, void \**buf*, size\_t *length*)

General Transmit.

**Return**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**

- [in] `hdl`: handle of Ethernet driver
- [in] `buf`: buffer of the packet to transfer
- [in] `length`: length of the buffer to transfer

*esp\_err\_t* **esp\_eth\_receive** (*esp\_eth\_handle\_t* *hdl*, uint8\_t \**buf*, uint32\_t \**length*)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Note** This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn't support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

**Return**

- ESP\_OK: receive frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: receive frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive frame buffer failed because some other error occurred

**Parameters**

- [in] `hdl`: handle of Ethernet driver
- [out] `buf`: buffer to preserve the received packet
- [out] `length`: length of the received packet

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* *hdl*, *esp\_eth\_io\_cmd\_t* *cmd*, void \**data*)

Misc IO function of Ethernet driver.

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred

**Parameters**

- [in] `hdl`: handle of Ethernet driver
- [in] `cmd`: IO control command
- [in] `data`: specified data for command

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* *hdl*)

Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by `os_timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] `hdl`: handle of Ethernet driver

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Return**

- ESP\_OK: increase reference successfully
- ESP\_ERR\_INVALID\_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

### Structures

**struct esp\_eth\_config\_t**

Configuration of Ethernet driver.

### Public Members

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (**\*stack\_input**) (*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

**Parameters**

- [in] eth\_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

*esp\_err\_t* (**\*on\_lowlevel\_init\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

*esp\_err\_t* (**\*on\_lowlevel\_deinit\_done**) (*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**

- [in] eth\_handle: handle of Ethernet driver

### Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

## Type Definitions

**typedef** void \***esp\_eth\_handle\_t**  
Handle of Ethernet driver.

## Header File

- [esp\\_eth/include/esp\\_eth\\_com.h](#)

## Functions

*esp\_err\_t* **esp\_eth\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)  
Detect PHY address.

### Return

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [out] detected\_addr: a valid address after detection

## Structures

**struct esp\_eth\_mediator\_s**  
Ethernet mediator.

## Public Members

*esp\_err\_t* (**\*phy\_reg\_read**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

### Return

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (**\*phy\_reg\_write**) (*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

### Return

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

### Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy\_addr: PHY Chip address (0~31)
- [in] phy\_reg: PHY register index code
- [in] reg\_value: PHY register value

*esp\_err\_t* (**\*stack\_input**) (*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

### Return

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

*esp\_err\_t* (\***on\_state\_changed**) (*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)  
Callback on Ethernet state changed.

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

**Macros****ETH\_MAX\_PAYLOAD\_LEN**

Maximum Ethernet payload size.

**ETH\_MIN\_PAYLOAD\_LEN**

Minimum Ethernet payload size.

**ETH\_HEADER\_LEN**

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

**ETH\_CRC\_LEN**

Ethernet frame CRC length.

**ETH\_VLAN\_TAG\_LEN**

Optional 802.1q VLAN Tag length.

**ETH\_JUMBO\_FRAME\_PAYLOAD\_LEN**

Jumbo frame payload size.

**ETH\_MAX\_PACKET\_SIZE**

Maximum frame size (1522 Bytes)

**ETH\_MIN\_PACKET\_SIZE**

Minimum frame size (64 Bytes)

**Type Definitions**

```
typedef struct esp_eth_mediator_s esp_eth_mediator_t  
Ethernet mediator.
```

**Enumerations**

```
enum esp_eth_state_t
```

Ethernet driver state.

*Values:*

```
ETH_STATE_LLINIT
```

Lowlevel init done

```
ETH_STATE_DEINIT
```

Deinit done

```
ETH_STATE_LINK
```

Link status changed

```
ETH_STATE_SPEED
```

Speed updated

**ETH\_STATE\_DUPLEX**  
Duplex updated

**ETH\_STATE\_PAUSE**  
Pause ability updated

**enum esp\_eth\_io\_cmd\_t**  
Command list for ioctl API.

*Values:*

**ETH\_CMD\_G\_MAC\_ADDR**  
Get MAC address

**ETH\_CMD\_S\_MAC\_ADDR**  
Set MAC address

**ETH\_CMD\_G\_PHY\_ADDR**  
Get PHY address

**ETH\_CMD\_S\_PHY\_ADDR**  
Set PHY address

**ETH\_CMD\_G\_SPEED**  
Get Speed

**ETH\_CMD\_S\_PROMISCUOUS**  
Set promiscuous mode

**ETH\_CMD\_S\_FLOW\_CTRL**  
Set flow control

**ETH\_CMD\_G\_DUPLEX\_MODE**  
Get Duplex mode

**enum eth\_link\_t**  
Ethernet link status.

*Values:*

**ETH\_LINK\_UP**  
Ethernet link is up

**ETH\_LINK\_DOWN**  
Ethernet link is down

**enum eth\_speed\_t**  
Ethernet speed.

*Values:*

**ETH\_SPEED\_10M**  
Ethernet speed is 10Mbps

**ETH\_SPEED\_100M**  
Ethernet speed is 100Mbps

**enum eth\_duplex\_t**  
Ethernet duplex mode.

*Values:*

**ETH\_DUPLEX\_HALF**  
Ethernet is in half duplex

**ETH\_DUPLEX\_FULL**  
Ethernet is in full duplex

**enum eth\_event\_t**  
Ethernet event declarations.

Values:

<b>ETHERNET_EVENT_START</b>	Ethernet driver start
<b>ETHERNET_EVENT_STOP</b>	Ethernet driver stop
<b>ETHERNET_EVENT_CONNECTED</b>	Ethernet got a valid link
<b>ETHERNET_EVENT_DISCONNECTED</b>	Ethernet lost a valid link

## Header File

- [esp\\_eth/include/esp\\_eth\\_mac.h](#)

## Structures

**struct esp\_eth\_mac\_s**  
Ethernet MAC.

## Public Members

*esp\_err\_t* (**\*set\_mediator**) (*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)  
Set mediator for Ethernet MAC.

### Return

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

### Parameters

- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

*esp\_err\_t* (**\*init**) (*esp\_eth\_mac\_t* \*mac)  
Initialize Ethernet MAC.

### Return

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

### Parameters

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (**\*deinit**) (*esp\_eth\_mac\_t* \*mac)  
Deinitialize Ethernet MAC.

### Return

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

### Parameters

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (**\*start**) (*esp\_eth\_mac\_t* \*mac)  
Start Ethernet MAC.

### Return

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

### Parameters

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***stop**) (*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

*esp\_err\_t* (\***transmit**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_ARG: transmit packet failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: transmit packet failed because of wrong state of MAC
- ESP\_FAIL: transmit packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] buf: packet buffer to transmit
- [in] length: length of packet

*esp\_err\_t* (\***receive**) (*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

**Note** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer.

After the function returned, the value of “length” means the real length of received data.

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

*esp\_err\_t* (\***read\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] phy\_addr: PHY chip address (0~31)
- [in] phy\_reg: PHY register index code
- [out] reg\_value: PHY register value

*esp\_err\_t* (\***write\_phy\_reg**) (*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout

- `ESP_FAIL`: write PHY register failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `phy_addr`: PHY chip address (0~31)
- [in] `phy_reg`: PHY register index code
- [in] `reg_value`: PHY register value

`esp_err_t (*set_addr) (esp_eth_mac_t *mac, uint8_t *addr)`

Set MAC address.

**Return**

- `ESP_OK`: set MAC address successfully
- `ESP_ERR_INVALID_ARG`: set MAC address failed because of invalid argument
- `ESP_FAIL`: set MAC address failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `addr`: MAC address

`esp_err_t (*get_addr) (esp_eth_mac_t *mac, uint8_t *addr)`

Get MAC address.

**Return**

- `ESP_OK`: get MAC address successfully
- `ESP_ERR_INVALID_ARG`: get MAC address failed because of invalid argument
- `ESP_FAIL`: get MAC address failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [out] `addr`: MAC address

`esp_err_t (*set_speed) (esp_eth_mac_t *mac, eth_speed_t speed)`

Set speed of MAC.

**Return**

- `ESP_OK`: set MAC speed successfully
- `ESP_ERR_INVALID_ARG`: set MAC speed failed because of invalid argument
- `ESP_FAIL`: set MAC speed failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `speed`: MAC speed

`esp_err_t (*set_duplex) (esp_eth_mac_t *mac, eth_duplex_t duplex)`

Set duplex mode of MAC.

**Return**

- `ESP_OK`: set MAC duplex mode successfully
- `ESP_ERR_INVALID_ARG`: set MAC duplex failed because of invalid argument
- `ESP_FAIL`: set MAC duplex failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `duplex`: MAC duplex

`esp_err_t (*set_link) (esp_eth_mac_t *mac, eth_link_t link)`

Set link status of MAC.

**Return**

- `ESP_OK`: set link status successfully
- `ESP_ERR_INVALID_ARG`: set link status failed because of invalid argument
- `ESP_FAIL`: set link status failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `link`: Link status

`esp_err_t (*set_promiscuous) (esp_eth_mac_t *mac, bool enable)`

Set promiscuous of MAC.

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `enable`: set true to enable promiscuous mode; set false to disable promiscuous mode

`esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)`

Enable flow control on MAC layer or not.

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `enable`: set true to enable flow control; set false to disable flow control

`esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)`

Set the PAUSE ability of peer node.

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `ability`: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

`esp_err_t (*del)(esp_eth_mac_t *mac)`

Free memory of Ethernet MAC.

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance

**struct eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

**Public Members**

`uint32_t sw_reset_timeout_ms`

Software reset timeout value (Unit: ms)

`uint32_t rx_task_stack_size`

Stack size of the receive task

`uint32_t rx_task_prio`

Priority of the receive task

`int smi_mdc_gpio_num`

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

`int smi_mdio_gpio_num`

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

`uint32_t flags`

Flags that specify extra capability for mac driver

**Macros**

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG ()**

Default configuration for Ethernet MAC object.

**Type Definitions**

```
typedef struct esp_eth_mac_s esp_eth_mac_t
```

Ethernet MAC.

**Header File**

- [esp\\_eth/include/esp\\_eth\\_phy.h](#)

**Functions**

```
esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)
```

Create a PHY instance of IP101.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_rt18201 (const eth_phy_config_t *config)
```

Create a PHY instance of RTL8201.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_lan8720 (const eth_phy_config_t *config)
```

Create a PHY instance of LAN8720.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_dp83848 (const eth_phy_config_t *config)
```

Create a PHY instance of DP83848.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

```
esp_eth_phy_t *esp_eth_phy_new_ksz8041 (const eth_phy_config_t *config)
```

Create a PHY instance of KSZ8041.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**

- [in] config: configuration of PHY

## Structures

### struct esp\_eth\_phy\_s

Ethernet PHY.

## Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

### Return

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

### Parameters

- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

*esp\_err\_t* (\***reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

### Return

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

### Parameters

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

**Note** Hardware reset is mostly done by pull down and up PHY's nRST pin

### Return

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

### Parameters

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

### Return

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

### Parameters

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

### Return

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

### Parameters

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***negotiate**)(*esp\_eth\_phy\_t* \*phy)

Start auto negotiation.

### Return

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred

### Parameters

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

*esp\_err\_t* (\***pwrc1**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; ser false to power off Ethernet PHY

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

**Parameters**

- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

**Parameters**

- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

*esp\_err\_t* (\***del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

**struct eth\_phy\_config\_t**

Ethernet PHY configuration.

## Public Members

`int32_t phy_addr`  
PHY address, set -1 to enable PHY address detection at initialization stage

`uint32_t reset_timeout_ms`  
Reset timeout value (Unit: ms)

`uint32_t autonego_timeout_ms`  
Auto-negotiation timeout value (Unit: ms)

`int reset_gpio_num`  
Reset GPIO number, -1 means no hardware reset

## Macros

`ESP_ETH_PHY_ADDR_AUTO`  
`ETH_PHY_DEFAULT_CONFIG()`  
Default configuration for Ethernet PHY object.

## Type Definitions

`typedef struct esp_eth_phy_s esp_eth_phy_t`  
Ethernet PHY.

## Header File

- [esp\\_eth/include/esp\\_eth\\_netif\\_glue.h](#)

## Functions

`void *esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)`  
Create a netif glue for Ethernet driver.

**Note** netif glue is used to attach io driver to TCP/IP netif

**Return** glue object, which inherits esp\_netif\_driver\_base\_t

### Parameters

- eth\_hdl: Ethernet driver handle

`esp_err_t esp_eth_del_netif_glue(void *glue)`  
Delete netif glue of Ethernet driver.

**Return** -ESP\_OK: delete netif glue successfully

### Parameters

- glue: netif glue

`esp_err_t esp_eth_set_default_handlers(void *esp_netif)`  
Register default IP layer handlers for Ethernet.

**Note** : Ethernet handle might not yet properly initialized when setting up these default handlers

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp\_netif is NULL)
- ESP\_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp\_event handler

### Parameters

- [in] esp\_netif: esp network interface handle created for Ethernet driver

`esp_err_t esp_eth_clear_default_handlers(void *esp_netif)`  
Unregister default IP layer handlers for Ethernet.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameter (esp\_netif is NULL)
- ESP\_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp\_event handler

**Parameters**

- [in] esp\_netif: esp network interface handle created for Ethernet driver

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

**2.2.3 IP Network Layer**

**ESP-NETIF**

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

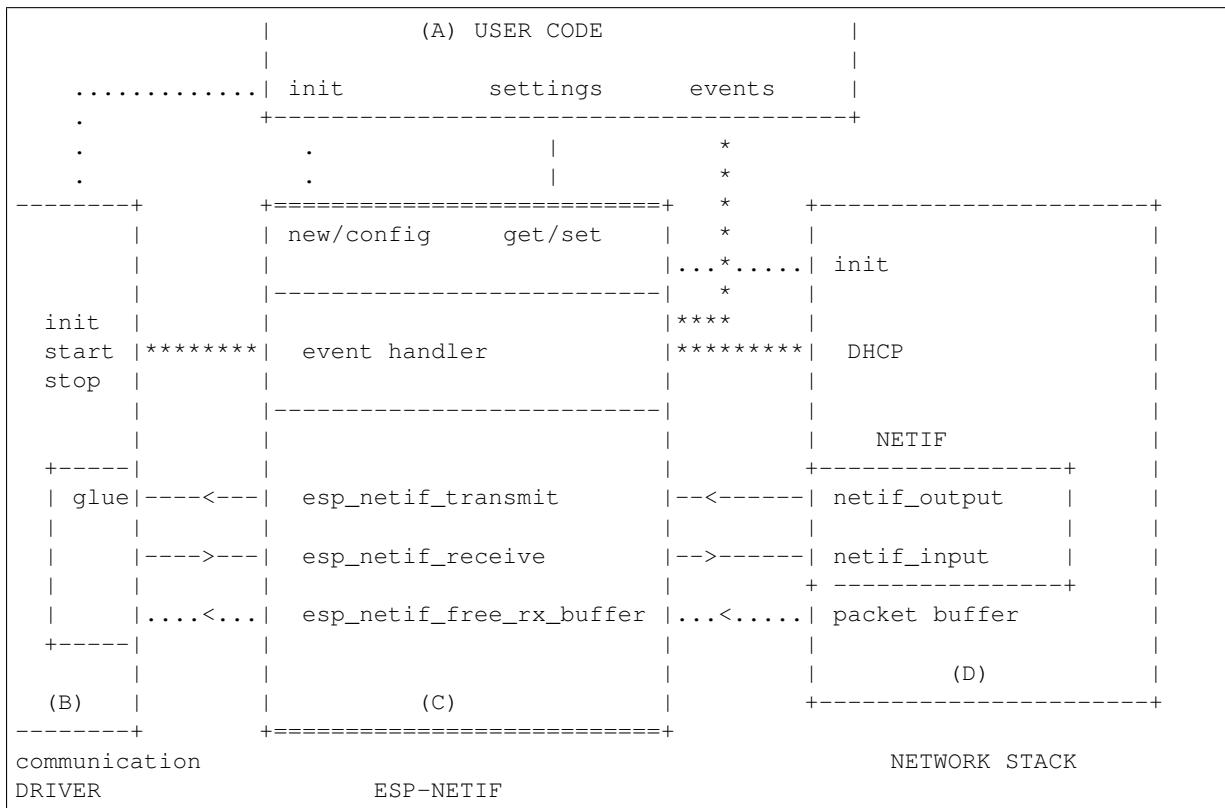

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip\_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP Adapter Migration Guide](#) section in case existing applications to be ported to use the esp-netif API instead.

**ESP-NETIF architecture**

**Data and event flow in the diagram**

- ..... Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back

- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF, former tcpip\_adapter** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**ESP-NETIF programmer' s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*.

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- `esp_netif/include/esp_netif.h`

### Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

#### Return

- ESP\_OK on success
- ESP\_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

#### Return

- ESP\_ERR\_INVALID\_STATE if `esp_netif` not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t *esp_netif_config`)

Creates an instance of new esp-netif object based on provided config.

#### Return

- pointer to esp-netif object on success
- NULL otherwise

#### Parameters

- [in] `esp_netif_config`: pointer esp-netif configuration

void `esp_netif_destroy` (`esp_netif_t *esp_netif`)

Destroys the `esp_netif` object.

**Parameters**

- [in] `esp_netif`: pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (`esp_netif_t *esp_netif`, `const esp_netif_driver_ifconfig_t *driver_config`)

Configures driver related options of `esp_netif` object.

**Return**

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` if invalid parameters provided

**Parameters**

- [inout] `esp_netif`: pointer to the object to be configured
- [in] `driver_config`: pointer esp-netif io driver related configuration

*esp\_err\_t* **esp\_netif\_attach** (`esp_netif_t *esp_netif`, `esp_netif_io_driver_handle driver_handle`)

Attaches `esp_netif` instance to the io driver handle.

Calling this function enables connecting specific `esp_netif` object with already initialized io driver to update `esp_netif` object with driver specific configuration (i.e. calls `post_attach` callback, which typically sets io driver callbacks to `esp_netif` instance and starts the driver)

**Return**

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED` if driver's `post_attach` callback failed

**Parameters**

- [inout] `esp_netif`: pointer to `esp_netif` object to be attached
- [in] `driver_handle`: pointer to the driver handle

*esp\_err\_t* **esp\_netif\_receive** (`esp_netif_t *esp_netif`, `void *buffer`, `size_t len`, `void *eb`)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**

- `ESP_OK`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `buffer`: Received data
- [in] `len`: Length of the data frame
- [in] `eb`: Pointer to internal buffer (used in Wi-Fi driver)

void **esp\_netif\_action\_start** (`void *esp_netif`, `esp_event_base_t base`, `int32_t event_id`, `void *data`)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_stop** (`void *esp_netif`, `esp_event_base_t base`, `int32_t event_id`, `void *data`)

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- `base`:
- `event_id`:
- `data`:

void **esp\_netif\_action\_connected** (void \**esp\_netif*, *esp\_event\_base\_t* *base*, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- *base*:
- *event\_id*:
- *data*:

void **esp\_netif\_action\_disconnected** (void \**esp\_netif*, *esp\_event\_base\_t* *base*, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- *base*:
- *event\_id*:
- *data*:

void **esp\_netif\_action\_got\_ip** (void \**esp\_netif*, *esp\_event\_base\_t* *base*, int32\_t *event\_id*, void \**data*)

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- *base*:
- *event\_id*:
- *data*:

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \**esp\_netif*, uint8\_t *mac*[])

Set the mac address for the interface instance.

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [in] *mac*: Desired mac address for the related network interface

*esp\_err\_t* **esp\_netif\_get\_mac** (*esp\_netif\_t* \**esp\_netif*, uint8\_t *mac*[])

Get the mac address for the interface instance.

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

**Parameters**

- [in] *esp\_netif*: Handle to esp-netif instance
- [out] *mac*: Resultant mac address for the related network interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (*esp\_netif\_t* \**esp\_netif*, const char \**hostname*)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG\_LWIP\_LOCAL\_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error

- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `hostname`: New hostname for the interface. Maximum length 32 bytes.

*esp\_err\_t* **esp\_netif\_get\_hostname** (`esp_netif_t *esp_netif`, **const** char \*\**hostname*)

Get interface hostname.

**Return**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `hostname`: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

bool **esp\_netif\_is\_netif\_up** (`esp_netif_t *esp_netif`)

Test if supplied interface is up or down.

**Return**

- true - Interface is up
- false - Interface is down

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (`esp_netif_t *esp_netif`, `esp_netif_ip_info_t *ip_info`)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (`esp_netif_t *esp_netif`, `esp_netif_ip_info_t *ip_info`)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `ip_info`: If successful, IP information will be returned in this argument.

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (`esp_netif_t *esp_netif`, **const** `esp_netif_ip_info_t *ip_info`)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a `SYSTEM_EVENT_STA_GOT_IP` or `SYSTEM_EVENT_ETH_GOT_IP` event.

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED` If DHCP server or client is still running

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: IP information to set on the specified interface

*esp\_err\_t* `esp_netif_set_old_ip_info`(`esp_netif_t *esp_netif`, `const esp_netif_ip_info_t *ip_info`)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `ip_info`: Store the old IP information for the specified interface

int `esp_netif_get_netif_impl_index`(`esp_netif_t *esp_netif`)

Get net interface index from network stack implementation.

**Note** This index could be used in `setsockopt()` to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied `esp_netif`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* `esp_netif_get_netif_impl_name`(`esp_netif_t *esp_netif`, `char *name`)

Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `name`: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

*esp\_err\_t* `esp_netif_dhcps_option`(`esp_netif_t *esp_netif`, `esp_netif_dhcp_option_mode_t opt_op`, `esp_netif_dhcp_option_id_t opt_id`, `void *opt_val`, `uint32_t opt_len`)

Set or Get DHCP server option.

**Return**

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance

- [in] `opt_op`: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

*esp\_err\_t* **esp\_netif\_dhcp\_option** (*esp\_netif\_t \*esp\_netif*, *esp\_netif\_dhcp\_option\_mode\_t opt\_op*, *esp\_netif\_dhcp\_option\_id\_t opt\_id*, *void \*opt\_val*, *uint32\_t opt\_len*)

Set or Get DHCP client option.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `opt_op`: ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- [in] `opt_id`: Option index to get or set, must be one of the supported enum values.
- [inout] `opt_val`: Pointer to the option parameter.
- [in] `opt_len`: Length of the option parameter.

*esp\_err\_t* **esp\_netif\_dhcp\_start** (*esp\_netif\_t \*esp\_netif*)

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcp\_stop** (*esp\_netif\_t \*esp\_netif*)

Stop DHCP client (only if enabled in interface object)

**Note** Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcp\_get\_status** (*esp\_netif\_t \*esp\_netif*, *esp\_netif\_dhcp\_status\_t \*status*)

Get DHCP client status.

#### Return

- ESP\_OK

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance
- [out] `status`: If successful, the status of DHCP client will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t \*esp\_netif*, *esp\_netif\_dhcp\_status\_t \*status*)

Get DHCP Server status.

#### Return

- ESP\_OK

#### Parameters

- [in] `esp_netif`: Handle to esp-netif instance

- [out] status: If successful, the status of the DHCP server will be returned in this argument.

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \**esp\_netif*)

Start DHCP server (only if enabled in interface object)

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \**esp\_netif*)

Stop DHCP server (only if enabled in interface object)

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_dns\_type\_t* *type*,  
*esp\_netif\_dns\_info\_t* \**dns*)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

#### Return

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance
- [in] *type*: Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- [in] *dns*: DNS Server address to set

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \**esp\_netif*, *esp\_netif\_dns\_type\_t* *type*,  
*esp\_netif\_dns\_info\_t* \**dns*)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

#### Return

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

#### Parameters

- [in] *esp\_netif*: Handle to esp-netif instance

- [in] type: Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- [out] dns: DNS Server result is written here on success

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (esp\_netif\_t \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

#### Return

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (esp\_netif\_t \*esp\_netif, esp\_ip6\_addr\_t \*if\_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

#### Return

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [out] if\_ip6: IPv6 information will be returned in this argument if successful.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (esp\_netif\_t \*esp\_netif, esp\_ip6\_addr\_t \*if\_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

#### Return

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [out] if\_ip6: IPv6 information will be returned in this argument if successful.

int **esp\_netif\_get\_all\_ip6** (esp\_netif\_t \*esp\_netif, esp\_ip6\_addr\_t if\_ip6[])

Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [out] if\_ip6: Array of IPv6 addresses will be copied to the argument

void **esp\_netif\_set\_ip4\_addr** (esp\_ip4\_addr\_t \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

#### Parameters

- [out] addr: IP address to be set
- a: the first octet (127 for IP 127.0.0.1)
- b:
- c:
- d:

char \***esp\_ip4addr\_ntoa** (const esp\_ip4\_addr\_t \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

**Parameters**

- addr: ip address in network order to convert
- buf: target buffer where the string is stored
- buflen: length of buf

uint32\_t **esp\_ip4addr\_aton** (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Return** ip address in network order

**Parameters**

- addr: IP address in ascii representation (e.g. "127.0.0.1" )

esp\_err\_t **esp\_netif\_str\_to\_ip4** (const char \*src, esp\_ip4\_addr\_t \*dst)

Converts Ascii internet IPv4 address into esp\_ip4\_addr\_t.

**Return**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

**Parameters**

- [in] src: IPv4 address in ascii representation (e.g. "127.0.0.1" )
- [out] dst: Address of the target esp\_ip4\_addr\_t structure to receive converted address

esp\_err\_t **esp\_netif\_str\_to\_ip6** (const char \*src, esp\_ip6\_addr\_t \*dst)

Converts Ascii internet IPv6 address into esp\_ip6\_addr\_t Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1" )

**Return**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

**Parameters**

- [in] src: IPv6 address in ascii representation (e.g. "2001:0db8:85a3:0000:0000:0002:0001" )
- [out] dst: Address of the target esp\_ip6\_addr\_t structure to receive converted address

esp\_netif\_iodriver\_handle **esp\_netif\_get\_io\_driver** (esp\_netif\_t \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

esp\_netif\_t \***esp\_netif\_get\_handle\_from\_ifkey** (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- if\_key: Textual description of network interface

esp\_netif\_flags\_t **esp\_netif\_get\_flags** (esp\_netif\_t \*esp\_netif)

Returns configured flags for this interface.

**Return** Configuration flags

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

const char \***esp\_netif\_get\_ifkey** (esp\_netif\_t \*esp\_netif)

Returns configured interface key for this esp-netif instance.

**Return** Textual description of related interface

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

**const char \*esp\_netif\_get\_desc** (esp\_netif\_t \*esp\_netif)

Returns configured interface type for this esp-netif instance.

**Return** Enumerated type of this interface, such as station, AP, ethernet

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

**int esp\_netif\_get\_route\_prio** (esp\_netif\_t \*esp\_netif)

Returns configured routing priority number.

**Return** Integer representing the instance's route-prio, or -1 if invalid parameters

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

**int32\_t esp\_netif\_get\_event\_id** (esp\_netif\_t \*esp\_netif, esp\_netif\_ip\_event\_type\_t event\_type)

Returns configured event for this esp-netif instance and supplied event type.

**Return** specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event\_type is not known

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance
- event\_type: (either get or lost IP)

**esp\_netif\_t \*esp\_netif\_next** (esp\_netif\_t \*esp\_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Return** First netif from the list if supplied parameter is NULL, next one otherwise

**Parameters**

- [in] esp\_netif: Handle to esp-netif instance

**size\_t esp\_netif\_get\_nr\_of\_ifs** (void)

Returns number of registered esp\_netif objects.

**Return** Number of esp\_netifs

**void esp\_netif\_netstack\_buf\_ref** (void \*netstack\_buf)

increase the reference counter of net stack buffer

**Parameters**

- [in] netstack\_buf: the net stack buffer

**void esp\_netif\_netstack\_buf\_free** (void \*netstack\_buf)

free the netstack buffer

**Parameters**

- [in] netstack\_buf: the net stack buffer

## Macros

**`_ESP_NETIF_SUPPRESS_LEGACY_WARNING_`**

## WiFi default API reference

### Header File

- [esp\\_wifi/include/esp\\_wifi\\_default.h](#)

### Functions

**esp\_err\_t esp\_netif\_attach\_wifi\_station** (esp\_netif\_t \*esp\_netif)

Attaches wifi station interface to supplied netif.

**Return**

- ESP\_OK on success
- ESP\_FAIL if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi station to

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (`esp_netif_t *esp_netif`)

Attaches wifi soft AP interface to supplied netif.

**Return**

- ESP\_OK on success
- ESP\_FAIL if attach failed

**Parameters**

- `esp_netif`: instance to attach the wifi AP to

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Return**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

**Return**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void *\*esp\_netif*)

Clears default wifi event handlers for supplied network interface.

**Return**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

**Parameters**

- `esp_netif`: instance of corresponding if object

`esp_netif_t *`**esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

**Return** pointer to esp-netif instance

`esp_netif_t *`**esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

**Return** pointer to esp-netif instance

`esp_netif_t *`**esp\_netif\_create\_wifi** (*wifi\_interface\_t* *wifi\_if*, `esp_netif_inherent_config_t` *\*esp\_netif\_config*)

Creates `esp_netif` WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return** pointer to esp-netif instance

**Parameters**

- [in] *wifi\_if*: type of wifi interface
- [in] *esp\_netif\_config*: inherent esp-netif configuration pointer

*esp\_err\_t* **esp\_netif\_create\_default\_wifi\_mesh\_netifs** (`esp_netif_t` *\*\*p\_netif\_sta*, `esp_netif_t` *\*\*p\_netif\_ap*)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** ESP\_OK on success

**Parameters**

- [out] *p\_netif\_sta*: pointer where the resultant STA interface is saved (if non NULL)
- [out] *p\_netif\_ap*: pointer where the resultant AP interface is saved (if non NULL)

## TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from `tcpip_adapter` API to its successor *ESP-NETIF*.

### Updating network connection code

**Network stack initialization** Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the *ESP-NETIF* initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

**Network interface creation** TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the *ESP-NETIF* to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta()`; or `esp_netif_create_default_wifi_ap()`; after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)

**Replacing other `tcpip_adapter` API** All the `tcpip_adapter` functions have their *esp-netif* counter-part. Please refer to the `esp_netif.h` grouped into these sections:

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

**Default event handlers** Event handlers are moved from `tcpip_adapter` to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of *esp-netif* specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

Instead of

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since `ip4addr_ntoa()` is a LwIP API, the *esp-netif* provides `esp_ip4addr_ntoa()` as a replacement, but the above method is generally preferred.

**IP addresses** It is preferred to use *esp-netif* defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. \* [esp-netif IP address definitions](#)

**Next steps** Additional step in porting an application to fully benefit from the *ESP-NETIF* is to disable the `tcpip_adapter` compatibility layer in the component configuration: `ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface` and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with `esp-netif` connection capabilities. By convention the I/O driver has to register itself as an `esp-netif` driver and thus holds a dependency on `esp-netif` component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with `esp-netif`:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from `esp-netif` (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the `esp-netif` instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related `esp-netif` instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as...
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver...
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between `esp-netif` and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
```

(continues on next page)

```

        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}

```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

### Header File

- [esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

### Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)`

Returns esp-netif handle.

**Return** handle to related esp-netif instance

#### Parameters

- [in] dev: opaque ptr to network interface of specific TCP/IP stack

`void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Return** handle to related network stack netif handle

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance

`esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Return** ESP\_OK on success, an error passed from the I/O driver otherwise

#### Parameters

- [in] esp\_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

`esp_err_t esp_netif_transmit_wrap`(`esp_netif_t *esp_netif`, `void *data`, `size_t len`, `void *netstack_buf`)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Return** ESP\_OK on success, an error passed from the I/O driver otherwise

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `data`: Data to be transmitted
- [in] `len`: Length of the data frame
- [in] `netstack_buf`: net stack buffer

`void esp_netif_free_rx_buffer`(`void *esp_netif`, `void *buffer`)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

**Parameters**

- [in] `esp_netif`: Handle to esp-netif instance
- [in] `buffer`: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the [TCP/IP Adapter Migration Guide](#) to update existing IDF applications.

## 2.2.4 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.3 Peripherals API

### 2.3.1 Analog to Digital Converter

#### Overview

The ESP32-C3 integrates two 12-bit SAR (Successive Approximation Register) ADCs, supporting a total of 6 measurement channels (analog enabled pins).

These channels are supported:

**ADC1:**

- 5 channels: GPIO0 - GPIO4

**ADC2:**

- 1 channels: GPIO5

#### ADC Limitations

---

**Note:**

- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.
- A specific ADC module can only work under one operating mode at any one time, either Continuous Read Mode or Single Read Mode.

- For continuous (DMA) read mode, the ADC sampling frequency (the `sample_freq_hz` member of `adc_digi_config_t`) should be within `SOC_ADC_SAMPLE_FREQ_THRES_LOW` and `SOC_ADC_SAMPLE_FREQ_THRES_HIGH`
  - ADC2 continuous (DMA) mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in *ESP32C3 Errata* <[https://www.espressif.com/sites/default/files/documentation/esp32-c3\\_errata\\_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-c3_errata_en.pdf)>. For compatibility, you can enable `CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3` to force use ADC2.
  - ADC2 oneshot mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in *ESP32C3 Errata* <[https://www.espressif.com/sites/default/files/documentation/esp32-c3\\_errata\\_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-c3_errata_en.pdf)>. For compatibility, you can enable `CONFIG_ADC_ONESHOT_FORCE_USE_ADC2_ON_C3` to force use ADC2.
- 

### Driver Usage

Each ADC unit supports two work modes, ADC single read mode and ADC continuous (DMA) mode. ADC single read mode is suitable for low-frequency sampling operations. ADC continuous (DMA) read mode is suitable for high-frequency continuous sampling actions.

---

**Note:** ADC readings from a pin not connected to any signal are random.

---

**ADC Continuous (DMA) Read mode** Please use the ADC continuous read mode driver as the following steps:

- Initialize the ADC driver by calling the function `adc_digi_initialize()`.
  - Initialize the ADC controller by calling the function `adc_digi_controller_config()`.
  - Start the ADC continuous reading by calling the function `adc_digi_start()`.
  - After starting the ADC, you can get the ADC reading result by calling the function `adc_digi_read_bytes()`. Before stopping the ADC (by calling `adc_digi_stop()`), the driver will keep converting the analog data to digital data.
  - Stop the ADC reading by calling the function `adc_digi_stop()`.
  - Deinitialize the ADC driver by calling the function `adc_digi_deinit()`.
- 

**Note:** See *ADC Limitations* for the limitation of using ADC continuous (DMA) read mode.

---

**ADC Single Read mode** The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

---

**Note:** See *ADC Limitations* for the limitation of using ADC single read mode.

---

### Application Example

The code example for using ADC single read mode and ADC continuous (DMA) read mode can be found in the `peripherals/adc/esp32c3` directory of ESP-IDF examples.

## GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIOn_CHANNEL` is the ADC1 channel number of GPIO n.

## API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

## ADC driver

### Header File

- `driver/esp32c3/include/driver/adc.h`

### Functions

`esp_err_t adc_digi_filter_reset (adc_digi_filter_idx_t idx)`

Reset adc digital controller filter.

#### Return

- `ESP_OK` Success

#### Parameters

- `idx`: Filter index.

`esp_err_t adc_digi_filter_set_config (adc_digi_filter_idx_t idx, adc_digi_filter_t *config)`

Set adc digital controller filter configuration.

#### Return

- `ESP_OK` Success

#### Parameters

- `idx`: Filter index.
- `config`: See `adc_digi_filter_t`.

`esp_err_t adc_digi_filter_get_config (adc_digi_filter_idx_t idx, adc_digi_filter_t *config)`

Get adc digital controller filter configuration.

#### Return

- `ESP_OK` Success

#### Parameters

- `idx`: Filter index.
- `config`: See `adc_digi_filter_t`.

`esp_err_t adc_digi_filter_enable (adc_digi_filter_idx_t idx, bool enable)`

Enable/disable adc digital controller filter. Filtering the ADC data to obtain smooth data at higher sampling rates.

#### Return

- `ESP_OK` Success

#### Parameters

- `idx`: Filter index.
- `enable`: Enable/Disable filter.

`esp_err_t adc_digi_monitor_set_config (adc_digi_monitor_idx_t idx, adc_digi_monitor_t *config)`

Config monitor of adc digital controller.

**Return**

- ESP\_OK Success

**Parameters**

- `idx`: Monitor index.
- `config`: See `adc_digi_monitor_t`.

`esp_err_t` **adc\_digi\_monitor\_enable** (`adc_digi_monitor_idx_t` `idx`, bool `enable`)

Enable/disable monitor of adc digital controller.

**Return**

- ESP\_OK Success

**Parameters**

- `idx`: Monitor index.
- `enable`: True or false enable monitor.

**Header File**

- `hal/include/hal/adc_types.h`

**Structures**

**struct** `adc_digi_pattern_table_t`

ADC digital controller (DMA mode) conversion rules setting.

**Public Members**

`uint8_t` **atten** : 2

ADC sampling voltage attenuation configuration. Modification of attenuation affects the range of measurements. 0: measurement range 0 - 800mV, 1: measurement range 0 - 1100mV, 2: measurement range 0 - 1350mV, 3: measurement range 0 - 2600mV.

`uint8_t` **channel** : 3

ADC channel index.

`uint8_t` **unit** : 1

ADC unit index.

`uint8_t` **reserved** : 2

reserved0

`uint8_t` **val**

Raw data value

**struct** `adc_digi_output_data_t`

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

**Public Members**

`uint32_t` **data** : 12

ADC real output data info. Resolution: 12 bit.

`uint32_t` **reserved12** : 1

Reserved12.

`uint32_t` **channel** : 3

ADC channel index info. If (`channel < ADC_CHANNEL_MAX`), The data is valid. If (`channel > ADC_CHANNEL_MAX`), The data is invalid.

`uint32_t` **unit** : 1

ADC unit index info. 0: ADC1; 1: ADC2.

`uint32_t` **reserved17\_31** : 15

Reserved17.

```
struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
```

When the configured output format is 12bit. ADC\_DIGI\_FORMAT\_11BIT

```
uint32_t val
```

Raw data value

```
struct adc_digi_clk_t
```

ADC digital controller (DMA mode) clock system setting. Calculation formula:  $\text{controller\_clk} = (\text{APLL or APB}) / (\text{div\_num} + \text{div\_a} / \text{div\_b} + 1)$ .

**Note** : The clocks of the DAC digital controller use the ADC digital controller clock divider.

### Public Members

```
bool use_apll
```

true: use APLL clock; false: use APB clock.

```
uint32_t div_num
```

Division factor. Range: 0 ~ 255. Note: When a higher frequency clock is used (the division factor is less than 9), the ADC reading value will be slightly offset.

```
uint32_t div_b
```

Division factor. Range: 1 ~ 63.

```
uint32_t div_a
```

Division factor. Range: 0 ~ 63.

```
struct adc_digi_config_t
```

CONFIG\_IDF\_TARGET\_ESP32.

ADC digital controller (DMA mode) configuration parameters.

Example setting: When using ADC1 channel0 to measure voltage, the sampling rate is required to be 1 kHz:

sample rate	1 kHz	1 kHz	1 kHz
conv_mode	single	both	alter
adc1_pattern_len	1	1	1
dig_clk.use_apll	0	0	0
dig_clk.div_num	99	99	99
dig_clk.div_b	0	0	0
dig_clk.div_a	0	0	0
interval	400	400	200
`trigger_meas_freq`	1 kHz	1 kHz	2 kHz

Explanation of the relationship between `conv_limit_num`, `dma_eof_num` and the number of DMA outputs:

conv_mode	single	both	alter
trigger meas times	1	1	1
conv_limit_num	+1	+1	+1
dma_eof_num	+1	+2	+1
dma output (byte)	+2	+4	+2

### Public Members

bool **conv\_limit\_en**

Enable the function of limiting ADC conversion times. If the number of ADC conversion trigger count is equal to the `limit_num`, the conversion is stopped.

uint32\_t **conv\_limit\_num**

Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32\_t **adc\_pattern\_len**

Pattern table length for digital controller. Range: 0 ~ 7 (0: Don't change the pattern table setting). The pattern table that defines the conversion rules for each SAR ADC. Each table has 7 items, in which channel selection, resolution and attenuation are stored. When the conversion is started, the controller reads conversion rules from the pattern table one by one. For each controller the scan sequence has at most 16 different rules before repeating itself.

*adc\_digi\_pattern\_table\_t* \***adc\_pattern**

Pointer to pattern table for digital controller. The table size defined by `adc_pattern_len`.

uint32\_t **sample\_freq\_hz**

The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz  $F_s = F_d / \text{interval} / 2$   $F_s$ : sampling frequency;  $F_d$ : digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

**struct adc\_arbiter\_t**

ADC arbiter work mode and priority setting.

**Note** ESP32-S2: Only ADC2 support arbiter.

### Public Members

*adc\_arbiter\_mode\_t* **mode**

Refer to `adc_arbiter_mode_t`. Note: only support ADC2.

uint8\_t **rtc\_pri**

RTC controller priority. Range: 0 ~ 2.

uint8\_t **dig\_pri**

Digital controller priority. Range: 0 ~ 2.

uint8\_t **pwdet\_pri**

Wi-Fi controller priority. Range: 0 ~ 2.

**struct adc\_digi\_filter\_t**

ADC digital controller (DMA mode) filter configuration.

**Note** For ESP32-S2, The filter object of the ADC is fixed.

**Note** For ESP32-S2, The filter object is always all enabled channels.

### Public Members

*adc\_unit\_t* **adc\_unit**

Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

*adc\_channel\_t* **channel**

Set adc channel number for filter. For ESP32-S2, it's always `ADC_CHANNEL_MAX`

*adc\_digi\_filter\_mode\_t* **mode**

Set adc filter mode for filter. See `adc_digi_filter_mode_t`.

**struct adc\_digi\_monitor\_t**

ADC digital controller (DMA mode) monitor configuration.

**Note** For ESP32-S2, The monitor object of the ADC is fixed.

**Note** For ESP32-S2, The monitor object is always all enabled channels.

### Public Members

#### `adc_unit_t` **adc\_unit**

Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

#### `adc_channel_t` **channel**

Set adc channel number for monitor. For ESP32-S2, it's always ADC\_CHANNEL\_MAX

#### `adc_digi_monitor_mode_t` **mode**

Set adc monitor mode. See `adc_digi_monitor_mode_t`.

#### `uint32_t` **h\_threshold**

Set monitor threshold of adc digital controller.

#### `uint32_t` **l\_threshold**

Set monitor threshold of adc digital controller.

### Macros

#### `ADC_ARBITER_CONFIG_DEFAULT()`

ADC arbiter default configuration.

**Note** ESP32S2: Only ADC2 supports (needs) an arbiter.

### Enumerations

#### `enum` **adc\_unit\_t**

ADC unit enumeration.

**Note** For ADC digital controller (DMA mode), ESP32 doesn't support `ADC_UNIT_2`, `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER`.

*Values:*

`ADC_UNIT_1 = 1`

SAR ADC 1.

`ADC_UNIT_2 = 2`

SAR ADC 2.

`ADC_UNIT_BOTH = 3`

SAR ADC 1 and 2.

`ADC_UNIT_ALTER = 7`

SAR ADC 1 and 2 alternative mode.

`ADC_UNIT_MAX`

#### `enum` **adc\_channel\_t**

ADC channels handle. See `adc1_channel_t`, `adc2_channel_t`.

**Note** For ESP32 ADC1, don't use `ADC_CHANNEL_8`, `ADC_CHANNEL_9`. See `adc1_channel_t`.

*Values:*

`ADC_CHANNEL_0 = 0`

ADC channel

`ADC_CHANNEL_1`

ADC channel

`ADC_CHANNEL_2`

ADC channel

**ADC\_CHANNEL\_3**  
ADC channel

**ADC\_CHANNEL\_4**  
ADC channel

**ADC\_CHANNEL\_5**  
ADC channel

**ADC\_CHANNEL\_6**  
ADC channel

**ADC\_CHANNEL\_7**  
ADC channel

**ADC\_CHANNEL\_8**  
ADC channel

**ADC\_CHANNEL\_9**  
ADC channel

**ADC\_CHANNEL\_MAX**

**enum adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC. See `adc1_config_channel_atten`.

*Values:*

**ADC\_ATTEN\_DB\_0 = 0**  
No input attenuation, ADC can measure up to approx. 800 mV.

**ADC\_ATTEN\_DB\_2\_5 = 1**  
The input voltage of ADC will be attenuated, extending the range of measurement to up to approx. 1100 mV.

**ADC\_ATTEN\_DB\_6 = 2**  
The input voltage of ADC will be attenuated, extending the range of measurement to up to approx. 1350 mV.

**ADC\_ATTEN\_DB\_11 = 3**  
The input voltage of ADC will be attenuated, extending the range of measurement to up to approx. 2600 mV.

**ADC\_ATTEN\_MAX**

**enum adc\_i2s\_source\_t**

ESP32 ADC DMA source selection.

*Values:*

**ADC\_I2S\_DATA\_SRC\_IO\_SIG = 0**  
I2S data from GPIO matrix signal

**ADC\_I2S\_DATA\_SRC\_ADC = 1**  
I2S data from ADC

**ADC\_I2S\_DATA\_SRC\_MAX**

**enum adc\_bits\_width\_t**

ADC resolution setting option.

*Values:*

**ADC\_WIDTH\_BIT\_12 = 3**  
ADC capture width is 12Bit.

**ADC\_WIDTH\_MAX**

**enum adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

**Note** The conversion mode affects the sampling frequency: **SINGLE\_UNIT\_1**: When the measurement is triggered, only ADC1 is sampled once. **SINGLE\_UNIT\_2**: When the measurement is triggered, only ADC2 is sampled once. **BOTH\_UNIT**: When the measurement is triggered, ADC1 and ADC2 are sampled at the same time. **ALTER\_UNIT**: When the measurement is triggered, ADC1 or ADC2 samples alternately.

*Values:*

**ADC\_CONV\_SINGLE\_UNIT\_1** = 1  
SAR ADC 1.

**ADC\_CONV\_SINGLE\_UNIT\_2** = 2  
SAR ADC 2.

**ADC\_CONV\_BOTH\_UNIT** = 3  
SAR ADC 1 and 2.

**ADC\_CONV\_ALTER\_UNIT** = 7  
SAR ADC 1 and 2 alternative mode.

**ADC\_CONV\_UNIT\_MAX**

**enum adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

**ADC\_DIGI\_FORMAT\_12BIT**  
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (*adc\_digi\_output\_data\_t*). Note: For single convert mode.

**ADC\_DIGI\_FORMAT\_11BIT**  
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (*adc\_digi\_output\_data\_t*). Note: For multi or alter convert mode.

**ADC\_DIGI\_FORMAT\_MAX**

**enum adc\_arbiter\_mode\_t**

ADC arbiter work mode option.

**Note** ESP32-S2: Only ADC2 support arbiter.

*Values:*

**ADC\_ARB\_MODE\_SHIELD**  
Force shield arbiter, Select the highest priority controller to work.

**ADC\_ARB\_MODE\_FIX**  
Fixed priority switch controller mode.

**ADC\_ARB\_MODE\_LOOP**  
Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

**enum adc\_digi\_filter\_idx\_t**

ADC digital controller (DMA mode) filter index options.

**Note** For ESP32-S2, The filter object of the ADC is fixed.

*Values:*

**ADC\_DIGI\_FILTER\_IDX0** = 0  
The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

**ADC\_DIGI\_FILTER\_IDX1**

The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

**ADC\_DIGI\_FILTER\_IDX\_MAX****enum adc\_digi\_filter\_mode\_t**

ADC digital controller (DMA mode) filter type options. Expression:  $\text{filter\_data} = (k-1)/k * \text{last\_data} + \text{new\_data} / k$ .

*Values:*

**ADC\_DIGI\_FILTER\_DIS = -1**

Disable filter

**ADC\_DIGI\_FILTER\_IIR\_2 = 0**

The filter mode is first-order IIR filter. The coefficient is 2.

**ADC\_DIGI\_FILTER\_IIR\_4**

The filter mode is first-order IIR filter. The coefficient is 4.

**ADC\_DIGI\_FILTER\_IIR\_8**

The filter mode is first-order IIR filter. The coefficient is 8.

**ADC\_DIGI\_FILTER\_IIR\_16**

The filter mode is first-order IIR filter. The coefficient is 16.

**ADC\_DIGI\_FILTER\_IIR\_64**

The filter mode is first-order IIR filter. The coefficient is 64.

**ADC\_DIGI\_FILTER\_IIR\_MAX****enum adc\_digi\_monitor\_idx\_t**

ADC digital controller (DMA mode) monitor index options.

**Note** For ESP32-S2, The monitor object of the ADC is fixed.

*Values:*

**ADC\_DIGI\_MONITOR\_IDX0 = 0**

The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.

**ADC\_DIGI\_MONITOR\_IDX1**

The monitor index 1. For ESP32-S2, It can only be used to monitor all enabled channels of ADC2 unit at the same time.

**ADC\_DIGI\_MONITOR\_IDX\_MAX****enum adc\_digi\_monitor\_mode\_t**

Set monitor mode of adc digital controller. MONITOR\_HIGH: If ADC\_OUT > threshold, Generates monitor interrupt. MONITOR\_LOW: If ADC\_OUT < threshold, Generates monitor interrupt.

*Values:*

**ADC\_DIGI\_MONITOR\_DIS = 0**

Disable monitor.

**ADC\_DIGI\_MONITOR\_EN**

If ADC\_OUT < threshold, Generates monitor interrupt. If ADC\_OUT > threshold, Generates monitor interrupt.

**ADC\_DIGI\_MONITOR\_MAX****Header File**

- [driver/include/driver/adc\\_common.h](#)

**Functions**

void **adc\_power\_on** (void)

Enable ADC power.

void **adc\_power\_off** (void)

Power off SAR ADC.

void **adc\_power\_acquire** (void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void **adc\_power\_release** (void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

*esp\_err\_t* **adc1\_pad\_get\_io\_num** (*adc1\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the GPIO number of a specific ADC1 channel.

**Return**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_ARG if channel not valid

**Parameters**

- channel: Channel to get the GPIO number
- gpio\_num: output buffer to hold the GPIO number

*esp\_err\_t* **adc1\_config\_channel\_atten** (*adc1\_channel\_t* channel, *adc\_atten\_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

*esp\_err\_t* `adc1_config_width` (*adc\_bits\_width\_t* `width_bit`)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `width_bit`: Bit capture width for ADC1

`int` `adc1_get_raw` (*adc1\_channel\_t* `channel`)

Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**

- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**

- `channel`: ADC1 channel to read

*esp\_err\_t* `adc2_pad_get_io_num` (*adc2\_channel\_t* `channel`, *gpio\_num\_t* \*`gpio_num`)

Get the GPIO number of a specific ADC2 channel.

**Return**

- `ESP_OK` if success
- `ESP_ERR_INVALID_ARG` if channel not valid

**Parameters**

- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

*esp\_err\_t* `adc2_config_channel_atten` (*adc2\_channel\_t* `channel`, *adc\_atten\_t* `atten`)

Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450

(continues on next page)

(continued from previous page)

	0	0 ~ 750
ESP32-S2	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

`esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)`

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with `ESP_ERR_TIMEOUT`.

**Note** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

#### Return

- ESP\_OK if success
- ESP\_ERR\_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP\_ERR\_INVALID\_STATE The controller status is invalid. Please try again.

#### Parameters

- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

`esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)`

Output ADC1 or ADC2's reference voltage to `adc2_chan_t`'s IO.

This function routes the internal reference voltage of ADCn to one of ADC2's channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2's internal reference voltage.

#### Return

- ESP\_OK: `v_ref` successfully routed to selected GPIO
- ESP\_ERR\_INVALID\_ARG: Unsupported GPIO

#### Parameters

- `[in] adc_unit`: ADC unit index
- `[in] gpio`: GPIO number (Only ADC2's channels IO are supported)

*esp\_err\_t* **adc2\_vref\_to\_gpio**(*gpio\_num\_t* *gpio*)

Output ADC2 reference voltage to *adc2\_chan\_t*'s IO.

This function routes the internal reference voltage of ADCn to one of ADC2's channels. This reference voltage can then be manually measured for calibration purposes.

**Return**

- ESP\_OK: v\_ref successfully routed to selected GPIO
- ESP\_ERR\_INVALID\_ARG: Unsupported GPIO

**Parameters**

- [in] *gpio*: GPIO number (ADC2's channels are supported)

*esp\_err\_t* **adc\_digi\_controller\_config**(const *adc\_digi\_config\_t* \**config*)

Setting the digital controller.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_ERR\_INVALID\_ARG If the combination of arguments is invalid.
- ESP\_OK On success

**Parameters**

- *config*: Pointer to digital controller paramter. Refer to *adc\_digi\_config\_t*.

*esp\_err\_t* **adc\_digi\_initialize**(const *adc\_digi\_init\_config\_t* \**init\_config*)

Initialize the Digital ADC.

**Return**

- ESP\_ERR\_INVALID\_ARG If the combination of arguments is invalid.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_NO\_MEM If out of memory
- ESP\_OK On success

**Parameters**

- *init\_config*: Pointer to Digital ADC initialization config. Refer to *adc\_digi\_init\_config\_t*.

*esp\_err\_t* **adc\_digi\_start**(void)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_stop**(void)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_digi\_read\_bytes**(*uint8\_t* \**buf*, *uint32\_t* *length\_max*, *uint32\_t* \**out\_length*, *uint32\_t* *timeout\_ms*)

Read bytes from Digital ADC through DMA.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP\_ERR\_TIMEOUT Operation timed out
- ESP\_OK On success

**Parameters**

- [out] *buf*: Buffer to read from ADC.
- [in] *length\_max*: Expected length of data read from the ADC.
- [out] *out\_length*: Real length of data read from the ADC via this API.
- [in] *timeout\_ms*: Time to wait for data via this API, in millisecond.

*esp\_err\_t* **adc\_digi\_deinitialize**(void)

Deinitialize the Digital ADC.

**Return**

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

**Structures****struct `adc_digi_init_config_s`**

Digital ADC DMA configuration.

**Public Members**`uint32_t max_store_buf_size`

Max length of the converted data that driver can store before they are processed.

`uint32_t conv_num_each_intr`

Bytes of data that can be converted in 1 interrupt.

`uint32_t adc1_chan_mask`

Channel list of ADC1 to be initialized.

`uint32_t adc2_chan_mask`

Channel list of ADC2 to be initialized.

**Macros****`ADC_ATTEN_0db`**

ADC rtc controller attenuation option.

**Note** This definitions are only for being back-compatible**`ADC_ATTEN_2_5db`****`ADC_ATTEN_6db`****`ADC_ATTEN_11db`****`ADC_WIDTH_BIT_DEFAULT`**The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.**`ADC_WIDTH_9Bit`****`ADC_WIDTH_10Bit`****`ADC_WIDTH_11Bit`****`ADC_WIDTH_12Bit`****`ADC_MAX_DELAY`**Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.**Type Definitions****typedef struct `adc_digi_init_config_s` `adc_digi_init_config_t`**

Digital ADC DMA configuration.

**Enumerations****enum `adc1_channel_t`***Values:***`ADC1_CHANNEL_0` = 0**

ADC1 channel 0 is GPIO0

**`ADC1_CHANNEL_1`**

ADC1 channel 1 is GPIO1

**ADC1\_CHANNEL\_2**

ADC1 channel 2 is GPIO2

**ADC1\_CHANNEL\_3**

ADC1 channel 3 is GPIO3

**ADC1\_CHANNEL\_4**

ADC1 channel 4 is GPIO4

**ADC1\_CHANNEL\_MAX****enum adc2\_channel\_t**

Values:

**ADC2\_CHANNEL\_0 = 0**

ADC2 channel 0 is GPIO5

**ADC2\_CHANNEL\_MAX****enum adc\_i2s\_encode\_t**

ADC digital controller encode option.

Values:

**ADC\_ENCODE\_12BIT**

ADC to DMA data format, , [15:12]-channel [11:0]-12 bits ADC data

**ADC\_ENCODE\_11BIT**

ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

**ADC\_ENCODE\_MAX**

## ADC Calibration

### Header File

- [esp\\_adc\\_cal/include/esp\\_adc\\_cal.h](#)

### Functions

**esp\_err\_t esp\_adc\_cal\_check\_efuse** (*esp\_adc\_cal\_value\_t value\_type*)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

**Note** in ESP32S2, only ESP\_ADC\_CAL\_VAL\_EFUSE\_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

**Return**

- ESP\_OK: The calibration mode is supported in eFuse
- ESP\_ERR\_NOT\_SUPPORTED: Error, eFuse values are not burned
- ESP\_ERR\_INVALID\_ARG: Error, invalid argument (ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF)

**Parameters**

- *value\_type*: Type of calibration value (ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF or ESP\_ADC\_CAL\_VAL\_EFUSE\_TP)

**esp\_adc\_cal\_value\_t esp\_adc\_cal\_characterize** (*adc\_unit\_t adc\_num, adc\_atten\_t atten, adc\_bits\_width\_t bit\_width, uint32\_t default\_vref, esp\_adc\_cal\_characteristics\_t\*chars*)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of  $[y = \text{coeff\_a} * x + \text{coeff\_b}]$ . Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

**Note** For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC\_WIDTH\_BIT\_13 is supported. The parameter `default_vref` is unused.

**Return**

- `ESP_ADC_CAL_VAL_EFUSE_VREF`: eFuse Vref used for characterization
- `ESP_ADC_CAL_VAL_EFUSE_TP`: Two Point value used for characterization (only in Linear Mode)
- `ESP_ADC_CAL_VAL_DEFAULT_VREF`: Default Vref used for characterization

**Parameters**

- `[in] adc_num`: ADC to characterize (`ADC_UNIT_1` or `ADC_UNIT_2`)
- `[in] atten`: Attenuation to characterize
- `[in] bit_width`: Bit width configuration of ADC
- `[in] default_vref`: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- `[out] chars`: Pointer to empty structure used to store ADC characteristics

```
uint32_t esp_adc_cal_raw_to_voltage (uint32_t          adc_reading,          const
                                     esp_adc_cal_characteristics_t *chars)
```

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC's characteristics.

**Note** Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return** Voltage in mV

**Parameters**

- `[in] adc_reading`: ADC reading
- `[in] chars`: Pointer to initialized structure containing ADC characteristics

```
esp_err_t esp_adc_cal_get_voltage (adc_channel_t channel, const esp_adc_cal_characteristics_t
                                     *chars, uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

**Return**

- `ESP_OK`: ADC read and converted to mV
- `ESP_ERR_TIMEOUT`: Error, timed out attempting to read ADC
- `ESP_ERR_INVALID_ARG`: Error due to invalid arguments

**Parameters**

- `[in] channel`: ADC Channel to read
- `[in] chars`: Pointer to initialized ADC characteristics structure
- `[out] voltage`: Pointer to store converted voltage

## Structures

```
struct esp_adc_cal_characteristics_t
```

Structure storing characteristics of an ADC.

**Note** Call `esp_adc_cal_characterize()` to initialize the structure

## Public Members

```
adc_unit_t adc_num
```

ADC number

```
adc_atten_t atten
```

ADC attenuation

*adc\_bits\_width\_t* **bit\_width**

ADC bit width

uint32\_t **coeff\_a**

Gradient of ADC-Voltage curve

uint32\_t **coeff\_b**

Offset of ADC-Voltage curve

uint32\_t **vref**

Vref used by lookup table

**const** uint32\_t \***low\_curve**

Pointer to low Vref curve of lookup table (NULL if unused)

**const** uint32\_t \***high\_curve**

Pointer to high Vref curve of lookup table (NULL if unused)

### Enumerations

**enum** **esp\_adc\_cal\_value\_t**

Type of calibration value used in characterization.

*Values:*

**ESP\_ADC\_CAL\_VAL\_EFUSE\_VREF** = 0

Characterization based on reference voltage stored in eFuse

**ESP\_ADC\_CAL\_VAL\_EFUSE\_TP** = 1

Characterization based on Two Point values stored in eFuse

**ESP\_ADC\_CAL\_VAL\_DEFAULT\_VREF** = 2

Characterization based on default reference voltage

**ESP\_ADC\_CAL\_VAL\_MAX**

**ESP\_ADC\_CAL\_VAL\_NOT\_SUPPORTED** = *ESP\_ADC\_CAL\_VAL\_MAX*

## 2.3.2 General Purpose Timer

### Introduction

The ESP32-C3 chip contains two hardware timer groups. Each group has two general-purpose hardware timers. They are all 54-bit generic timers based on 16-bit pre-scalers and 54-bit up / down counters which are capable of being auto-reloaded.

### Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- *Timer Initialization* - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- *Timer Control* - describes how to read a timer's value, pause or start a timer, and change how it operates.
- *Alarms* - shows how to set and use alarms.
- *Interrupts* - explains how to use interrupt callbacks.

**Timer Initialization** The two ESP32-C3 timer groups, with two timers in each, provide the total of four individual timers for use. An ESP32-C3 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Clock Source:** Select the clock source, which together with the **Divider** define the resolution of the working timer. By default the clock source is APB\_CLK (typically 80 MHz).
- **Divider:** Sets how quickly the timer's counter is "ticking". The setting `divider` is used as a divisor of the clock source.
- **Mode:** Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable:** If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable:** Can be set using `alarm_en`.
- **Auto Reload:** Sets if the counter should `auto_reload` the initial counter value on the timer's alarm or continue incrementing or decrementing.

To get the current values of the timer's settings, use the function `timer_get_config()`.

**Timer Control** Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to `true`, or call `timer_start()`. You can specify the timer's initial counter value by calling `timer_set_counter_value()`. To check the timer's current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section *Timer Initialization*.

You can also reconfigure the timer by using dedicated functions to change individual settings:

Setting	Dedicated Function	Description
Divider	<code>timer_set_divider()</code>	Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.
Mode	<code>timer_set_counter_mode()</code>	Set if the counter should be incrementing or decrementing
Auto Reload	<code>timer_set_auto_reload()</code>	Set if the initial counter value should be reloaded on the timer's alarm

**Alarms** To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section [Interrupts](#) on how to configure interrupts.
- When `auto_reload` is enabled, the timer's counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

---

#### Note:

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
  - Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.
- 

To check the specified alarm value, call `timer_get_alarm_value()`.

**Interrupts** Registration of an interrupt callback for a specific timer can be done by calling `timer_isr_callback_add()` and passing in the group ID, timer ID, callback handler and user data. The callback handler will be invoked in ISR context, so user shouldn't put any blocking API in the callback function. The benefit of using interrupt callback instead of precessing interrupt from scratch is, you don't have to deal with interrupt status check and clean stuffs, they are all addressed before the callback got run in driver's default interrupt handler.

For more information on how to use interrupts, please see the application example below.

### Application Example

The 54-bit hardware timer example: [peripherals/timer\\_group](#).

### API Reference

#### Header File

- [driver/include/driver/timer.h](#)

#### Functions

`esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `timer_val`: Pointer to accept timer counter value.

`esp_err_t timer_get_counter_time_sec` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, double \*time)

Read the counter value of hardware timer, in unit of a given scale.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `time`: Pointer, type of `double*`, to accept timer counter value, in seconds.

`esp_err_t timer_set_counter_value` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, `uint64_t` load\_val)

Set counter value to hardware timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `load_val`: Counter value to write to the hardware timer.

`esp_err_t timer_start` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Start the counter of hardware timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_pause` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Pause the counter of hardware timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_set_counter_mode` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_count\_dir\_t* counter\_dir)

Set counting mode for hardware timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `counter_dir`: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, *timer\_autoreload\_t* reload)

Enable or disable counter reload function when alarm event occurs.

#### Return

- `ESP_OK` Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `reload`: Counter reload mode.

*esp\_err\_t* **timer\_set\_divider** (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`, *uint32\_t* `divider`)

Set hardware timer source clock divider. Timer groups clock are divider from APB clock.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `divider`: Timer clock divider value. The divider's range is from 2 to 65536.

*esp\_err\_t* **timer\_set\_alarm\_value** (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`, *uint64\_t* `alarm_value`)

Set timer alarm value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: A 64-bit value to set the alarm value.

*esp\_err\_t* **timer\_get\_alarm\_value** (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`, *uint64\_t* `*alarm_value`)

Get timer alarm value.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_value`: Pointer of A 64-bit value to accept the alarm value.

*esp\_err\_t* **timer\_set\_alarm** (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`, *timer\_alarm\_t* `alarm_en`)

Enable or disable generation of timer alarm events.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `alarm_en`: To enable or disable timer alarm function.

*esp\_err\_t* **timer\_isr\_callback\_add** (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`, *timer\_isr\_t* `isr_handler`, *void* `*arg`, *int* `intr_alloc_flags`)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

**Note** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call `timer_isr_register(...)` to register ISR.

**Parameters**

- `group_num`: Timer group number

- `timer_num`: Timer index of timer group
- `isr_handler`: Interrupt handler function, it is a callback function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_isr_callback_remove` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Remove ISR handle callback for the corresponding timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group

`esp_err_t timer_isr_register` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, void (\*fn) void \*, void \*arg, int intr\_alloc\_flags, *timer\_isr\_handle\_t* \*handle) Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

**Note** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(..)` before your handling, and call `timer_spinlock_give(...)` after your handling.

#### Parameters

- `group_num`: Timer group number
- `timer_num`: Timer index of timer group
- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t timer_init` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num, const *timer\_config\_t* \*config)

Initializes and configure the timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer to timer initialization parameters.

`esp_err_t timer_deinit` (*timer\_group\_t* group\_num, *timer\_idx\_t* timer\_num)

Deinitializes the timer.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

`esp_err_t timer_get_config(timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)`

Get timer configure value.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- `config`: Pointer of struct to accept timer parameters.

`esp_err_t timer_group_intr_enable(timer_group_t group_num, timer_intr_t intr_mask)`

Enable timer group interrupt, by enable mask.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt enable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_group_intr_disable(timer_group_t group_num, timer_intr_t intr_mask)`

Disable timer group interrupt, by disable mask.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Timer interrupt disable mask.
  - `TIMER_INTR_T0`: t0 interrupt
  - `TIMER_INTR_T1`: t1 interrupt
  - `TIMER_INTR_WDT`: watchdog interrupt

`esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Enable timer interrupt.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

`esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Disable timer interrupt.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

`void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)`

Clear timer interrupt status, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_clr_intr_status_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Clear timer interrupt status, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_enable_alarm_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Enable alarm interrupt, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

uint64\_t `timer_group_get_counter_value_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`)

Get the current counter value, just used in ISR.

**Return**

- Counter value

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.

void `timer_group_set_alarm_value_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`,  
uint64\_t `alarm_val`)

Set the alarm threshold for the timer, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.
- `alarm_val`: Alarm threshold.

void `timer_group_set_counter_enable_in_isr` (*timer\_group\_t* `group_num`, *timer\_idx\_t* `timer_num`,  
*timer\_start\_t* `counter_en`)

Enable/disable a counter, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index.
- `counter_en`: Enable/disable.

*timer\_intr\_t* `timer_group_intr_get_in_isr` (*timer\_group\_t* `group_num`)

Get the masked interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

uint32\_t `timer_group_get_intr_status_in_isr` (*timer\_group\_t* `group_num`)

Get interrupt status, just used in ISR.

**Return**

- Interrupt status

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

void `timer_group_clr_intr_sta_in_isr` (*timer\_group\_t* `group_num`, *timer\_intr\_t* `intr_mask`)

Clear the masked interrupt status, just used in ISR.

**Parameters**

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `intr_mask`: Masked interrupt.

bool `timer_group_get_auto_reload_in_isr` (*timer\_group\_t* *group\_num*, *timer\_idx\_t* *timer\_num*)

Get auto reload enable status, just used in ISR.

#### Return

- True Auto reload enabled
- False Auto reload disabled

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- `timer_num`: Timer index

*esp\_err\_t* `timer_spinlock_take` (*timer\_group\_t* *group\_num*)

Take timer spinlock to enter critical protect.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

*esp\_err\_t* `timer_spinlock_give` (*timer\_group\_t* *group\_num*)

Give timer spinlock to exit critical protect.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `group_num`: Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

## Macros

`TIMER_BASE_CLK`

Frequency of the clock on the input of the timer groups

## Type Definitions

`typedef` bool (\**timer\_isr\_t*) (void \*)

Interrupt handle callback function. User need to retrun a bool value in callback.

#### Return

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

**Note** If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

`typedef` *intr\_handle\_t* `timer_isr_handle_t`

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

## Header File

- [hal/include/hal/timer\\_types.h](#)

## Structures

`struct` `timer_config_t`

Data structure with timer' s configuration settings.

### Public Members

*timer\_alarm\_t* **alarm\_en**

Timer alarm enable

*timer\_start\_t* **counter\_en**

Counter enable

*timer\_intr\_mode\_t* **intr\_type**

Interrupt mode

*timer\_count\_dir\_t* **counter\_dir**

Counter direction

*timer\_autoreload\_t* **auto\_reload**

Timer auto-reload

uint32\_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

*timer\_src\_clk\_t* **clk\_src**

Use XTAL as source clock.

### Enumerations

**enum timer\_group\_t**

Selects a Timer-Group out of 2 available groups.

*Values:*

**TIMER\_GROUP\_0 = 0**

Hw timer group 0

**TIMER\_GROUP\_1 = 1**

Hw timer group 1

**TIMER\_GROUP\_MAX**

**enum timer\_idx\_t**

Select a hardware timer from timer groups.

*Values:*

**TIMER\_0 = 0**

Select timer0 of GROUPx

**TIMER\_MAX**

**enum timer\_count\_dir\_t**

Decides the direction of counter.

*Values:*

**TIMER\_COUNT\_DOWN = 0**

Descending Count from cnt.hightcnt.low

**TIMER\_COUNT\_UP = 1**

Ascending Count from Zero

**TIMER\_COUNT\_MAX**

**enum timer\_start\_t**

Decides whether timer is on or paused.

*Values:*

**TIMER\_PAUSE = 0**

Pause timer counter

**TIMER\_START = 1**  
Start timer counter

**enum timer\_intr\_t**  
Interrupt types of the timer.

*Values:*

**TIMER\_INTR\_T0 = BIT(0)**  
interrupt of timer 0

**TIMER\_INTR\_WDT = BIT(1)**  
interrupt of watchdog

**TIMER\_INTR\_NONE = 0**

**enum timer\_alarm\_t**  
Decides whether to enable alarm mode.

*Values:*

**TIMER\_ALARM\_DIS = 0**  
Disable timer alarm

**TIMER\_ALARM\_EN = 1**  
Enable timer alarm

**TIMER\_ALARM\_MAX**

**enum timer\_intr\_mode\_t**  
Select interrupt type if running in alarm mode.

*Values:*

**TIMER\_INTR\_LEVEL = 0**  
Interrupt mode: level mode

**TIMER\_INTR\_MAX**

**enum timer\_autoreload\_t**  
Select if Alarm needs to be loaded by software or automatically reload by hardware.

*Values:*

**TIMER\_AUTORELOAD\_DIS = 0**  
Disable auto-reload: hardware will not load counter value after an alarm event

**TIMER\_AUTORELOAD\_EN = 1**  
Enable auto-reload: hardware will load counter value after an alarm event

**TIMER\_AUTORELOAD\_MAX**

**enum timer\_src\_clk\_t**  
Select timer source clock.

*Values:*

**TIMER\_SRC\_CLK\_APB = 0**  
Select APB as the source clock

**TIMER\_SRC\_CLK\_XTAL = 1**  
Select XTAL as the source clock

### 2.3.3 GPIO & RTC GPIO

#### Overview

The ESP32-C3 chip features 22 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-C3 Technical Reference Manual > IO MUX and GPIO*

*Matrix (GPIO, IO\_MUX)* [PDF]. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO12-17 are usually used for SPI flash.
- Note that GPIO 18 and 19 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
- ESP32-C3 doesn't have separate "RTC GPIO" support. However, GPIO0-5 keep the rtc feature, which can be used for power-management and analog subsystem.

### Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

### API Reference - Normal GPIO

#### Header File

- [driver/include/driver/gpio.h](#)

#### Functions

*esp\_err\_t gpio\_config* (*const gpio\_config\_t \*pGPIOConfig*)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

#### Return

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- pGPIOConfig: Pointer to GPIO configure struct

*esp\_err\_t gpio\_reset\_pin* (*gpio\_num\_t gpio\_num*)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP\_OK.

#### Parameters

- gpio\_num: GPIO number.

*esp\_err\_t gpio\_set\_intr\_type* (*gpio\_num\_t gpio\_num, gpio\_int\_type\_t intr\_type*)

GPIO set interrupt trigger type.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- gpio\_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- intr\_type: Interrupt type, select from gpio\_int\_type\_t

*esp\_err\_t gpio\_intr\_enable* (*gpio\_num\_t gpio\_num*)

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to section 3.11 of 'ECO\_and\_Workarounds\_for\_Bugs\_in\_ESP32' for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

#### Return

- ESP\_OK Success

- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* `gpio_num`)

Disable GPIO module interrupt signal.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* `gpio_num`, *uint32\_t* `level`)

GPIO set output level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

**Parameters**

- `gpio_num`: GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level`: Output level. 0: low ; 1: high

*int* **gpio\_get\_level** (*gpio\_num\_t* `gpio_num`)

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**

- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* `gpio_num`, *gpio\_mode\_t* `mode`)

GPIO set direction.

Configure GPIO direction, such as `output_only`, `input_only`, `output_and_input`

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode`: GPIO direction

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* `gpio_num`, *gpio\_pull\_mode\_t* `pull`)

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull`: GPIO pull up/down mode.

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number.
- intr\_type: GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)) void \*

, void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the [interrupt allocation functions](#).

**Parameters**

- fn: Interrupt handler function.
- intr\_alloc\_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- arg: Parameter for handler function
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-up on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- gpio\_num: GPIO number

*esp\_err\_t* **gpiopulldown\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-down on GPIO.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* `gpio_num`)

Disable pull-up on GPIO.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_install\_isr\_service** (*int* `intr_alloc_flags`)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Return**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_INVALID_ARG` GPIO error

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

*void* **gpio\_uninstall\_isr\_service** (*void*)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* `gpio_num`, *gpio\_isr\_t* `isr_handler`, *void \**`args`)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number
- `isr_handler`: ISR handler function for the corresponding GPIO number.
- `args`: parameter for ISR handler.

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* `gpio_num`)

Remove ISR handler for the corresponding GPIO pin.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* `strength`)

Set GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Drive capability of the pad

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* `gpio_num`, *gpio\_drive\_cap\_t* `*strength`)

Get GPIO pad drive capability.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: GPIO number, only support output GPIOs
- `strength`: Pointer to accept drive capability of the pad

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* `gpio_num`)

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

**Parameters**

- `gpio_num`: GPIO number, only support output-capable GPIOs

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* `gpio_num`)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

**Parameters**

- `gpio_num`: GPIO number, only support output-capable GPIOs

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pad hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t *gpio\_num*, uint32\_t *signal\_idx*)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- *gpio\_num*: GPIO number of the pad.
- *signal\_idx*: Peripheral signal id to input. One of the \*\_IN\_IDX signals in soc/gpio\_sig\_map.h.

void **gpio\_iomux\_out** (uint8\_t *gpio\_num*, int *func*, bool *oen\_inv*)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- *gpio\_num*: *gpio\_num* GPIO number of the pad.
- *func*: The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in soc/io\_mux\_reg.h.
- *oen\_inv*: True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold digital and rtc gpio pad.

**Note** GPIO force hold, whether the chip in sleep mode or wakeup mode.

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Force unhold digital and rtc gpio pad.

**Note** GPIO force unhold, whether the chip in sleep mode or wakeup mode.

*esp\_err\_t* **gpio\_sleep\_sel\_en** (*gpio\_num\_t* *gpio\_num*)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Return**

- ESP\_OK Success

**Parameters**

- *gpio\_num*: GPIO number of the pad.

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (*gpio\_num\_t* *gpio\_num*)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Return**

- ESP\_OK Success

**Parameters**

- *gpio\_num*: GPIO number of the pad.

*esp\_err\_t* **gpio\_sleep\_set\_direction** (*gpio\_num\_t* *gpio\_num*, *gpio\_mode\_t* *mode*)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

**Parameters**

- *gpio\_num*: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, *gpio\_num* should be GPIO\_NUM\_16 (16);
- *mode*: GPIO direction

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (*gpio\_num\_t* *gpio\_num*, *gpio\_pull\_mode\_t* *pull*)

Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull`: GPIO pull up/down mode.

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_enable** (*gpio\_num\_t* `gpio_num`, *gpio\_int\_type\_t* `intr_type`)

Enable GPIO deep-sleep wake-up function.

**Note** Called by the SDK. User shouldn't call this directly in the APP.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_disable** (*gpio\_num\_t* `gpio_num`)

Disable GPIO deep-sleep wake-up function.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `gpio_num`: GPIO number

## Macros

**GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (`gpio_num`)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (`gpio_num`)

Check whether it can be a valid GPIO number of output mode.

**GPIO\_IS\_VALID\_DIGITAL\_IO\_PAD** (`gpio_num`)

Check whether it can be a valid digital I/O pad.

**GPIO\_IS\_DEEP\_SLEEP\_WAKEUP\_VALID\_GPIO** (`gpio_num`)

### 2.3.4 HMAC

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

#### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

## HMAC on the ESP32-C3

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

### HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.

### HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

### HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.

4. Burn the “soft JTAG disable” bit by `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)`. This will permanently disable JTAG unless the correct key value is provided by software.

#### JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP(8)` means that this key can only be used for HMAC generation for software usage:

```
#include "esp32c3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                                     ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

## API Reference

### Header File

- `esp32c3/include/esp_hmac.h`

### Functions

`esp_err_t esp_hmac_calculate` (*hmac\_key\_id\_t* key\_id, **const** void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S2).

**Note** Uses the HMAC peripheral in “upstream” mode.

**Return**

- ESP\_OK, if the calculation was successful,
- ESP\_FAIL, if the hmac calculation failed

**Parameters**

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- `message`: the message for which to calculate the HMAC
- `message_len`: message length return ESP\_ERR\_INVALID\_STATE if unsuccessful
- `[out] hmac`: the hmac result; the buffer behind the provided pointer must be 32 bytes long

*esp\_err\_t* **esp\_hmac\_jtag\_enable** (*hmac\_key\_id\_t* `key_id`, **const** *uint8\_t* \*`token`)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Return**

- ESP\_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP\_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE\_HARD\_DIS\_JTAG eFuse parameter.
- ESP\_ERR\_INVALID\_ARG, invalid input arguments

**Parameters**

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- `token`: Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

*esp\_err\_t* **esp\_hmac\_jtag\_disable** (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable()` API.

**Return**

- ESP\_OK return ESP\_OK after writing the HMAC\_SET\_INVALIDATE\_JTAG\_REG with value 1.

## Enumerations

**enum** `hmac_key_id_t`

The possible efuse keys for the HMAC peripheral

*Values:*

**HMAC\_KEY0** = 0

**HMAC\_KEY1**

**HMAC\_KEY2**

**HMAC\_KEY3**

**HMAC\_KEY4**

**HMAC\_KEY5**

**HMAC\_KEY\_MAX**

### 2.3.5 Digital Signature

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

#### Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

---

**Note:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

#### Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC\_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC\_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the python script [configure\\_ds.py](#). More details about the *configure\_ds.py* script can be found at [mqtt example README](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. *Non Volatile Storage* can be used to store the encrypted private key parameters in flash. The script [configure\\_ds.py](#) creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-C3. The application then needs to read the DS data from NVS, which can be done with the function *esp\_read\_ds\_data\_from\_nvs* in file [ssl\\_mutual\\_auth/main/app\\_main.c](#)

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the *esp\_tls* context (as *ds\_data*), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

### Example for SSL Mutual Authentication using DS

The example [ssl\\_ds](#) shows how to use the DS peripheral for mutual authentication. The example uses *mqtt\_client* (Implemented through *ESP-MQTT*) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with *ESP-TLS*. See [example README](#) for more details.

## API Reference

### Header File

- [esp32s2/include/esp\\_ds.h](#)

### Functions

*esp\_err\_t* **esp\_ds\_sign** (**const** void \**message*, **const** *esp\_ds\_data\_t* \**data*, *hmac\_key\_id\_t* *key\_id*, void \**signature*)

Sign the message.

This function is a wrapper around *esp\_ds\_finish\_sign()* and *esp\_ds\_start\_sign()*, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

**Note** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

#### Return

- ESP\_OK if successful, the signature was written to the parameter *signature*.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or *data->rsa\_length* is too long or 0
- ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP\_ERR\_NO\_MEM if there hasn't been enough memory to allocate the context object
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY if there's a problem with passing the HMAC key to the DS component
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST if the message digest didn't match; the signature is invalid.
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

#### Parameters

- *message*: the message to be signed; its length is determined by *data->rsa\_length*
- *data*: the encrypted signing key data (AES encrypted RSA key + IV)

- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- `signature`: the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long

`esp_err_t esp_ds_start_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)`

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

**Note** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

#### Return

- `ESP_OK` if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component

#### Parameters

- `message`: the message to be signed; its length is determined by `data->rsa_length`
- `data`: the encrypted signing key data (AES encrypted RSA key + IV)
- `key_id`: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- `esp_ds_ctx`: the context object which is needed for finishing the signing process later

bool `esp_ds_is_busy`(void)

Return true if the DS peripheral is busy, otherwise false.

**Note** Only valid if `esp_ds_start_sign()` was called before.

`esp_err_t esp_ds_finish_sign(void *signature, esp_ds_context_t *esp_ds_ctx)`

Finish the signing process.

#### Return

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

#### Parameters

- `signature`: the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long
- `esp_ds_ctx`: the context object retrieved by `esp_ds_start_sign()`

`esp_err_t esp_ds_encrypt_params(esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)`

Encrypt the private key parameters.

#### Return

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `p_data->rsa_length` is too long

#### Parameters

- `data`: Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- `iv`: Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- `p_data`: Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.

- `key`: Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

### Structures

#### **struct esp\_digital\_signature\_data**

Encrypted private key data. Recommended to store in flash in this format.

**Note** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

### Public Members

#### *esp\_digital\_signature\_length\_t* **rsa\_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in `'c'`, or invalid results will be returned. (The DS peripheral will always use the value in `'c'`, not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

**Note** In IDF, the enum type `length` is the same as of type `unsigned`, so they can be used interchangeably. See the ROM code for the original declaration of `struct ets_ds_data_t`.

`uint8_t iv[ESP_DS_IV_LEN]`  
IV value used to encrypt `'c'`

`uint8_t c[ESP_DS_C_LEN]`  
Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

#### **struct esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

Not used for signing with DS peripheral, but can be encrypted in-device by calling `esp_ds_encrypt_params()`

**Note** This documentation is mostly taken from the ROM code.

### Public Members

`uint32_t Y[4096 / 32]`  
RSA exponent.

`uint32_t M[4096 / 32]`  
RSA modulus.

`uint32_t Rb[4096 / 32]`  
RSA r inverse operand.

`uint32_t M_prime`  
RSA M prime operand.

*esp\_digital\_signature\_length\_t* **length**  
RSA length.

### Macros

**ESP\_ERR\_HW\_CRYPT\_DS\_HMAC\_FAIL**  
HMAC peripheral problem

**ESP\_ERR\_HW\_CRYPT\_DS\_INVALID\_KEY**  
given HMAC key isn't correct, HMAC peripheral problem

**ESP\_ERR\_HW\_CRYPT\_DS\_INVALID\_DIGEST**  
message digest check failed, result is invalid

**ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING**

padding check failed, but result is produced anyway and can be read

**ESP\_DS\_IV\_LEN****ESP\_DS\_C\_LEN****Type Definitions**

```
typedef struct esp_ds_context esp_ds_context_t
```

```
typedef struct esp_digital_signature_data esp_ds_data_t
```

Encrypted private key data. Recommended to store in flash in this format.

**Note** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

**Enumerations**

```
enum esp_digital_signature_length_t
```

Values:

```
ESP_DS_RSA_1024 = (1024 / 32) - 1
```

```
ESP_DS_RSA_2048 = (2048 / 32) - 1
```

```
ESP_DS_RSA_3072 = (3072 / 32) - 1
```

```
ESP_DS_RSA_4096 = (4096 / 32) - 1
```

## 2.3.6 I2C Driver

**Warning:** This document is not updated for ESP32-C3 yet.

**Overview**

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C3 has only one I2C controller (also referred to as port) which is responsible for handling communications on I2C bus. The I2C controller can operate as master or slave.

**Driver Features**

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

**Driver Usage**

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver* - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item

- a) *Communication as Master* - handle communications (master)
- b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver* - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-C3's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,    // select frequency specific to your_
↳project
    // .clk_flags = 0,                          /*< Optional, you can use I2C_SCLK_SRC_FLAG_*_
↳flags to choose i2c source clock here. */
};
```

Configuration example (slave):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

**Source Clock Configuration** Clock sources allocator is added for supporting different clock sources (Master only). The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

Table 1: Characteristics of ESP32-C3 clock sources

Clock name	MAX freq for SCL frequency	Clock capabilities
XTAL	2 MHz	/
RTC	1 MHz	<code>I2C_SCLK_SRC_FLAG_AWARE_DFS</code> , <code>I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</code>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock's baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C3, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_system/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

ESP32-C3's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send  $n$  bytes to a slave.

Fig. 6: I2C command link - master write example

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`
  - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
  - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
  - d) **Stop bit** - `i2c_master_stop()`
 Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read  $n$  bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Fig. 7: I2C command link - master read example

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`  
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
- `i2c_slave_write_buffer()`  
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

**Interrupt Handling** During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32-C3 Technical Reference Manual > I2C Controller (I2C) > Interrupts* [PDF] for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the [I2C specification](#). Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

Table 2: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<a href="#"><i>i2c_set_period()</i></a>
SCL and SDA signal timing used during generation of <b>start</b> signals	<a href="#"><i>i2c_set_start_timing()</i></a>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<a href="#"><i>i2c_set_stop_timing()</i></a>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<a href="#"><i>i2c_set_data_timing()</i></a>
I2C timeout	<a href="#"><i>i2c_set_timeout()</i></a>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <a href="#"><i>i2c_trans_mode_t</i></a>	<a href="#"><i>i2c_set_data_mode()</i></a>

Each of the above functions has a *\_get\_* counterpart to check the currently set value. For example, to check the I2C timeout value, call [\*i2c\\_get\\_timeout\(\)\*](#).

To check the default parameter values which are set during the driver configuration process, please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function [\*i2c\\_set\\_pin\(\)\*](#). If you want to modify already entered values, use the function [\*i2c\\_param\\_config\(\)\*](#).

---

**Note:** ESP32-C3's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the [I2C specification](#).

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions [\*i2c\\_reset\\_tx\\_fifo\(\)\*](#) and [\*i2c\\_reset\\_rx\\_fifo\(\)\*](#) for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function [\*i2c\\_driver\\_install\(\)\*](#) and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling [\*i2c\\_driver\\_delete\(\)\*](#).

Before calling [\*i2c\\_driver\\_delete\(\)\*](#) to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

### Application Example

I2C master and slave example: [peripherals/i2c](#).

### API Reference

#### Header File

- [driver/include/driver/i2c.h](#)

**Functions**

***esp\_err\_t* i2c\_driver\_install** (*i2c\_port\_t* i2c\_num, *i2c\_mode\_t* mode, *size\_t* slv\_rx\_buf\_len, *size\_t* slv\_tx\_buf\_len, *int* intr\_alloc\_flags)

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver install error

**Parameters**

- `i2c_num`: I2C port number
- `mode`: I2C mode (master or slave)
- `slv_rx_buf_len`: receiving buffer size for slave mode

**Parameters**

- `slv_tx_buf_len`: sending buffer size for slave mode

**Parameters**

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

***esp\_err\_t* i2c\_driver\_delete** (*i2c\_port\_t* i2c\_num)

I2C driver delete.

**Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

***esp\_err\_t* i2c\_param\_config** (*i2c\_port\_t* i2c\_num, *const* *i2c\_config\_t* \*i2c\_conf)

I2C parameter initialization.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `i2c_conf`: pointer to I2C parameter settings

***esp\_err\_t* i2c\_reset\_tx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C tx hardware fifo

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

***esp\_err\_t* i2c\_reset\_rx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C rx fifo

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

*esp\_err\_t* **i2c\_isr\_register** (*i2c\_port\_t* *i2c\_num*, void (\**fn*)) void \*  
void \**arg*, int *intr\_alloc\_flags*, *intr\_handle\_t* \**handle*) I2C isr handler register.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *fn*: isr handler function
- *arg*: parameter for isr handler function
- *intr\_alloc\_flags*: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- *handle*: handle return from esp\_intr\_alloc.

*esp\_err\_t* **i2c\_isr\_free** (*intr\_handle\_t* *handle*)

to delete and free I2C isr.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *handle*: handle of isr.

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* *i2c\_num*, int *sda\_io\_num*, int *scl\_io\_num*, bool *sda\_pullup\_en*, bool  
*scl\_pullup\_en*, *i2c\_mode\_t* *mode*)

Configure GPIO signal for I2C sck and sda.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *sda\_io\_num*: GPIO number for I2C sda signal
- *scl\_io\_num*: GPIO number for I2C scl signal
- *sda\_pullup\_en*: Whether to enable the internal pullup for sda pin
- *scl\_pullup\_en*: Whether to enable the internal pullup for scl pin
- *mode*: I2C mode

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and init I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Return** i2c command link handler

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t* *cmd\_handle*)

Free I2C command link.

**Note** Before we build I2C command link, we need to call `i2c_cmd_link_create()` to create a command link. After we finish sending the commands, we need to call `i2c_cmd_link_delete()` to release and return the resources.

**Parameters**

- *cmd\_handle*: I2C command handle

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t* *cmd\_handle*)

Queue command for I2C master to generate a start signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *cmd\_handle*: I2C cmd link

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t data, bool ack\_en)

Queue command for I2C master to write one byte to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- cmd\_handle: I2C cmd link
- data: I2C one byte command to write to bus
- ack\_en: enable ack check for master

*esp\_err\_t* **i2c\_master\_write** (*i2c\_cmd\_handle\_t* cmd\_handle, const uint8\_t \*data, size\_t data\_len, bool ack\_en)

Queue command for I2C master to write buffer to I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr\_flag is ESP\_INTR\_FLAG\_IRAM, please use the memory allocated from internal RAM.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- cmd\_handle: I2C cmd link
- data: data to send

**Parameters**

- data\_len: data length
- ack\_en: enable ack check for master

*esp\_err\_t* **i2c\_master\_read\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, *i2c\_ack\_type\_t* ack)

Queue command for I2C master to read one byte from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr\_flag is ESP\_INTR\_FLAG\_IRAM, please use the memory allocated from internal RAM.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- cmd\_handle: I2C cmd link
- data: pointer accept the data byte

**Parameters**

- ack: ack value for read command

*esp\_err\_t* **i2c\_master\_read** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, size\_t data\_len, *i2c\_ack\_type\_t* ack)

Queue command for I2C master to read data from I2C bus.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Note** If the psram is enabled and intr\_flag is ESP\_INTR\_FLAG\_IRAM, please use the memory allocated from internal RAM.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- cmd\_handle: I2C cmd link
- data: data buffer to accept the data from bus

**Parameters**

- data\_len: read data length
- ack: ack value for read command

*esp\_err\_t* **i2c\_master\_stop** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue command for I2C master to generate a stop signal.

**Note** Only call this function in I2C master mode Call `i2c_master_cmd_begin()` to send all queued commands

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `cmd_handle`: I2C cmd link

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

**Note** Only call this function in I2C master mode

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave doesn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

**Parameters**

- `i2c_num`: I2C port number
- `cmd_handle`: I2C command handler
- `ticks_to_wait`: maximum wait ticks.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`

I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes that pushed to the I2C slave buffer.

**Parameters**

- `i2c_num`: I2C port number
- `data`: data pointer to write into internal buffer
- `size`: data size
- `ticks_to_wait`: Maximum waiting ticks

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`

I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes that read from I2C slave buffer.

**Parameters**

- `i2c_num`: I2C port number
- `data`: data pointer to accept data from internal buffer
- `max_size`: Maximum data size to read
- `ticks_to_wait`: Maximum waiting ticks

`esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)`  
set I2C master clock period

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `high_period`: clock cycle number during SCL is high level, `high_period` is a 14 bit value
- `low_period`: clock cycle number during SCL is low level, `low_period` is a 14 bit value

`esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)`

get I2C master clock period

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `high_period`: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- `low_period`: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

`esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)`

enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine broken. enable hardware filter can filter out high frequency interference and make the master more stable.

**Note** Enable filter will slow the SCL clock.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `cyc_num`: the APB cycles need to be filtered( $0 \leq cyc\_num \leq 7$ ). When the period of a pulse is less than  $cyc\_num * APB\_cycle$ , the I2C controller will ignore this pulse.

`esp_err_t i2c_filter_disable(i2c_port_t i2c_num)`

disable filter on I2C bus

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`

set I2C master start signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- `hold_time`: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`

get I2C master start signal timing

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `setup_time`: pointer to get setup time
- `hold_time`: pointer to get hold time

*esp\_err\_t* **i2c\_set\_stop\_timing** (*i2c\_port\_t* *i2c\_num*, int *setup\_time*, int *hold\_time*)  
set I2C master stop signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *setup\_time*: clock num between the rising-edge of SCL and the rising-edge of SDA, it's a 10-bit value.
- *hold\_time*: clock number after the STOP bit's rising-edge, it's a 14-bit value.

*esp\_err\_t* **i2c\_get\_stop\_timing** (*i2c\_port\_t* *i2c\_num*, int \**setup\_time*, int \**hold\_time*)  
get I2C master stop signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *setup\_time*: pointer to get setup time.
- *hold\_time*: pointer to get hold time.

*esp\_err\_t* **i2c\_set\_data\_timing** (*i2c\_port\_t* *i2c\_num*, int *sample\_time*, int *hold\_time*)  
set I2C data signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *sample\_time*: clock number I2C used to sample data on SDA after the rising-edge of SCL, it's a 10-bit value
- *hold\_time*: clock number I2C used to hold the data after the falling-edge of SCL, it's a 10-bit value

*esp\_err\_t* **i2c\_get\_data\_timing** (*i2c\_port\_t* *i2c\_num*, int \**sample\_time*, int \**hold\_time*)  
get I2C data signal timing

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *sample\_time*: pointer to get sample time
- *hold\_time*: pointer to get hold time

*esp\_err\_t* **i2c\_set\_timeout** (*i2c\_port\_t* *i2c\_num*, int *timeout*)  
set I2C timeout value

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- *i2c\_num*: I2C port number
- *timeout*: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

*esp\_err\_t* **i2c\_get\_timeout** (*i2c\_port\_t* *i2c\_num*, int \**timeout*)  
get I2C timeout value

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number
- `timeout`: pointer to get timeout value

`esp_err_t i2c_set_data_mode` (`i2c_port_t` `i2c_num`, `i2c_trans_mode_t` `tx_trans_mode`,  
`i2c_trans_mode_t` `rx_trans_mode`)

set I2C data transfer mode

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: I2C sending data mode
- `rx_trans_mode`: I2C receiving data mode

`esp_err_t i2c_get_data_mode` (`i2c_port_t` `i2c_num`, `i2c_trans_mode_t` `*tx_trans_mode`,  
`i2c_trans_mode_t` `*rx_trans_mode`)

get I2C data transfer mode

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

## Macros

### `I2C_APB_CLK_FREQ`

I2C source clock is APB clock, 80MHz

### `I2C_NUM_0`

I2C port 0

### `I2C_NUM_1`

I2C port 1

### `I2C_NUM_MAX`

I2C port max

## Type Definitions

`typedef void *i2c_cmd_handle_t`

I2C command handle

## Header File

- [hal/include/hal/i2c\\_types.h](#)

## Structures

`struct i2c_config_t`

I2C initialization parameters.

### Public Members

`i2c_mode_t mode`

I2C mode

int `sda_io_num`

GPIO number for I2C sda signal

**int scl\_io\_num**  
GPIO number for I2C scl signal

**bool sda\_pullup\_en**  
Internal GPIO pull mode for I2C sda signal

**bool scl\_pullup\_en**  
Internal GPIO pull mode for I2C scl signal

**uint32\_t clk\_speed**  
I2C clock frequency for master mode, (no higher than 1MHz for now)

**struct i2c\_config\_t::[anonymous]::[anonymous] master**  
I2C master config

**uint8\_t addr\_10bit\_en**  
I2C 10bit address mode enable for slave mode

**uint16\_t slave\_addr**  
I2C address for slave mode

**struct i2c\_config\_t::[anonymous]::[anonymous] slave**  
I2C slave config

**uint32\_t clk\_flags**  
Bitwise of I2C\_SCLK\_SRC\_FLAG\_\*\*FOR\_DFS\*\* for clk source choice

### Macros

#### **I2C\_SCLK\_SRC\_FLAG\_FOR\_NOMAL**

Any one clock source that is available for the specified frequency may be chosen

#### **I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS**

For REF tick clock, it won't change with APB.

#### **I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP**

For light sleep mode.

#### **I2C\_CLK\_FREQ\_MAX**

Use the highest speed that is available for the clock source picked by clk\_flags.

### Type Definitions

**typedef int i2c\_port\_t**

I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

### Enumerations

**enum i2c\_mode\_t**

*Values:*

**I2C\_MODE\_SLAVE = 0**

I2C slave mode

**I2C\_MODE\_MASTER**

I2C master mode

**I2C\_MODE\_MAX**

**enum i2c\_rw\_t**

*Values:*

**I2C\_MASTER\_WRITE = 0**

I2C write data

**I2C\_MASTER\_READ**

I2C read data

**enum i2c\_trans\_mode\_t**

*Values:*

**I2C\_DATA\_MODE\_MSB\_FIRST** = 0  
I2C data msb first

**I2C\_DATA\_MODE\_LSB\_FIRST** = 1  
I2C data lsb first

**I2C\_DATA\_MODE\_MAX**

**enum i2c\_addr\_mode\_t**

*Values:*

**I2C\_ADDR\_BIT\_7** = 0  
I2C 7bit address for slave mode

**I2C\_ADDR\_BIT\_10**  
I2C 10bit address for slave mode

**I2C\_ADDR\_BIT\_MAX**

**enum i2c\_ack\_type\_t**

*Values:*

**I2C\_MASTER\_ACK** = 0x0  
I2C ack for each byte read

**I2C\_MASTER\_NACK** = 0x1  
I2C nack for each byte read

**I2C\_MASTER\_LAST\_NACK** = 0x2  
I2C nack for the last byte

**I2C\_MASTER\_ACK\_MAX**

**enum i2c\_sclk\_t**

I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

*Values:*

**I2C\_SCLK\_DEFAULT** = 0  
I2C source clock not selected

**I2C\_SCLK\_XTAL**  
I2C source clock from XTAL, 40M

**I2C\_SCLK\_RTC**  
I2C source clock from 8M RTC, 8M

**I2C\_SCLK\_MAX**

### 2.3.7 I2S

**Warning:** This document is not updated for ESP32-C3 yet.

#### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

An I2S bus consists of the following lines:

- Bit clock line
- Channel select line

- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- Dedicated DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter's (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

---

**Note:** For high accuracy clock applications, use the APLL\_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL\_CLK clock source by setting `i2s_config_t::use_apll` to TRUE.

If `i2s_config_t::use_apll = TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true:  $0 < \text{MCLK}/\text{LRCK}/\text{channels}/\text{bits\_per\_sample} < 64$ .

---

## Functional Overview

**Installing the Driver** Install the I2S driver by calling the function `i2s_driver_install()` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Configuration example:

```
static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin()` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the I2S DMA Tx buffer, and then the data will be transmitted automatically.

```
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the I2S DMA Rx buffer, once the data is received by the I2S controller.

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install()` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

### Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there are two short configuration examples for the I2S driver.

#### I2S configuration

```
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
```

(continues on next page)

(continued from previous page)

```

        .dma_buf_len = 64,
        .use_apll = false
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 26,
    .ws_io_num = 25,
    .data_out_num = 22,
    .data_in_num = I2S_PIN_NO_CHANGE
};

...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↪driver

i2s_set_pin(i2s_num, &pin_config);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

### Configuring I2S to use internal DAC for analog output

```

#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT, /* the DAC module will only take_
↪the 8bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
↪driver

i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the_
↪internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

## API Reference

### Header File

- [driver/include/driver/i2s.h](#)

## Functions

*esp\_err\_t* **i2s\_set\_pin** (*i2s\_port\_t* *i2s\_num*, **const** *i2s\_pin\_config\_t* \**pin*)

Set I2S pin number.

Inside the pin configuration structure, set I2S\_PIN\_NO\_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

### Parameters

- *i2s\_num*: I2S\_NUM\_0 or I2S\_NUM\_1
- *pin*: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if \**pin* is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL IO error

*esp\_err\_t* **i2s\_set\_dac\_mode** (*i2s\_dac\_mode\_t* *dac\_mode*)

Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- *dac\_mode*: DAC mode configurations - see `i2s_dac_mode_t`

*esp\_err\_t* **i2s\_driver\_install** (*i2s\_port\_t* *i2s\_num*, **const** *i2s\_config\_t* \**i2s\_config*, int *queue\_size*, void \**i2s\_queue*)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

### Parameters

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1
- *i2s\_config*: I2S configurations - see `i2s_config_t` struct
- *queue\_size*: I2S event queue size/depth.
- *i2s\_queue*: I2S event queue handle, if set NULL, driver will not use an event queue.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

*esp\_err\_t* **i2s\_driver\_uninstall** (*i2s\_port\_t* *i2s\_num*)

Uninstall I2S driver.

### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

### Parameters

- *i2s\_num*: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t* **i2s\_write** (*i2s\_port\_t* *i2s\_num*, **const** void \**src*, size\_t *size*, size\_t \**bytes\_written*, TickType\_t *ticks\_to\_wait*)

Write data to I2S DMA transmit buffer.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1
- `src`: Source address to write from
- `size`: Size of data in bytes
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

`esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)`

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see [i2s\\_config\\_t](#)).

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1
- `src`: Source address to write from
- `size`: Size of data in bytes
- `src_bits`: Source audio bit
- `aim_bits`: Bit wanted, no more than 32, and must be greater than `src_bits`
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)`

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call `i2s_adc_enable` and `i2s_adc_disable` around the whole reading process, to prevent the data getting corrupted.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1
- `dest`: Destination address to read into
- `size`: Size of data in bytes
- `[out] bytes_read`: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- `ticks_to_wait`: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

`esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)`

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and [i2s\\_config\\_t](#) configuration parameters (number of

channels, bits\_per\_sample).

`bit_clock = rate * (number of channels) * bits_per_sample`

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1
- `rate`: I2S sample rate (ex: 8000, 44100...)

*esp\_err\_t i2s\_stop(i2s\_port\_t i2s\_num)*

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t i2s\_start(i2s\_port\_t i2s\_num)*

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t i2s\_zero\_dma\_buffer(i2s\_port\_t i2s\_num)*

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1

*esp\_err\_t i2s\_set\_clk(i2s\_port\_t i2s\_num, uint32\_t rate, i2s\_bits\_per\_sample\_t bits, i2s\_channel\_t ch)*

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM Out of memory

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1
- `rate`: I2S sample rate (ex: 8000, 44100...)
- `bits`: I2S bit width (I2S\_BITS\_PER\_SAMPLE\_16BIT, I2S\_BITS\_PER\_SAMPLE\_24BIT, I2S\_BITS\_PER\_SAMPLE\_32BIT)
- `ch`: I2S channel, (I2S\_CHANNEL\_MONO, I2S\_CHANNEL\_STEREO)

float *i2s\_get\_clk(i2s\_port\_t i2s\_num)*

get clock set on particular port number.

**Return**

- actual clock set by i2s driver

**Parameters**

- `i2s_num`: I2S\_NUM\_0, I2S\_NUM\_1

**Macros****I2S\_PIN\_NO\_CHANGE**

Use in `i2s_pin_config_t` for pins which should not be changed

**Type Definitions**

```
typedef intr_handle_t i2s_isr_handle_t
```

**Header File**

- `hal/include/hal/i2s_types.h`

**Structures**

```
struct i2s_config_t
```

I2S configuration parameters for `i2s_param_config` function.

**Public Members**

```
i2s_mode_t mode
```

I2S work mode

```
int sample_rate
```

I2S sample rate

```
i2s_bits_per_sample_t bits_per_sample
```

I2S bits per sample

```
i2s_channel_fmt_t channel_format
```

I2S channel format

```
i2s_comm_format_t communication_format
```

I2S communication format

```
int intr_alloc_flags
```

Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info

```
int dma_buf_count
```

I2S DMA Buffer Count

```
int dma_buf_len
```

I2S DMA Buffer Length

```
bool use_apll
```

I2S using APLL as main I2S clock, enable it to get accurate clock

```
bool tx_desc_auto_clear
```

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

```
int fixed_mclk
```

I2S using fixed MCLK output. If `use_apll = true` and `fixed_mclk > 0`, then the clock output for i2s is fixed and equal to the `fixed_mclk` value.

```
struct i2s_event_t
```

Event structure used in I2S event queue.

### Public Members

***i2s\_event\_type\_t* type**

I2S event type

**size\_t size**

I2S data size for I2S\_DATA event

**struct i2s\_pin\_config\_t**

I2S pin number for i2s\_set\_pin.

### Public Members

int **bck\_io\_num**

BCK in out pin

int **ws\_io\_num**

WS in out pin

int **data\_out\_num**

DATA out pin

int **data\_in\_num**

DATA in pin

### Enumerations

**enum i2s\_port\_t**

I2S port number, the max port number is (I2S\_NUM\_MAX -1).

*Values:*

**I2S\_NUM\_0 = 0**

I2S port 0

**I2S\_NUM\_MAX**

I2S port max

**enum i2s\_bits\_per\_sample\_t**

I2S bit width per sample.

*Values:*

**I2S\_BITS\_PER\_SAMPLE\_8BIT = 8**

I2S bits per sample: 8-bits

**I2S\_BITS\_PER\_SAMPLE\_16BIT = 16**

I2S bits per sample: 16-bits

**I2S\_BITS\_PER\_SAMPLE\_24BIT = 24**

I2S bits per sample: 24-bits

**I2S\_BITS\_PER\_SAMPLE\_32BIT = 32**

I2S bits per sample: 32-bits

**enum i2s\_channel\_t**

I2S channel.

*Values:*

**I2S\_CHANNEL\_MONO = 1**

I2S 1 channel (mono)

**I2S\_CHANNEL\_STEREO = 2**

I2S 2 channel (stereo)

**enum i2s\_comm\_format\_t**

I2S communication standard format.

*Values:***I2S\_COMM\_FORMAT\_STAND\_I2S = 0X01**

I2S communication I2S Philips standard, data launch at second BCK

**I2S\_COMM\_FORMAT\_STAND\_MSB = 0X02**

I2S communication MSB alignment standard, data launch at first BCK

**I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT = 0x04**

PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

**I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG = 0x0C**

PCM Long standard. The period of synchronization signal (WS) is channel\_bit\*bck cycles.

**I2S\_COMM\_FORMAT\_STAND\_MAX**

standard max

**I2S\_COMM\_FORMAT\_I2S = 0x01**

I2S communication format I2S, correspond to I2S\_COMM\_FORMAT\_STAND\_I2S

**I2S\_COMM\_FORMAT\_I2S\_MSB = 0x01**

I2S format MSB, (I2S\_COMM\_FORMAT\_I2S | I2S\_COMM\_FORMAT\_I2S\_MSB) correspond to I2S\_COMM\_FORMAT\_STAND\_I2S

**I2S\_COMM\_FORMAT\_I2S\_LSB = 0x02**

I2S format LSB, (I2S\_COMM\_FORMAT\_I2S | I2S\_COMM\_FORMAT\_I2S\_LSB) correspond to I2S\_COMM\_FORMAT\_STAND\_MSB

**I2S\_COMM\_FORMAT\_PCM = 0x04**

I2S communication format PCM, correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT

**I2S\_COMM\_FORMAT\_PCM\_SHORT = 0x04**

PCM Short, (I2S\_COMM\_FORMAT\_PCM | I2S\_COMM\_FORMAT\_PCM\_SHORT) correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_SHORT

**I2S\_COMM\_FORMAT\_PCM\_LONG = 0x08**

PCM Long, (I2S\_COMM\_FORMAT\_PCM | I2S\_COMM\_FORMAT\_PCM\_LONG) correspond to I2S\_COMM\_FORMAT\_STAND\_PCM\_LONG

**enum i2s\_channel\_fmt\_t**

I2S channel format type.

*Values:***I2S\_CHANNEL\_FMT\_RIGHT\_LEFT = 0x00****I2S\_CHANNEL\_FMT\_ALL\_RIGHT****I2S\_CHANNEL\_FMT\_ALL\_LEFT****I2S\_CHANNEL\_FMT\_ONLY\_RIGHT****I2S\_CHANNEL\_FMT\_ONLY\_LEFT****enum i2s\_mode\_t**

I2S Mode, default is I2S\_MODE\_MASTER | I2S\_MODE\_TX.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.*Values:***I2S\_MODE\_MASTER = 1**

Master mode

**I2S\_MODE\_SLAVE = 2**

Slave mode

**I2S\_MODE\_TX** = 4  
TX mode

**I2S\_MODE\_RX** = 8  
RX mode

**enum i2s\_clock\_src\_t**  
I2S source clock.

*Values:*

**I2S\_CLK\_D2CLK** = 0  
Clock from PLL\_D2\_CLK(160M)

**I2S\_CLK\_APLL**  
Clock from APLL

**enum i2s\_event\_type\_t**  
I2S event types.

*Values:*

**I2S\_EVENT\_DMA\_ERROR**

**I2S\_EVENT\_TX\_DONE**  
I2S DMA finish sent 1 buffer

**I2S\_EVENT\_RX\_DONE**  
I2S DMA finish received 1 buffer

**I2S\_EVENT\_MAX**  
I2S event max index

**enum i2s\_dac\_mode\_t**  
I2S DAC mode for `i2s_set_dac_mode`.

**Note** PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

**I2S\_DAC\_CHANNEL\_DISABLE** = 0  
Disable I2S built-in DAC signals

**I2S\_DAC\_CHANNEL\_RIGHT\_EN** = 1  
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

**I2S\_DAC\_CHANNEL\_LEFT\_EN** = 2  
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

**I2S\_DAC\_CHANNEL\_BOTH\_EN** = 0x3  
Enable both of the I2S built-in DAC channels.

**I2S\_DAC\_CHANNEL\_MAX** = 0x4  
I2S built-in DAC mode max index

## 2.3.8 LED Control

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

## Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C3 only supports configuring channels in “low speed” mode.

1. *Timer Configuration* by specifying the PWM signal’s frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 8: Key Settings of LED PWM Controller’s API

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section *Supported Range of Frequency and Duty Resolutions*.

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

---

**Note:** All the timers and channels in the ESP32-C3's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

---

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2^{**} \text{duty\_resolution}) - 1$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

## Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of  $\sim 0.012\%$  ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the *ESP32-C3 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]*).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

## Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc](#).

## API Reference

### Header File

- `driver/include/driver/ledc.h`

### Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

#### Parameters

- ledc\_conf: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

#### Return

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

**Parameters**

- `timer_conf`: Pointer of LEDC timer configure struct

*esp\_err\_t* **ledc\_update\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_set\_pin** (int *gpio\_num*, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `ledc_channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *uint32\_t* idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `idle_level`: Set output idle level after LEDC stops.

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, *uint32\_t* freq\_hz)

LEDC set channel frequency (Hz)

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`
- `freq_hz`: Set the LEDC frequency

*uint32\_t* **ledc\_get\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

**Return**

- 0 error
- Others Current LEDC frequency

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num`: LEDC timer index (0-3), select from `ledc_timer_t`

`esp_err_t ledc_set_duty_with_hpoint` (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t duty, uint32\_t hpoint*)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- `hpoint`: Set the LEDC hpoint value(max: `0xffff`)

`int ledc_get_hpoint` (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel*)

LEDC get hpoint value, the counter value when the output is set high level.

**Return**

- `LEDC_ERR_VAL` if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

`esp_err_t ledc_set_duty` (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t duty*)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

**Note** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$

`uint32_t ledc_get_duty` (*ledc\_mode\_t speed\_mode, ledc\_channel\_t channel*)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

**Return**

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- `fade_direction`: Set the direction of the gradient
- `step_num`: Set the number of the gradient
- `duty_cycle_num`: Set how many LEDC tick each time the gradient lasts
- `duty_scale`: Set gradient change amplitude

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)) void \*  
, void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

**Parameters**

- `fn`: Interrupt handler function.
- `arg`: User-supplied argument passed to the handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

**Return**

- (-1) Parameter error
- Other Current LEDC duty

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider`: Timer clock divide value, the timer clock is divided from the selected clock source
- `duty_resolution`: Resolution of duty setting in number of bits. The range of duty values is [0, (2\*\*duty\_resolution)]
- `clk_src`: Select LEDC source clock.

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* `speed_mode`, *ledc\_timer\_t* `timer_sel`)

Pause LEDC timer counter.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* `speed_mode`, *ledc\_timer\_t* `timer_sel`)

Resume LEDC timer.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* `speed_mode`, *ledc\_channel\_t* `channel`, *ledc\_timer\_t* `timer_sel`)

Bind LEDC channel with the selected timer.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* `speed_mode`, *ledc\_channel\_t* `channel`, *uint32\_t* `target_duty`, *uint32\_t* `scale`, *uint32\_t* `cycle_num`)

Set LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,

- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading  $[0, (2^{**}duty\_resolution) - 1]$
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

#### Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading.  $(0 - (2^{**} duty\_resolution - 1))$
- `max_fade_time_ms`: The maximum time of the fading ( ms ).

*esp\_err\_t* **ledc\_fade\_func\_install** (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function already installed.

#### Parameters

- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (`OR`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

void **ledc\_fade\_func\_uninstall** (void)

Uninstall LEDC fade function.

*esp\_err\_t* **ledc\_fade\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

#### Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0-7), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- `hpoint`: Set the LEDC hpoint value(max: 0xffff)

```
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel,
                                       uint32_t target_duty, uint32_t max_fade_time_ms,
                                       ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading.(  $0 - (2^{**}duty\_resolution - 1)$ ))
- `max_fade_time_ms`: The maximum time of the fading ( ms ).
- `fade_mode`: choose blocking or non-blocking mode

```
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel,
                                       uint32_t target_duty, uint32_t scale, uint32_t cy-
                                       cle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

**Parameters**

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0-7), select from `ledc_channel_t`
- `target_duty`: Target duty of fading  $[0, (2^{**}duty\_resolution) - 1]$
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles
- `fade_mode`: choose blocking or non-blocking mode

**Macros**

`LEDC_APB_CLK_HZ`

`LEDC_REF_CLK_HZ`

`LEDC_ERR_DUTY`

`LEDC_ERR_VAL`

## Type Definitions

```
typedef intr_handle_t ledc_isr_handle_t
```

## Header File

## Structures

```
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for `ledc_channel_config` function.

### Public Members

```
int gpio_num
```

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

```
ledc_mode_t speed_mode
```

LEDC speed `speed_mode`, high-speed mode or low-speed mode

```
ledc_channel_t channel
```

LEDC channel (0 - 7)

```
ledc_intr_type_t intr_type
```

configure interrupt, Fade interrupt enable or Fade interrupt disable

```
ledc_timer_t timer_sel
```

Select the timer source of channel (0 - 3)

```
uint32_t duty
```

LEDC channel duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$

```
int hpoint
```

LEDC channel `hpoint` value, the max value is `0xffff`

```
struct ledc_timer_config_t
```

Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

### Public Members

```
ledc_mode_t speed_mode
```

LEDC speed `speed_mode`, high-speed mode or low-speed mode

```
ledc_timer_bit_t duty_resolution
```

LEDC channel duty resolution

```
ledc_timer_bit_t bit_num
```

Deprecated in ESP-IDF 3.0. This is an alias to ‘`duty_resolution`’ for backward compatibility with ESP-IDF 2.1

```
ledc_timer_t timer_num
```

The timer source of channel (0 - 3)

```
uint32_t freq_hz
```

LEDC timer frequency (Hz)

```
ledc_clk_cfg_t clk_cfg
```

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`

**LEDC\_TIMER\_14\_BIT**  
LEDC PWM duty resolution of 14 bits

**LEDC\_TIMER\_BIT\_MAX**

**enum ledc\_fade\_mode\_t**

*Values:*

**LEDC\_FADE\_NO\_WAIT = 0**  
LEDC fade function will return immediately

**LEDC\_FADE\_WAIT\_DONE**  
LEDC fade function will block until fading to the target duty

**LEDC\_FADE\_MAX**

### 2.3.9 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

Fig. 9: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. [Configure Driver](#)
2. [Transmit Data](#) or [Receive Data](#)
3. [Change Operation Parameters](#)
4. [Use Interrupts](#)

Fig. 10: RMT Receiver Overview

The RMT has four channels numbered from zero to three. The first half (i.e. Channel 0 ~ 1) channels can only be configured for transmitting, and the other half (i.e. Channel 2 ~ 3) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

### Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

### Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt\_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio\_num**.
- How many **memory blocks** will be used by the channel, set with **mem\_block\_num**.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
  - When **RMT\_CHANNEL\_FLAGS\_AWARE\_DFS** is set, RMT channel will take REF\_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See [power\\_management](#) for more information.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk\_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT\_CHANNEL\_FLAGS\_AWARE\_DFS** is set in **flags**, RMT source clock is changed to REF\_TICK or XTAL.

---

**Note:** The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

---

There are also couple of specific parameters that should be set up depending if selected channel is configured in [Transmit Mode](#) or [Receive Mode](#):

**Transmit Mode** When configuring channel in transmit mode, set **tx\_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop\_en**
- Enable the RMT carrier signal - **carrier\_en**
- Frequency of the carrier in Hz - **carrier\_freq\_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier\_duty\_percent**

- Level of the RMT output, when the carrier is applied - **carrier\_level**
- Enable the RMT output if idle - **idle\_output\_en**
- Set the signal level on the RMT output if idle - **idle\_level**

**Receive Mode** In receive mode, set **rx\_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter\_en**
- A threshold of the filter, set in the number of ticks - **filter\_ticks\_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle\_threshold**. The receiver will ignore pulses longer than this setting.

**Finalize Configuration** Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is  $> 0$ , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either *Transmit Data* or *Receive Data*. This is described in next two sections.

### Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

Fig. 11: Structure of RMT items (L - signal level)

For a simple example how to define a block of items see [peripherals/rmt/morse\\_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller's internal memory, see `rmt_set_mem_block_num()`.

### Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 192 x 32-bits of internal RAM shared between all four channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in [peripherals/rmt/ir\\_protocols](#).

To stop the receiver, call `rmt_rx_stop()`.

### Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

### Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

### Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

### Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

### Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

---

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

---

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32c3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

**Warning:** It's not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

## Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

## Application Examples

- Using RMT to send morse code: [peripherals/rmt/morse\\_code](#).
- Using RMT to drive RGB LED strip: [peripherals/rmt/led\\_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir\\_protocols](#).
- Musical buzzer example: [peripherals/rmt/musical\\_buzzer](#).

## API Reference

### Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `div_cnt`: RMT counter clock divider

*esp\_err\_t* **rmt\_get\_clk\_div**(*rmt\_channel\_t* channel, uint8\_t \*div\_cnt)

Get RMT clock divider, channel clock is divided from source clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- div\_cnt: pointer to accept RMT counter divider

*esp\_err\_t* **rmt\_set\_rx\_idle\_thresh**(*rmt\_channel\_t* channel, uint16\_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- thresh: RMT RX idle threshold

*esp\_err\_t* **rmt\_get\_rx\_idle\_thresh**(*rmt\_channel\_t* channel, uint16\_t \*thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

*esp\_err\_t* **rmt\_set\_mem\_block\_num**(*rmt\_channel\_t* channel, uint8\_t rmt\_mem\_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start\_addr\_CHn to end\_addr\_CHn, which are defined by: Memory block start address is RMT\_CHANNEL\_MEM(n) (in soc/rmt\_reg.h), that is, start\_addr\_chn = RMT base address + 0x800 + 64 \* 4 \* n, and end\_addr\_chn = RMT base address + 0x800 + 64 \* 4 \* n + 64 \* 4 \* RMT\_MEM\_SIZE\_CHn mod 512 \* 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_mem\_num: RMT RX memory block number, one block has 64 \* 32 bits.

*esp\_err\_t* **rmt\_get\_mem\_block\_num**(*rmt\_channel\_t* channel, uint8\_t \*rmt\_mem\_num)

Get RMT memory block number.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `rmt_mem_num`: Pointer to accept RMT RX memory block number

`esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)`

Configure RMT carrier for TX signal.

Set different values for `carrier_high` and `carrier_low` to set different frequency of carrier. The unit of `carrier_high/low` is the source clock tick, not the divided channel counter clock.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `carrier_en`: Whether to enable output carrier.
- `high_level`: High level duration of carrier
- `low_level`: Low level duration of carrier.
- `carrier_level`: Configure the way carrier wave is modulated for channel.
  - 1' b1:transmit on low output level
  - 1' b0:transmit on high output level

`esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)`

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `pd_en`: RMT memory low power enable.

`esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)`

Get RMT memory low power mode.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `pd_en`: Pointer to accept RMT memory low power mode.

`esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)`

Set RMT start sending data from memory.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `tx_idx_rst`: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

`esp_err_t rmt_tx_stop(rmt_channel_t channel)`

Set RMT stop sending.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel

*esp\_err\_t* **rmt\_rx\_start** (*rmt\_channel\_t* channel, bool rx\_idx\_rst)

Set RMT start receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rx\_idx\_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

*esp\_err\_t* **rmt\_rx\_stop** (*rmt\_channel\_t* channel)

Set RMT stop receiving data.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_tx\_memory\_reset** (*rmt\_channel\_t* channel)

Reset RMT TX memory.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_rx\_memory\_reset** (*rmt\_channel\_t* channel)

Reset RMT RX memory.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_set\_memory\_owner** (*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* owner)

Set RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- owner: To set when the transmitter or receiver can process the memory of channel.

*esp\_err\_t* **rmt\_get\_memory\_owner** (*rmt\_channel\_t* channel, *rmt\_mem\_owner\_t* \*owner)

Get RMT memory owner.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- owner: Pointer to get memory owner.

*esp\_err\_t* **rmt\_set\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool loop\_en)

Set RMT tx loop mode.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

*esp\_err\_t* **rmt\_get\_tx\_loop\_mode** (*rmt\_channel\_t* channel, bool \*loop\_en)

Get RMT tx loop mode.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `loop_en`: Pointer to accept RMT transmitter loop sending mode.

*esp\_err\_t* **rmt\_set\_rx\_filter** (*rmt\_channel\_t* channel, bool rx\_filter\_en, uint8\_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `rx_filter_en`: To enable RMT receiver filter.
- `thresh`: Threshold of pulse width for receiver.

*esp\_err\_t* **rmt\_set\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* base\_clk)

Set RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `base_clk`: To choose source clock for RMT module.

*esp\_err\_t* **rmt\_get\_source\_clk** (*rmt\_channel\_t* channel, *rmt\_source\_clk\_t* \*src\_clk)

Get RMT source clock.

RMT module has two clock sources:

1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `src_clk`: Pointer to accept source clock for RMT module.

*esp\_err\_t* **rmt\_set\_idle\_level** (*rmt\_channel\_t* channel, bool idle\_out\_en, *rmt\_idle\_level\_t* level)

Set RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel

- `idle_out_en`: To enable idle level output.
- `level`: To set the output signal's level for channel in idle state.

`esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)`

Get RMT idle output level for transmitter.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `idle_out_en`: Pointer to accept value of enable idle.
- `level`: Pointer to accept value of output signal's level in idle state for specified channel.

`esp_err_t rmt_get_status(rmt_channel_t channel, uint32_t *status)`

Get RMT status.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `status`: Pointer to accept channel status. Please refer to `RMT_CHnSTATUS_REG(n=0~7)` in `rmt_reg.h` for more details of each field.

`esp_err_t rmt_set_rx_intr_en(rmt_channel_t channel, bool en)`

Set RMT RX interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable RX interrupt.

`esp_err_t rmt_set_err_intr_en(rmt_channel_t channel, bool en)`

Set RMT RX error interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable RX err interrupt.

`esp_err_t rmt_set_tx_intr_en(rmt_channel_t channel, bool en)`

Set RMT TX interrupt enable.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `en`: enable or disable TX interrupt.

`esp_err_t rmt_set_tx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)`

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel

- `en`: enable or disable TX event interrupt.
- `evt_thresh`: RMT event interrupt threshold value

`esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`

Set RMT pin.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `mode`: TX or RX mode for RMT
- `gpio_num`: GPIO number to transmit or receive the signal.

`esp_err_t rmt_config(const rmt_config_t *rmt_param)`

Configure RMT parameters.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `rmt_param`: RMT parameter struct

`esp_err_t rmt_isr_register(void (*fn)) void *`

, void \*arg, int intr\_alloc\_flags, rmt\_isr\_handle\_t \*handle Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.
- `ESP_FAIL` System driver installed, can not register ISR handler for RMT

#### Parameters

- `fn`: Interrupt handler function.
- `arg`: Parameter for the handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- `handle`: If non-zero, a handle to later clean up the ISR gets stored here.

`esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)`

Deregister previously registered RMT interrupt handler.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Handle invalid

#### Parameters

- `handle`: Handle obtained from `rmt_isr_register`

`esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)`

Fill memory data of channel with given RMT items.

#### Return

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

#### Parameters

- `channel`: RMT channel
- `item`: Pointer of items.
- `item_num`: RMT sending items number.
- `mem_offset`: Index offset of memory.

*esp\_err\_t* **rmt\_driver\_install** (*rmt\_channel\_t* channel, size\_t rx\_buf\_size, int intr\_alloc\_flags)

Initialize RMT driver.

**Return**

- ESP\_ERR\_INVALID\_STATE Driver is already installed, call rmt\_driver\_uninstall first.
- ESP\_ERR\_NO\_MEM Memory allocation failure
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rx\_buf\_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr\_alloc\_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp\_intr\_alloc.h for details. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.

*esp\_err\_t* **rmt\_driver\_uninstall** (*rmt\_channel\_t* channel)

Uninstall RMT driver.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_get\_channel\_status** (*rmt\_channel\_status\_result\_t* \*channel\_status)

Get the current status of eight channels.

**Note** Do not call this function if it is possible that rmt\_driver\_uninstall will be called at the same time.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- [out] channel\_status: store the current status of each channel

*esp\_err\_t* **rmt\_get\_counter\_clock** (*rmt\_channel\_t* channel, uint32\_t \*clock\_hz)

Get speed of channel's internal counter clock.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- [out] clock\_hz: counter clock speed, in hz

*esp\_err\_t* **rmt\_write\_items** (*rmt\_channel\_t* channel, const rmt\_item32\_t \*rmt\_item, int item\_num, bool wait\_tx\_done)

RMT send waveform from rmt\_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait\_tx\_done is set to true, this function will block and will not return until all items have been sent out. If wait\_tx\_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- rmt\_item: head point of RMT items array. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.

- `item_num`: RMT data item number.
- `wait_tx_done`:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

*esp\_err\_t* **rmt\_wait\_tx\_done** (*rmt\_channel\_t* channel, TickType\_t wait\_time)

Wait RMT TX finished.

**Return**

- `ESP_OK` RMT Tx done successfully
- `ESP_ERR_TIMEOUT` Exceeded the 'wait\_time' given
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

**Parameters**

- `channel`: RMT channel
- `wait_time`: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with `ESP_ERR_TIMEOUT` if TX is busy (polling).

*esp\_err\_t* **rmt\_get\_ringbuf\_handle** (*rmt\_channel\_t* channel, RingbufHandle\_t \*buf\_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

**Parameters**

- `channel`: RMT channel
- `buf_handle`: Pointer to buffer handle to accept RX ringbuffer handle.

*esp\_err\_t* **rmt\_translator\_init** (*rmt\_channel\_t* channel, *sample\_to\_rmt\_t* fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**

- `ESP_FAIL` Init fail.
- `ESP_OK` Init success.

**Parameters**

- `channel`: RMT channel .
- `fn`: Point to the data conversion function.

*esp\_err\_t* **rmt\_translator\_set\_context** (*rmt\_channel\_t* channel, void \*context)

Set user context for the translator of specific channel.

**Return**

- `ESP_FAIL` Set context fail
- `ESP_OK` Set context success

**Parameters**

- `channel`: RMT channel number
- `context`: User context

*esp\_err\_t* **rmt\_translator\_get\_context** (const size\_t \*item\_num, void \*\*context)

Get the user context set by 'rmt\_translator\_set\_context' .

**Note** This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter 'item\_num' you got in that callback function.

**Return**

- `ESP_FAIL` Get context fail
- `ESP_OK` Get context success

**Parameters**

- `item_num`: Address of the memory which contains the number of translated items (It' s from driver' s internal memroy)
- `context`: Returned User context

*esp\_err\_t* **rmt\_write\_sample**(*rmt\_channel\_t* channel, **const** uint8\_t \*src, size\_t src\_size, bool wait\_tx\_done)

Translate uint8\_t type of data into rmt format and send it out. Requires rmt\_translator\_init to init the translator first.

**Return**

- ESP\_FAIL Send fail
- ESP\_OK Send success

**Parameters**

- channel: RMT channel .
- src: Pointer to the raw data.
- src\_size: The size of the raw data.
- wait\_tx\_done: Set true to wait all data send done.

*rmt\_tx\_end\_callback\_t* **rmt\_register\_tx\_end\_callback**(*rmt\_tx\_end\_fn\_t* function, void \*arg)

Registers a callback that will be called when transmission ends.

Called by rmt\_driver\_isr\_default in interrupt context.

**Note** Requires rmt\_driver\_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**

- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

*esp\_err\_t* **rmt\_set\_rx\_thr\_intr\_en**(*rmt\_channel\_t* channel, bool en, uint16\_t evt\_thresh)

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- en: enable or disable RX event interrupt.
- evt\_thresh: RMT event interrupt threshold value

*esp\_err\_t* **rmt\_add\_channel\_to\_group**(*rmt\_channel\_t* channel)

Add channel into a group (channels in the same group will transmit simultaneously)

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_remove\_channel\_from\_group**(*rmt\_channel\_t* channel)

Remove channel out of a group.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

*esp\_err\_t* **rmt\_set\_tx\_loop\_count**(*rmt\_channel\_t* channel, uint32\_t count)

Set loop count for RMT TX channel.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel
- count: loop count

*esp\_err\_t* **rmt\_memory\_rw\_rst** (*rmt\_channel\_t* channel)

Reset RMT TX/RX memory index.

**Return**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

**Parameters**

- channel: RMT channel

void **rmt\_set\_intr\_enable\_mask** (uint32\_t mask)

Set mask value to RMT interrupt enable register.

**Parameters**

- mask: Bit mask to set to the register

void **rmt\_clr\_intr\_enable\_mask** (uint32\_t mask)

Clear mask value to RMT interrupt enable register.

**Parameters**

- mask: Bit mask to clear the register

### Structures

**struct rmt\_tx\_config\_t**

Data struct of RMT TX configure parameters.

### Public Members

uint32\_t **carrier\_freq\_hz**

RMT carrier frequency

*rmt\_carrier\_level\_t* **carrier\_level**

Level of the RMT output, when the carrier is applied

*rmt\_idle\_level\_t* **idle\_level**

RMT idle level

uint8\_t **carrier\_duty\_percent**

RMT carrier duty (%)

uint32\_t **loop\_count**

Maximum loop count

bool **carrier\_en**

RMT carrier enable

bool **loop\_en**

Enable sending RMT items in a loop

bool **idle\_output\_en**

RMT idle level output enable

**struct rmt\_rx\_config\_t**

Data struct of RMT RX configure parameters.

### Public Members

uint16\_t **idle\_threshold**

RMT RX idle threshold

uint8\_t **filter\_ticks\_thresh**

RMT filter tick number

bool **filter\_en**

RMT receiver filter enable

bool **rm\_carrier**  
RMT receiver remove carrier enable

uint32\_t **carrier\_freq\_hz**  
RMT carrier frequency

uint8\_t **carrier\_duty\_percent**  
RMT carrier duty (%)

*rmt\_carrier\_level\_t* **carrier\_level**  
The level to remove the carrier

**struct rmt\_config\_t**  
Data struct of RMT configure parameters.

### Public Members

*rmt\_mode\_t* **rmt\_mode**  
RMT mode: transmitter or receiver

*rmt\_channel\_t* **channel**  
RMT channel

*gpio\_num\_t* **gpio\_num**  
RMT GPIO number

uint8\_t **clk\_div**  
RMT channel counter divider

uint8\_t **mem\_block\_num**  
RMT memory block number

uint32\_t **flags**  
RMT channel extra configurations, OR' d with RMT\_CHANNEL\_FLAGS\_[\*]

*rmt\_tx\_config\_t* **tx\_config**  
RMT TX parameter

*rmt\_rx\_config\_t* **rx\_config**  
RMT RX parameter

**struct rmt\_tx\_end\_callback\_t**  
Structure encapsulating a RMT TX end callback.

### Public Members

*rmt\_tx\_end\_fn\_t* **function**  
Function which is called on RMT TX end

void \***arg**  
Optional argument passed to function

### Macros

**RMT\_CHANNEL\_FLAGS\_AWARE\_DFS**  
Channel can work during APB clock scaling

**RMT\_MEM\_ITEM\_NUM**  
Define memory space of each RMT channel (in words = 4 bytes)

**RMT\_DEFAULT\_CONFIG\_TX** (gpio, channel\_id)  
Default configuration for Tx channel.

**RMT\_DEFAULT\_CONFIG\_RX** (gpio, channel\_id)  
Default configuration for RX channel.

### Type Definitions

**typedef** *intr\_handle\_t* **rmt\_isr\_handle\_t**

RMT interrupt handle.

**typedef** void (\**rmt\_tx\_end\_fn\_t*) (*rmt\_channel\_t* channel, void \*arg)

Type of RMT Tx End callback function.

**typedef** void (\**sample\_to\_rmt\_t*) (**const** void \*src, *rmt\_item32\_t* \*dest, *size\_t* src\_size, *size\_t* wanted\_num, *size\_t* \*translated\_size, *size\_t* \*item\_num)

User callback function to convert *uint8\_t* type data to rmt format(*rmt\_item32\_t*).

This function may be called from an ISR, so, the code should be short and efficient.

**Note** In fact, *item\_num* should be a multiple of *translated\_size*, e.g. : When we convert each byte of *uint8\_t* type data to rmt format data, the relation between *item\_num* and *translated\_size* should be  $item\_num = translated\_size * 8$ .

### Parameters

- *src*: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- [out] *dest*: Pointer to the buffer storing the rmt format data.
- *src\_size*: The raw data size.
- *wanted\_num*: The number of rmt format data that wanted to get.
- [out] *translated\_size*: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- [out] *item\_num*: The number of the rmt format data that actually converted to, it can be less than *wanted\_num* if there is not enough raw data, but cannot exceed *wanted\_num*. it should return 0 if no data was converted.

### Header File

- [hal/include/hal/rmt\\_types.h](#)

### Structures

**struct** *rmt\_channel\_status\_result\_t*

Data struct of RMT channel status.

### Public Members

*rmt\_channel\_status\_t* **status**[**RMT\_CHANNEL\_MAX**]

Store the current status of each channel

### Enumerations

**enum** *rmt\_channel\_t*

RMT channel ID.

*Values:*

**RMT\_CHANNEL\_0**

RMT channel number 0

**RMT\_CHANNEL\_1**

RMT channel number 1

**RMT\_CHANNEL\_2**

RMT channel number 2

**RMT\_CHANNEL\_3**

RMT channel number 3

**RMT\_CHANNEL\_MAX**

Number of RMT channels

**enum rmt\_mem\_owner\_t**

RMT Internal Memory Owner.

*Values:***RMT\_MEM\_OWNER\_TX**

RMT RX mode, RMT transmitter owns the memory block

**RMT\_MEM\_OWNER\_RX**

RMT RX mode, RMT receiver owns the memory block

**RMT\_MEM\_OWNER\_MAX****enum rmt\_source\_clk\_t**

Clock Source of RMT Channel.

*Values:***RMT\_BASECLK\_APB = 1**

RMT source clock is APB CLK, 80Mhz by default

**RMT\_BASECLK\_XTAL = 3**

RMT source clock is XTAL clock, 40Mhz by default

**RMT\_BASECLK\_MAX****enum rmt\_data\_mode\_t**

RMT Data Mode.

**Note** We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.*Values:***RMT\_DATA\_MODE\_FIFO****RMT\_DATA\_MODE\_MEM****RMT\_DATA\_MODE\_MAX****enum rmt\_mode\_t**

RMT Channel Working Mode (TX or RX)

*Values:***RMT\_MODE\_TX**

RMT TX mode

**RMT\_MODE\_RX**

RMT RX mode

**RMT\_MODE\_MAX****enum rmt\_idle\_level\_t**

RMT Idle Level.

*Values:***RMT\_IDLE\_LEVEL\_LOW**

RMT TX idle level: low Level

**RMT\_IDLE\_LEVEL\_HIGH**

RMT TX idle level: high Level

**RMT\_IDLE\_LEVEL\_MAX****enum rmt\_carrier\_level\_t**

RMT Carrier Level.

*Values:*

**RMT\_CARRIER\_LEVEL\_LOW**

RMT carrier wave is modulated for low Level output

**RMT\_CARRIER\_LEVEL\_HIGH**

RMT carrier wave is modulated for high Level output

**RMT\_CARRIER\_LEVEL\_MAX**

**enum rmt\_channel\_status\_t**

RMT Channel Status.

*Values:*

**RMT\_CHANNEL\_UNINIT**

RMT channel uninitialized

**RMT\_CHANNEL\_IDLE**

RMT channel status idle

**RMT\_CHANNEL\_BUSY**

RMT channel status busy

## 2.3.10 SD SPI Host Driver

### Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi\_dev\_handle\_t spi\_handle* returned when attaching the device to an SPI bus by calling *sdspi\_host\_init\_device*. The bus should be already initialized before (by *spi\_bus\_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro *SDSPI\_DEVICE\_CONFIG\_DEFAULT* to initialize a structure *sdmmc\_slot\_config\_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi\_host\_init\_device* to initialize the SD SPI device and attach to its bus.

Then use *SDSPI\_HOST\_DEFAULT* macro to initialize a *sdmmc\_host\_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device *spi\_handle* just returned from *sdspi\_host\_init\_device*. Call *sdmmc\_card\_init* with the *sdmmc\_host\_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

### Other Details

Only the following driver's API functions are normally used by most applications:

- *sdspi\_host\_init()*
- *sdspi\_host\_init\_device()*
- *sdspi\_host\_remove\_device()*
- *sdspi\_host\_deinit()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc\_host\_t* structure. For more details, see *the SD/SDIO/MMC Driver*.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

## API Reference

### Header File

- `driver/include/driver/sdsp_i_host.h`

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

**Note** This function is not thread safe

#### Return

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` \*`dev_config`, `sdspi_dev_handle_t` \*`out_handle`)

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe

**Note** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `sdspi_host_init_device` has invalid arguments
- `ESP_ERR_NO_MEM` if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

#### Parameters

- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

`esp_err_t sdspi_host_remove_device` (`sdspi_dev_handle_t` `handle`)

Remove an SD SPI device.

**Return** Always `ESP_OK`

#### Parameters

- `handle`: Handle of the SD SPI device

`esp_err_t sdspi_host_do_transaction` (`sdspi_dev_handle_t` `handle`, `sdmmc_command_t` \*`cmdinfo`)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

#### Return

- `ESP_OK` on success
- `ESP_ERR_TIMEOUT` if response or data transfer has timed out
- `ESP_ERR_INVALID_CRC` if response or data transfer CRC check has failed
- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response

#### Parameters

- `handle`: Handle of the sdspi device
- `cmdinfo`: pointer to structure describing command and data to transfer

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**

- ESP\_OK on success
- other error codes may be returned in the future

**Parameters**

- host: Handle of the sdspi device
- freq\_khz: card clock frequency, in kHz

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

**Note** This function is not thread safe

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Return**

- ESP\_OK on success

**Parameters**

- handle: Handle of the sdspi device

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

**Return**

- ESP\_OK on success

**Parameters**

- handle: Handle of the sdspi device
- timeout\_ticks: Ticks to wait before timeout.

*esp\_err\_t* **sdspi\_host\_init\_slot** (int slot, const *sdspi\_slot\_config\_t* \*slot\_config)

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**

- slot: SPI controller to use (SPI2\_HOST or SPI3\_HOST)
- slot\_config: pointer to slot configuration structure

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_init_slot` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

## Structures

**struct** **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

### Public Members

*spi\_host\_device\_t* **host\_id**  
SPI host to use, SPIx\_HOST (see spi\_types.h).

*gpio\_num\_t* **gpio\_cs**  
GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**  
GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**  
GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**  
GPIO number of interrupt line (input) for SDIO card.

**struct sdspi\_slot\_config\_t**  
Extra configuration for SPI host.

### Public Members

*gpio\_num\_t* **gpio\_cs**  
GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**  
GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**  
GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**  
GPIO number of interrupt line (input) for SDIO card.

*gpio\_num\_t* **gpio\_miso**  
GPIO number of MISO signal.

*gpio\_num\_t* **gpio\_mosi**  
GPIO number of MOSI signal.

*gpio\_num\_t* **gpio\_sck**  
GPIO number of SCK signal.

int **dma\_channel**  
DMA channel to be used by SPI driver (1 or 2).

### Macros

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_HOST\_DEFAULT** ()

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by *sdspi\_host\_init\_device* ().

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_DEVICE\_CONFIG\_DEFAULT** ()

Macro defining default configuration of SD SPI device.

**SDSPI\_SLOT\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SPI host

**Type Definitions**

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

## 2.3.11 Sigma-delta Modulation

### Introduction

ESP32-C3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

### Functionality Overview

There are four independent sigma-delta modulation channels identified with *sigmadelta\_channel\_t*. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in *sigmadelta\_config\_t* and then applying this configuration with *sigmadelta\_config()*.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - *sigmadelta\_set\_prescale()*
- **Duty** of the output signal - *sigmadelta\_set\_duty()*
- **GPIO pin** to output modulated signal - *sigmadelta\_set\_pin()*

The range of the 'duty' input parameter of *sigmadelta\_set\_duty()* is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of *sigmadelta\_set\_duty()*.

### Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

### Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

### API Reference

#### Header File

- [driver/include/driver/sigmadelta.h](#)

Fig. 12: Sallen-Key Low Pass Filter

**Functions**

`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`

Configure Sigma-delta channel.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver already initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- config: Pointer of Sigma-delta channel configuration struct

`esp_err_t sigmadelta_set_duty(sigmadelat_channel_t channel, int8_t duty)`

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be  $V_{dc} = V_{DDIO} / 256 * duty + V_{DDIO}/2$ , where VDDIO is the power supply voltage.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- channel: Sigma-delta channel number
- duty: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

`esp_err_t sigmadelta_set_prescale(sigmadelat_channel_t channel, uint8_t prescale)`

Set Sigma-delta channel's clock pre-scale value. The source clock is APP\_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP\_CLK / pre\_scale.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE sigmadelta driver has not been initialized
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadelta_set_pin` (*sigmadelta\_channel\_t* channel, *gpio\_num\_t* gpio\_num)

Set Sigma-delta signal output pin.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` sigmadelta driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `channel`: Sigma-delta channel number
- `gpio_num`: GPIO number of output pin.

### Header File

- [hal/include/hal/sigmadelta\\_types.h](#)

### Structures

**struct sigmadelta\_config\_t**

Sigma-delta configure struct.

### Public Members

*sigmadelta\_channel\_t* **channel**

Sigma-delta channel number

**int8\_t sigmadelta\_duty**

Sigma-delta duty, duty ranges from -128 to 127.

**uint8\_t sigmadelta\_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

**uint8\_t sigmadelta\_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

### Enumerations

**enum sigmadelta\_port\_t**

SIGMADELTA port number, the max port number is (SIGMADELTA\_NUM\_MAX -1).

*Values:*

**SIGMADELTA\_PORT\_0**

SIGMADELTA port 0

**SIGMADELTA\_PORT\_MAX**

SIGMADELTA port max

**enum sigmadelta\_channel\_t**

Sigma-delta channel list.

*Values:*

**SIGMADELTA\_CHANNEL\_0**

Sigma-delta channel 0

**SIGMADELTA\_CHANNEL\_1**

Sigma-delta channel 1

**SIGMADELTA\_CHANNEL\_2**

Sigma-delta channel 2

**SIGMADELTA\_CHANNEL\_3**

Sigma-delta channel 3

**SIGMADELTA\_CHANNEL\_MAX**

Sigma-delta channel max

## 2.3.12 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3's SPI peripherals while they function as masters.

### Overview of ESP32-C3's SPI peripherals

ESP32-C3 integrates 3 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

### Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>Device</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
<b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
<b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
<b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
<b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
<b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
<b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
<b>Assertion</b>	The action of activating a line.
<b>De-assertion</b>	The action of returning the line back to inactive (back to idle) status.
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Features

### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it' s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Com-mand</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Ad-dress</b>	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

---

**Note:** Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 us.

- Interrupt Transaction via CPU: 27  $\mu$ s.
- Polling Transaction via DMA: 10  $\mu$ s.
- Polling Transaction via CPU: 9  $\mu$ s.

**SPI Clock Frequency** Transferring each byte takes eight times the clock period  $8/f_{spi}$ .

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is  $20+8n/F_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

### Application Example

The code example for displaying graphics on an ESP32-WROVER-KIT' s 320x240 LCD screen can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [hal/include/hal/spi\\_types.h](#)

### Structures

**struct spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

### Public Members

`uint8_t cmd_lines`

The line width of command phase, e.g. 2-line-cmd-phase.

`uint8_t addr_lines`

The line width of address phase, e.g. 1-line-addr-phase.

`uint8_t data_lines`

The line width of data phase, e.g. 4-line-data-phase.

### Enumerations

**enum spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

**SPI1\_HOST = 0**

SPI1.

**SPI2\_HOST = 1**

SPI2.

**SPI3\_HOST = 2**

SPI3.

**enum spi\_event\_t**

SPI Events.

*Values:*

**SPI\_EV\_BUF\_TX = BIT(0)**

The buffer has sent data to master.

**SPI\_EV\_BUF\_RX = BIT(1)**

The buffer has received data from master.

**SPI\_EV\_SEND\_DMA\_READY = BIT(2)**

Slave has loaded its TX data buffer to the hardware (DMA).

**SPI\_EV\_SEND = BIT(3)**

Master has received certain number of the data, the number is determined by Master.

**SPI\_EV\_RECV\_DMA\_READY = BIT(4)**

Slave has loaded its RX data buffer to the hardware (DMA).

**SPI\_EV\_RECV = BIT(5)**

Slave has received certain number of data from master, the number is determined by Master.

**SPI\_EV\_CMD9 = BIT(6)**

Received CMD9 from master.

**SPI\_EV\_CMDA = BIT(7)**

Received CMDA from master.

**SPI\_EV\_TRANS = BIT(8)**

A transaction has done.

**enum spi\_command\_t**

SPI command.

*Values:*

**SPI\_CMD\_HD\_WRBUF = BIT(0)**

**SPI\_CMD\_HD\_RDBUF = BIT(1)**

**SPI\_CMD\_HD\_WRDMA = BIT(2)**

**SPI\_CMD\_HD\_RDDMA = BIT(3)**

**SPI\_CMD\_HD\_SEG\_END = BIT(4)**

**SPI\_CMD\_HD\_EN\_QPI = BIT(5)**

**SPI\_CMD\_HD\_WR\_END = BIT(6)**

**SPI\_CMD\_HD\_INT0 = BIT(7)**

```
SPI_CMD_HD_INT1 = BIT(8)
```

```
SPI_CMD_HD_INT2 = BIT(9)
```

### Header File

- `driver/include/driver/spi_common.h`

### Functions

```
esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config,  
                             spi_dma_chan_t dma_chan)
```

Initialize a SPI bus.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

#### Parameters

- `host_id`: SPI peripheral that controls this bus
- `bus_config`: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma_chan`: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

```
esp_err_t spi_bus_free(spi_host_device_t host_id)
```

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

#### Parameters

- `host_id`: SPI peripheral to free

### Structures

```
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

```
int mosi_io_num
```

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

**int miso\_io\_num**  
GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

**int sclk\_io\_num**  
GPIO pin for Spi CLock signal, or -1 if not used.

**int quadwp\_io\_num**  
GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.

**int quadhd\_io\_num**  
GPIO pin for HD (HOLD) signal which is used as D3 in 4-bit communication modes, or -1 if not used.

**int max\_transfer\_sz**  
Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE if DMA is disabled.

**uint32\_t flags**  
Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON\_BUSFLAG\_\* flags.

**int intr\_flags**  
Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP\_INTR\_FLAG\_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

### SPI\_MAX\_DMA\_LEN

#### SPI\_SWAP\_DATA\_TX (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx\_buffer to &data.

#### Parameters

- DATA: Data to be sent, can be uint8\_t, uint16\_t or uint32\_t.
- LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

#### SPI\_SWAP\_DATA\_RX (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

#### Parameters

- DATA: Data to be rearranged, can be uint8\_t, uint16\_t or uint32\_t.
- LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

### SPICOMMON\_BUSFLAG\_SLAVE

Initialize I/O in slave mode.

### SPICOMMON\_BUSFLAG\_MASTER

Initialize I/O in master mode.

### SPICOMMON\_BUSFLAG\_IOMUX\_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

### SPICOMMON\_BUSFLAG\_GPIO\_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

```
SPI_DMA_DISABLED = 0
```

Do not enable DMA for SPI.

```
SPI_DMA_CH_AUTO = 3
```

Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master****Header File**

- [driver/include/driver/spi\\_master.h](#)

**Functions**

```
esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t  
*dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_FOUND if host doesn't have any free CS slots
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Parameters**

- host\_id: SPI peripheral to allocate device on
- dev\_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if device already is freed
- ESP\_OK on success

**Parameters**

- handle: Device handle to free

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if there was no room in the queue before ticks\_to\_wait expired
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions are not finished
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using `spi_host_add_dev`
- trans\_desc: Description of transaction to execute
- ticks\_to\_wait: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if there was no completed transaction before ticks\_to\_wait expired
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using `spi_host_add_dev`
- trans\_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- ticks\_to\_wait: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using `spi_host_add_dev`
- trans\_desc: Description of transaction to execute

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the device cannot get control of the bus before ticks\_to\_wait expired
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions are not finished
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using spi\_host\_add\_dev
- trans\_desc: Description of transaction to execute
- ticks\_to\_wait: Ticks to wait until there's room in the queue; currently only portMAX\_DELAY is supported.

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the transaction cannot finish before ticks\_to\_wait expired
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using spi\_host\_add\_dev
- ticks\_to\_wait: Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi\_device\_polling\_start() followed by spi\_device\_polling\_end(). Do not use this when there is still a transaction that hasn't been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Parameters**

- handle: Device handle obtained using spi\_host\_add\_dev
- trans\_desc: Description of transaction to execute

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi\_device\_release\_bus is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**

- ESP\_ERR\_INVALID\_ARG : wait is not set to portMAX\_DELAY.
- ESP\_OK : Success.

**Parameters**

- device: The device to occupy the bus.
- wait: Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX\_DELAY.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t dev*)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**

- *dev*: The device to release the bus.

int **spi\_cal\_clock** (int *fapb*, int *hz*, int *duty\_cycle*, uint32\_t \**reg\_o*)

Calculate the working frequency that is most close to desired frequency, and also the register value.

**Parameters**

- *fapb*: The frequency of apb clock, should be APB\_CLK\_FREQ.
- *hz*: Desired working frequency
- *duty\_cycle*: Duty cycle of the spi clock
- *reg\_o*: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

int **spi\_get\_actual\_clock** (int *fapb*, int *hz*, int *duty\_cycle*)

Calculate the working frequency that is most close to desired frequency.

**Return** Actual working frequency that most fit.

**Parameters**

- *fapb*: The frequency of apb clock, should be APB\_CLK\_FREQ.
- *hz*: Desired working frequency
- *duty\_cycle*: Duty cycle of the spi clock

void **spi\_get\_timing** (bool *gpio\_is\_used*, int *input\_delay\_ns*, int *eff\_clk*, int \**dummy\_o*, int \**cycles\_remain\_o*)

Calculate the timing settings of specified frequency and settings.

**Note** If *\*\*dummy\_o\** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**

- *gpio\_is\_used*: True if using GPIO matrix, or False if iomux pins are used.
- *input\_delay\_ns*: Input delay from SCLK launch edge to MISO data valid.
- *eff\_clk*: Effective clock frequency (in Hz) from *spi\_cal\_clock*.
- *dummy\_o*: Address of dummy bits used output. Set to NULL if not needed.
- *cycles\_remain\_o*: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool *gpio\_is\_used*, int *input\_delay\_ns*)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**

- *gpio\_is\_used*: True if using GPIO matrix, or False if native pins are used.
- *input\_delay\_ns*: Input delay from SCLK launch edge to MISO data valid.

## Structures

**struct spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

## Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when SPI\_TRANS\_VARIABLE\_CMD is not used, otherwise ignored.

**uint8\_t address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

**uint8\_t dummy\_bits**

Amount of dummy bits to insert between address and data phase.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

**uint16\_t duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16\_t cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8\_t cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock\_speed\_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t* pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t* post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

### Public Members

**uint32\_t flags**

Bitwise OR of SPI\_TRANS\_\* flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**size\_t length**

Total data length, in bits.

**size\_t rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**uint8\_t tx\_data[4]**

If SPI\_TRANS\_USE\_TXDATA is set, data set here is sent directly from this variable.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

**uint8\_t rx\_data[4]**

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

**struct spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

### Public Members

**struct spi\_transaction\_t base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

**uint8\_t command\_bits**

The command length in this transaction, in bits.

**uint8\_t address\_bits**

The address length in this transaction, in bits.

**uint8\_t dummy\_bits**

The dummy length in this transaction, in bits.

**Macros****SPI\_MASTER\_FREQ\_8M**

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).  
8MHz

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you' re going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK****SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the command\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the address\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the dummy\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**Type Definitions**

```
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t) (spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
    Handle for a device on a SPI bus.
```

### 2.3.13 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C3's SPI peripherals while they function as slaves.

**Overview of ESP32-C3's SPI peripherals**

ESP32-C3 integrates one general purpose SPI controller which can be used as slave node driven by an off-chip SPI master. The controller is called SPI2 and has an independent signal bus with the same name.

**Terminology**

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral external to ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>Device</b>	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• <b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• <b>MOSI</b>	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• <b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• <b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• <b>QUADWP</b>	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• <b>QUADHD</b>	Hold signal. Only used for 4-bit (qio/qout) transactions.
• <b>Assertion</b>	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
<b>Transaction</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

### Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

### Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

### Speed and Timing Considerations

**Transaction Interval** The ESP32-C3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

### API Reference

#### Header File

- [driver/include/driver/spi\\_slave.h](#)

#### Functions

```
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                             const spi_slave_interface_config_t *slave_config,
                             spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Return

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

#### Parameters

- *host*: SPI peripheral to use as a SPI slave interface
- *bus\_config*: Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- *slave\_config*: Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- *dma\_chan*: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI\_DMA\_DISABLED limits the size of transactions.
  - Set to SPI\_DMA\_DISABLED if only the SPI flash uses this bus.
  - Set to SPI\_DMA\_CH\_AUTO to let the driver to allocate the DMA channel.

```
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

#### Return

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed
- ESP\_OK on success

#### Parameters

- `host`: SPI peripheral to free

```
esp_err_t spi_slave_queue_trans (spi_host_device_t host, const spi_slave_transaction_t
                                **trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

#### Parameters

- `host`: SPI peripheral that is acting as a slave
- `trans_desc`: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_slave_get_trans_result (spi_host_device_t host, spi_slave_transaction_t
                                     **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

#### Parameters

- `host`: SPI peripheral to that is acting as a slave
- `[out] trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

```
esp_err_t spi_slave_transmit (spi_host_device_t host, spi_slave_transaction_t *trans_desc, Tick-
                              Type_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

#### Return

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

#### Parameters

- `host`: SPI peripheral to that is acting as a slave
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait`: Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

## Structures

**struct spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members****int spics\_io\_num**

CS GPIO pin for this device.

**uint32\_t flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi\_slave\_queue\_trans but not yet finished using spi\_slave\_get\_trans\_result) at the same time.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***slave\_transaction\_cb\_t* post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

***slave\_transaction\_cb\_t* post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

**struct spi\_slave\_transaction\_t**

This structure describes one SPI transaction

**Public Members****size\_t length**

Total data length, in bits.

**size\_t trans\_len**

Transaction data length, in bits.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

**Macros****SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**Type Definitions**

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t) (spi_slave_transaction_t *trans)
```

**2.3.14 TWAI****Overview**

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *TWAI Protocol Summary*
2. *Signals Lines and Transceiver*
3. *Driver Configuration*
4. *Driver Operation*
5. *Examples*

**TWAI Protocol Summary**

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).

- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

### Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX**, **RX**, **BUS-OFF**, and **CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3’s GPIO pads.

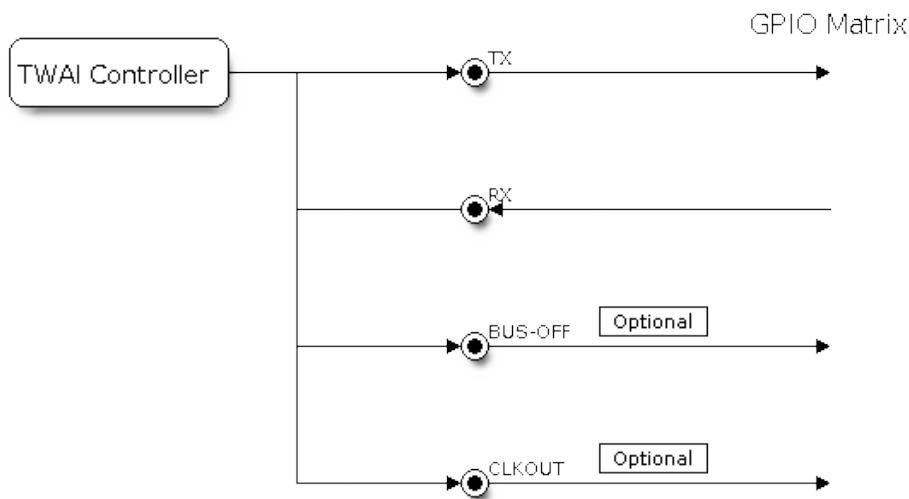

Fig. 13: Signal lines of the TWAI controller

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock (APB Clock).

**Note:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

## Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 3: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**Note:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI\_ALERT\_BELOW\_ERR\_WARN is raised when both TEC and REC return back to values below **96**.

---

**Note:** When enabling alerts, the `TWAI_ALERT_AND_LOG` flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and `TWAI_ALERT_AND_LOG` if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

---

**Note:** The `TWAI_ALERT_ALL` and `TWAI_ALERT_NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

---

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quanta** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quanta
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quanta by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-C3, the `brp` can be **any even number from 2 to 16384**.

Fig. 14: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`

- `TWAI_TIMING_CONFIG_1KBITS()`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 15: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 16: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.

- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

### Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 17: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"

...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```
#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```
#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
```

(continues on next page)

(continued from previous page)

```

uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The TWAI Network example demonstrates communication between two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- [hal/include/hal/twai\\_types.h](#)

### Structures

**struct twai\_message\_t**

Structure to store a TWAI message.

**Note** The flags member is deprecated

#### Public Members

uint32\_t **extd** : 1

Extended Frame Format (29bit ID)

uint32\_t **rtr** : 1

Message is a Remote Frame

uint32\_t **ss** : 1

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self** : 1

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp** : 1

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32\_t **reserved** : 27

Reserved bits

uint32\_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[**TWAI\_FRAME\_MAX\_DLC**]

Data bytes (not relevant in RTR frame)

**struct twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

#### Public Members

uint32\_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8\_t **tseg\_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8\_t **tseg\_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8\_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple\_sampling**

Enables triple sampling when the TWAI controller samples a bit

**struct twai\_filter\_config\_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

**Note** Macro initializers are available for this structure

### Public Members

uint32\_t **acceptance\_code**

32-bit acceptance code

uint32\_t **acceptance\_mask**

32-bit acceptance mask

bool **single\_filter**

Use Single Filter Mode (see documentation)

### Macros

**TWAI\_EXTD\_ID\_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

### Enumerations

**enum twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

**TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

**TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

**TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- [driver/include/driver/twai.h](#)

**Functions**

```
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const
                             twai_timing_config_t *t_config, const twai_filter_config_t
                             *f_config)
```

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

**Return**

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

**Parameters**

- [in] `g_config`: General configuration structure
- [in] `t_config`: Timing configuration structure
- [in] `f_config`: Filter configuration structure

```
esp_err_t twai_driver_uninstall(void)
```

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

```
esp_err_t twai_start(void)
```

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Return**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

```
esp_err_t twai_stop(void)
```

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Return**

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

```
esp_err_t twai_transmit(const twai_message_t *message, TickType_t ticks_to_wait)
```

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

#### Return

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

#### Parameters

- [in] message: Message to transmit
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on the TX queue

*esp\_err\_t twai\_receive (twai\_message\_t \*message, TickType\_t ticks\_to\_wait)*

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### Return

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

#### Parameters

- [out] message: Received message
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block on RX queue

*esp\_err\_t twai\_read\_alerts (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)*

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

#### Return

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

#### Parameters

- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks\_to\_wait: Number of FreeRTOS ticks to block for alert

*esp\_err\_t twai\_reconfigure\_alerts (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)*

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### Return

- ESP\_OK: Alerts reconfigured

- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

**Parameters**

- `[in] alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- `[out] current_alerts`: Bit field of currently raised alerts. Set to `NULL` if unused

*esp\_err\_t* **twai\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The `BUS_RECOVERED` alert can be enabled to alert the application when the bus recovery process completes.

**Return**

- `ESP_OK`: Bus recovery started
- `ESP_ERR_INVALID_STATE`: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_get\_status\_info** (*twai\_status\_info\_t* \**status\_info*)

Get current status information of the TWAI driver.

**Return**

- `ESP_OK`: Status information retrieved
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

**Parameters**

- `[out] status_info`: Status information

*esp\_err\_t* **twai\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

**Return**

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t* **twai\_clear\_receive\_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when `twai_start()` is called.

**Return**

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

**Structures**

**struct twai\_general\_config\_t**

Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

*twai\_mode\_t* **mode**

Mode of TWAI controller

*gpio\_num\_t* **tx\_io**

Transmit GPIO number

*gpio\_num\_t rx\_io*  
Receive GPIO number

*gpio\_num\_t clkout\_io*  
CLKOUT GPIO number (optional, set to -1 if unused)

*gpio\_num\_t bus\_off\_io*  
Bus off indicator GPIO number (optional, set to -1 if unused)

uint32\_t **tx\_queue\_len**  
Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32\_t **rx\_queue\_len**  
Number of messages RX queue can hold

uint32\_t **alerts\_enabled**  
Bit field of alerts to enable (see documentation)

uint32\_t **clkout\_divider**  
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr\_flags**  
Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

**struct twai\_status\_info\_t**  
Structure to store status information of TWAI driver.

### Public Members

*twai\_state\_t state*  
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t **msgs\_to\_tx**  
Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**  
Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**  
Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**  
Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**  
Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**  
Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overrun\_count**  
Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**  
Number of instances arbitration was lost

uint32\_t **bus\_error\_count**  
Number of instances a bus error has occurred

### Macros

**TWAI\_IO\_UNUSED**  
Marks GPIO as unused in TWAI configuration

### Enumerations

**enum twai\_state\_t**

TWAI driver states.

*Values:*

**TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

**TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

**TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

**TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

## 2.3.15 UART

### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adapted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C3 chip has two UART controllers (UART0 and UART1) that feature an identical set of registers for ease of programming and flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

### Functional Overview

The following overview describes how to establish communication between an ESP32-C3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-C3's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```

const int uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));

```

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 4: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```

// Set UART pins (TX: IO4, RX: IO5, RTS: IO19, CTS: IO20)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 19, 20));

```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```

// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));

```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const int uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const int uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-C3 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in [peripherals/uart/uart\\_events](#).
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example [peripherals/uart/uart\\_events](#). It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

## Overview of RS485 specific communication options

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-C3 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C3's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the  $\sim$ RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-C3's RS485 interface connection.

### Note:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

### Circuit A: Collision Detection Circuit

(continues on next page)

(continued from previous page)

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

## Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32-C3 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- [driver/include/driver/uart.h](#)

### Functions

*esp\_err\_t* **uart\_driver\_install** (*uart\_port\_t* *uart\_num*, int *rx\_buffer\_size*, int *tx\_buffer\_size*, int *queue\_size*, *QueueHandle\_t* \**uart\_queue*, int *intr\_alloc\_flags*)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** *Rx\_buffer\_size* should be greater than `UART_FIFO_LEN`. *Tx\_buffer\_size* should be either zero or greater than `UART_FIFO_LEN`.

#### Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

#### Parameters

- *uart\_num*: UART port number, the max port number is `(UART_NUM_MAX - 1)`.
- *rx\_buffer\_size*: UART RX ring buffer size.
- *tx\_buffer\_size*: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- *queue\_size*: UART event queue size/depth.
- *uart\_queue*: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to `NULL`, driver will not use an event queue.
- *intr\_alloc\_flags*: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info. Do not set `ESP_INTR_FLAG_IRAM` here (the driver's ISR handler is not located in IRAM)

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* *uart\_num*)

Uninstall UART driver.

#### Return

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

#### Parameters

- *uart\_num*: UART port number, the max port number is `(UART_NUM_MAX - 1)`.

bool **uart\_is\_driver\_installed** (*uart\_port\_t* *uart\_num*)

Checks whether the driver is installed or not.

**Return**

- true driver is installed
- false driver is not installed

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* `data_bit`)

Set UART data bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: UART data bits

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* `uart_num`, *uart\_word\_length\_t* `*data_bit`)

Get the UART data bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*data_bit`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `data_bit`: Pointer to accept value of UART data bits.

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* `uart_num`, *uart\_stop\_bits\_t* `stop_bits`)

Set UART stop bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Fail

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits`: UART stop bits

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* `uart_num`, *uart\_stop\_bits\_t* `*stop_bits`)

Get the UART stop bit configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*stop_bit`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `stop_bits`: Pointer to accept value of UART stop bits.

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* `uart_num`, *uart\_parity\_t* `parity_mode`)

Set UART parity mode.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `parity_mode`: the enum of uart parity configuration

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* `uart_num`, *uart\_parity\_t* `*parity_mode`)

Get the UART parity mode configuration.

**Return**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (`*parity_mode`)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

- `parity_mode`: Pointer to accept value of UART parity mode.

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* *baudrate*)

Set UART baud rate.

**Return**

- `ESP_FAIL` Parameter error
- `ESP_OK` Success

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate`: UART baud rate.

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* *uart\_num*, *uint32\_t* *\*baudrate*)

Get the UART baud rate configuration.

**Return**

- `ESP_FAIL` Parameter error
- `ESP_OK` Success, result will be put in (*\*baudrate*)

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate`: Pointer to accept value of UART baud rate

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* *uart\_num*, *uint32\_t* *inverse\_mask*)

Set UART line inverse mode.

**Return**

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `inverse_mask`: Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *uart\_hw\_flowcontrol\_t* *flow\_ctrl*, *uint8\_t* *rx\_thresh*)

Set hardware flow control.

**Return**

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ `UART_FIFO_LEN`). Only when `UART_HW_FLOWCTRL_RTS` is set, will the `rx_thresh` value be set.

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *bool* *enable*, *uint8\_t* *rx\_thresh\_xon*, *uint8\_t* *rx\_thresh\_xoff*)

Set software flow control.

**Return**

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

**Parameters**

- `uart_num`: `UART_NUM_0`, `UART_NUM_1` or `UART_NUM_2`
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* *uart\_num*, *uart\_hw\_flowcontrol\_t* *\*flow\_ctrl*)

Get the UART hardware flow control configuration.

**Return**

- `ESP_FAIL` Parameter error

- ESP\_OK Success, result will be put in (\*flow\_ctrl)

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `flow_ctrl`: Option for different flow control mode.

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* `uart_num`, *uint32\_t* `clr_mask`)

Clear UART interrupt status.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `clr_mask`: Bit mask of the interrupt status to be cleared.

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* `uart_num`, *uint32\_t* `enable_mask`)

Set UART interrupt enable.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable_mask`: Bit mask of the enable bits.

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* `uart_num`, *uint32\_t* `disable_mask`)

Clear UART interrupt enable bits.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `disable_mask`: Bit mask of the disable bits.

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* `uart_num`)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* `uart_num`)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* `uart_num`)

Disable UART TX interrupt (TXFIFO\_EMPTY INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* `uart_num`, *int* `enable`, *int* `thresh`)

Enable UART TX interrupt (TXFIFO\_EMPTY INTERRUPT)

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `enable`: 1: enable; 0: disable
- `thresh`: Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

*esp\_err\_t* **uart\_isr\_register** (*uart\_port\_t* `uart_num`, void (\**fn*)) void \*  
*arg*, int *intr\_alloc\_flags*, *uart\_isr\_handle\_t* \**handle*) Register UART interrupt handler (ISR).

**Note** UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `fn`: Interrupt handler function.
- `arg`: parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

*esp\_err\_t* **uart\_isr\_free** (*uart\_port\_t* `uart_num`)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* `uart_num`, int `tx_io_num`, int `rx_io_num`, int `rts_io_num`, int  
`cts_io_num`)

Set UART pin number.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Note** Instead of GPIO number a macro 'UART\_PIN\_NO\_CHANGE' may be provided to keep the currently allocated pin.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `tx_io_num`: UART TX pin GPIO number.
- `rx_io_num`: UART RX pin GPIO number.
- `rts_io_num`: UART RTS pin GPIO number.
- `cts_io_num`: UART CTS pin GPIO number.

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: RTS output low (active); 0: RTS output high (block)

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* `uart_num`, int `level`)

Manually set the UART DTR pin level.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `level`: 1: DTR output low; 0: DTR output high

*esp\_err\_t* `uart_set_tx_idle_num` (*uart\_port\_t* `uart_num`, *uint16\_t* `idle_num`)

Set UART idle interval after tx FIFO is empty.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `idle_num`: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

*esp\_err\_t* `uart_param_config` (*uart\_port\_t* `uart_num`, **const** *uart\_config\_t* \*`uart_config`)

Set UART configuration parameters.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `uart_config`: UART parameter settings

*esp\_err\_t* `uart_intr_config` (*uart\_port\_t* `uart_num`, **const** *uart\_intr\_config\_t* \*`intr_conf`)

Configure UART interrupts.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `intr_conf`: UART interrupt settings

*esp\_err\_t* `uart_wait_tx_done` (*uart\_port\_t* `uart_num`, *TickType\_t* `ticks_to_wait`)

Wait until UART TX FIFO is empty.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `ticks_to_wait`: Timeout, count in RTOS ticks

*int* `uart_tx_chars` (*uart\_port\_t* `uart_num`, **const** *char* \*`buffer`, *uint32\_t* `len`)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

**Return**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `buffer`: data buffer address
- `len`: data length to send

int **uart\_write\_bytes** (*uart\_port\_t* *uart\_num*, const void \**src*, size\_t *size*)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *src*: data buffer address
- *size*: data length to send

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* *uart\_num*, const void \**src*, size\_t *size*, int *brk\_len*)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

#### Return

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *src*: data buffer address
- *size*: data length to send
- *brk\_len*: break signal duration(unit: the time it takes to send one bit at current baudrate)

int **uart\_read\_bytes** (*uart\_port\_t* *uart\_num*, void \**buf*, uint32\_t *length*, TickType\_t *ticks\_to\_wait*)

UART read bytes from UART buffer.

#### Return

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).
- *buf*: pointer to the buffer.
- *length*: data length
- *ticks\_to\_wait*: sTimeout, count in RTOS ticks

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* *uart\_num*)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

#### Parameters

- *uart\_num*: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* *uart\_num*)

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

#### Return

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* `uart_get_buffered_data_len` (*uart\_port\_t* `uart_num`, *size\_t* \*`size`)

UART get RX ring buffer cached data length.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).
- `size`: Pointer of *size\_t* to accept cached data length

*esp\_err\_t* `uart_disable_pattern_det_intr` (*uart\_port\_t* `uart_num`)

UART disable pattern detect function. Designed for applications like ‘AT commands’ . When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART\_NUM\_MAX -1).

*esp\_err\_t* `uart_enable_pattern_det_baud_intr` (*uart\_port\_t* `uart_num`, *char* `pattern_chr`, *uint8\_t* `chr_num`, *int* `chr_tout`, *int* `post_idle`, *int* `pre_idle`)

UART enable pattern detect function. Designed for applications like ‘AT commands’ . When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**

- ESP\_OK Success
- ESP\_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as `at_cmd` char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last `at_cmd` char
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first `at_cmd` char.

*int* `uart_pattern_pop_pos` (*uart\_port\_t* `uart_num`)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

int `uart_pattern_get_pos` (*uart\_port\_t* *uart\_num*)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application' s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

#### Return

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* *uart\_num*, int *queue\_length*)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

#### Return

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

#### Parameters

- `uart_num`: UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* *uart\_num*, *uart\_mode\_t* *mode*)

UART set communication mode.

**Note** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

#### Parameters

- `uart_num`: Uart number to configure, the max port number is (`UART_NUM_MAX - 1`).
- `mode`: UART UART mode to set

*esp\_err\_t* `uart_set_rx_full_threshold` (*uart\_port\_t* *uart\_num*, int *threshold*)

Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver is not installed

#### Parameters

- `uart_num`: `UART_NUM_0`, `UART_NUM_1` or `UART_NUM_2`
- `threshold`: Threshold value above which RX fifo full interrupt is generated

*esp\_err\_t* `uart_set_tx_empty_threshold` (*uart\_port\_t* *uart\_num*, int *threshold*)

Set uart threshold values for TX fifo empty.

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver is not installed

**Parameters**

- `uart_num`: UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* *uart\_num*, **const** *uint8\_t* *tout\_thresh*)

UART set threshold timeout for TOUT feature.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

**Parameters**

- `uart_num`: Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* *uart\_num*, **bool** \**collision\_flag*)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by `collision_flag`. \*`collision_flag` = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

**Parameters**

- `uart_num`: Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- `collision_flag`: Pointer to variable of type `bool` to return collision flag.

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* *uart\_num*, *int* *wakeup\_threshold*)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF\_TICK as UART clock source, by setting `use_ref_tick` field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

**Parameters**

- `uart_num`: UART number, the max port number is (UART\_NUM\_MAX -1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* *uart\_num*, *int* \**out\_wakeup\_threshold*)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

**Parameters**

- `uart_num`: UART number, the max port number is (UART\_NUM\_MAX -1).
- `[out] out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* *uart\_num*)

Wait until UART tx memory empty and the last char send ok (polling mode).

- **Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- `uart_num`: UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* *uart\_num*, bool *loop\_back\_en*)

Configure TX signal loop back to RX module, just for the test usage.

- **Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- `uart_num`: UART number
- `loop_back_en`: Set ture to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* *uart\_num*, bool *always\_rx\_timeout\_en*)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- `uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

**struct** `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

`uint32_t` **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t` **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t` **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

`uint8_t` **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

**struct** `uart_event_t`

Event structure used in UART event queue.

## Public Members

### `uart_event_type_t` type

UART event type

### `size_t` size

UART data size for UART\_DATA event

### bool `timeout_flag`

UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

## Macros

### `UART_NUM_0`

UART port 0

### `UART_NUM_1`

UART port 1

### `UART_NUM_MAX`

UART port max

### `UART_PIN_NO_CHANGE`

Constant for `uart_set_pin` function which indicates that UART pin should not be changed

### `UART_FIFO_LEN`

Length of the UART HW FIFO.

### `UART_BITRATE_MAX`

Maximum configurable bitrate.

## Type Definitions

`typedef intr_handle_t uart_isr_handle_t`

## Enumerations

### `enum uart_event_type_t`

UART event types used in the ring buffer.

*Values:*

#### `UART_DATA`

UART data event

#### `UART_BREAK`

UART break event

#### `UART_BUFFER_FULL`

UART RX buffer full event

#### `UART_FIFO_OVF`

UART FIFO overflow event

#### `UART_FRAME_ERR`

UART RX frame error event

#### `UART_PARITY_ERR`

UART RX parity event

#### `UART_DATA_BREAK`

UART TX data and break event

#### `UART_PATTERN_DET`

UART pattern detected

**UART\_EVENT\_MAX**  
UART event max index

### Header File

- [hal/include/hal/uart\\_types.h](#)

### Structures

**struct uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

#### Public Members

**uint8\_t cmd\_char**  
UART AT cmd char

**uint8\_t char\_num**  
AT cmd char repeat number

**uint32\_t gap\_tout**  
gap time(in baud-rate) between AT cmd char

**uint32\_t pre\_idle**  
the idle time(in baud-rate) between the non AT char and first AT char

**uint32\_t post\_idle**  
the idle time(in baud-rate) between the last AT char and the none AT char

**struct uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

#### Public Members

**uint8\_t xon\_char**  
Xon flow control char

**uint8\_t xoff\_char**  
Xoff flow control char

**uint8\_t xon\_thrd**  
If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

**uint8\_t xoff\_thrd**  
If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

**struct uart\_config\_t**

UART configuration parameters for uart\_param\_config function.

#### Public Members

**int baud\_rate**  
UART baud rate

**uart\_word\_length\_t data\_bits**  
UART byte size

**uart\_parity\_t parity**  
UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

bool **use\_ref\_tick**

Deprecated method to select ref tick clock source, set `source_clk` field instead

### Type Definitions

**typedef int uart\_port\_t**

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

### Enumerations

**enum uart\_mode\_t**

UART mode selection.

*Values:*

**UART\_MODE\_UART** = 0x00

mode: regular UART mode

**UART\_MODE\_RS485\_HALF\_DUPLEX** = 0x01

mode: half duplex RS485 UART mode control by RTS pin

**UART\_MODE\_IRDA** = 0x02

mode: IRDA UART mode

**UART\_MODE\_RS485\_COLLISION\_DETECT** = 0x03

mode: RS485 collision detection UART mode (used for test purposes)

**UART\_MODE\_RS485\_APP\_CTRL** = 0x04

mode: application control RS485 UART mode (used for test purposes)

**enum uart\_word\_length\_t**

UART word length constants.

*Values:*

**UART\_DATA\_5\_BITS** = 0x0

word length: 5bits

**UART\_DATA\_6\_BITS** = 0x1

word length: 6bits

**UART\_DATA\_7\_BITS** = 0x2

word length: 7bits

**UART\_DATA\_8\_BITS** = 0x3

word length: 8bits

**UART\_DATA\_BITS\_MAX** = 0x4

**enum uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

**UART\_STOP\_BITS\_1** = 0x1

stop bit: 1bit

**UART\_STOP\_BITS\_1\_5** = 0x2  
stop bit: 1.5bits

**UART\_STOP\_BITS\_2** = 0x3  
stop bit: 2bits

**UART\_STOP\_BITS\_MAX** = 0x4

**enum uart\_parity\_t**

UART parity constants.

*Values:*

**UART\_PARITY\_DISABLE** = 0x0  
Disable UART parity

**UART\_PARITY\_EVEN** = 0x2  
Enable UART even parity

**UART\_PARITY\_ODD** = 0x3  
Enable UART odd parity

**enum uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

**UART\_HW\_FLOWCTRL\_DISABLE** = 0x0  
disable hardware flow control

**UART\_HW\_FLOWCTRL\_RTS** = 0x1  
enable RX hardware flow control (rts)

**UART\_HW\_FLOWCTRL\_CTS** = 0x2  
enable TX hardware flow control (cts)

**UART\_HW\_FLOWCTRL\_CTS\_RTS** = 0x3  
enable hardware flow control

**UART\_HW\_FLOWCTRL\_MAX** = 0x4

**enum uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

**UART\_SIGNAL\_INV\_DISABLE** = 0  
Disable UART signal inverse

**UART\_SIGNAL\_IRDA\_TX\_INV** = (0x1 << 0)  
inverse the UART irda\_tx signal

**UART\_SIGNAL\_IRDA\_RX\_INV** = (0x1 << 1)  
inverse the UART irda\_rx signal

**UART\_SIGNAL\_RXD\_INV** = (0x1 << 2)  
inverse the UART rxd signal

**UART\_SIGNAL\_CTS\_INV** = (0x1 << 3)  
inverse the UART cts signal

**UART\_SIGNAL\_DSR\_INV** = (0x1 << 4)  
inverse the UART dsr signal

**UART\_SIGNAL\_TXD\_INV** = (0x1 << 5)  
inverse the UART txd signal

**UART\_SIGNAL\_RTS\_INV** = (0x1 << 6)  
inverse the UART rts signal

```
UART_SIGNAL_DTR_INV = (0x1 << 7)
    inverse the UART dtr signal
```

```
enum uart_sclk_t
    UART source clock.
```

*Values:*

```
UART_SCLK_APB = 0x0
    UART source clock from APB
```

```
UART_SCLK_RTC = 0x1
    UART source clock from RTC
```

```
UART_SCLK_XTAL = 0x2
    UART source clock from XTAL
```

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

- [soc/esp32c3/include/soc/uart\\_channel.h](#)

### Macros

```
UART_GPIO21_DIRECT_CHANNEL
UART_NUM_0_TXD_DIRECT_GPIO_NUM
UART_GPIO20_DIRECT_CHANNEL
UART_NUM_0_RXD_DIRECT_GPIO_NUM
UART_TXD_GPIO21_DIRECT_CHANNEL
UART_RXD_GPIO20_DIRECT_CHANNEL
```

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.4 Application Protocols

### 2.4.1 ASIO port

## Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

## Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp\\_echo\\_server](#)
- [protocols/asio/tcp\\_echo\\_server](#)
- [protocols/asio/chat\\_client](#)
- [protocols/asio/chat\\_server](#)
- [protocols/asio/ssl\\_client\\_server](#)

Please refer to the specific example README.md for details

## 2.4.2 ESP-MQTT

### Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

### Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

## Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

## Configuration

### URI

- Currently support `mqtt`, `mqtt`s, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
  - `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtt://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

### SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

### Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from `menuconfig`
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menuconfig`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

### Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)`  
Creates mqtt client handle based on the configuration.

**Return** `mqtt_client_handle` if successfully created, `NULL` on error

#### Parameters

- `config`: mqtt configuration structure

`esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)`

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Return** `ESP_FAIL` if URI parse error, `ESP_OK` on success

#### Parameters

- `client`: mqtt client handle
- `uri`:

`esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)`

Starts mqtt client with already created client handle.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` on other error

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force reconnection upon a specific event.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force disconnection from the broker.

**Return** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization

#### Parameters

- `client`: mqtt client handle

`esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)`

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

**Return** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

**Parameters**

- `client`: mqtt client handle

`int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)`

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Return** message\_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
- `topic`:
- `qos`:

`int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)`

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message\_id of the subscribe message on success -1 on failure

**Parameters**

- `client`: mqtt client handle
- `topic`:

`int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)`

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Return** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure.

**Parameters**

- `client`: mqtt client handle
- `topic`: topic string
- `data`: payload string (set to NULL, sending empty payload message)
- `len`: data length, if set to 0, length is calculated from payload string
- `qos`: qos of publish message
- `retain`: retain flag

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp\_mqtt\_client\_publish() which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of esp\_mqtt\_client\_publish().

**Return** message\_id if queued successfully, -1 otherwise

**Parameters**

- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag
- store: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

**Return** ESP\_OK ESP\_ERR\_INVALID\_ARG on wrong initialization

**Parameters**

- client: mqtt client handle

*esp\_err\_t* **esp\_mqtt\_set\_config** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_client\_config\_t* \*config)

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event).

**Return** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

**Parameters**

- client: mqtt client handle
- config: mqtt configuration structure

*esp\_err\_t* **esp\_mqtt\_client\_register\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Registers mqtt event.

**Return** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization  
ESP\_OK on success

**Parameters**

- client: mqtt client handle
- event: event type
- event\_handler: handler callback
- event\_handler\_arg: handlers context

int **esp\_mqtt\_client\_get\_outbox\_size** (*esp\_mqtt\_client\_handle\_t* client)

Get outbox size.

**Return** outbox size 0 on wrong initialization

**Parameters**

- client: mqtt client handle

## Structures

**struct esp\_mqtt\_error\_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from tcp\_transport/esp-tls | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from MQTT broker on connection |

### Public Members

`esp_err_t esp_tls_last_esp_err`

last esp\_err code reported from esp-tls component

int `esp_tls_stack_err`

tls specific error code reported from underlying tls stack

int `esp_tls_cert_verify_flags`

tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t error_type`

error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`

connection refused error code reported from MQTT broker on connection

int `esp_transport_sock_errno`

errno from the underlying socket

struct `esp_mqtt_event_t`

MQTT event configuration structure

### Public Members

`esp_mqtt_event_id_t event_id`

MQTT event type

`esp_mqtt_client_handle_t client`

MQTT client handle for this event

void `*user_context`

User context passed from MQTT client config

char `*data`

Data associated with this event

int `data_len`

Length of the data for this event

int `total_data_len`

Total length of the data (longer data are supplied with multiple events)

int `current_data_offset`

Actual offset for the data associated with this event

char `*topic`

Topic associated with this event

int `topic_len`

Length of the topic for this event associated with this event

int `msg_id`

MQTT message id of message

int **session\_present**  
MQTT session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**  
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool **retain**  
Retained flag of the message associated with this event

int **qos**  
qos of the messages associated with this event

bool **dup**  
dup flag of the message associated with this event

**struct esp\_mqtt\_client\_config\_t**  
MQTT client configuration structure

### Public Members

*mqtt\_event\_callback\_t* **event\_handle**  
handle for MQTT events as a callback in legacy mode

*esp\_event\_loop\_handle\_t* **event\_loop\_handle**  
handle for MQTT event loop library

const char \***host**  
MQTT server domain (ipv4 as string)

const char \***uri**  
Complete MQTT broker URI

uint32\_t **port**  
MQTT server port

bool **set\_null\_client\_id**  
Selects a NULL client id

const char \***client\_id**  
Set client id. Ignored if set\_null\_client\_id == true If NULL set the default client id. Default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char \***username**  
MQTT username

const char \***password**  
MQTT password

const char \***lwt\_topic**  
LWT (Last Will and Testament) message topic (NULL by default)

const char \***lwt\_msg**  
LWT message (NULL by default)

int **lwt\_qos**  
LWT message qos

int **lwt\_retain**  
LWT retained message flag

int **lwt\_msg\_len**  
LWT message length

int **disable\_clean\_session**  
mqtt clean session, default clean\_session is true

**int `keepalive`**  
mqtt keepalive, default is 120 seconds

**bool `disable_auto_reconnect`**  
this mqtt client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

**void `*user_context`**  
pass user context to this option, then can receive that context in `event->user_context`

**int `task_prio`**  
MQTT task priority, default is 5, can be changed in `make menuconfig`

**int `task_stack`**  
MQTT task stack size, default is 6144 bytes, can be changed in `make menuconfig`

**int `buffer_size`**  
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if `out_buffer_size` defined)

**const char `*cert_pem`**  
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

**size\_t `cert_len`**  
Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

**const char `*client_cert_pem`**  
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

**size\_t `client_cert_len`**  
Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

**const char `*client_key_pem`**  
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

**size\_t `client_key_len`**  
Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

***esp\_mqtt\_transport\_t* `transport`**  
overrides URI transport

**int `refresh_connection_after_ms`**  
Refresh connection after this value (in milliseconds)

**const struct *psk\_key\_hint* `*psk_hint_key`**  
Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

**bool `use_global_ca_store`**  
Use a global `ca_store` for all the connections in which this bool is set.

***esp\_err\_t* (`*crt_bundle_attach`) (void `*conf`)**  
Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

**int `reconnect_timeout_ms`**  
Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

**const char `**alpn_protos`**  
NULL-terminated list of supported application protocols to be used for ALPN

**const char \*clientkey\_password**  
Client key decryption password string

**int clientkey\_password\_len**  
String length of the password pointed to by `clientkey_password`

**esp\_mqtt\_protocol\_ver\_t protocol\_ver**  
MQTT protocol version used for connection, defaults to value from `menuconfig`

**int out\_buffer\_size**  
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

**bool skip\_cert\_common\_name\_check**  
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

**bool use\_secure\_element**  
enable secure element for enabling SSL connection

**void \*ds\_data**  
carrier of handle for digital signature parameters

**int network\_timeout\_ms**  
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

**bool disable\_keepalive**  
Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

**const char \*path**  
Path in the URI

**int message\_retransmit\_timeout**  
timeout for retransmit of failed packet

## Macros

### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

`MQTT_ERROR_TYPE_TCP_TRANSPORT` error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from `MQTT_ERROR_TYPE_ESP_TLS` layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

## Type Definitions

**typedef struct esp\_mqtt\_client \*esp\_mqtt\_client\_handle\_t**

**typedef struct esp\_mqtt\_error\_codes esp\_mqtt\_error\_codes\_t**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
<code>MQTT_ERROR_TYPE_TCP_TRANSPORT</code>	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
<code>MQTT_ERROR_TYPE_CONNECTION_REFUSED</code>	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

**typedef esp\_mqtt\_event\_t \*esp\_mqtt\_event\_handle\_t**

**typedef esp\_err\_t (\*mqtt\_event\_callback\_t)(esp\_mqtt\_event\_handle\_t event)**

## Enumerations

### enum esp\_mqtt\_event\_id\_t

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

*Values:*

**MQTT\_EVENT\_ANY** = -1

**MQTT\_EVENT\_ERROR** = 0

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

**MQTT\_EVENT\_CONNECTED**

connected event, additional context: `session_present` flag

**MQTT\_EVENT\_DISCONNECTED**

disconnected event

**MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- `msg_id` message id
- data pointer to the received data
- `data_len` length of the data for this event

**MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event

**MQTT\_EVENT\_PUBLISHED**

published event, additional context: `msg_id`

**MQTT\_EVENT\_DATA**

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- retain retain flag of the message
- qos qos level of the message
- dup dup flag of the message Note: Multiple **MQTT\_EVENT\_DATA** could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

**MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

### enum esp\_mqtt\_connect\_return\_code\_t

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_CONNECTION\_ACCEPTED** = 0

Connection accepted

**MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

MQTT connection refused reason: Wrong protocol

**MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

MQTT connection refused reason: ID rejected

**MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

**MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

MQTT connection refused reason: Wrong user

**MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

**enum esp\_mqtt\_error\_type\_t**

MQTT connection error codes propagated via ERROR event

*Values:*

**MQTT\_ERROR\_TYPE\_NONE** = 0

**MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

**MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

**enum esp\_mqtt\_transport\_t**

*Values:*

**MQTT\_TRANSPORT\_UNKNOWN** = 0x0

**MQTT\_TRANSPORT\_OVER\_TCP**

MQTT over TCP, using scheme: mqtt

**MQTT\_TRANSPORT\_OVER\_SSL**

MQTT over SSL, using scheme: mqttssl

**MQTT\_TRANSPORT\_OVER\_WS**

MQTT over Websocket, using scheme: ws

**MQTT\_TRANSPORT\_OVER\_WSS**

MQTT over Websocket Secure, using scheme: wss

**enum esp\_mqtt\_protocol\_ver\_t**

MQTT protocol version used for connection

*Values:*

**MQTT\_PROTOCOL\_UNDEFINED** = 0

**MQTT\_PROTOCOL\_V\_3\_1**

**MQTT\_PROTOCOL\_V\_3\_1\_1**

## 2.4.3 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.

- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert\_buf** and **cacert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA cert.
  - `cacert_bytes` - size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

## Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**Note:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

---

**Note:** *These values are subject to change with change in configuration options and version of respective libraries.*

---

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such

as how to calculate private key parameters can be found in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in *Digital Signature*.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## API Reference

### Header File

- [esp-tls/esp\\_tls.h](#)

### Functions

*esp\_tls\_t* \***esp\_tls\_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Return** *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t* \***esp\_tls\_conn\_new** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_new\_async*)

**Return** pointer to *esp\_tls\_t*, or NULL if connection couldn't be opened.

#### Parameters

- [in] hostname: Hostname of the host.
- [in] hostlen: Length of hostname.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.

int **esp\_tls\_conn\_new\_sync** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### Return

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

#### Parameters

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- [in] *tls*: Pointer to esp-tls as esp-tls handle.

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new**(const char \**url*, const *esp\_tls\_cfg\_t* \**cfg*)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp\_tls\_conn\_new*() API. However this API accepts host’s url.

**Return** pointer to *esp\_tls\_t*, or NULL if connection couldn’t be opened.

#### Parameters

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.

int **esp\_tls\_conn\_new\_async**(const char \**hostname*, int *hostlen*, int *port*, const *esp\_tls\_cfg\_t* \**cfg*,  
*esp\_tls\_t* \**tls*)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

#### Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

#### Parameters

- [in] *hostname*: Hostname of the host.
- [in] *hostlen*: Length of hostname.
- [in] *port*: Port number of the host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*. *non\_block* member of this structure should be set to be true.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

int **esp\_tls\_conn\_http\_new\_async**(const char \**url*, const *esp\_tls\_cfg\_t* \**cfg*, *esp\_tls\_t* \**tls*)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp\_tls\_conn\_new*() API. However this API accepts host’s url.

#### Return

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

#### Parameters

- [in] *url*: url of host.
- [in] *cfg*: TLS configuration as *esp\_tls\_cfg\_t*.
- [in] *tls*: pointer to esp-tls as esp-tls handle.

static ssize\_t **esp\_tls\_conn\_write**(*esp\_tls\_t* \**tls*, const void \**data*, size\_t *datalen*)

Write from buffer ‘*data*’ into specified *tls* connection.

#### Return

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer from which data will be written.
- [in] `datalen`: Length of data buffer.

**static** ssize\_t `esp_tls_conn_read` (*esp\_tls\_t* \*`tls`, void \*`data`, size\_t `datalen`)

Read from specified tls connection into the buffer 'data' .

**Return**

- $> 0$  if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- $0$  if read operation was not successful. The underlying connection was closed.
- $< 0$  if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer to hold read data.
- [in] `datalen`: Length of data buffer.

void `esp_tls_conn_delete` (*esp\_tls\_t* \*`tls`)

Compatible version of `esp_tls_conn_destroy()` to close the TLS/SSL connection.

**Note** This API will be removed in IDFv5.0

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

int `esp_tls_conn_destroy` (*esp\_tls\_t* \*`tls`)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

**Return** -  $0$  on success

- $-1$  if socket error or an invalid argument

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

ssize\_t `esp_tls_get_bytes_avail` (*esp\_tls\_t* \*`tls`)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

**Return**

- $-1$  in case of invalid arg
- bytes available in the application data record read buffer

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.

*esp\_err\_t* `esp_tls_get_conn_sockfd` (*esp\_tls\_t* \*`tls`, int \*`sockfd`)

Returns the connection socket file descriptor from *esp\_tls* session.

**Return** - `ESP_OK` on success and value of `sockfd` will be updated with socket file descriptor for connection

- `ESP_ERR_INVALID_ARG` if (`tls == NULL || sockfd == NULL`)

**Parameters**

- [in] `tls`: handle to *esp\_tls* context
- [out] `sockfd`: int pointer to sockfd value.

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store**(void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Return**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store**(const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Return**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] cacert\_pem\_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- [in] cacert\_pem\_bytes: Length of the buffer.

void **esp\_tls\_free\_global\_ca\_store**(void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error**(*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in *esp\_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred
- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

**Parameters**

- [in] h: esp-tls error handle.
- [out] esp\_tls\_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code
- [out] esp\_tls\_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type**(*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in *esp\_tls* of a specific type The error information is cleared internally upon return.

**Return**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

**Parameters**

- [in] h: esp-tls error handle.
- [in] err\_type: specific error type
- [out] error\_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

`mbedtls_x509_crt *esp_tls_get_global_ca_store` (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

**Note** Modifying the pointer might cause a failure in verifying the certificates.

**Return**

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

## Structures

**struct esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

### Public Members

`esp_err_t last_error`

error code (based on `ESP_ERR_ESP_TLS_BASE`) of the last occurred error

int `esp_tls_error_code`

`esp_tls` error code from last `esp_tls` failed api

int `esp_tls_flags`

last certification verification flags

**struct psk\_key\_hint**

ESP-TLS preshared key and hint structure.

### Public Members

const uint8\_t \*`key`

key in PSK authentication mode in binary format

const size\_t `key_size`

length of the key

const char \*`hint`

hint in PSK authentication mode in string format

**struct tls\_keep\_alive\_cfg**

Keep alive parameters structure.

### Public Members

bool `keep_alive_enable`

Enable keep-alive timeout

int `keep_alive_idle`

Keep-alive idle time (second)

int `keep_alive_interval`

Keep-alive interval time (second)

int `keep_alive_count`

Keep-alive packet retry send count

**struct esp\_tls\_cfg**

ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

### Public Members

#### **const** char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: `const char **alpn_protos = { "h2", NULL };`

- where 'h2' is the protocol name

#### **const** unsigned char \***cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

#### **const** unsigned char \***cacert\_pem\_buf**

CA certificate buffer legacy name

#### unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

#### unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

#### **const** unsigned char \***clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

#### **const** unsigned char \***clientcert\_pem\_buf**

Client certificate legacy name

#### unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

#### unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

#### **const** unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

#### **const** unsigned char \***clientkey\_pem\_buf**

Client key legacy name

#### unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

#### unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

#### **const** unsigned char \***clientkey\_password**

Client key decryption password string

#### unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**  
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**  
Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**  
Network timeout in milliseconds

bool **use\_global\_ca\_store**  
Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**  
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**  
Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**  
Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**  
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**) (void \*conf)  
Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**  
Pointer for digital signature peripheral context

**struct esp\_tls**  
ESP-TLS Connection Handle.

### Public Members

mbedtls\_ssl\_context **ssl**  
TLS/SSL context

mbedtls\_entropy\_context **entropy**  
mbedtls entropy context structure

mbedtls\_ctr\_drbg\_context **ctr\_drbg**  
mbedtls ctr drbg context structure. CTR\_DRBG is deterministic random bit generation based on AES-256

mbedtls\_ssl\_config **conf**  
TLS/SSL configuration to be shared between mbedtls\_ssl\_context structures

mbedtls\_net\_context **server\_fd**  
mbedtls wrapper type for sockets

mbedtls\_x509\_crt **cacert**  
Container for the X.509 CA certificate

mbedtls\_x509\_crt \***cacert\_ptr**  
Pointer to the cacert being used.

mbedtls\_x509\_crt **clientcert**  
Container for the X.509 client certificate

mbedtls\_pk\_context **clientkey**  
Container for the private key of the client certificate

int **sockfd**

Underlying socket file descriptor.

ssize\_t (\***read**) (**struct esp\_tls** \*tls, char \*data, size\_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize\_t (\***write**) (**struct esp\_tls** \*tls, **const** char \*data, size\_t datalen)

Callback function for writing data to TLS/SSL connection.

*esp\_tls\_conn\_state\_t* **conn\_state**

ESP-TLS Connection state

fd\_set **rset**

read file descriptors

fd\_set **wset**

write file descriptors

bool **is\_tls**

indicates connection type (TLS or NON-TLS)

*esp\_tls\_role\_t* **role**

esp-tls role

- ESP\_TLS\_CLIENT
- ESP\_TLS\_SERVER

*esp\_tls\_error\_handle\_t* **error\_handle**

handle to error descriptor

## Macros

**ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

**ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

**ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

**ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

**ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

**ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set socket option

**ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

**ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_ESP\_TLS\_SE\_FAILED**

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE**

**ESP\_TLS\_ERR\_SSL\_TIMEOUT**

### Type Definitions

**typedef struct esp\_tls\_last\_error \*esp\_tls\_error\_handle\_t**

**typedef struct esp\_tls\_last\_error esp\_tls\_last\_error\_t**

Error structure containing relevant errors in case tls error occurred.

**typedef enum esp\_tls\_conn\_state esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

**typedef enum esp\_tls\_role esp\_tls\_role\_t**

**typedef struct psk\_key\_hint psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

**typedef struct tls\_keep\_alive\_cfg tls\_keep\_alive\_cfg\_t**

Keep alive parameters structure.

**typedef struct esp\_tls\_cfg esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

**Note** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.

**typedef struct esp\_tls esp\_tls\_t**

ESP-TLS Connection Handle.

### Enumerations

**enum esp\_tls\_error\_type\_t**

Definition of different types/sources of error codes reported from different components

*Values:*

**ESP\_TLS\_ERR\_TYPE\_UNKNOWN** = 0

**ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error errno

**ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

**ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

**ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type esp\_err\_t

**ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

**ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

**ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type invalid entry

**enum esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

## 2.4.4 ESP HTTP Client

### Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the `event_handle` (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it' s done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`' s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

### Application Example

```

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
            break;
        case HTTP_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
            break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

```

(continues on next page)

(continued from previous page)

```

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
             esp_http_client_get_status_code(client),
             esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

## Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with same ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

## Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);

```

## HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#) (enabled by default).

---

**Note:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

---

## HTTPS example

```

static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);
}

```

(continues on next page)

(continued from previous page)

```

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
             esp_http_client_get_status_code(client),
             esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);
}

```

## HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always to called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

**Perform HTTP request as Stream reader** Check the example function `http_perform_as_stream_reader` at [protocols/esp\\_http\\_client](#).

## HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of config entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

### Config authentication example with URI

```

esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};

```

### Config authentication example with username, password entry

```

esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",

```

(continues on next page)

```

    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};

```

HTTP Client example: [protocols/esp\\_http\\_client](#).

## API Reference

### Header File

- [esp\\_http\\_client/include/esp\\_http\\_client.h](#)

### Functions

*esp\_http\_client\_handle\_t* **esp\_http\_client\_init** (**const** *esp\_http\_client\_config\_t* \**config*)

Start a HTTP session This function must be the first function to call, and it returns a *esp\_http\_client\_handle\_t* that you must use as input to other functions in the interface. This call MUST have a corresponding call to *esp\_http\_client\_cleanup* when the operation is complete.

#### Return

- *esp\_http\_client\_handle\_t*
- NULL if any errors

#### Parameters

- [in] *config*: The configurations, see *http\_client\_config\_t*

*esp\_err\_t* **esp\_http\_client\_perform** (*esp\_http\_client\_handle\_t* *client*)

Invoke this function after *esp\_http\_client\_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp\_http\_client\_handle\_t* as input as the *esp\_http\_client\_init* call returned. *esp\_http\_client\_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp\_http\_client\_perform()*, *is\_async* member of *esp\_http\_client\_config\_t* must be set while making a call to *esp\_http\_client\_init()* API. You can do any amount of calls to *esp\_http\_client\_perform* while using the same *esp\_http\_client\_handle\_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp\_http\_client* will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp\_http\_client\_set\_\** between the invokes to set options for the following *esp\_http\_client\_perform*.

**Note** You must never call this function simultaneously from two places using the same client handle.

Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp\_http\_client\_handle\_t*. This function include *esp\_http\_client\_open* -> *esp\_http\_client\_write* -> *esp\_http\_client\_fetch\_headers* -> *esp\_http\_client\_read* (and option) *esp\_http\_client\_close*.

#### Return

- ESP\_OK on successful
- ESP\_FAIL on error

#### Parameters

- *client*: The *esp\_http\_client* handle

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* *client*, **const** char \**url*)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

#### Return

- ESP\_OK
- ESP\_FAIL

#### Parameters

- [in] *client*: The *esp\_http\_client* handle

- [in] url: The url

*esp\_err\_t* **esp\_http\_client\_set\_post\_field**(*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The `esp_http_client` handle
- [in] data: post data pointer
- [in] len: post length

int **esp\_http\_client\_get\_post\_field**(*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Return** Size of post data

**Parameters**

- [in] client: The client
- [out] data: Point to post data pointer

*esp\_err\_t* **esp\_http\_client\_set\_header**(*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The `esp_http_client` handle
- [in] key: The header key
- [in] value: The header value

*esp\_err\_t* **esp\_http\_client\_get\_header**(*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The `esp_http_client` handle
- [in] key: The header key
- [out] value: The header value

*esp\_err\_t* **esp\_http\_client\_get\_username**(*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The `esp_http_client` handle
- [out] value: The username value

*esp\_err\_t* **esp\_http\_client\_set\_username**(*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The esp\_http\_client handle
- [in] username: The username value

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp\_http\_client\_init.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The esp\_http\_client handle
- [out] value: The password value

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The esp\_http\_client handle
- [in] password: The password value

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The esp\_http\_client handle
- [in] auth\_type: The esp\_http\_client auth type

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Return**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

**Parameters**

- [in] client: The esp\_http\_client handle
- [in] method: The method

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The esp\_http\_client handle
- [in] key: The key

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] *client*: The `esp_http_client` handle
- [in] *write\_len*: HTTP Content length need to write to the server

int `esp_http_client_write` (*esp\_http\_client\_handle\_t client*, const char \**buffer*, int *len*)  
This function will write data to the HTTP connection previously opened by `esp_http_client_open()`

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: This value must not be larger than the *write\_len* parameter provided to `esp_http_client_open()`

int `esp_http_client_fetch_headers` (*esp\_http\_client\_handle\_t client*)  
This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked` response)
- (-1: ESP\_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- [in] *client*: The `esp_http_client` handle

bool `esp_http_client_is_chunked_response` (*esp\_http\_client\_handle\_t client*)  
Check response data is chunked.

**Return** true or false

**Parameters**

- [in] *client*: The `esp_http_client` handle

int `esp_http_client_read` (*esp\_http\_client\_handle\_t client*, char \**buffer*, int *len*)  
Read data from http stream.

**Return**

- (-1) if any errors
- Length of data was read

**Parameters**

- [in] *client*: The `esp_http_client` handle
- *buffer*: The buffer
- [in] *len*: The length

int `esp_http_client_get_status_code` (*esp\_http\_client\_handle\_t client*)  
Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Return** Status code

**Parameters**

- [in] *client*: The `esp_http_client` handle

int `esp_http_client_get_content_length` (*esp\_http\_client\_handle\_t client*)  
Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Return**

- (-1) Chunked transfer
- Content-Length value as bytes

**Parameters**

- [in] *client*: The `esp_http_client` handle

*esp\_err\_t* **esp\_http\_client\_close** (*esp\_http\_client\_handle\_t* client)

Close http connection, still kept all http request resources.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The esp\_http\_client handle

*esp\_err\_t* **esp\_http\_client\_cleanup** (*esp\_http\_client\_handle\_t* client)

This function must be the last function to call for an session. It is the opposite of the esp\_http\_client\_init function and must be called with the same handle as input that a esp\_http\_client\_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with esp\_http\_client.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The esp\_http\_client handle

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t* client)

Get transport type.

**Return**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

**Parameters**

- [in] client: The esp\_http\_client handle

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Return**

- ESP\_OK
- ESP\_FAIL

**Parameters**

- [in] client: The esp\_http\_client handle

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

- [in] client: The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

**Return**

- true
- false

**Parameters**

- [in] client: The esp\_http\_client handle

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls esp\_http\_client\_read multiple times till the end of data is reached or till the buffer gets full.

**Return**

- Length of data was read

**Parameters**

- [in] `client`: The `esp_http_client` handle
- `buffer`: The buffer
- [in] `len`: The buffer length

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* `client`, int *\*len*)

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Return**

- `ESP_OK` If successful, `len` will have discarded length
- `ESP_FAIL` If failed to read response
- `ESP_ERR_INVALID_ARG` If the client is `NULL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- `len`: Length of data discarded

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* `client`, char *\*url*, const int *len*)

Get URL from client.

**Return**

- `ESP_OK`
- `ESP_FAIL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [inout] `url`: The buffer to store URL
- [in] `len`: The buffer length

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* `client`, int *\*len*)

Get Chunk-Length from client.

**Return**

- `ESP_OK` If successful, `len` will have length of current chunk
- `ESP_FAIL` If the server is not a chunked server
- `ESP_ERR_INVALID_ARG` If the client or `len` are `NULL`

**Parameters**

- [in] `client`: The `esp_http_client` handle
- [out] `len`: Variable to store length

**Structures**

**struct esp\_http\_client\_event**

HTTP Client events data.

**Public Members**

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

`esp_http_client_handle_t` context

void **\*data**

data of the event

int **data\_len**

data length of data

void **\*user\_data**

user\_data context, from *esp\_http\_client\_config\_t* `user_data`

**char \*header\_key**  
For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header key

**char \*header\_value**  
For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header value

**struct esp\_http\_client\_config\_t**  
HTTP configuration.

### Public Members

**const char \*url**  
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

**const char \*host**  
Domain or IP as string

**int port**  
Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

**const char \*username**  
Using for Http authentication

**const char \*password**  
Using for Http authentication

*esp\_http\_client\_auth\_type\_t* **auth\_type**  
Http authentication type, see esp\_http\_client\_auth\_type\_t

**const char \*path**  
HTTP Path, if not set, default is /

**const char \*query**  
HTTP query

**const char \*cert\_pem**  
SSL server certification, PEM format as string, if the client requires to verify server

**const char \*client\_cert\_pem**  
SSL client certification, PEM format as string, if the server requires to verify client

**const char \*client\_key\_pem**  
SSL client key, PEM format as string, if the server requires to verify client

**const char \*client\_key\_password**  
Client key decryption password string

**size\_t client\_key\_password\_len**  
String length of the password pointed to by client\_key\_password

**const char \*user\_agent**  
The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**  
HTTP Method

**int timeout\_ms**  
Network timeout in milliseconds

**bool disable\_auto\_redirect**  
Disable HTTP automatic redirects

**int max\_redirection\_count**  
Max number of redirections on receiving HTTP redirect status code, using default value if zero

**int max\_authorization\_retries**  
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see `esp_http_client_transport_t`

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void \***user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

*esp\_err\_t* (**\*crt\_bundle\_attach**) (void \*conf)

Function pointer to `esp_cert_bundle_attach`. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to `esp_err_t`

### Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

### Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

```
HTTP_EVENT_ERROR = 0
```

This event occurs when there are any errors during execution

```
HTTP_EVENT_ON_CONNECTED
```

Once the HTTP has been connected to the server, no data exchange has been performed

```
HTTP_EVENT_HEADERS_SENT
```

After sending all the headers to the server

```
HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
```

This header has been kept for backward compatability and will be deprecated in future versions esp-idf

```
HTTP_EVENT_ON_HEADER
```

Occurs when receiving each header sent from the server

```
HTTP_EVENT_ON_DATA
```

Occurs when receiving data from the server, possibly multiple portions of the packet

```
HTTP_EVENT_ON_FINISH
```

Occurs when finish a HTTP session

```
HTTP_EVENT_DISCONNECTED
```

The connection has been disconnected

```
enum esp_http_client_transport_t
```

HTTP Client transport.

*Values:*

```
HTTP_TRANSPORT_UNKNOWN = 0x0
```

Unknown

```
HTTP_TRANSPORT_OVER_TCP
```

Transport over tcp

```
HTTP_TRANSPORT_OVER_SSL
```

Transport over ssl

```
enum esp_http_client_method_t
```

HTTP method.

*Values:*

```
HTTP_METHOD_GET = 0
```

HTTP GET Method

```
HTTP_METHOD_POST
```

HTTP POST Method

```
HTTP_METHOD_PUT
```

HTTP PUT Method

```
HTTP_METHOD_PATCH
```

HTTP PATCH Method

**HTTP\_METHOD\_DELETE**  
HTTP DELETE Method

**HTTP\_METHOD\_HEAD**  
HTTP HEAD Method

**HTTP\_METHOD\_NOTIFY**  
HTTP NOTIFY Method

**HTTP\_METHOD\_SUBSCRIBE**  
HTTP SUBSCRIBE Method

**HTTP\_METHOD\_UNSUBSCRIBE**  
HTTP UNSUBSCRIBE Method

**HTTP\_METHOD\_OPTIONS**  
HTTP OPTIONS Method

**HTTP\_METHOD\_COPY**  
HTTP COPY Method

**HTTP\_METHOD\_MOVE**  
HTTP MOVE Method

**HTTP\_METHOD\_LOCK**  
HTTP LOCK Method

**HTTP\_METHOD\_UNLOCK**  
HTTP UNLOCK Method

**HTTP\_METHOD\_PROPFIND**  
HTTP PROPFIND Method

**HTTP\_METHOD\_PROPPATCH**  
HTTP PROPPATCH Method

**HTTP\_METHOD\_MKCOL**  
HTTP MKCOL Method

**HTTP\_METHOD\_MAX**

**enum esp\_http\_client\_auth\_type\_t**  
HTTP Authentication type.

*Values:*

**HTTP\_AUTH\_TYPE\_NONE = 0**  
No authentication

**HTTP\_AUTH\_TYPE\_BASIC**  
HTTP Basic authentication

**HTTP\_AUTH\_TYPE\_DIGEST**  
HTTP Digest authentication

**enum HttpStatus\_Code**  
Enum for the HTTP status codes.

*Values:*

**HttpStatus\_Ok = 200**

**HttpStatus\_MultipleChoices = 300**

**HttpStatus\_MovedPermanently = 301**

**HttpStatus\_Found = 302**

**HttpStatus\_SeeOther = 303**

**HttpStatus\_TemporaryRedirect = 307**

```

HttpStatus_PermanentRedirect = 308
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

```

## 2.4.5 HTTP Server

### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C3. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including uri name, method type (eg. HTTPD\_GET/HTTPD\_POST/HTTPD\_PUT etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

### Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);

```

(continues on next page)

(continued from previous page)

```

if (ret <= 0) { /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
        /* In case of timeout one can choose to retry calling
         * httpd_req_rcv(), but to keep it simple, here we
         * respond with an HTTP 408 (Request Timeout) error */
        httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
     * ensure that the underlying socket is closed */
    return ESP_FAIL;
}

/* Send a simple response */
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

```

(continues on next page)

}

**Simple HTTP server example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↪data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↪context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

### Websocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#). Please check the example under [protocols/http\\_server/ws\\_echo\\_server](#)

### API Reference

#### Header File

- [esp\\_http\\_server/include/esp\\_http\\_server.h](#)

**Functions**

*esp\_err\_t* **httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, **const** *httpd\_uri\_t*\*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

**Note** URI handlers can be registered in real time as long as the server handle is valid.

**Return**

- ESP\_OK : On successfully registering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_HANDLERS\_FULL : If no slots left for new handler
- ESP\_ERR\_HTTPD\_HANDLER\_EXISTS : If handler with same URI and method is already registered

**Parameters**

- [in] handle: handle to HTTPD server instance
- [in] uri\_handler: pointer to handler that needs to be registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, **const** char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

**Return**

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

**Parameters**

- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, **const** char \*uri)

Unregister all URI handlers with the specified uri string.

**Return**

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

**Parameters**

- [in] handle: handle to HTTPD server instance
- [in] uri: uri string specifying all handlers that need to be deregistered

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server' s receive function (by session FD)

This function overrides the web server' s receive function. This same function is used to read HTTP request packets.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

**Return**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] recv\_func: The receive function to be set for this session

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server' s send function (by session FD)

This function overrides the web server' s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

**Return**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] send\_func: The send function to be set for this session

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server' s pending function (by session FD)

This function overrides the web server' s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

**Return**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] hd: HTTPD instance handle
- [in] sockfd: Session socket FD
- [in] pending\_func: The receive function to be set for this session

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Return**

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**

- [in] `r`: The request whose socket descriptor should be found

int `httpd_req_recv` (`httpd_req_t *r`, char \*`buf`, size\_t `buf_len`)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘`buf_len`’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling `socket recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling `socket recv()`

**Parameters**

- [in] `r`: The request being responded to
- [in] `buf`: Pointer to a buffer that the data will be read into
- [in] `buf_len`: Length of the buffer

size\_t `httpd_req_get_hdr_value_len` (`httpd_req_t *r`, const char \*`field`)

Search for a field in request headers and return the string length of it’ s value.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

**Parameters**

- [in] `r`: The request being responded to
- [in] `field`: The header field to be searched in the request

`esp_err_t` `httpd_req_get_hdr_value_str` (`httpd_req_t *r`, const char \*`field`, char \*`val`, size\_t `val_size`)

Get the value string of a field from the request headers.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length

**Return**

- `ESP_OK` : Field found in the request header and value string copied
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

**Parameters**

- `[in]` `r`: The request being responded to
- `[in]` `field`: The field to be searched in the header
- `[out]` `val`: Pointer to the buffer into which the value will be copied if the field is found
- `[in]` `val_size`: Size of the user buffer “val”

`size_t httpd_req_get_url_query_len` (`httpd_req_t *r`)

Get Query string length from the request URL.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

**Return**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

**Parameters**

- `[in]` `r`: The request being responded to

`esp_err_t httpd_req_get_url_query_str` (`httpd_req_t *r`, `char *buf`, `size_t buf_len`)

Get Query string from the request URL.

**Note**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

**Parameters**

- `[in]` `r`: The request being responded to
- `[out]` `buf`: Pointer to the buffer into which the query string will be copied (if found)
- `[in]` `buf_len`: Length of output buffer

`esp_err_t httpd_query_key_value` (`const char *qry`, `const char *key`, `char *val`, `size_t val_size`)

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

**Note**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

**Return**

- ESP\_OK : Key is found in the URL query string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

**Parameters**

- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val\_size: Size of the user buffer “val”

bool **httpd\_uri\_match\_wildcard**(const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “\*” anywhere else in the template will be taken literally.

**Return** true if a match was found

**Parameters**

- [in] uri\_template: URI template (pattern)
- [in] uri\_to\_match: URI to be matched
- [in] match\_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

*esp\_err\_t* **httpd\_resp\_send**(*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf\_len: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

#### Note

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

#### Return

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

#### Parameters

- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that stores the data
- [in] buf\_len: Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

*static esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

#### Parameters

- [in] r: The request being responded to
- [in] str: String to be sent as response body

*static esp\_err\_t* **httpd\_resp\_sendstr\_chunk** (*httpd\_req\_t* \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `httpd_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### Return

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

#### Parameters

- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to
- `[in] status`: The HTTP status code of this response

`esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)`

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to
- `[in] type`: The Content Type of the response

`esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)`

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to
- `[in] field`: The field name of the HTTP header
- `[in] value`: The value of this HTTP header

`esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] req`: Pointer to the HTTP request for which the response needs to be sent
- `[in] error`: Error type to send
- `[in] msg`: Error message string (pass `NULL` for default message)

**static** *esp\_err\_t* `httpd_resp_send_404` (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to

**static** *esp\_err\_t* `httpd_resp_send_408` (*httpd\_req\_t* \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to

**static** *esp\_err\_t* `httpd_resp_send_500` (*httpd\_req\_t* \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

**Parameters**

- `[in] r`: The request being responded to

int `httpd_send` (*`httpd_req_t` \*r, const char \*buf, size\_t buf\_len*)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

**Note**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`

**Return**

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

**Parameters**

- `[in] r`: The request being responded to
- `[in] buf`: Buffer from where the fully constructed packet is to be read
- `[in] buf_len`: Length of the buffer

int `httpd_socket_send` (*`httpd_handle_t` hd, int sockfd, const char \*buf, size\_t buf\_len, int flags*)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Return**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

**Parameters**

- `[in] hd`: server instance
- `[in] sockfd`: session socket file descriptor
- `[in] buf`: buffer with bytes to send
- `[in] buf_len`: data size
- `[in] flags`: flags for the send() function

int `httpd_socket_recv` (*`httpd_handle_t` hd, int sockfd, char \*buf, size\_t buf\_len, int flags*)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

**Parameters**

- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf\_len: data size
- [in] flags: flags for the send() function

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd\_err\_code\_t*. See prototype *httpd\_err\_handler\_func\_t* above for details.

**Return**

- ESP\_OK : handler registered successfully
- ESP\_ERR\_INVALID\_ARG : invalid error code or server handle

**Parameters**

- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler\_fn: User implemented handler function (Pass NULL to unset any previously set handler)

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, **const** *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Return**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)
- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

**Parameters**

- [in] config: Configuration for new instance of the server

- [out] handle: Handle to newly created instance of the server. NULL on error

*esp\_err\_t* **httpd\_stop**(*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

#### Return

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

#### Parameters

- [in] handle: Handle to server returned by httpd\_start

*esp\_err\_t* **httpd\_queue\_work**(*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

**Note** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

#### Return

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

#### Parameters

- [in] handle: Handle to server returned by httpd\_start
- [in] work: Pointer to the function to be executed in the HTTPD' s context
- [in] arg: Pointer to the arguments that should be passed to this function

void \***httpd\_sess\_get\_ctx**(*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd\_req\_t structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

#### Return

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

#### Parameters

- [in] handle: Handle to server returned by httpd\_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

void **httpd\_sess\_set\_ctx**(*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

#### Parameters

- [in] handle: Handle to server returned by httpd\_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free\_fn: Function that should be called to free the context

void **httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)  
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

**Return**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session ‘transport’ context by socket descriptor.

See `httpd_sess_set_ctx()`

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Transport context object to assign to the session
- [in] free\_fn: Function that should be called to free the transport context

void **httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)  
Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

void **httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)  
Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)  
Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**

- ESP\_OK : On successfully initiating closure
- ESP\_FAIL : Failure to queue work
- ESP\_ERR\_NOT\_FOUND : Socket fd not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor of the session to be closed

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)  
Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**

- ESP\_OK : Socket found and LRU counter updated
- ESP\_ERR\_NOT\_FOUND : Socket not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

**Return**

- ESP\_OK : Successfully retrieved session list
- ESP\_ERR\_INVALID\_ARG : Wrong arguments or list is longer than allocated

**Parameters**

- [in] handle: Handle to server returned by `httpd_start`
- [inout] fds: In: Number of fds allocated in the supplied structure client\_fds Out: Number of valid client fds returned in client\_fds,
- [out] client\_fds: Array of client fds

**Structures****struct httpd\_config**

HTTP Server Configuration Structure.

**Note** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge “Least Recently Used” connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_transport_ctx_free_fn`

Free function for global transport context

[\*httpd\\_open\\_func\\_t\*](#) `open_fn`

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

[\*httpd\\_close\\_func\\_t\*](#) `close_fn`

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

[\*httpd\\_uri\\_match\\_func\\_t\*](#) `uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct httpd\_req**

HTTP Request Data Structure.

## Public Members

[\*httpd\\_handle\\_t\*](#) `handle`

Handle to server instance

**int method**

The type of HTTP request, -1 if unsupported method

**const char uri[HTTPD\_MAX\_URI\_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size\_t content\_len**

Length of the request body

**void \*aux**

Internally used members

**void \*user\_ctx**

User context pointer passed during URI registration.

**void \*sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free\_ctx function is set.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess\_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

**bool ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess\_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess\_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free\_ctx or free()) only if the socket gets closed.

**struct httpd\_uri**

Structure for URI handler.

### Public Members

**const char \*uri**

The URI to handle

[\*httpd\\_method\\_t\*](#) **method**

Method supported by the URI

[\*esp\\_err\\_t\*](#) (\***handler**) ([\*httpd\\_req\\_t\*](#) \*r)

Handler to call for supported request method. This must return ESP\_OK, or else the underlying socket will be closed.

**void \*user\_ctx**

Pointer to user context data which will be available to handler

### Macros

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD SOCK\_ERR\_FAIL**

**HTTPD SOCK\_ERR\_INVALID**

**HTTPD SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**HTTPD\_DEFAULT\_CONFIG ()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN**

### Type Definitions

**typedef struct *httpd\_req* httpd\_req\_t**

HTTP Request Data Structure.

**typedef struct *httpd\_uri* httpd\_uri\_t**

Structure for URI handler.

**typedef int (\*httpd\_send\_func\_t) (*httpd\_handle\_t* hd, int sockfd, **const** char \*buf, size\_t buf\_len, int flags)**

Prototype for HTTPDs low-level send function.

**Note** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

#### Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `send()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

**typedef int (\*httpd\_recv\_func\_t) (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)**

Prototype for HTTPDs low-level recv function.

**Note** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

#### Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the `send()` function

**typedef int (\*httpd\_pending\_func\_t) (*httpd\_handle\_t* hd, int sockfd)**

Prototype for HTTPDs low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCKET_ERR_` codes, which will be handled accordingly in the server task.

#### Return

- Bytes : The number of bytes waiting to be received
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket `pending()`
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket `pending()`

#### Parameters

- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor

**typedef *esp\_err\_t* (\*httpd\_err\_handler\_func\_t) (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error)**

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

**Parameters**

- `[in]` `req`: HTTP request for which the error needs to be handled
- `[in]` `error`: Error type

```
typedef void *httpd_handle_t  
HTTP Server Instance Handle.
```

Every instance of the server will have a unique handle.

```
typedef enum http_method httpd_method_t  
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.
```

```
typedef void (*httpd_free_ctx_fn_t) (void *ctx)  
Prototype for freeing context data (if any)
```

**Parameters**

- `[in]` `ctx`: object to free

```
typedef esp_err_t (*httpd_open_func_t) (httpd_handle_t hd, int sockfd)  
Function prototype for opening a session.
```

Called immediately after the socket was opened to set up the send/rcv functions and other parameters of the socket.

**Return**

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

**Parameters**

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

```
typedef void (*httpd_close_func_t) (httpd_handle_t hd, int sockfd)  
Function prototype for closing a session.
```

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**

- `[in]` `hd`: server instance
- `[in]` `sockfd`: session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t) (const char *reference_uri, const char  
*uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

**Return** true on match

**Parameters**

- `[in]` `reference_uri`: URI/template with respect to which the other URI is matched
- `[in]` `uri_to_match`: URI/template being matched to the reference URI/template

- [in] `match_upto`: For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**typedef struct *httpd\_config* httpd\_config\_t**

HTTP Server Configuration Structure.

**Note** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**typedef void (\*httpd\_work\_fn\_t) (void \*arg)**

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

#### Parameters

- [in] `arg`: The arguments for this work function

### Enumerations

**enum httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

`HTTPD_500_INTERNAL_SERVER_ERROR = 0`

`HTTPD_501_METHOD_NOT_IMPLEMENTED`

`HTTPD_505_VERSION_NOT_SUPPORTED`

`HTTPD_400_BAD_REQUEST`

`HTTPD_401_UNAUTHORIZED`

`HTTPD_403_FORBIDDEN`

`HTTPD_404_NOT_FOUND`

`HTTPD_405_METHOD_NOT_ALLOWED`

`HTTPD_408_REQ_TIMEOUT`

`HTTPD_411_LENGTH_REQUIRED`

`HTTPD_414_URI_TOO_LONG`

`HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`

`HTTPD_ERR_CODE_MAX`

## 2.4.6 HTTPS server

### Overview

This component is built on top of `esp_http_server`. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for `esp_http_server` applies also to a server you create this way.

### Used APIs

The following API of `esp_http_server` should not be used with `esp_https_server`, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`

- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config_t.global_transport_ctx`
  - `httpd_config_t.global_transport_ctx_free_fn`
  - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

## Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- [esp\\_https\\_server/include/esp\\_https\\_server.h](#)

### Functions

`esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

#### Parameters

- [inout] `config`: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] `handle`: - storage for the server handle, must be a valid pointer

void `httpd_ssl_stop(httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

#### Parameters

- [in] `handle`:

### Structures

`struct httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

## Public Members

### *httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

### **const** uint8\_t \***cacert\_pem**

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https\_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client\_verify\_cert\_pem var) 2)There should be another variable servercert which would hold servers own certificate (should inherit current role of cacert var)

### size\_t **cacert\_len**

CA certificate byte length

### **const** uint8\_t \***client\_verify\_cert\_pem**

Client verify authority certificate (CA used to sign clients, or client cert itself)

### size\_t **client\_verify\_cert\_len**

Client verify authority cert len

### **const** uint8\_t \***prvtkey\_pem**

Private key

### size\_t **prvtkey\_len**

Private key byte length

### *httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

### uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

### uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

## Macros

### **HTTPD\_SSL\_CONFIG\_DEFAULT** ()

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

## Type Definitions

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

## Enumerations

```
enum httpd_ssl_transport_mode_t
```

Values:

```
HTTPD_SSL_TRANSPORT_SECURE
```

```
HTTPD_SSL_TRANSPORT_INSECURE
```

## 2.4.7 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\r\n",
        recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\r\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
```

(continues on next page)

(continued from previous page)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↳time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,
↳received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↳ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
↳can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

### Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

### API Reference

### Header File

- [lwip/include/apps/ping/ping\\_sock.h](#)

## Functions

*esp\_err\_t* **esp\_ping\_new\_session**(**const** *esp\_ping\_config\_t* \**config*, **const** *esp\_ping\_callbacks\_t* \**cbs*, *esp\_ping\_handle\_t* \**hdl\_out*)

Create a ping session.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_FAIL: other internal error (e.g. socket error)
- ESP\_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

### Parameters

- *config*: ping configuration
- *cbs*: a bunch of callback functions invoked by internal ping task
- *hdl\_out*: handle of ping session

*esp\_err\_t* **esp\_ping\_delete\_session**(*esp\_ping\_handle\_t* *hdl*)

Delete a ping session.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

### Parameters

- *hdl*: handle of ping session

*esp\_err\_t* **esp\_ping\_start**(*esp\_ping\_handle\_t* *hdl*)

Start the ping session.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

### Parameters

- *hdl*: handle of ping session

*esp\_err\_t* **esp\_ping\_stop**(*esp\_ping\_handle\_t* *hdl*)

Stop the ping session.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

### Parameters

- *hdl*: handle of ping session

*esp\_err\_t* **esp\_ping\_get\_profile**(*esp\_ping\_handle\_t* *hdl*, *esp\_ping\_profile\_t* *profile*, void \**data*, uint32\_t *size*)

Get runtime profile of ping session.

### Return

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP\_OK: get profile successfully

### Parameters

- *hdl*: handle of ping session
- *profile*: type of profile
- *data*: profile data
- *size*: profile data size

## Structures

**struct** **esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

### Public Members

void **\*cb\_args**

arguments for callback functions

void (**\*on\_ping\_success**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (**\*on\_ping\_timeout**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (**\*on\_ping\_end**) (*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

**struct esp\_ping\_config\_t**

Type of “ping” configuration.

### Public Members

uint32\_t **count**

A “ping” session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

**typedef** void **\*esp\_ping\_handle\_t**

Type of “ping” session handle.

**Enumerations****enum esp\_ping\_profile\_t**

Profile of ping session.

*Values:***ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

**ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

**ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

**ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

**ESP\_PING\_PROF\_REPLY**

Number of reply packets received

**ESP\_PING\_PROF\_IPADDR**

IP address of replied target

**ESP\_PING\_PROF\_SIZE**

Size of received packet

**ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

**ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

**2.4.8 ESP Local Control****Overview**

ESP Local Control (**esp\_local\_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp\_local\_ctrl** service over BLE transport is performed as follows:

```

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = &(protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
    }
};

```

(continues on next page)

(continued from previous page)

```

        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[]  asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]  asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOM\_SEC1*: specifies that end to end encryption is used.
2. *PROTOCOM\_SEC0*: specifies that data will be exchanged as a plain text.
3. *PROTOCOM\_SEC\_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t \** in this context.

## Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
                                     ↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t_
                                     ↪*prop_values,
```

(continues on next page)

(continued from previous page)

```

                                void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↳props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                    prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

## Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp\_local\_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp\_local\_ctrl** service:

1. *get\_prop\_count* : This should simply return the total number of properties supported by the service
2. *get\_prop\_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set\_prop\_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get\_prop\_count* and then *get\_prop\_values*, hence form an index to name mapping for all properties. Now when calling *set\_prop\_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

Table 5: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl/version	https://<ip>.mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl/control	https://<ip>.mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- [esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)

## Functions

**const** *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_ble** (void)

Function for obtaining BLE transport mode.

**const** *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_httpd** (void)

Function for obtaining HTTPD transport mode.

*esp\_err\_t* **esp\_local\_ctrl\_start** (const *esp\_local\_ctrl\_config\_t* \*config)

Start local control service.

### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

### Parameters

- [in] config: Pointer to configuration structure

*esp\_err\_t* **esp\_local\_ctrl\_stop** (void)

Stop local control service.

*esp\_err\_t* **esp\_local\_ctrl\_add\_property** (const *esp\_local\_ctrl\_prop\_t* \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

### Return

- ESP\_OK : Success
- ESP\_FAIL : Failure

### Parameters

- [in] prop: Property description structure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

### Return

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

### Parameters

- [in] name: Name of the property to remove

**const** *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

### Return

- Pointer to property
- NULL if not found

### Parameters

- [in] name: Name of the property to find

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

**Return**

- ESP\_OK : Success
- ESP\_FAIL : Failure

**Parameters**

- [in] ep\_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user\_ctx: User data

**Unions****union esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

**Public Members***esp\_local\_ctrl\_transport\_config\_ble\_t* \*ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \*httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

**Structures****struct esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**Public Members**

## char \*name

Unique name of property

## uint32\_t type

Type of property. This may be set to application defined enums

## size\_t size

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

## uint32\_t flags

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

## void \*ctx

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

## void (\*ctx\_free\_fn) (void \*ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

**void \*data**

Pointer to memory holding property value

**size\_t size**

Size of property value

**void (\*free\_fn)(void \*data)**

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

*esp\_err\_t* (**\*get\_prop\_values**)(size\_t props\_count, **const** *esp\_local\_ctrl\_prop\_t* props[],  
*esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**

- [in] props\_count: Total elements in the props array
- [in] props: Array of properties, the current values for which have been requested by the client
- [out] prop\_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- [in] usr\_ctx: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

*esp\_err\_t* (**\*set\_prop\_values**)(size\_t props\_count, **const** *esp\_local\_ctrl\_prop\_t* props[], **const**  
*esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

**Parameters**

- [in] props\_count: Total elements in the props array
- [in] props: Array of properties, the values for which the client requests to change
- [in] prop\_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument

- [in] `usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

void **\*usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (**\*usr\_ctx\_free\_fn**) (void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

### Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, `sec0/sec1` or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void **\*custom\_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

void **\*pop**

Proof of possession to be used for local control. Could be NULL.

**struct esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

**const esp\_local\_ctrl\_transport\_t \*transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

### Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

### Type Definitions

**typedef struct esp\_local\_ctrl\_prop esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**typedef struct *esp\_local\_ctrl\_prop\_val* esp\_local\_ctrl\_prop\_val\_t**  
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**typedef struct *esp\_local\_ctrl\_handlers* esp\_local\_ctrl\_handlers\_t**  
Handlers for receiving and responding to local control commands for getting and setting properties.

**typedef struct esp\_local\_ctrl\_transport esp\_local\_ctrl\_transport\_t**  
Transport mode (BLE / HTTPD) over which the service will be provided.  
  
This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

**typedef struct *protocomm\_ble\_config* esp\_local\_ctrl\_transport\_config\_ble\_t**  
Configuration for transport mode BLE.  
  
This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

**typedef struct *httpd\_ssl\_config* esp\_local\_ctrl\_transport\_config\_httpd\_t**  
Configuration for transport mode HTTPD.  
  
This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`.

**typedef enum *esp\_local\_ctrl\_proto\_sec* esp\_local\_ctrl\_proto\_sec\_t**  
Security types for `esp_local_control`.

**typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* esp\_local\_ctrl\_proto\_sec\_cfg\_t**  
Protocom security configs

**typedef struct *esp\_local\_ctrl\_config* esp\_local\_ctrl\_config\_t**  
Configuration structure to pass to `esp_local_ctrl_start()`

### Enumerations

**enum esp\_local\_ctrl\_proto\_sec**  
Security types for `esp_local_control`.

*Values:*

**PROTCOM\_SEC0 = 0**

**PROTCOM\_SEC1**

**PROTCOM\_SEC\_CUSTOM**

## 2.4.9 mDNS Service

### Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called `Bonjour`. Apple releases an installer for Windows that can be found on [Apple's support page](#). On Linux, mDNS is provided by `avahi` and is usually installed by default.

### mDNS Properties

- `hostname`: the hostname that the device will respond to. If not set, the `hostname` will be read from the interface. Example: `my-esp32c3` will resolve to `my-esp32c3.local`
- `default_instance`: friendly name for your device, like `Jhon's ESP32-C3 Thing`. If not set, `hostname` will be used.

Example method to start mDNS for the STA interface and set `hostname` and `default_instance`:

```

void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32c3");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32-C3 Thing");
}

```

**mDNS Services** mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- `instance_name`: friendly name for your service, like Jhon's EESP32-C3 Web Server. If not defined, `default_instance` will be used.
- `service_type`: (required) service type, prepended with underscore. Some common types can be found [here](#).
- `proto`: (required) protocol that the service runs on, prepended with underscore. Example: `_tcp` or `_udp`
- `port`: (required) network port that the service runs on
- `txt`: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```

void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-C3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "{esp32c3}"},
        {"u", "user"},
        {"p", "password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}

```

**mDNS Query** mDNS provides methods for browsing for services and resolving host's IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```

void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);
}

```

(continues on next page)

(continued from previous page)

```

struct ip4_addr addr;
addr.addr = 0;

esp_err_t err = mdns_query_a(host_name, 2000, &addr);
if(err){
    if(err == ESP_ERR_NOT_FOUND){
        printf("Host was not found!");
        return;
    }
    printf("Query Failed");
    return;
}

printf(IPSTR, IP2STR(&addr));
}

```

Example method to resolve local services:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
        ↪protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;

```

(continues on next page)

(continued from previous page)

```

esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
if(err){
    ESP_LOGE(TAG, "Query Failed");
    return;
}
if(!results){
    ESP_LOGW(TAG, "No results found!");
    return;
}

mdns_print_results(results);
mdns_query_results_free(results);
}

```

Example of using the methods above:

```

void my_app_some_method(){
    //search for esp32c3-mdns.local
    resolve_mdns_host("esp32c3-mdns");

    //search for HTTP servers
    find_mdns_service("_http", "_tcp");
    //or file servers
    find_mdns_service("_smb", "_tcp"); //windows sharing
    find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
    find_mdns_service("_nfs", "_tcp"); //NFS server
    find_mdns_service("_ftp", "_tcp"); //FTP server
    //or networked printer
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}

```

## Application Example

mDNS server/scanner example: [protocols/mdns](#).

## API Reference

### Header File

- [mdns/include/mdns.h](#)

### Functions

*esp\_err\_t* **mdns\_init** (void)

Initialize mDNS on given interface.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE when failed to register event handler
- ESP\_ERR\_NO\_MEM on memory error
- ESP\_FAIL when failed to start mdns task

void **mdns\_free** (void)

Stop and free mDNS server.

*esp\_err\_t* **mdns\_hostname\_set** (const char \*hostname)

Set the hostname for mDNS server required if you want to advertise services.

#### Return

- ESP\_OK success

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- `hostname`: Hostname to set

*esp\_err\_t* **mdns\_instance\_name\_set** (**const** char \**instance\_name*)

Set the default instance name for mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- `instance_name`: Instance name to set

*esp\_err\_t* **mdns\_service\_add** (**const** char \**instance\_name*, **const** char \**service\_type*, **const** char \**proto*, **uint16\_t** *port*, *mdns\_txt\_item\_t* *txt*[], **size\_t** *num\_items*)

Add service to mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM memory error
- ESP\_FAIL failed to add service

**Parameters**

- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used
- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `port`: service port
- `txt`: string array of TXT data (eg. {{ "var" ," val" },{ "other" ," 2" }})
- `num_items`: number of items in TXT data

*esp\_err\_t* **mdns\_service\_remove** (**const** char \**service\_type*, **const** char \**proto*)

Remove service from mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)

*esp\_err\_t* **mdns\_service\_instance\_name\_set** (**const** char \**service\_type*, **const** char \**proto*, **const** char \**instance\_name*)

Set instance name for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- `service_type`: service type (`_http`, `_ftp`, etc)
- `proto`: service protocol (`_tcp`, `_udp`)
- `instance_name`: instance name to set

*esp\_err\_t* **mdns\_service\_port\_set** (**const** char \**service\_type*, **const** char \**proto*, **uint16\_t** *port*)

Set service port.

**Return**

- ESP\_OK success

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *port*: service port

*esp\_err\_t* **mdns\_service\_txt\_set** (**const** char *service\_type*, **const** char *proto*, *mdns\_txt\_item\_t* *txt*[], **uint8\_t** *num\_items*)

Replace all TXT items for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *txt*: array of TXT data (eg. {{ "var" ," val" },{ "other" ," 2" }})
- *num\_items*: number of items in TXT data

*esp\_err\_t* **mdns\_service\_txt\_item\_set** (**const** char *service\_type*, **const** char *proto*, **const** char *key*, **const** char *value*)

Set/Add TXT item for service TXT record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to add/update
- *value*: the new value of the key

*esp\_err\_t* **mdns\_service\_txt\_item\_remove** (**const** char *service\_type*, **const** char *proto*, **const** char *key*)

Remove TXT item for service TXT record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Service not found
- ESP\_ERR\_NO\_MEM memory error

**Parameters**

- *service\_type*: service type (`_http`, `_ftp`, etc)
- *proto*: service protocol (`_tcp`, `_udp`)
- *key*: the key that you want to remove

*esp\_err\_t* **mdns\_service\_remove\_all** (void)

Remove and free all services from mDNS server.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **mdns\_query** (**const** char *name*, **const** char *service\_type*, **const** char *proto*, **uint16\_t** *type*, **uint32\_t** *timeout*, **size\_t** *max\_results*, *mdns\_result\_t* *\*\*results*)

Query mDNS for host or service All following query methods are derived from this one.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG timeout was not given

**Parameters**

- name: service instance or host name (NULL for PTR queries)
- service\_type: service type (`_http`, `_arduino`, `_ftp` etc.) (NULL for host queries)
- proto: service protocol (`_tcp`, `_udp`, etc.) (NULL for host queries)
- type: type of query (`MDNS_TYPE_*`)
- timeout: time in milliseconds to wait for answers.
- max\_results: maximum results to be collected
- results: pointer to the results of the query results must be freed using `mdns_query_results_free` below

void `mdns_query_results_free` (*mdns\_result\_t* \*results)

Free query results.

**Parameters**

- results: linked list of results to be freed

*esp\_err\_t* `mdns_query_ptr` (**const** char \*service\_type, **const** char \*proto, uint32\_t timeout, size\_t max\_results, *mdns\_result\_t* \*\*results)

Query mDNS for service.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- service\_type: service type (`_http`, `_arduino`, `_ftp` etc.)
- proto: service protocol (`_tcp`, `_udp`, etc.)
- timeout: time in milliseconds to wait for answer.
- max\_results: maximum results to be collected
- results: pointer to the results of the query

*esp\_err\_t* `mdns_query_srv` (**const** char \*instance\_name, **const** char \*service\_type, **const** char \*proto, uint32\_t timeout, *mdns\_result\_t* \*\*result)

Query mDNS for SRV record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- instance\_name: service instance name
- service\_type: service type (`_http`, `_arduino`, `_ftp` etc.)
- proto: service protocol (`_tcp`, `_udp`, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

*esp\_err\_t* `mdns_query_txt` (**const** char \*instance\_name, **const** char \*service\_type, **const** char \*proto, uint32\_t timeout, *mdns\_result\_t* \*\*result)

Query mDNS for TXT record.

**Return**

- ESP\_OK success
- ESP\_ERR\_INVALID\_STATE mDNS is not running
- ESP\_ERR\_NO\_MEM memory error
- ESP\_ERR\_INVALID\_ARG parameter error

**Parameters**

- instance\_name: service instance name

- `service_type`: service type (`_http`, `_arduino`, `_ftp` etc.)
- `proto`: service protocol (`_tcp`, `_udp`, etc.)
- `timeout`: time in milliseconds to wait for answer.
- `result`: pointer to the result of the query

`esp_err_t mdns_query_a (const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)`  
Query mDNS for A record.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

**Parameters**

- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer.
- `addr`: pointer to the resulting IP4 address

`esp_err_t mdns_query_aaaa (const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)`  
Query mDNS for AAAA record.

**Return**

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

**Parameters**

- `host_name`: host name to look for
- `timeout`: time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- `addr`: pointer to the resulting IP6 address

`esp_err_t mdns_handle_system_event (void *ctx, system_event_t *event)`

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

**Parameters**

- `ctx`: The system event context
- `event`: The system event

**Structures**

`struct mdns_txt_item_t`

mDNS basic text item structure Used in `mdns_service_add()`

**Public Members**

`const char *key`  
item key name

`const char *value`  
item value string

`struct mdns_ip_addr_s`

mDNS query linked list IP item

**Public Members**

`esp_ip_addr_t addr`  
IP address

`struct mdns_ip_addr_s *next`  
next IP, or NULL for the last IP in the list

**struct mdns\_result\_s**  
mDNS query result structure

### Public Members

**struct mdns\_result\_s \*next**  
next result, or NULL for the last result in the list

**mdns\_if\_t tcpip\_if**  
interface index

**mdns\_ip\_protocol\_t ip\_protocol**  
ip\_protocol type of the interface (v4/v6)

**char \*instance\_name**  
instance name

**char \*hostname**  
hostname

**uint16\_t port**  
service port

**mdns\_txt\_item\_t \*txt**  
txt record

**size\_t txt\_count**  
number of txt items

**mdns\_ip\_addr\_t \*addr**  
linked list of IP addresses found

### Macros

**MDNS\_TYPE\_A**

**MDNS\_TYPE\_PTR**

**MDNS\_TYPE\_TXT**

**MDNS\_TYPE\_AAAA**

**MDNS\_TYPE\_SRV**

**MDNS\_TYPE\_OPT**

**MDNS\_TYPE\_NSEC**

**MDNS\_TYPE\_ANY**

### Type Definitions

**typedef struct mdns\_ip\_addr\_s mdns\_ip\_addr\_t**  
mDNS query linked list IP item

**typedef enum mdns\_if\_internal mdns\_if\_t**

**typedef struct mdns\_result\_s mdns\_result\_t**  
mDNS query result structure

### Enumerations

**enum mdns\_ip\_protocol\_t**  
mDNS enum to specify the ip\_protocol type

*Values:*

**MDNS\_IP\_PROTOCOL\_V4**

```

MDNS_IP_PROTOCOL_V6
MDNS_IP_PROTOCOL_MAX
enum mdns_if_internal
Values:
MDNS_IF_STA = 0
MDNS_IF_AP = 1
MDNS_IF_ETH = 2
MDNS_IF_MAX

```

## 2.4.10 ESP-Modbus

### Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- `Modbus RTU`—This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- `Modbus ASCII`—This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon ( “:” ) and trailing newline (CR/LF).
- `Modbus TCP/IP` or `Modbus TCP`—This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

**Modbus port specific API overview** ESP-IDF supports Modbus Serial/TCP slave and master protocol stacks (port) and provides Modbus controller interface API to interact with user application.

The functions below are used to create and then initialize actual Modbus controller interface for Serial/TCP port accordingly:

`esp_err_t mbc_slave_init` (mb\_port\_type\_t *port\_type*, void \*\**handler*)

Initialize Modbus Slave controller and stack for Serial port.

#### Return

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Parameter error
- `ESP_ERR_NOT_SUPPORTED` Port type not supported
- `ESP_ERR_INVALID_STATE` Initialization failure

#### Parameters

- [out] *handler*: handler(pointer) to master data structure
- [in] *port\_type*: the type of port

`esp_err_t mbc_master_init` (mb\_port\_type\_t *port\_type*, void \*\**handler*)

Initialize Modbus Master controller and stack for Serial port.

#### Return

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Parameter error

- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

**Parameters**

- [out] `handler`: handler(pointer) to master data structure
- [in] `port_type`: type of stack

*esp\_err\_t* `mbc_slave_init_tcp`(void \*\**handler*)

Initialize Modbus Slave controller and stack for TCP port.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

**Parameters**

- [out] `handler`: handler(pointer) to master data structure

*esp\_err\_t* `mbc_master_init_tcp`(void \*\**handler*)

Initialize Modbus controller and stack for TCP port.

**Return**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Parameter error
- ESP\_ERR\_NOT\_SUPPORTED Port type not supported
- ESP\_ERR\_INVALID\_STATE Initialization failure

**Parameters**

- [out] `handler`: handler(pointer) to master data structure

**Modbus common interface API overview** The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

*esp\_err\_t* `mbc_slave_setup`(void \**comm\_info*)

Set Modbus communication parameters for the controller.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

**Parameters**

- `comm_info`: Communication parameters structure.

*esp\_err\_t* `mbc_master_setup`(void \**comm\_info*)

Set Modbus communication parameters for the controller.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Incorrect parameter data

**Parameters**

- `comm_info`: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information. Note: The communication structure provided as a parameter is different for serial and TCP communication mode.

`mbc_slave_set_descriptor()`: Initialization of slave descriptor.

`mbc_master_set_descriptor()`: Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

*esp\_err\_t* `mbc_slave_start`(void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

*esp\_err\_t* **mbc\_master\_start** (void)

Start Modbus communication stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

*esp\_err\_t* **mbc\_slave\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

*esp\_err\_t* **mbc\_master\_destroy** (void)

Destroy Modbus controller and stack.

**Return**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus\_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Enable Modbus stack support ..” for appropriate communication mode that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

**Modbus slave interface API overview** The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus\_controller interface using *mbc\_slave\_set\_descriptor()* API call before start of communication. The interface API functions below are used for Modbus slave application:

*esp\_err\_t* **mbc\_slave\_set\_descriptor** (mb\_register\_area\_descriptor\_t *descr\_data*)

Set Modbus area descriptor.

**Return**

- ESP\_OK: The appropriate descriptor is set
- ESP\_ERR\_INVALID\_ARG: The argument is incorrect

**Parameters**

- *descr\_data*: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the *mbc\_slave\_start()* API is called the Modbus stack can access the data in user data structures by request from master. See the *mb\_register\_area\_descriptor\_t* and example for more information.

*mb\_event\_group\_t* **mbc\_slave\_check\_event** (*mb\_event\_group\_t* *group*)

Wait for specific event on parameter change.

**Return**

- *mb\_event\_group\_t* event bits triggered

**Parameters**

- *group*: Group event bit mask to wait for change

The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return ESP\_OK. See the *mb\_event\_group\_t* for more information about Modbus event masks.

*esp\_err\_t* **mbc\_slave\_get\_param\_info** (mb\_param\_info\_t \*reg\_info, uint32\_t timeout)

Get parameter information.

#### Return

- ESP\_OK Success
- ESP\_ERR\_TIMEOUT Can not get data from parameter queue or queue overflow

#### Parameters

- [out] reg\_info: parameter info structure
- timeout: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig 'CONFIG\_FMB\_CONTROLLER\_NOTIFY\_QUEUE\_SIZE' key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The mb\_param\_info\_t structure contain information about accessed parameter.

**Modbus master interface API overview** The Modbus master implementation requires parameter description table be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to be assigned to the modbus\_controller interface using *mbc\_master\_set\_descriptor()* API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

*esp\_err\_t* **mbc\_master\_set\_descriptor** (const mb\_parameter\_descriptor\_t \*descriptor, const uint16\_t num\_elements)

Assign parameter description table for Modbus controller interface.

#### Return

- esp\_err\_t ESP\_OK - set descriptor successfully
- esp\_err\_t ESP\_ERR\_INVALID\_ARG - invalid argument in function call

#### Parameters

- [in] descriptor: pointer to parameter description table
- num\_elements: number of elements in the table

Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular implementation. Note: TCP communication stack requires to setup additional information about modbus slaves that corresponds to each address(index) used in description table. This information with IP addresses of the slaves is assigned using communication structure and interface setup call.

*esp\_err\_t* **mbc\_master\_send\_request** (mb\_param\_request\_t \*request, void \*data\_ptr)

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

#### Return

- esp\_err\_t ESP\_OK - request was successful
- esp\_err\_t ESP\_ERR\_INVALID\_ARG - invalid argument of function
- esp\_err\_t ESP\_ERR\_INVALID\_RESPONSE - an invalid response from slave
- esp\_err\_t ESP\_ERR\_TIMEOUT - operation timeout or no response from slave
- esp\_err\_t ESP\_ERR\_NOT\_SUPPORTED - the request command is not supported by slave
- esp\_err\_t ESP\_FAIL - slave returned an exception or other failure

#### Parameters

- [in] request: pointer to request structure of type mb\_param\_request\_t
- [in] data\_ptr: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

*esp\_err\_t* **mbc\_master\_get\_cid\_info** (uint16\_t cid, const mb\_parameter\_descriptor\_t \*\*param\_info)

Get information about supported characteristic defined as cid. Uses parameter description table to get this

information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param\_info. Returns ESP\_ERR\_NOT\_FOUND if characteristic is not supported.

**Return**

- esp\_err\_t ESP\_OK - request was successful and buffer contains the supported characteristic name
- esp\_err\_t ESP\_ERR\_INVALID\_ARG - invalid argument of function
- esp\_err\_t ESP\_ERR\_NOT\_FOUND - the characteristic (cid) not found
- esp\_err\_t ESP\_FAIL - unknown error during lookup table processing

**Parameters**

- [in] cid: characteristic id
- param\_info: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as cid. It will check if characteristic is supported and returns its description.

*esp\_err\_t mbc\_master\_get\_parameter* (uint16\_t cid, char \*name, uint8\_t \*value, uint8\_t \*type)

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

**Return**

- esp\_err\_t ESP\_OK - request was successful and value buffer contains representation of actual parameter data from slave
- esp\_err\_t ESP\_ERR\_INVALID\_ARG - invalid argument of function or parameter descriptor
- esp\_err\_t ESP\_ERR\_INVALID\_RESPONSE - an invalid response from slave
- esp\_err\_t ESP\_ERR\_INVALID\_STATE - invalid state during data processing or allocation failure
- esp\_err\_t ESP\_ERR\_TIMEOUT - operation timed out and no response from slave
- esp\_err\_t ESP\_ERR\_NOT\_SUPPORTED - the request command is not supported by slave
- esp\_err\_t ESP\_ERR\_NOT\_FOUND - the parameter is not found in the parameter description table
- esp\_err\_t ESP\_FAIL - slave returned an exception or other failure

**Parameters**

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

*esp\_err\_t mbc\_master\_set\_parameter* (uint16\_t cid, char \*name, uint8\_t \*value, uint8\_t \*type)

Set characteristic's value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

**Return**

- esp\_err\_t ESP\_OK - request was successful and value was saved in the slave device registers
- esp\_err\_t ESP\_ERR\_INVALID\_ARG - invalid argument of function or parameter descriptor
- esp\_err\_t ESP\_ERR\_INVALID\_RESPONSE - an invalid response from slave during processing of parameter
- esp\_err\_t ESP\_ERR\_INVALID\_STATE - invalid state during data processing or allocation failure
- esp\_err\_t ESP\_ERR\_TIMEOUT - operation timed out and no response from slave
- esp\_err\_t ESP\_ERR\_NOT\_SUPPORTED - the request command is not supported by slave
- esp\_err\_t ESP\_FAIL - slave returned an exception or other failure

**Parameters**

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic's value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

## Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support ...” for appropriate communication mode and related configuration keys.

[protocols/modbus/serial/mb\\_slave](#)

[protocols/modbus/serial/mb\\_master](#)

[protocols/modbus/tcp/mb\\_tcp\\_slave](#)

[protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example README.md for details.

## 2.4.11 ESP WebSocket Client

### Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32-C3

### Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

### Configuration

#### URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
  - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

**TLS** Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

---

**Note:** If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will to default not requiring verification.

---

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem ``

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol** The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

---

**Note:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

---

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Events**

- **WEBSOCKET\_EVENT\_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET\_EVENT\_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET\_EVENT\_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET\_EVENT\_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

**Limitations and Known Issues**

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

## Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://websocket.org) server can be found here: [protocols/websocket](https://protocols/websocket).

**Sending Text Data** The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

## API Reference

### Header File

- [esp\\_websocket\\_client/include/esp\\_websocket\\_client.h](#)

### Functions

`esp_websocket_client_handle_t esp_websocket_client_init (const esp_websocket_client_config_t *config)`

Start a WebSocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

#### Return

- `esp_websocket_client_handle_t`
- NULL if any errors

#### Parameters

- [in] `config`: The configuration

`esp_err_t esp_websocket_client_set_uri (esp_websocket_client_handle_t client, const char *uri)`

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client
- [in] `uri`: The uri

`esp_err_t esp_websocket_client_start (esp_websocket_client_handle_t client)`

Open the WebSocket connection.

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

`esp_err_t esp_websocket_client_stop (esp_websocket_client_handle_t client)`

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

#### Parameters

- [in] `client`: The client

`esp_err_t esp_websocket_client_destroy (esp_websocket_client_handle_t client)`

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an

session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- [in] `client`: The client

int `esp_websocket_client_send` (*`esp_websocket_client_handle_t client`*, **const** char \**`data`*, int *`len`*, `TickType_t timeout`)

Generic write data to the WebSocket connection; defaults to binary send.

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

int `esp_websocket_client_send_bin` (*`esp_websocket_client_handle_t client`*, **const** char \**`data`*, int *`len`*, `TickType_t timeout`)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

int `esp_websocket_client_send_text` (*`esp_websocket_client_handle_t client`*, **const** char \**`data`*, int *`len`*, `TickType_t timeout`)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] `client`: The client
- [in] `data`: The data
- [in] `len`: The length
- [in] `timeout`: Write data timeout in RTOS ticks

*`esp_err_t`* `esp_websocket_client_close` (*`esp_websocket_client_handle_t client`*, `TickType_t timeout`)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- [in] `client`: The client
- [in] `timeout`: Timeout in RTOS ticks for waiting

`esp_err_t esp_websocket_client_close_with_code` (*esp\_websocket\_client\_handle\_t* `client`, int `code`, **const** char \*`data`, int `len`, TickType\_t `timeout`)

Close the WebSocket connection in a clean way with custom code/data. Closing sequence is the same as for `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- [in] `client`: The client
- [in] `code`: Close status code as defined in RFC6455 section-7.4
- [in] `data`: Additional data to closing message
- [in] `len`: The length of the additional data
- [in] `timeout`: Timeout in RTOS ticks for waiting

bool `esp_websocket_client_is_connected` (*esp\_websocket\_client\_handle\_t* `client`)

Check the WebSocket client connection state.

**Return**

- true
- false

**Parameters**

- [in] `client`: The client handle

`esp_err_t esp_websocket_register_events` (*esp\_websocket\_client\_handle\_t* `client`, *esp\_websocket\_event\_id\_t* `event`, *esp\_event\_handler\_t* `event_handler`, void \*`event_handler_arg`)

Register the Websocket Events.

**Return** `esp_err_t`

**Parameters**

- `client`: The client handle
- `event`: The event id
- `event_handler`: The callback function
- `event_handler_arg`: User context

## Structures

**struct** `esp_websocket_event_data_t`

Websocket event data.

## Public Members

**const** char \*`data_ptr`

Data pointer

int `data_len`

Data length

uint8\_t `op_code`

Received opcode

*esp\_websocket\_client\_handle\_t* `client`

`esp_websocket_client_handle_t` context

void \*`user_context`

`user_data` context, from *esp\_websocket\_client\_config\_t* `user_data`

**int payload\_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

**int payload\_offset**

Actual offset for the data associated with this event

**struct esp\_websocket\_client\_config\_t**

Websocket client setup configuration.

### Public Members

**const char \*uri**

Websocket URI, the information on the URI can be overrides the other fields below, if any

**const char \*host**

Domain or IP as string

**int port**

Port to connect, default depend on esp\_websocket\_transport\_t (80 or 443)

**const char \*username**

Using for Http authentication - Not supported for now

**const char \*password**

Using for Http authentication - Not supported for now

**const char \*path**

HTTP Path, if not set, default is /

**bool disable\_auto\_reconnect**

Disable the automatic reconnect function when disconnected

**void \*user\_context**

HTTP user data context

**int task\_prio**

Websocket task priority

**int task\_stack**

Websocket task stack

**int buffer\_size**

Websocket buffer size

**const char \*cert\_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert\_len.

**size\_t cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

**const char \*client\_cert**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client\_key has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client\_cert\_len.

**size\_t client\_cert\_len**

Length of the buffer pointed to by client\_cert. May be 0 for null-terminated pem

**const char \*client\_key**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client\_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client\_key\_len

`size_t client_key_len`  
Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

`esp_websocket_transport_t transport`  
Websocket transport type, see `esp_websocket_transport_t`

char \*`subprotocol`  
Websocket subprotocol

char \*`user_agent`  
Websocket user-agent

char \*`headers`  
Websocket additional headers

int `pingpong_timeout_sec`  
Period before connection is aborted due to no PONGs received

bool `disable_pingpong_discon`  
Disable auto-disconnect due to no PONG received within `pingpong_timeout_sec`

bool `use_global_ca_store`  
Use a global `ca_store` for all the connections in which this bool is set.

bool `skip_cert_common_name_check`  
Skip any validation of server certificate CN field

bool `keep_alive_enable`  
Enable keep-alive timeout

int `keep_alive_idle`  
Keep-alive idle time. Default is 5 (second)

int `keep_alive_interval`  
Keep-alive interval time. Default is 5 (second)

int `keep_alive_count`  
Keep-alive packet retry send count. Default is 3 counts

size\_t `ping_interval_sec`  
Websocket ping interval, defaults to 10 seconds if not set

### Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

```
enum esp_websocket_event_id_t
```

Websocket Client events id.

*Values:*

`WEBSOCKET_EVENT_ANY` = -1

`WEBSOCKET_EVENT_ERROR` = 0

This event occurs when there are any errors during execution

`WEBSOCKET_EVENT_CONNECTED`

Once the Websocket has been connected to the server, no data exchange has been performed

`WEBSOCKET_EVENT_DISCONNECTED`

The connection has been disconnected

`WEBSOCKET_EVENT_DATA`

When receiving data from the server, possibly multiple portions of the packet

`WEBSOCKET_EVENT_CLOSED`

The connection has been closed cleanly

```
WEBSOCKET_EVENT_MAX
enum esp_websocket_transport_t
    Websocket Client transport.
```

*Values:*

```
WEBSOCKET_TRANSPORT_UNKNOWN = 0x0
    Transport unknown

WEBSOCKET_TRANSPORT_OVER_TCP
    Transport over tcp

WEBSOCKET_TRANSPORT_OVER_SSL
    Transport over ssl
```

## 2.4.12 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

### ESP SPI Slave HD (Half Duplex) Mode Protocol

#### SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consists of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave  
This phase determines the rest phases of the transactions. See *Supported Commands*.
- Address: 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- Dummy: 8-bit, floating, optional  
This phase is the turn around time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to master.
- Data: variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here's the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See [Supported Commands](#)), except from the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit from the QPI mode, master can send EXQPI command.

### Supported Commands

**Note:** The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

## Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

## Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.

3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `Document of SDMMC driver` structure).
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.

2. Call `essl_send_paket ()` to send data to the slave.

## RX FIFO

1. Call `essl_get_rx_data_size ()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet ()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt ()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- [esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl.h](#)

### Functions

`esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)`

Initialize the slave.

#### Return

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

#### Parameters

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)`

Wait for interrupt of an ESSL slave device.

#### Return

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Return

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

#### Parameters

- `handle`: Handle of an ESSL device.
- `out_tx_num`: Output of buffer num that host can send data to ESSL slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)`

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Return

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

#### Parameters

- `handle`: Handle of an ESSL device.
- `out_rx_size`: Output of data size to read from slave, in bytes
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_reset_cnt (essl_handle_t handle)`

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

#### Return

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init.

#### Parameters

- `handle`: Handle of an ESSL device.

`esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Return

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init or other argument is not valid.
- `ESP_ERR_TIMEOUT`: No buffer to use, or error from SDMMC host controller.
- `ESP_ERR_NOT_FOUND`: Slave is not ready for receiving.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

#### Parameters

- `handle`: Handle of a `essl` device.
- `start`: Start address of the packet to send
- `length`: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)`

Get a packet from ESSL slave.

#### Return

- `ESP_OK` Success: All the data has been read from the slave.
- `ESP_ERR_INVALID_ARG`: Invalid argument, The handle is not initialized or the other arguments are invalid.
- `ESP_ERR_NOT_FINISHED`: Read was successful, but there is still data remaining.
- `ESP_ERR_NOT_FOUND`: Slave is not ready to send data.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

#### Parameters

- `handle`: Handle of a `essl` device.
- `[out] out_data`: Data output address
- `size`: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- `[out] out_length`: Output of length the data actually received from slave.

- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_write_reg(essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)`

Write general purpose R/W registers (8-bit) of ESSL slave.

**Note** sdio 28-31 are reserved, the lower API helps to skip.

**Return**

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**

- `handle`: Handle of an ESSL device.
- `addr`: Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- `value`: Value to write to the register.
- `value_o`: Output of the returned written value.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_read_reg(essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)`

Read general purpose R/W registers (8-bit) of ESSL slave.

**Return**

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `addr`: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- `value_o`: Output value read from the register.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)`

wait for an interrupt of the slave

**Return**

- `ESP_OK`: If interrupt is triggered.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- `ESP_ERR_TIMEOUT`: No interrupts before timeout.

**Parameters**

- `handle`: Handle of a `essl` device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)`

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `intr_mask`: Mask of interrupt bits to clear.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)`

Get interrupt bits of ESSL slave.

**Return**

- `ESP_OK`: Success
- `ESP_INVALID_ARG`: If both `intr_raw` and `intr_st` are NULL.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- `handle`: Handle of a `essl` device.
- `intr_raw`: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_set\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t *ena\_mask*, uint32\_t *wait\_ms*)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

#### Return

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \**ena\_mask\_o*, uint32\_t *wait\_ms*)

Get interrupt enable bits of ESSL slave.

#### Return

- ESP\_OK Success
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t` **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t *intr\_mask*, uint32\_t *wait\_ms*)

Send interrupts to slave. Each bit of the interrupt will be triggered.

#### Return

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

#### Parameters

- `handle`: Handle of a `essl` device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

## Macros

**ESP\_ERR\_NOT\_FINISHED**

There is still remaining data.

## Type Definitions

**typedef struct** `essl_dev_t` \***essl\_handle\_t**

Handle of an ESSL device.

## Header File

- [esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

## Functions

`esp_err_t` **essl\_sdio\_init\_dev** (*essl\_handle\_t* \**out\_handle*, const *essl\_sdio\_config\_t* \**config*)

Initialize the ESSL SDIO device and get its handle.

#### Return

- ESP\_OK: on success

- ESP\_ERR\_NO\_MEM: memory exhausted.

**Parameters**

- out\_handle: Output of the handle.
- config: Configuration for the ESSL SDIO device.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Return**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

**Parameters**

- handle: Handle of the ESSL SDIO device to deinit.

**Structures**

**struct** **essl\_sdio\_config\_t**

Configuration for the essl SDIO device.

**Public Members**

*sdmnc\_card\_t* \*card

The initialized sdmnc card pointer of the slave.

int **rcv\_buffer\_size**

The pre-negotiated rcv buffer size used by both the host and the slave.

**Header File**

- esp\_serial\_slave\_link/include/esp\_serial\_slave\_link/essl\_spi.h

**Functions**

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, **const** *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

**Return**

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

**Parameters**

- [out] out\_handle: Output of the handle
- init\_config: Configuration for the ESSL SPI device

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Return**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

**Parameters**

- handle: Handle of the ESSL SPI device

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

**Note** The registers for Master/Slave synchronization are reserved. Do not use them. (see rx\_sync\_reg in *essl\_spi\_config\_t*)

**Return**

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.
- ESP\_ERR\_INVALID\_ARG: The address argument is not valid. See note 1.

- or other return value from `:cpp:func:spi_device_transmit`.

**Parameters**

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1).
- `[out] out_value`: Read buffer for the shared registers.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

*esp\_err\_t* **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Return**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

**Parameters**

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `[out] out_data`: Output data address
- `size`: The size of the output data.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

*esp\_err\_t* **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

**Note** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in [essl\\_spi\\_config\\_t](#))

**Note** Feature of checking the actual written value (`out_value`) is not supported.

**Return**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to NULL. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

**Parameters**

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- `value`: Buffer for data to send, should be align to 4.
- `[out] out_value`: Not supported, should be set to NULL.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

*esp\_err\_t* **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

**Return**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

**Parameters**

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `data`: Address of the data to send
- `size`: Size of the data to send.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

**Note** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

**Parameters**

- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)

*esp\_err\_t* `essl_spi_rdbuf` (*spi\_device\_handle\_t* `spi`, `uint8_t *out_data`, `int addr`, `int len`, `uint32_t flags`)

Read the shared buffer from the slave in ISR way.

**Note** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a `rdbuf` SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

**Parameters**

- `spi`: SPI device handle representing the slave
- [out] `out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

*esp\_err\_t* `essl_spi_rdbuf_polling` (*spi\_device\_handle\_t* `spi`, `uint8_t *out_data`, `int addr`, `int len`, `uint32_t flags`)

Read the shared buffer from the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

**Parameters**

- `spi`: SPI device handle representing the slave
- [out] `out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

*esp\_err\_t* `essl_spi_wrbuf` (*spi\_device\_handle\_t* `spi`, `const uint8_t *data`, `int addr`, `int len`, `uint32_t flags`)

Write the shared buffer of the slave in ISR way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

**Parameters**

- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

*esp\_err\_t* `essl_spi_wrbuf_polling` (*spi\_device\_handle\_t* `spi`, `const uint8_t *data`, `int addr`, `int len`, `uint32_t flags`)

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the

len is shorter than a word.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_polling\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- addr: Address of the slave shared buffer,
- len: Length to write
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_rddma** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

**Note** This function combines several :cpp:func:essl\_spi\_rddma\_seg and one :cpp:func:essl\_spi\_rddma\_done at the end. Used when the slave is working in segment mode.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- [out] out\_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len: Total length of data to receive.
- seg\_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma\_done will still be sent.)
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

**Note** To read long buffer, call :cpp:func:essl\_spi\_rddma instead.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- [out] out\_data: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- seg\_len: Length of this segment
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the rddma\_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note** This is required only when the slave is working in segment mode.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

**Note** This function combines several :cpp:func:essl\_spi\_wrdma\_seg and one

:cpp:func:essl\_spi\_wrdma\_done at the end. Used when the slave is working in segment mode.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- len: Total length of data to send.
- seg\_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma\_done will still be sent.)
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

**Note** To send long buffer, call :cpp:func:essl\_spi\_wrdma instead.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- seg\_len: Length of this segment
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the wrdma\_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

**Note** This is required only when the slave is working in segment mode.

**Return**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Parameters**

- spi: SPI device handle representing the slave
- flags: SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Structures**

**struct** **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \*spi

Pointer to SPI device handle.

uint32\_t tx\_buf\_size

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t tx\_sync\_reg

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t rx\_sync\_reg

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.4.13 ESP x509 Certificate Bundle

#### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Apr 26 03:12:05 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

---

#### Configuration

Most configuration is done through `menuconfig`. `Make` and `CMake` will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

#### Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of [curl](#). Another

alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech' s [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, *cmn\_cert\_authorities.csv*, from [this list](#) provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in [Updating the Certificate Bundle](#).

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

## API Reference

### Header File

- [mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \**conf*)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

#### Return

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

#### Parameters

- [in] *conf*: The config struct for the SSL connection.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \**conf*)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

#### Parameters

- [in] *conf*: The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \**x509\_bundle*, size\_t *bundle\_size*)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

#### Return

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

#### Parameters

- [in] *x509\_bundle*: A pointer to the certificate bundle.

- [in] `bundle_size`: Size of the certificate bundle in bytes.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

## 2.4.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.5 Provisioning API

### 2.5.1 Protocol Communication

#### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

**Following features are available for provisioning :**

- **Communication security at application level -**
  - `protocomm_security0` (no security)
  - `protocomm_security1` (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with `protocomm_security1` only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for `protocomm_security1`) by performing the two way handshake. See [Unified Provisioning](#) for more details about the secure handshake logic.

#### Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/legacy/softap\\_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                            const uint8_t *inbuf, ssize_t inlen,
                            uint8_t **outbuf, ssize_t *outlen,
                            void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }
}

```

(continues on next page)

(continued from previous page)

```

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
     * throughout the scope of protocomm endpoint. This need not be
     ↪static,
     * ie. could be dynamically allocated and freed at the time of
     ↪endpoint
     * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
     * request handlers, setting security creates an endpoint and
     ↪registers
     * the handler provided by protocomm_security1. One can similarly use
     * protocomm_security0. Only one type of security can be set for a
     * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
    ↪&pop_obj);

    /* Private data passed to the endpoint must be valid throughout the
     ↪scope
     * of protocomm endpoint. This need not be static, ie. could be
     ↪dynamically
     * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a
     ↪unique name
     * and register a handler function along with private data to be
     ↪passed at the
     * time of handler execution. Multiple endpoints can be added as long
     ↪as they
     * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
                          echo_req_handler, (void *) &priv_data);

    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)

```

(continues on next page)

(continued from previous page)

```

{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

### Transport Example (BLE) with Security 0

For complete example see [provisioning/legacy/ble\\_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
→table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can
→be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
→NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
→NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");
}

```

(continues on next page)

(continued from previous page)

```

/* Stop BLE protocomm service */
protocomm_ble_stop(pc);

protocomm_delete(pc);
}

```

## API Reference

### Header File

- [protocomm/include/common/protocomm.h](#)

### Functions

*protocomm\_t* \***protocomm\_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the *protocomm\_t* structure initialized to NULL.

#### Return

- *protocomm\_t*\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t* \*pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using *protocomm\_new* ().

#### Parameters

- [in] pc: Pointer to the protocomm instance to be deleted

*esp\_err\_t* **protocomm\_add\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name, *protocomm\_req\_handler\_t* h, void \*priv\_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

#### Note

- An endpoint must be bound to a valid protocomm instance, created using *protocomm\_new* ().
- This function internally calls the registered *add\_endpoint* () function of the selected transport which is a member of the *protocomm\_t* instance structure.

#### Return

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

#### Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] h: Endpoint handler function
- [in] priv\_data: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

#### Note

- This function internally calls the registered *remove\_endpoint* () function which is a member of the *protocomm\_t* instance structure.

**Return**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Allocates internal resources for new transport session.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] session\_id: Unique ID for a communication session

*esp\_err\_t* **protocomm\_close\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Frees internal resources used by a transport session.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] session\_id: Unique ID for a communication session

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**

- ESP\_OK : Request handled successfully
- ESP\_FAIL : Internal error in execution of registered handler
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep\_name: Endpoint identifier(name) string
- [in] session\_id: Unique ID for a communication session
- [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen: Length of the input buffer
- [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen: Buffer length of the allocated output buffer

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const *protocomm\_security\_pop\_t* \*pop)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string
- `[in] sec`: Pointer to endpoint security instance
- `[in] pop`: Pointer to proof of possession for authenticating a client

*esp\_err\_t* **protocomm\_unset\_security** (*protocomm\_t* \*pc, **const** char \*ep\_name)

Remove endpoint security for a `protocomm` instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string

*esp\_err\_t* **protocomm\_set\_version** (*protocomm\_t* \*pc, **const** char \*ep\_name, **const** char \*version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note**

- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Version endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string
- `[in] version`: Version identifier(name) string

*esp\_err\_t* **protocomm\_unset\_version** (*protocomm\_t* \*pc, **const** char \*ep\_name)

Remove version verification endpoint from a `protocomm` instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the `protocomm` instance
- `[in] ep_name`: Endpoint identifier(name) string

### Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t) (uint32_t session_id, const uint8_t *inbuf,
                                             ssize_t inlen, uint8_t **outbuf, ssize_t *outlen,
                                             void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**Note** Structure of the protocomm object is kept private

### Header File

- [protocomm/include/security/protocomm\\_security.h](#)

### Structures

```
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

### Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Public Members

```
int ver
```

Unique version number of security implementation

```
esp_err_t (*init) (protocomm_security_handle_t *handle)
```

Function for initializing/allocating security infrastructure

```
esp_err_t (*cleanup) (protocomm_security_handle_t handle)
```

Function for deallocating security infrastructure

```
esp_err_t (*new_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)
```

Starts new secure transport session with specified ID

```
esp_err_t (*close_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)
```

Closes a secure transport session with specified ID

```
esp_err_t (*security_req_handler) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Handler function for authenticating connection request and establishing secure session

```
esp_err_t (*encrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
```

Function which implements the encryption algorithm

*esp\_err\_t* (\***decrypt**) (*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, **const** uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*outbuf, ssize\_t \*outlen)  
Function which implements the decryption algorithm

### Type Definitions

**typedef struct** *protocomm\_security\_pop* **protocomm\_security\_pop\_t**

Proof Of Possession for authenticating a secure session.

**typedef void** \**protocomm\_security\_handle\_t*

**typedef struct** *protocomm\_security* **protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Header File

- [protocomm/include/security/protocomm\\_security0.h](#)

### Header File

- [protocomm/include/security/protocomm\\_security1.h](#)

### Header File

- [protocomm/include/transports/protocomm\\_httpd.h](#)

### Functions

*esp\_err\_t* **protocomm\_httpd\_start** (*protocomm\_t* \*pc, **const** *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

#### Return

- **ESP\_OK** : Success
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_NOT\_SUPPORTED** : Transport layer bound to another protocomm instance
- **ESP\_ERR\_INVALID\_STATE** : Transport layer already bound to this protocomm instance
- **ESP\_ERR\_NO\_MEM** : Memory allocation for server resource failed
- **ESP\_ERR\_HTTPD\_\*** : HTTP server error on start

#### Parameters

- [in] pc: Protocomm instance pointer obtained from `protocomm_new()`
- [in] config: Pointer to config structure for initializing HTTP server

*esp\_err\_t* **protocomm\_httpd\_stop** (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

#### Return

- **ESP\_OK** : Success
- **ESP\_ERR\_INVALID\_ARG** : Null / incorrect protocomm instance pointer

#### Parameters

- [in] pc: Same protocomm instance that was passed to `protocomm_httpd_start()`

## Unions

**union** `protocomm_httpd_config_data_t`  
*#include* <protocomm\_httpd.h> Protocomm HTTPD Configuration Data

### Public Members

`void *handle`  
HTTP Server Handle, if `ext_handle_provided` is set to true

*protocomm\_http\_server\_config\_t* `config`  
HTTP Server Configuration, if a server is not already active

## Structures

**struct** `protocomm_http_server_config_t`  
Config parameters for protocomm HTTP server.

### Public Members

`uint16_t port`  
Port on which the HTTP server will listen

`size_t stack_size`  
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned `task_priority`  
Priority of server task

**struct** `protocomm_httpd_config_t`  
Config parameters for protocomm HTTP server.

### Public Members

`bool ext_handle_provided`  
Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* `data`  
Protocomm HTTPD Configuration Data

## Macros

`PROTOCOLM_HTTPD_DEFAULT_CONFIG ()`

## Header File

- [protocomm/include/transport/protocomm\\_ble.h](#)

## Functions

*esp\_err\_t* `protocomm_ble_start` (*protocomm\_t* \*pc, **const** *protocomm\_ble\_config\_t* \*config)  
Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

### Return

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE start error
- `ESP_ERR_NO_MEM` : Error allocating memory for internal resources

- `ESP_ERR_INVALID_STATE` : Error in ble config
- `ESP_ERR_INVALID_ARG` : Null arguments

**Parameters**

- `[in] pc`: Protocomm instance pointer obtained from `protocomm_new()`
- `[in] config`: Pointer to config structure for initializing BLE

*esp\_err\_t* **protocomm\_ble\_stop** (*protocomm\_t* \*pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

**Note** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

**Parameters**

- `[in] pc`: Same protocomm instance that was passed to `protocomm_ble_start()`

**Structures****struct name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

**const char \*name**

Name of the handler, which is passed to protocomm layer

**uint16\_t uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm\_ble\_config**

Config parameters for protocomm BLE service.

**Public Members**

**char device\_name[MAX\_BLE\_DEVNAME\_LEN]**

BLE device name being broadcast at the time of provisioning

**uint8\_t service\_uuid[BLE\_UUID128\_VAL\_LENGTH]**

128 bit UUID of the provisioning service

**uint8\_t \*manufacturer\_data**

BLE device manufacturer data pointer in advertisement

**ssize\_t manufacturer\_data\_len**

BLE device manufacturer data length in advertisement

**ssize\_t nu\_lookup\_count**

Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**

Pointer to the Name-UUID lookup table

**unsigned ble\_bonding : 1**

BLE bonding

**unsigned ble\_sm\_sc : 1**

BLE security flag

## Macros

### **MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

### **BLE\_UUID128\_VAL\_LENGTH**

### **MAX\_BLE\_MANUFACTURER\_DATA\_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

## Type Definitions

```
typedef struct name_uuid protocomm_ble_name_uuid_t
```

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

```
typedef struct protocomm_ble_config protocomm_ble_config_t
```

Config parameters for protocomm BLE service.

## 2.5.2 Unified Provisioning

### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app

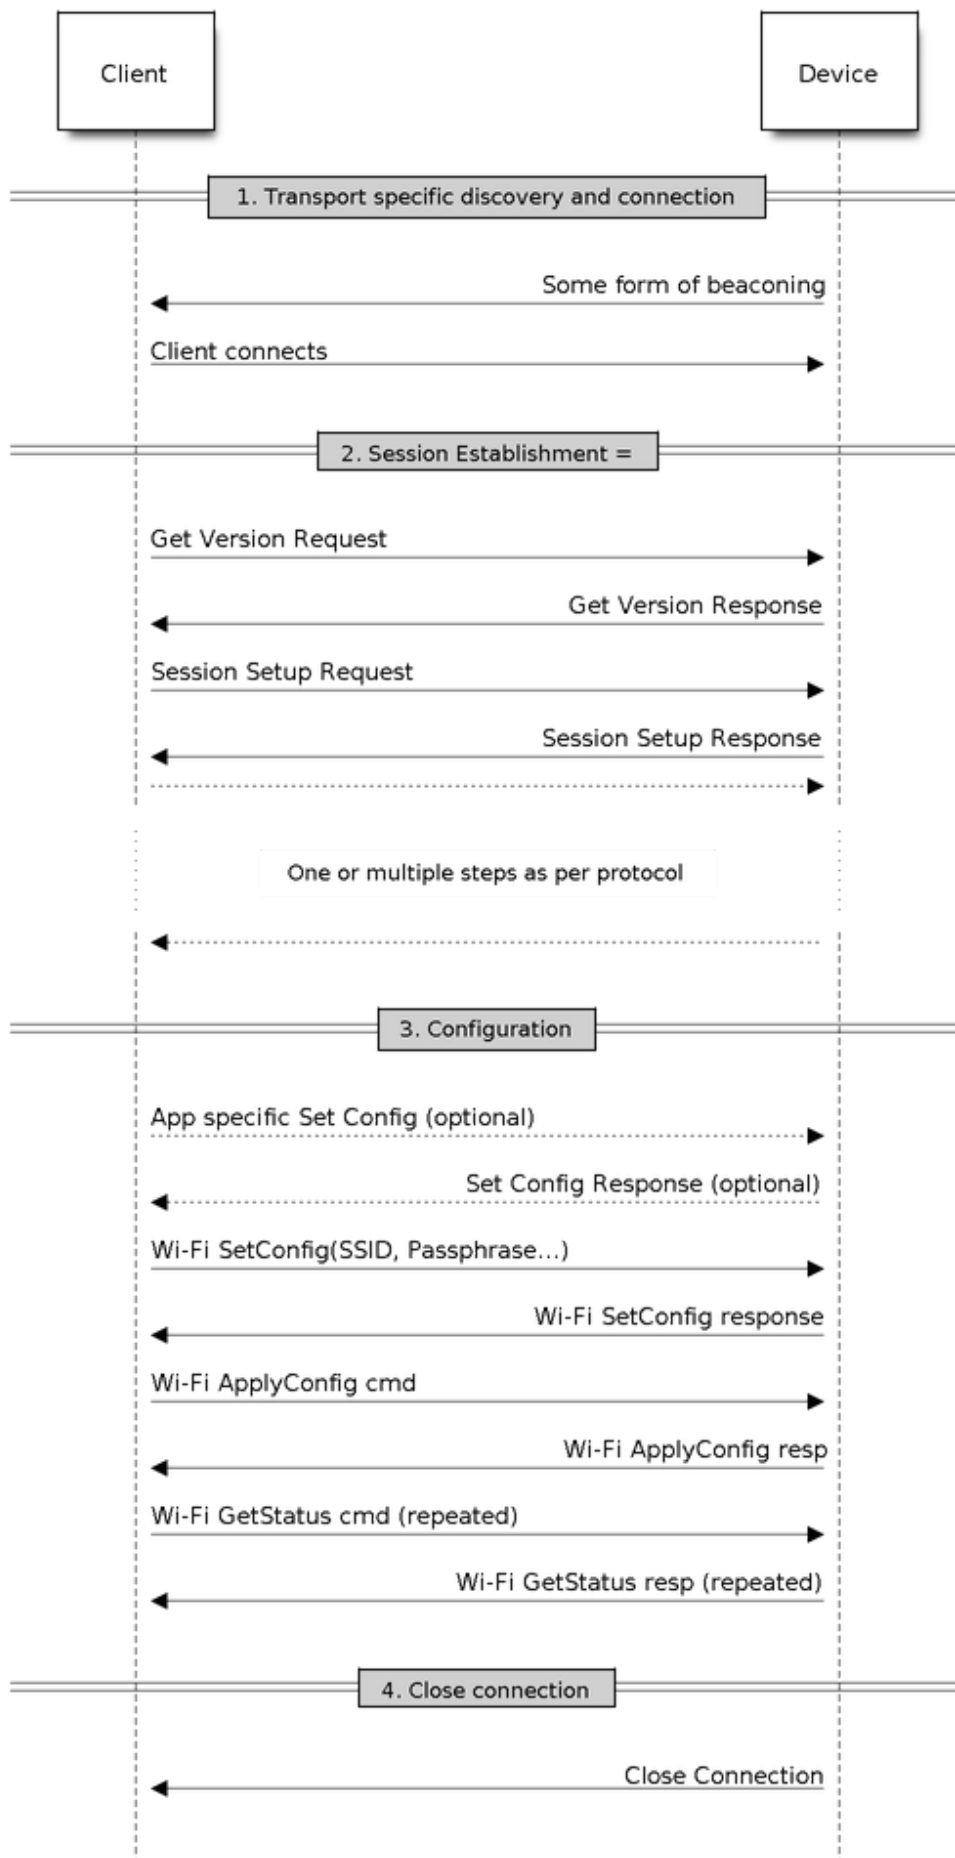

Fig. 18: Typical Provisioning Process

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

## Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

## Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

## Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Fig. 19: Unified Provisioning Architecture

### Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

### Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage.

Application implementation can be found as an example under [provisioning](#).

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

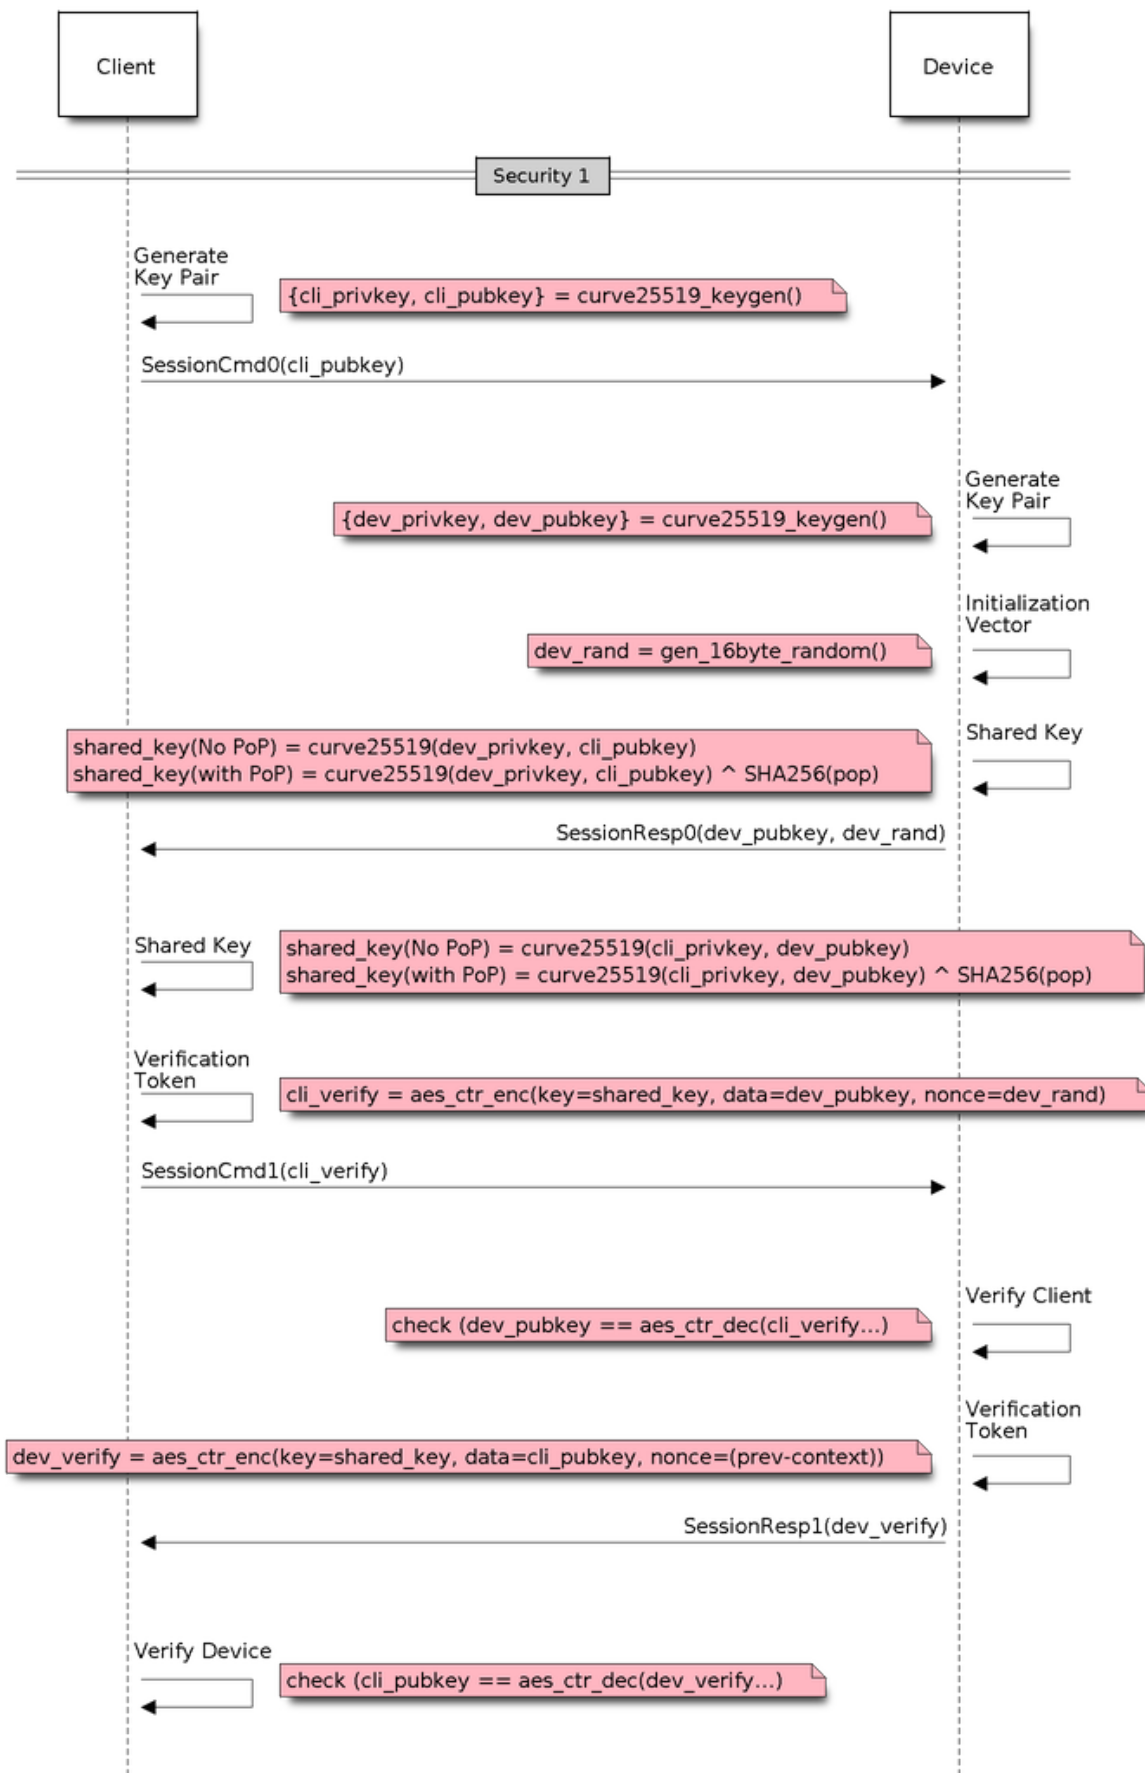

Fig. 20: Security1

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.3 Wi-Fi Provisioning

#### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of `wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization** `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by *protocomm*. Hence, we have three options :
  - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme\_event\_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future re-boot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app\_event\_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT` `s` that are emitted to the default event loop handler. See definition

of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
                →*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                "\n\tSSID      : %s\n\tPassword : %s",
                (const char *) wifi_sta_cfg->ssid,
                (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
                →reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                "\n\tPlease reset to factory and retry_
                →provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi_
                →access-point not found");
                break;
            }
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```
bool provisioned = false;
ESP_ERR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`s` and call `:cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
```

(continues on next page)

(continued from previous page)

```

        wifi_prov_mgr_deinit();
    }
}

```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

Table 6: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like `:prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding `.proto` files can be found under `wifi_provisioning/proto`) :

- *get\_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set\_config* - For setting the Wi-Fi connection credentials
- *apply\_config* - For applying the credentials saved during *set\_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi\_config* commands described above. The *wifi\_scan* endpoint supports the following protobuf commands :

- *scan\_start* - For starting Wi-Fi scan with various options :
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group\_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting *group\_channels* to 4, will create 5 groups, with each group having 3 channels, except the last one which will have  $14 \% 3 = 2$  channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - *period\_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan\_status* - Gives the status of scanning process :
  - *scan\_finished* (output) - When scan has finished this returns true
  - *result\_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan\_result* - For fetching scan results. This can be called even if scan is still on going
  - *start\_index* (input) - Starting index from where to fetch the entries from the results list
  - *count* (input) - Number of entries to fetch from the starting index
  - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rsqi* information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↳key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, _
↳custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call *wifi\_prov\_mgr\_endpoint\_unregister()* to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the *apply\_config* command, the provisioning service will be stopped (and BLE

/ SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI\_PROV\_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/wifi\\_prov\\_mgr](#)

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## API Reference

### Header File

- [wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)

### Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

### Return

- ESP\_OK : Success
- ESP\_FAIL : Fail

**Parameters**

- [in] config: Configuration structure

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call esp\_wifi\_set\_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi\_prov\_mgr\_start\_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- ESP\_OK : Retrieved provision state successfully
- ESP\_FAIL : Wi-Fi not initialized
- ESP\_ERR\_INVALID\_ARG : Null argument supplied
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

**Parameters**

- [out] provisioned: True if provisioned, else false

*esp\_err\_t* **wifi\_prov\_mgr\_start\_provisioning** (*wifi\_prov\_security\_t* security, const char \*pop, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi\_prov\_scheme\_ble : This starts protocomm\_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi\_prov\_scheme\_softap : This activates SoftAP mode of Wi-Fi and starts protocomm\_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type \_esp\_wifi\_prov.\_tcp)

Event WIFI\_PROV\_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi\_prov\_mgr\_is\_provisioned() yields true

**Return**

- ESP\_OK : Provisioning started successfully
- ESP\_FAIL : Failed to start provisioning service
- ESP\_ERR\_INVALID\_STATE : Provisioning manager not initialized or already started

**Parameters**

- [in] security: Specify which protocomm security scheme to use :
  - WIFI\_PROV\_SECURITY\_0 : For no security
  - WIFI\_PROV\_SECURITY\_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- [in] pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- [in] service\_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE

- [in] `service_key`: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

void **wifi\_prov\_mgr\_stop\_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t *cleanup\_delay*)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

#### Return

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

#### Parameters

- [in] `cleanup_delay`: Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

*esp\_err\_t* **wifi\_prov\_mgr\_set\_app\_info** (const char \**label*, const char \**version*, const char \*\**capabilities*, size\_t *total\_capabilities*)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Return**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

**Parameters**

- `[in] label`: String indicating the application name.
- `[in] version`: String indicating the application version. There is no constraint on format.
- `[in] capabilities`: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- `[in] total_capabilities`: Size of capabilities array

`esp_err_t wifi_prov_mgr_endpoint_create (const char *ep_name)`

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

**Parameters**

- `[in] ep_name`: unique name of the endpoint

`esp_err_t wifi_prov_mgr_endpoint_register (const char *ep_name, proto-comm_req_handler_t handler, void *user_ctx)`

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

**Parameters**

- `[in] ep_name`: Name of the endpoint
- `[in] handler`: Endpoint handler function
- `[in] user_ctx`: User data

`void wifi_prov_mgr_endpoint_unregister (const char *ep_name)`

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters**

- [in] ep\_name: Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_event\_handler** (void \*ctx, *system\_event\_t* \*event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

**Note** : This function is DEPRECATED, because events are now handled internally using the event loop library, esp\_event. Calling this will do nothing and simply return ESP\_OK.

**Return**

- ESP\_OK : Event handled successfully

**Parameters**

- [in] ctx: Event context data
- [in] event: Event info

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

**Return**

- ESP\_OK : Successfully retrieved Wi-Fi state
- ESP\_FAIL : Provisioning app not running

**Parameters**

- [out] state: Pointer to wifi\_prov\_sta\_state\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_disconnect\_reason** (*wifi\_prov\_sta\_fail\_reason\_t* \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Return**

- ESP\_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP\_FAIL : Provisioning app not running

**Parameters**

- [out] reason: Pointer to wifi\_prov\_sta\_fail\_reason\_t variable to be filled

*esp\_err\_t* **wifi\_prov\_mgr\_configure\_sta** (*wifi\_config\_t* \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI\_PROV\_CRED\_RECV is emitted after credentials have been applied and Wi-Fi station started

**Return**

- ESP\_OK : Wi-Fi configured and started successfully
- ESP\_FAIL : Failed to set configuration

**Parameters**

- [in] wifi\_cfg: Pointer to Wi-Fi configuration structure

*esp\_err\_t* **wifi\_prov\_mgr\_reset\_sm\_state\_on\_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Return**

- ESP\_OK : Reset provisioning state machine successfully
- ESP\_FAIL : Failed to reset provisioning state machine
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

## Structures

### **struct wifi\_prov\_event\_handler\_t**

Event handler that is used by the manager while provisioning service is active.

### Public Members

#### *wifi\_prov\_cb\_func\_t* **event\_cb**

Callback function to be executed on provisioning events

#### void **\*user\_data**

User context data to pass as parameter to callback function

### **struct wifi\_prov\_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

### Public Members

#### *esp\_err\_t* (**\*prov\_start**) (*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

#### *esp\_err\_t* (**\*prov\_stop**) (*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

#### void (**\*new\_config**) (void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*

#### void (**\*delete\_config**) (void \*config)

Function which is to be called by the manager to delete a configuration generated using *new\_config()*

#### *esp\_err\_t* (**\*set\_config\_service**) (void \*config, **const** char \*service\_name, **const** char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

#### *esp\_err\_t* (**\*set\_config\_endpoint**) (void \*config, **const** char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

#### *wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

### **struct wifi\_prov\_mgr\_config\_t**

Structure for specifying the manager configuration.

### Public Members

#### *wifi\_prov\_scheme\_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server

- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

#### `wifi_prov_event_handler_t` `scheme_event_handler`

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

#### `wifi_prov_event_handler_t` `app_event_handler`

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

### Macros

#### `WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

### Type Definitions

```
typedef void (*wifi_prov_cb_func_t) (void *user_data, wifi_prov_cb_event_t event, void
                                     *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

### Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

```
WIFI_PROV_INIT
```

Emitted when the manager is initialized

```
WIFI_PROV_START
```

Indicates that provisioning has started

```
WIFI_PROV_CRED_RECV
```

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

```
WIFI_PROV_CRED_FAIL
```

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

**WIFI\_PROV\_CRED\_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

**WIFI\_PROV\_END**

Signals that provisioning service has stopped

**WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

**enum wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

*Values:*

**WIFI\_PROV\_SECURITY\_0 = 0**

No security (plain-text communication)

**WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)

**Functions**

void `wifi_prov_scheme_ble_event_cb_free_bt`(void \**user\_data*, [wifi\\_prov\\_cb\\_event\\_t](#) *event*, void \**event\_data*)

void `wifi_prov_scheme_ble_event_cb_free_ble`(void \**user\_data*, [wifi\\_prov\\_cb\\_event\\_t](#) *event*, void \**event\_data*)

void `wifi_prov_scheme_ble_event_cb_free_bt`(void \**user\_data*, [wifi\\_prov\\_cb\\_event\\_t](#) *event*, void \**event\_data*)

[esp\\_err\\_t](#) `wifi_prov_scheme_ble_set_service_uuid`(uint8\_t \**uuid128*)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

**Parameters**

- [in] `uuid128`: A custom 128 bit UUID

[esp\\_err\\_t](#) `wifi_prov_scheme_ble_set_mfg_data`(uint8\_t \**mfg\_data*, `ssize_t` *mfg\_data\_len*)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

**Note** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan

response data size limits i.e.  $(mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)$ . If the `mfg_data` length exceeds this limit, the length will be truncated.

**Return**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

**Parameters**

- `[in] mfg_data`: Custom manufacturer data
- `[in] mfg_data_len`: Manufacturer data length

**Macros**

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
```

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
```

```
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT
```

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_softap.h](#)

**Functions**

void `wifi_prov_scheme_softap_set_httpd_handle` (void *\*handle*)  
Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note** This API should be called before `wifi_prov_mgr_start_provisioning()`

**Parameters**

- `[in] handle`: Handle to HTTPD server instance

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_console.h](#)

**Header File**

- [wifi\\_provisioning/include/wifi\\_provisioning/wifi\\_config.h](#)

**Functions**

`esp_err_t wifi_prov_config_data_handler` (uint32\_t *session\_id*, const uint8\_t *\*inbuf*, ssize\_t *inlen*, uint8\_t *\*\*outbuf*, ssize\_t *\*outlen*, void *\*priv\_data*)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

**Structures**

```
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.

**Public Members**

```
char ip_addr[IP4ADDR_STRLEN_MAX]
```

IP Address received by station

char **bssid**[6]  
BSSID of the AP to which connection was established

char **ssid**[33]  
SSID of the to which connection was established

uint8\_t **channel**  
Channel of the AP

uint8\_t **auth\_mode**  
Authorization mode of the AP

**struct wifi\_prov\_config\_get\_data\_t**  
WiFi status data to be sent in response to `get_status` request from master.

### Public Members

*wifi\_prov\_sta\_state\_t* **wifi\_state**  
WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**  
Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**  
Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

**struct wifi\_prov\_config\_set\_data\_t**  
WiFi config data received by slave during `set_config` request from master.

### Public Members

char **ssid**[33]  
SSID of the AP to which the slave is to be connected

char **password**[64]  
Password of the AP

char **bssid**[6]  
BSSID of the AP

uint8\_t **channel**  
Channel of the AP

**struct wifi\_prov\_config\_handlers**  
Internal handlers for receiving and responding to protocol requests from master.

This is to be passed as `priv_data` for protocol request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Public Members

*esp\_err\_t* (**\*get\_status\_handler**) (*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (**\*set\_config\_handler**) (**const** *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (**\*apply\_config\_handler**) (*wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

`wifi_prov_ctx_t *ctx`

Context pointer to be passed to above handler functions upon invocation

### Type Definitions

**typedef struct** wifi\_prov\_ctx **wifi\_prov\_ctx\_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

**typedef struct** wifi\_prov\_config\_handlers **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

**enum** wifi\_prov\_sta\_state\_t

WiFi STA status for conveying back to the provisioning master.

Values:

**WIFI\_PROV\_STA\_CONNECTING**

**WIFI\_PROV\_STA\_CONNECTED**

**WIFI\_PROV\_STA\_DISCONNECTED**

**enum** wifi\_prov\_sta\_fail\_reason\_t

WiFi STA connection fail reason.

Values:

**WIFI\_PROV\_STA\_AUTH\_ERROR**

**WIFI\_PROV\_STA\_AP\_NOT\_FOUND**

Code examples for above API are provided in the [provisioning](#) directory of ESP-IDF examples.

Code example for above API is provided in [wifi/smart\\_config](#)

Code example for above API is provided in [wifi/wifi\\_easy\\_connect/dpp-enrollee](#)

## 2.6 Storage API

### 2.6.1 FAT Filesystem Support

ESP-IDF uses the [FatFs](#) library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

#### Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
  - Path prefix where to mount the filesystem (e.g. `"/sdcard"`, `"/spiflash"`)
  - FatFs drive number
  - A variable which will receive the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see *FatFs documentation* <<http://www.elm-chan.org/fsw/ff/doc/mount.html>>.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, `"/sdcard/hello.txt"`).
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, use the POSIX `lseek` function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
7. Close all open files.
8. Call the FatFs function `f_mount` for the same drive number, with `NULL` `FATFS*` argument, to unmount the filesystem.
9. Call the FatFs function `ff_diskio_register()` with `NULL` `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount`, `esp_vfs_fat_sdspi_mount` and `esp_vfs_fat_sdcard_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

`esp_err_t esp_vfs_fat_register(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)`

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

**Note** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

#### Parameters

- `base_path`: path prefix where FATFS should be registered
- `fat_drive`: FATFS drive specification; if only one drive is used, can be an empty string
- `max_files`: maximum number of files which can be open at the same time
- `[out] out_fs`: pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

`esp_err_t esp_vfs_fat_unregister_path(const char *base_path)`

Un-register FATFS from VFS.

**Note** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_path`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if FATFS is not registered in VFS

#### Parameters

- `base_path`: path prefix where FATFS is registered. This is the same used when

esp\_vfs\_fat\_register was called

### Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()` and `esp_vfs_fat_sdcard_unmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

```
esp_err_t esp_vfs_fat_sdmmc_mount (const char *base_path, const sdmmc_host_t *host_config,
                                   const void *slot_config, const esp_vfs_fat_mount_config_t
                                   *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

#### Parameters

- `base_path`: path where partition should be registered (e.g. `"/sdcard"`)
- `host_config`: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT()`. (Deprecated) For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT()`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: if not NULL, pointer to the card information structure will be returned via this argument

```
esp_err_t esp_vfs_fat_sdspi_mount (const char *base_path, const sdmmc_host_t
                                   *host_config_input, const sdspi_device_config_t *slot_config,
                                   const esp_vfs_fat_mount_config_t *mount_config, sd-
                                   mmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

#### Parameters

- `base_path`: path where partition should be registered (e.g. `"/sdcard"` )
- `host_config_input`: Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

**struct esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

#### Public Members

bool **format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max\_files**

Max number of open files.

size\_t **allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and  $128 * \text{sector size}$ . For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

*esp\_err\_t* **esp\_vfs\_fat\_sdcard\_unmount** (`const char *base_path, sdmmc_card_t *card`)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

#### Return

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the card argument is unregistered
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

#### Using FatFs with VFS in read-only mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_rawflash_mount()` and `esp_vfs_fat_rawflash_unmount()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for

data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```
esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label,  
                                     const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_rawflash\_mount was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**

- base\_path: path where FATFS partition should be mounted (e.g. “/spiflash” )
- partition\_label: label of the partition which should be used
- mount\_config: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount (const char *base_path, const char  
                                       *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp\_vfs\_fat\_rawflash\_mount.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount hasn't been called

**Parameters**

- base\_path: path where partition should be registered (e.g. “/spiflash” )
- partition\_label: label of partition to be unmounted

## FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk\_xxx functions for driver number pdrv, corresponding function in discio\_impl for given pdrv will be called.

**Parameters**

- pdrv: drive number
- discio\_impl: pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

### Public Members

DSTATUS (**\*init**) (unsigned char pdrv)  
disk initialization function

DSTATUS (**\*status**) (unsigned char pdrv)  
disk status check function

DRESULT (**\*read**) (unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)  
sector read function

DRESULT (**\*write**) (unsigned char pdrv, **const** unsigned char \*buff, uint32\_t sector, unsigned count)  
sector write function

DRESULT (**\*ioctl**) (unsigned char pdrv, unsigned char cmd, void \*buff)  
function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmmc** (unsigned char pdrv, *sdmmc\_card\_t* \*card)  
Register SD/MMC diskio driver

#### Parameters

- pdrv: drive number
- card: pointer to *sdmmc\_card\_t* structure describing a card; card should be initialized before calling `f_mount`.

*esp\_err\_t* **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, *wl\_handle\_t* flash\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- flash\_handle: handle of the wear levelling partition.

*esp\_err\_t* **ff\_diskio\_register\_raw\_partition** (unsigned char pdrv, **const** *esp\_partition\_t* \*part\_handle)  
Register spi flash partition

#### Parameters

- pdrv: drive number
- part\_handle: pointer to raw flash partition.

## 2.6.2 Manufacturing Utility

### Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#).
- [Flash Download tool](#) (available on Windows only). Just download it, unzip, and follow the instructions inside the *doc* folder.
- Direct flash programming using custom production tools.

### Prerequisites

This utility is dependent on `esp-idf`'s NVS partition utility.

- **Operating System requirements:**
  - Linux/macOS/Windows (standard distributions)

- **The following packages are needed to use this utility:**
  - Python

---

**Note:****Before using this utility, please make sure that:**

- The path to Python is added to the PATH environment variable.
  - You have installed the packages from *requirement.txt*, the file in the root of the esp-idf directory.
- 

**Workflow****CSV Configuration File**

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,    <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

---

**Note:** The first line in this file should always be the namespace entry.

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

---

**Note:****Make sure there are no spaces:**

- before and after ‘,’
  - at the end of each line in a CSV file
-

## Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1, key2, key3, . . . .  
value1, value2, value3, . . . .
```

---

**Note:** The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

---

Each line should contain the `value` of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id, firmware_key, serial_no, device_no  
1, 1a2b3c4d5e6faabb, A1, 101  
2, 1a2b3c4d5e6fccdd, , 102  
3, 1a2b3c4d5e6feeff, , 103
```

---

**Note:** If the `'REPEAT'` tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the `'REPEAT'` tag.

---

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key, type, encoding, value  
key, namespace, ,  
key1, type1, encoding1, value1  
key2, type2, encoding2, value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

## Running the utility

**Usage:**

```
python mfg_gen.py [-h] {generate, generate-key} . . .
```

**Optional Arguments:**

No.	Parameter	Description
1	-h, -help	show this help message and exit

**Commands:**

Run `mfg_gen.py {command} -h` for additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption

### To generate factory images for each device (Default):

#### Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                          [--keyfile KEYFILE] [--inputkey INPUTKEY]
                          [--outdir OUTDIR]
                          conf values prefix size
```

#### Positional Arguments:

Parameter	Description
conf	Path to configuration csv file to parse
values	Path to values csv file to parse
prefix	Unique name for each output filename prefix
size	Size of NVS partition in bytes (must be multiple of 4096)

#### Optional Arguments:

Parameter	Description
-h, -help	show this help message and exit
-fileid FILEID	Unique file identifier(any key in values file) for each filename suffix (Default: numeric value(1,2,3...))
-version {1,2}	Set multipage blob version. Version 1 - Multipage blob support disabled. Version 2 - Multipage blob support enabled. Default: Version 2
-keygen	Generates key for encrypting NVS partition
-inputkey INPUTKEY	File having key for encrypting NVS partition
-outdir OUTDIR	Output directory to store files created (Default: current directory)

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

### To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

---

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

---

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

---

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

### To generate only encryption keys:

#### Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

#### Optional Arguments:

Parameter	Description
<code>-h, --help</code>	show this help message and exit
<code>--keyfile KEYFILE</code>	Path to output encryption keys file
<code>--outdir OUTDIR</code>	Output directory to store files created. (Default: current directory)

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

---

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

---

**Note:** To provide custom target filename use the `--keyfile` argument.

---

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.6.3 Non-volatile storage library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying storage** Currently, NVS uses a portion of main flash memory through the *esp\_partition* API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the *nvs\_open()* API function or any other partition by specifying its name using the *nvs\_open\_from\_partition()* API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

---

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase_flash` target to erase all contents of the flash chip.

---

**Note:** NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

---

**Keys and values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

---

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

---

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- if the new value is of the same type as the old one, value is updated
- if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the *nvs\_open()* or *nvs\_open\_from\_partition* call. This call returns an opaque handle, which is used in subsequent calls to the *nvs\_get\_\**, *nvs\_set\_\**, and *nvs\_commit()* functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- *nvs\_entry\_find()* returns an opaque handle, which is used in subsequent calls to the *nvs\_entry\_next()* and *nvs\_entry\_info()* functions.
- *nvs\_entry\_next()* returns iterator to the next key-value pair.
- *nvs\_entry\_info()* returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find()` and `nvs_entry_next()` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator()`.

**Security, tampering, and robustness** NVS is not directly compatible with the ESP32-C3 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-C3 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

## NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet another partition, which is protected using [Flash Encryption](#). Therefore, enabling [Flash Encryption](#) is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when [Flash Encryption](#) is enabled. This is done because WiFi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the [NVS key partition](#). Two partition tables containing the [NVS key partition](#) are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash\\_encryption](#) for how to configure and use NVS encryption feature.

## NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted* and its size should be the minimum partition size (4KB). Refer to [Partition Tables](#) for more details. Two additional partition tables which contain the [NVS key partition](#) are provided under the partition table option (menuconfig->Partition Table). They can be directly used for [NVS Encryption](#). The structure of these partitions is depicted below.

-----+-----+-----+-----+-----
XTS encryption key (32)
-----+-----+-----+-----+-----
XTS tweak key (32)
-----+-----+-----+-----+-----
CRC32 (4)
-----+-----+-----+-----+-----

The XTS encryption keys in the [NVS key partition](#) can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:

When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first [NVS key partition](#). Then the API function automatically generates and stores the nvs keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`.

New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.

2. Use pre-generated key partition:

This option will be required by the user when keys in the *NVS key partition* are not generated by the application. The *NVS key partition* containing the XTS encryption keys can be generated with the help of *NVS Partition Generator Utility*. Then the user can store the pre generated key partition on the flash with help of the following two commands:

i) Build and flash the partition table

```
idf.py partition_table partition_table-flash
```

ii) Store the keys in the *NVS key partition* (on the flash) with the help of `parttool.py` (see Partition Tool section in *partition-tables* for more details)

```
parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_
↪partition offset" write_partition --partition-name="name of nvs_key_
↪partition" --input "nvs_key partition"
```

Since the key partition is marked as *encrypted* and *Flash Encryption* is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write** The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

**Encrypt the default NVS partition:** To enable encryption for the default NVS partition no additional steps are necessary. When *CONFIG\_NVS\_ENCRYPTION* is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first *NVS key partition* found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition:** To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

### NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details,

please refer to [NVS Partition Generator Utility](#).

### Application Example

You can find code examples in the [storage](#) directory of ESP-IDF examples:

#### [storage/nvs\\_rw\\_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-C3 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

#### [storage/nvs\\_rw\\_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-C3 module restarts.

- value - tracks the number of the ESP32-C3 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

#### [storage/nvs\\_rw\\_value\\_cxx](#)

This example does exactly the same as [storage/nvs\\_rw\\_value](#), except that it uses the C++ nvs handle class.

### Internals

**Log of key-value pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

**Empty/uninitialized** Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.

**Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

**Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

**Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

**Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

**Structure of a page** For now, we assume that flash sector size is 4096 bytes and that ESP32-C3 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-C3 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32-C3 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 \* 126) are not used.

**Empty (2' b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2' b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2' b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

+-----+   NS=0 Type=uint8_t Key="wifi" Value=1	Entry describing namespace "wifi"
+-----+   NS=1 Type=uint32_t Key="channel" Value=6	Key "channel" in namespace "wifi"
+-----+   NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
+-----+   NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"
+-----+	

**Item hash list** To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, *Page::findItem* first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

## API Reference

### Header File

- [nvs\\_flash/include/nvs\\_flash.h](#)

### Functions

*esp\_err\_t* **nvs\_flash\_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS\_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

1. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs\_keys” )
2. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
3. Internally call “nvs\_flash\_secure\_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

### Return

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from *nvs\_flash\_read\_security\_cfg* API (when “NVS\_ENCRYPTION” is enabled).
- error codes from *nvs\_flash\_generate\_keys* API (when “NVS\_ENCRYPTION” is enabled).

• error codes from `nvs_flash_secure_init_partition` API (when “NVS\_ENCRYPTION” is enabled).

`esp_err_t nvs_flash_init_partition(const char *partition_label)`  
Initialize NVS flash storage for the specified partition.

**Return**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `partition_label`: Label of the partition. Must be no longer than 16 characters.

`esp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

**Return**

- ESP\_OK if storage was successfully initialized
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_deinit(void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Return**

- ESP\_OK on success (storage was deinitialized)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition(const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage for given partition was not initialized prior to this call

**Parameters**

- [in] `partition_label`: Label of the partition

`esp_err_t nvs_flash_erase(void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn't happen)

`esp_err_t nvs_flash_erase_partition(const char *part_name)`

Erase specified NVS partition.

Erase all content of a specified NVS partition

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

**Parameters**

- [in] `part_name`: Name (label) of the partition which should be erased

`esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)`

Erase custom partition.

Erase all content of specified custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no partition with the specified parameters in the partition table
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `partition`: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is NULL, no encryption is used.

`esp_err_t nvs_flash_secure_init_partition (const char *partition_label, nvs_sec_cfg_t *cfg)`

Initialize NVS flash storage for the specified partition.

**Return**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] `partition_label`: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

`esp_err_t nvs_flash_generate_keys (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)`

Generate and store NVS keys in the provided esp partition.

**Return** -ESP\_OK, if `cfg` was read successfully; -or error codes from `esp_partition_write/erase` APIs.

**Parameters**

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.

- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

`esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)`

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked 'encrypted'.

**Return** -ESP\_OK, if `cfg` was read successfully; -ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED, if the partition is not yet written with keys. -ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

#### Parameters

- [in] `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- [out] `cfg`: Pointer to nvs security configuration structure. Pointer must be non-NULL.

### Structures

**struct nvs\_sec\_cfg\_t**

Key for encryption and decryption.

#### Public Members

`uint8_t eky[NVS_KEY_SIZE]`  
XTS encryption and decryption key

`uint8_t tky[NVS_KEY_SIZE]`  
XTS tweak key

### Macros

**NVS\_KEY\_SIZE**

### Header File

- [nvs\\_flash/include/nvs.h](#)

### Functions

`esp_err_t nvs_set_i8(nvs_handle_t handle, const char *key, int8_t value)`

set `int8_t` value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

#### Return

- ESP\_OK if value was set successfully
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if storage handle was opened as read only
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is not enough space in the underlying storage to save the value
- ESP\_ERR\_NVS\_REMOVE\_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

#### Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- [in] `value`: The value to set.

*esp\_err\_t nvs\_set\_u8* (*nvs\_handle\_t handle*, **const** char \**key*, uint8\_t *value*)  
set uint8\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_i16* (*nvs\_handle\_t handle*, **const** char \**key*, int16\_t *value*)  
set int16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_u16* (*nvs\_handle\_t handle*, **const** char \**key*, uint16\_t *value*)  
set uint16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_i32* (*nvs\_handle\_t handle*, **const** char \**key*, int32\_t *value*)  
set int32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_u32* (*nvs\_handle\_t handle*, **const** char \**key*, uint32\_t *value*)  
set uint32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_i64* (*nvs\_handle\_t handle*, **const** char \**key*, int64\_t *value*)  
set int64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_u64* (*nvs\_handle\_t handle*, **const** char \**key*, uint64\_t *value*)  
set uint64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t nvs\_set\_str* (*nvs\_handle\_t handle*, **const** char \**key*, **const** char \**value*)  
set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

#### Return

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

#### Parameters

- [in] `handle`: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- [in] `value`: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

*esp\_err\_t nvs\_get\_i8* (*nvs\_handle\_t handle*, **const** char \**key*, int8\_t \**out\_value*)  
get int8\_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

### Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

### Parameters

- `[in] handle`: Handle obtained from `nvs_open` function.
- `[in] key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- `out_value`: Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`  
get `uint8_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`  
get `int16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`  
get `uint16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`  
get `int32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`  
get `uint32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)`  
get `int64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64(nvs_handle_t handle, const char *key, uint64_t *out_value)`  
get `uint64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str(nvs_handle_t handle, const char *key, char *out_value, size_t *length)`  
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to `length`. Variable pointed to by `length` argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, `length` has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### Return

- `ESP_OK` if the value was retrieved successfully
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

### Parameters

- `[in]` `handle`: Handle obtained from `nvs_open` function.
- `[in]` `key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- `[out]` `out_value`: Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.
- `[inout]` `length`: A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

*esp\_err\_t* `nvs_get_blob`(*nvs\_handle\_t* `handle`, `const` `char`\*`key`, `void`\*`out_value`, `size_t`\*`length`)  
get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

*esp\_err\_t* `nvs_open`(`const` `char`\*`name`, *nvs\_open\_mode\_t* `open_mode`, *nvs\_handle\_t*\*`out_handle`)  
Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

### Return

- `ESP_OK` if storage handle was opened successfully
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "nvs" is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

### Parameters

- `[in]` `name`: Namespace name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- `[in]` `open_mode`: `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- `[out]` `out_handle`: If successful (return code is zero), handle will be returned in this argument.

*esp\_err\_t* **nvs\_open\_from\_partition**(const char \*part\_name, const char \*name, nvs\_open\_mode\_t open\_mode, nvs\_handle\_t \*out\_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

#### Return

- ESP\_OK if storage handle was opened successfully
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with specified name is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

#### Parameters

- [in] part\_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- [in] open\_mode: NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out\_handle: If successful (return code is zero), handle will be returned in this argument.

*esp\_err\_t* **nvs\_set\_blob**(nvs\_handle\_t handle, const char \*key, const void \*value, size\_t length)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

#### Return

- ESP\_OK if value was set successfully
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if storage handle was opened as read only
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is not enough space in the underlying storage to save the value
- ESP\_ERR\_NVS\_REMOVE\_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP\_ERR\_NVS\_VALUE\_TOO\_LONG if the value is too long

#### Parameters

- [in] handle: Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- [in] value: The value to set.
- [in] length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

*esp\_err\_t* **nvs\_erase\_key**(nvs\_handle\_t handle, const char \*key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- ESP\_OK if erase operation was successful
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if handle was opened as read only
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

#### Parameters

- [in] `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- [in] `key`: Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

`esp_err_t nvs_erase_all (nvs_handle_t handle)`

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

#### Return

- `ESP_OK` if erase operation was successful
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

#### Parameters

- [in] `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

`esp_err_t nvs_commit (nvs_handle_t handle)`

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

#### Return

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- other error codes from the underlying storage driver

#### Parameters

- [in] `handle`: Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

void `nvs_close (nvs_handle_t handle)`

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

#### Parameters

- [in] `handle`: Storage handle to close

`esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)`

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

#### Return

- `ESP_OK` if the changes have been written successfully. Return param `nvs_stats` will be filled.
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "name" is not found. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` equal to `NULL`.

- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

#### Parameters

- [in] `part_name`: Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` ( "nvs" ).
- [out] `nvs_stats`: Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

*esp\_err\_t* **nvs\_get\_used\_entry\_count** (*nvs\_handle\_t* handle, size\_t \*used\_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs.
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

#### Return

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if `handle` has been closed or is `NULL`. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` equal to `NULL`.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

#### Parameters

- [in] `handle`: Handle obtained from `nvs_open` function.
- [out] `used_entries`: Returns amount of used entries from a namespace.

*nvs\_iterator\_t* **nvs\_entry\_find** (**const** char \*part\_name, **const** char \*namespace\_name, *nvs\_type\_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no
↳other
// element for specified criteria was found.
}
```

**Return** Iterator used to enumerate all the entries found, or `NULL` if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any

more.

#### Parameters

- [in] `part_name`: Partition name
- [in] `namespace_name`: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- [in] `type`: One of `nvs_type_t` values.

`nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)`

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid `nvs_iterator_t` otherwise.

#### Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

void `nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)`

Fills `nvs_entry_info_t` structure with information about entry pointed to by the iterator.

#### Parameters

- [in] `iterator`: Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- [out] `out_info`: Structure to which entry information is copied.

void `nvs_release_iterator (nvs_iterator_t iterator)`

Release iterator.

#### Parameters

- [in] `iterator`: Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

### Structures

**struct** `nvs_entry_info_t`

information about entry obtained from `nvs_entry_info` function

#### Public Members

char `namespace_name`[16]

Namespace to which key-value belong

char `key`[`NVS_KEY_NAME_MAX_SIZE`]

Key of stored key-value pair

`nvs_type_t` `type`

Type of stored key-value pair

**struct** `nvs_stats_t`

**Note** Info about storage space NVS.

#### Public Members

size\_t `used_entries`

Amount of used entries.

size\_t `free_entries`

Amount of free entries.

size\_t `total_entries`

Amount all available entries.

size\_t `namespace_count`

Amount name space.

**Macros****ESP\_ERR\_NVS\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

**ESP\_ERR\_NVS\_NOT\_FOUND**

Id namespace doesn't exist yet and mode is NVS\_READONLY

**ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

**ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

**ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

**ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

**ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

**ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

**ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

**ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

**ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

**ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

**ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

**ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

String or blob length is longer than supported by the implementation

**ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_WRONG\_ENCRYPTION**

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**NVS\_KEY\_NAME\_MAX\_SIZE**

Maximal length of NVS key name (including null terminator)

**Type Definitions****typedef** uint32\_t **nvs\_handle\_t**

Opaque pointer type representing non-volatile storage handle

**typedef** *nvs\_handle\_t* **nvs\_handle****typedef** *nvs\_open\_mode\_t* **nvs\_open\_mode****typedef** struct nvs\_opaque\_iterator\_t \***nvs\_iterator\_t**

Opaque pointer type representing iterator to nvs entries

**Enumerations****enum** **nvs\_open\_mode\_t**

Mode of opening the non-volatile storage.

*Values:***NVS\_READONLY**

Read only

**NVS\_READWRITE**

Read and write

**enum** **nvs\_type\_t**

Types of variables.

*Values:***NVS\_TYPE\_U8** = 0x01

Type uint8\_t

**NVS\_TYPE\_I8** = 0x11

Type int8\_t

**NVS\_TYPE\_U16** = 0x02

Type uint16\_t

**NVS\_TYPE\_I16** = 0x12

Type int16\_t

**NVS\_TYPE\_U32** = 0x04

Type uint32\_t

**NVS\_TYPE\_I32** = 0x14

Type int32\_t

```

NVS_TYPE_U64 = 0x08
    Type uint64_t
NVS_TYPE_I64 = 0x18
    Type int64_t
NVS_TYPE_STR = 0x21
    Type string
NVS_TYPE_BLOB = 0x42
    Type blob
NVS_TYPE_ANY = 0xff
    Must be last

```

## 2.6.4 NVS Partition Generator Utility

### Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

### Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in *requirements.txt* in the root of the esp-idf directory.

### CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the <code>file</code> type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value.	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> is fixed and is not configurable. Any values in these cells are ignored.

---

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

---

Below is an example dump of such a CSV file:

```
key,type,encoding,value      <-- column header
namespace_name,namespace,,   <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

---

**Note:**

**Make sure there are no spaces:**

- before and after ‘,’
  - at the end of each line in a CSV file
- 

### NVS Entry and Namespace association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

---

**Note:** First entry in a CSV file should always be a namespace entry.

---

### Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section [Structure of entry](#). If you intend to use an older format, the utility provides an option to disable this feature.

### Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to [NVS Encryption](#) for more details.

### Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to [NVS Encryption](#) for more details.

### Running the utility

**Usage:**

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

No.	Parameter	Description

(continues on next page)

(continued from previous page)

```

| 1 | -h, --help | show this help message and exit
↵
+-----+
↵-----+

Commands:
    Run nvs_partition_gen.py {command} -h for additional help
+-----+
↵-----+
| No. | Parameter | Description
↵
+-----+
| 1 | generate | Generate NVS partition
↵
+-----+
↵-----+
| 2 | generate-key | Generate keys for encryption
↵
+-----+
↵-----+
| 3 | encrypt | Generate NVS encrypted partition
↵
+-----+
↵-----+
| 4 | decrypt | Decrypt NVS encrypted partition
↵
+-----+
↵-----+

```

**To generate NVS partition (Default):****Usage:**

```

python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir↵
↵OUTDIR]
                                input output size

Positional Arguments:
+-----+
↵-----+
| Parameter | Description
↵
+-----+
| input | Path to CSV file to parse
↵
+-----+
↵-----+
| output | Path to output NVS binary file
↵
+-----+
↵-----+
| size | Size of NVS partition in bytes (must be multiple↵
↵of 4096)
+-----+
↵-----+

Optional Arguments:
+-----+
↵-----+

```

(continues on next page)

(continued from previous page)

Parameter	Description
-h, --help	show this help message <b>and</b> exit
--version {1,2}	Set multipage blob version. Version 1 - Multipage blob support disabled. Version 2 - Multipage blob support enabled. Default: Version 2
--outdir OUTDIR	Output directory to store files created (Default: current directory)

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

### To generate only encryption keys:

#### Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                     [--outdir OUTDIR]
```

Optional Arguments:

Parameter	Description
-h, --help	show this help message <b>and</b> exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

### To generate encrypted NVS partition:

#### Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                   [--keyfile KEYFILE] [--inputkey 
↳ INPUTKEY]
                                   [--outdir OUTDIR]
                                   input output size

Positional Arguments:
+-----+-----+-----+
| Parameter | Description |
+-----+-----+-----+
| input     | Path to CSV file to parse |
+-----+-----+-----+
| output    | Path to output NVS binary file |
+-----+-----+-----+
| size     | Size of NVS partition in bytes (must be multiple 
↳ of 4096) |
+-----+-----+-----+

Optional Arguments:
+-----+-----+-----+
| Parameter | Description |
+-----+-----+-----+
| -h, --help | show this help message and exit |
+-----+-----+-----+
| --version {1,2} | Set multipage blob version. | |
| | | Version 1 - Multipage blob support disabled. |
| | | Version 2 - Multipage blob support enabled. |
| | | Default: Version 2 |
+-----+-----+-----+
| --keygen | Generates key for encrypting NVS partition |
+-----+-----+-----+
| --keyfile KEYFILE | Path to output encryption keys file |
+-----+-----+-----+
```

(continues on next page)

(continued from previous page)

--inputkey INPUTKEY	File having key <b>for</b> encrypting NVS partition	↵
↵		
+-----+	+-----+	
↵		
--outdir OUTDIR	Output directory to store files created	↵
↵		
	(Default: current directory)	↵
↵		
+-----+	+-----+	
↵		

You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↵0x3000 --keygen
```

**Note:** Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↵0x3000 --keygen --keyfile sample_keys.bin
```

**Note:** Encryption key of the following format <outdir>/keys/sample\_keys.bin is created.

**Note:** This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↵0x3000 --inputkey sample_keys.bin
```

### To decrypt encrypted NVS partition:

#### Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key_
↵output
```

Positional Arguments:		
Parameter	Description	↵
input	Path to encrypted NVS partition file to parse	↵
key	Path to file having keys <b>for</b> decryption	↵

(continues on next page)

(continued from previous page)

```

+-----+-----+
↪-----+
| output      |          Path to output decrypted binary file          ↪
↪          |
+-----+-----+
↪-----+

Optional Arguments:
+-----+-----+
↪-----+
| Parameter    |          Description          ↪
↪          |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| -h, --help   |          show this help message and exit          ↪
↪          |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| --outdir OUTDIR |          Output directory to store files created          ↪
↪          |          (Default: current directory)          ↪
↪          |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

**You can also provide the format version number:**

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --
↪-version 1
```

**Multipage Blob Support Enabled (Version 2):** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

---

**Note:** *Minimum NVS Partition Size needed is 0x3000 bytes.*

---

---

**Note:** *When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.*

---

### Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.

- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

## 2.6.5 SD/SDIO/MMC Driver

### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc\\_host.h](#) and [driver/include/driver/sdsp\\_i\\_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SD SPI host, see [SD SPI Host API](#)

### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the [storage/sd\\_card](#) directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (memory + IO) cards** The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread safety** Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the [sdmmc\\_card\\_t](#) structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

### API Reference

#### Header File

- [sdmmc/include/sdmmc\\_cmd.h](#)

#### Functions

[esp\\_err\\_t](#) [sdmmc\\_card\\_init](#) ([const](#) [sdmmc\\_host\\_t](#) \*host, [sdmmc\\_card\\_t](#) \*out\_card)

Probe and initialize SD/MMC card using given host

**Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

#### Return

- ESP\_OK on success
- One of the error codes from SDMMC host controller

#### Parameters

- host: pointer to structure defining host controller
- out\_card: pointer to structure which will receive information about the card when the function completes

void [sdmmc\\_card\\_print\\_info](#) (FILE \*stream, [const](#) [sdmmc\\_card\\_t](#) \*card)

Print information about the card to a stream.

#### Parameters

- `stream`: stream obtained using `fopen` or `fdopen`
- `card`: card information structure initialized using `sdmmc_card_init`

*esp\_err\_t* **sdmmc\_write\_sectors** (*sdmmc\_card\_t* \**card*, **const** void \**src*, size\_t *start\_sector*, size\_t *sector\_count*)

Write given number of sectors to SD/MMC card

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `src`: pointer to data buffer to read data from; data size must be equal to `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write

*esp\_err\_t* **sdmmc\_read\_sectors** (*sdmmc\_card\_t* \**card*, void \**dst*, size\_t *start\_sector*, size\_t *sector\_count*)

Read given number of sectors from the SD/MMC card

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `dst`: pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- `start_sector`: sector where to start reading
- `sector_count`: number of sectors to read

*esp\_err\_t* **sdmmc\_io\_read\_byte** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *reg*, uint8\_t \**out\_byte*)

Read one byte from an SDIO card using `IO_RW_DIRECT` (CMD52)

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `reg`: byte address within IO function
- `[out]` `out_byte`: output, receives the value read from the card

*esp\_err\_t* **sdmmc\_io\_write\_byte** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *reg*, uint8\_t *in\_byte*, uint8\_t \**out\_byte*)

Write one byte to an SDIO card using `IO_RW_DIRECT` (CMD52)

#### Return

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `reg`: byte address within IO function
- `in_byte`: value to be written
- `[out]` `out_byte`: if not `NULL`, receives new byte value read from the card (read-after-write).

*esp\_err\_t* **sdmmc\_io\_read\_bytes** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *addr*, void \**dst*, size\_t *size*)

Read multiple bytes from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using `CMD53` in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where reading starts
- `dst`: buffer which receives the data read from card
- `size`: number of bytes to read

*esp\_err\_t* **sdmmc\_io\_write\_bytes** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *addr*, const void \**src*, size\_t *size*)

Write multiple bytes to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written
- `size`: number of bytes to write

*esp\_err\_t* **sdmmc\_io\_read\_blocks** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *addr*, void \**dst*, size\_t *size*)

Read blocks of data from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `dst`: buffer which receives the data read from card
- `size`: number of bytes to read, must be divisible by the card block size.

*esp\_err\_t* **sdmmc\_io\_write\_blocks** (*sdmmc\_card\_t* \**card*, uint32\_t *function*, uint32\_t *addr*, const void \**src*, size\_t *size*)

Write blocks of data to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

**Return**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `function`: IO function number
- `addr`: byte address within IO function where writing starts
- `src`: data to be written

- `size`: number of bytes to read, must be divisible by the card block size.

`esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)`

Enable SDIO interrupt in the SDMMC host

#### Return

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if the host controller does not support IO interrupts

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`

`esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)`

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

#### Return

- `ESP_OK` if the interrupt is received
- `ESP_ERR_NOT_SUPPORTED` if the host controller does not support IO interrupts
- `ESP_ERR_TIMEOUT` if the interrupt does not happen in `timeout_ticks`

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `timeout_ticks`: time to wait for the interrupt, in RTOS ticks

`esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)`

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this functions store as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

#### Return

- `ESP_OK`: on success
- `ESP_ERR_INVALID_RESPONSE`: if the card does not (correctly) support CIS.
- `ESP_ERR_INVALID_SIZE`: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- `ESP_ERR_NOT_FOUND`: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

#### Parameters

- `card`: pointer to card information structure previously initialized using `sdmmc_card_init`
- `out_buffer`: Output buffer of the CIS data
- `buffer_size`: Size of the buffer.
- `inout_cis_size`: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

`esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)`

Parse and print the CIS information of a SDIO card.

**Note** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

#### Return

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: if the value from the card is not supported to be parsed.
- `ESP_ERR_INVALID_SIZE`: if the CIS size fields are not correct.

#### Parameters

- `buffer`: Buffer to parse
- `buffer_size`: Size of the buffer.

- `fp`: File pointer to print to, set to `NULL` to print to `stdout`.

### Structures

#### **struct sdmmc\_csd\_t**

Decoded values from SD card Card Specific Data register

#### **Public Members**

int **csd\_ver**

CSD structure format

int **mmc\_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector\_size**

sector size in bytes

int **read\_block\_len**

block length for reads

int **card\_command\_class**

Card Command Class for SD

int **tr\_speed**

Max transfer speed

#### **struct sdmmc\_cid\_t**

Decoded values from SD card Card IDentification register

#### **Public Members**

int **mfg\_id**

manufacturer identification number

int **oem\_id**

OEM/product identification number

char **name**[8]

product name (MMC v1 has the longest)

int **revision**

product revision

int **serial**

product serial number

int **date**

manufacturing date

#### **struct sdmmc\_scr\_t**

Decoded values from SD Configuration Register

**Public Members**

int **sd\_spec**  
SD Physical layer specification version, reported by card

int **bus\_width**  
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

**struct sdmmc\_ext\_csd\_t**  
Decoded values of Extended Card Specific Data

**Public Members**

uint8\_t **power\_class**  
Power class used by the card

**struct sdmmc\_switch\_func\_rsp\_t**  
SD SWITCH\_FUNC response buffer

**Public Members**

uint32\_t **data**[512 / 8 / sizeof(uint32\_t)]  
response data

**struct sdmmc\_command\_t**  
SD/MMC command information

**Public Members**

uint32\_t **opcode**  
SD or MMC command index

uint32\_t **arg**  
SD/MMC command argument

*sdmmc\_response\_t* **response**  
response buffer

void \***data**  
buffer to send or read into

size\_t **datalen**  
length of data buffer

size\_t **blklen**  
block length

int **flags**  
see below

*esp\_err\_t* **error**  
error returned from transfer

int **timeout\_ms**  
response timeout, in milliseconds

**struct sdmmc\_host\_t**  
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

### Public Members

`uint32_t flags`

flags defining host properties

`int slot`

slot number, to be passed to host functions

`int max_freq_khz`

max frequency supported by the host

`float io_voltage`

I/O voltage used by the controller (voltage switching is not supported)

`esp_err_t (*init) (void)`

Host function to initialize the driver

`esp_err_t (*set_bus_width) (int slot, size_t width)`

host function to set bus width

`size_t (*get_bus_width) (int slot)`

host function to get bus width

`esp_err_t (*set_bus_ddr_mode) (int slot, bool ddr_enable)`

host function to set DDR mode

`esp_err_t (*set_card_clk) (int slot, uint32_t freq_khz)`

host function to set card clock frequency

`esp_err_t (*do_transaction) (int slot, sdmmc_command_t *cmdinfo)`

host function to do a transaction

`esp_err_t (*deinit) (void)`

host function to deinitialize the driver

`esp_err_t (*deinit_p) (int slot)`

host function to deinitialize the driver, called with the `slot`

`esp_err_t (*io_int_enable) (int slot)`

Host function to enable SDIO interrupt line

`esp_err_t (*io_int_wait) (int slot, TickType_t timeout_ticks)`

Host function to wait for SDIO interrupt line to be active

`int command_timeout_ms`

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

`struct sdmmc_card_t`

SD/MMC card information structure

### Public Members

`sdmmc_host_t host`

Host with which the card is associated

`uint32_t ocr`

OCR (Operation Conditions Register) value

`sdmmc_cid_t cid`

decoded CID (Card IDentification) register value

`sdmmc_response_t raw_cid`

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

`sdmmc_csd_t csd`

decoded CSD (Card-Specific Data) register value

***sdmmc\_scr\_t scr***

decoded SCR (SD card Configuration Register) value

***sdmmc\_ext\_csd\_t ext\_csd***

decoded EXT\_CSD (Extended Card Specific Data) register value

**uint16\_t rca**

RCA (Relative Card Address)

**uint16\_t max\_freq\_khz**

Maximum frequency, in kHz, supported by the card

**uint32\_t is\_mem : 1**

Bit indicates if the card is a memory card

**uint32\_t is\_sdio : 1**

Bit indicates if the card is an IO card

**uint32\_t is\_mmc : 1**

Bit indicates if the card is MMC

**uint32\_t num\_io\_functions : 3**

If is\_sdio is 1, contains the number of IO functions on the card

**uint32\_t log\_bus\_width : 2**log<sub>2</sub>(bus width supported by card)**uint32\_t is\_ddr : 1**

Card supports DDR mode

**uint32\_t reserved : 23**

Reserved for future expansion

**Macros****SDMMC\_HOST\_FLAG\_1BIT**

host supports 1-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_4BIT**

host supports 4-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_8BIT**

host supports 8-line MMC protocol

**SDMMC\_HOST\_FLAG\_SPI**

host supports SPI protocol

**SDMMC\_HOST\_FLAG\_DDR**

host supports DDR mode for SD/MMC

**SDMMC\_HOST\_FLAG\_DEINIT\_ARG**host `deinit` function called with the slot argument**SDMMC\_FREQ\_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC\_FREQ\_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC\_FREQ\_PROBING**

SD/MMC probing speed

**SDMMC\_FREQ\_52M**

MMC 52MHz speed

**SDMMC\_FREQ\_26M**

MMC 26MHz speed

### Type Definitions

```
typedef uint32_t sdmmc_response_t[4]  
    SD/MMC command response buffer
```

## 2.6.6 SPI Flash API

### Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The `spi_flash` component also has higher-level API functions which work with partitions defined in the [partition table](#).

Different from the API before IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flashes chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.

However due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

---

**Note:** Flash APIs after IDF v4.0 are no longer *atomic*. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

---

Kconfig option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` can be used to switch `spi_flash_*` functions back to the implementation before IDF v4.0. However, the code size may get bigger if you use the new API and the old API the same time.

Encrypted reads and writes use the old implementation, even if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

### Support for features of flash chips

Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don't need any vendor-specific commands.

The Quad mode (QIO/QOUT) the following chip types are supported:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

The 32-bit address range of following chip type is supported:

1. W25Q256
2. GD25Q256

## Initializing a flash device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

---

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

---

## SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of *partition-specific functions*.

## SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

## Concurrency Constraints for flash on SPI1

**Concurrency Constraints for flash on SPI1** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-C3, the config option `CONFIG_SPI_FLASH_AUTO_SUSPEND` (enabled by default) allows the cache to read flash & PSRAM concurrently with SPI1 operations. See *When auto suspend is enabled* for more details.

If this option is disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see *When the caches are disabled*. This constraints will cause more IRAM/DRAM usages.

**When the caches are disabled** This means that all CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur. If you use the API functions documented here, then the caches will be disabled automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

See also [OS functions](#), [SPI Bus Lock](#).

**IRAM-Safe Interrupt Handlers** If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the [interrupt handler is registered](#).

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to place code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

---

### When auto suspend is enabled

**Important:** The flash chip you are using must have suspend/resume function, even then, and not all flash chips with suspend/resume support auto-suspend on ESP32-C3. If you use suspend feature on a unsupported chip, it may cause a severe crash. Therefore, we strongly suggest you reading the flash chip datasheets first. Ensure the flash chip satisfies the following conditions at minimum. Even then, thorough testing is recommended.

1. SUS bit in status registers should in SR2 bit7 (or SR bit15)(This is caused by the restriction of out software implementation).
  2. Suspend command is 75H, resume command is 7AH(This is caused by the restriction of out software implementation).
  3. When the flash is successfully suspended, all address of the flash, except from the section/block being erased, can be read correctly. And resume can be sent immediately at this state.
  4. When the flash is successfully resumed, another suspend can be sent immediately at this state.
- 

When auto suspend is enabled, the cache will be kept enabled while accessing the SPI1 bus (e.g. erasing/writing/reading main flash). The hardware handles the arbitration between them.

If SPI1 operation is short (like reading operation), the CPU and the cache will wait until the SPI1 operation is done. However if it's an erasing, auto suspend will happen, interrupting the erasing, making the CPU able to read from cache in limited time.

This way some code/variables can be put into the flash/psram instead of IRAM/DRAM, while still able to be executed during flash erasing. This reduces the some usage of IRAM/DRAM.

Please note this feature has the overhead of the flash suspend/resume. The flash erasing can be extremely long if the erasing is interrupted too often. Use FreeRTOS task priorities to ensure that only real-time critical tasks are executed at higher priority than flash erase, to allow the flash erase to complete in reasonable time.

In other words, there are three kinds of code:

1. Critical code: inside IRAM/DRAM. This kind of code usually has high performance requirements, related to cache/flash/psram, or called very often.

2. Cached code: inside flash/psram. This kind of code has lower performance requirements or called less often. They will execute during erasing, with some overhead.
3. Low priority code: inside flash/psram and disabled during erasing. This kind of code should be forbidden from executed to avoid affecting the flash erasing, by setting a lower task priority than the erasing task.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See [Concurrency Constraints for flash on SPI1](#) for more details.

## Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

---

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

---

## SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

## Memory mapping API

ESP32-C3 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

---

## SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provides support of some OS functions (e.g. lock, delay) in different stages (1st/2st boot, or the app).

**Host driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-C3 memory-spi functionalities. However due to the speed limitations of ESP32-C3, the HAL layer can't provide high-speed implementations to some reading commands (So we didn't do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access to the flash regardless of the low-level hardware.

**Chip driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.

3. Some devices of SPI Master driver may requires to use the bus monopolized during a period. (especially when the device doesn't have CS wire, or the wire is controlled by the software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

### See also

- [Partition Table documentation](#)
- [Over The Air Update \(OTA\) API](#) provides high-level API for updating app firmware stored in flash.
- [Non-Volatile Storage \(NVS\) API](#) provides a structured API for storing small pieces of data in SPI flash.

### Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

## API Reference - SPI Flash

### Header File

- `spi_flash/include/esp_flash_spi_init.h`

### Functions

```
esp_err_t spi_bus_add_flash_device(esp_flash_t *out_chip, const
                                esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Return

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

#### Parameters

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

*esp\_err\_t* **spi\_bus\_remove\_flash\_device** (*esp\_flash\_t* \*chip)

Remove a SPI Flash device from the SPI bus.

**Return**

- ESP\_ERR\_INVALID\_ARG: The chip is invalid.
- ESP\_OK: success.

**Parameters**

- chip: The flash device to remove.

### Structures

**struct esp\_flash\_spi\_device\_config\_t**

Configurations for the SPI Flash to init.

### Public Members

*spi\_host\_device\_t* **host\_id**

Bus to use.

int **cs\_io\_num**

GPIO pin to output the CS signal.

*esp\_flash\_io\_mode\_t* **io\_mode**

IO mode to read from the Flash.

*esp\_flash\_speed\_t* **speed**

Speed of the Flash clock.

int **input\_delay\_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

### Header File

- `spi_flash/include/esp_flash.h`

### Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**Note** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Note** If the `chip->drv` pointer is NULL, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

**Return** ESP\_OK on success, or a flash error code if initialisation fails.

**Parameters**

- chip: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Return** true if set, otherwise false.

**Parameters**

- chip: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

*esp\_err\_t esp\_flash\_read\_id(esp\_flash\_t \*chip, uint32\_t \*out\_id)*

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via *esp\_flash\_init()*
- [out] *out\_id*: Pointer to receive ID value.

**Return** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t esp\_flash\_get\_size(esp\_flash\_t \*chip, uint32\_t \*out\_size)*

Detect flash size based on flash ID.

**Note** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

**Return** ESP\_OK on success, or a flash error code if operation failed.

**Parameters**

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via *esp\_flash\_init()*
- [out] *out\_size*: Detected size in bytes.

*esp\_err\_t esp\_flash\_erase\_chip(esp\_flash\_t \*chip)*

Erase flash chip contents.

**Return**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

**Parameters**

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via *esp\_flash\_init()*

*esp\_err\_t esp\_flash\_erase\_region(esp\_flash\_t \*chip, uint32\_t start, uint32\_t len)*

Erase a region of the flash chip.

Sector size is specified in *chip->drv->sector\_size* field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

**Parameters**

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via *esp\_flash\_init()*
- *start*: Address to start erasing flash. Must be sector aligned.
- *len*: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in *chip->drv->block\_erase\_size* field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Return**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t esp\_flash\_get\_chip\_write\_protect(esp\_flash\_t \*chip, bool \*write\_protected)*

Read if the entire chip is write protected.

**Note** A correct result for this flag depends on the SPI flash chip model and *chip\_drv* in use (via the ‘*chip->drv*’ field).

**Return** ESP\_OK on success, or a flash error code if operation failed.

**Parameters**

- *chip*: Pointer to identify flash chip. Must have been successfully initialised via *esp\_flash\_init()*
- [out] *write\_protected*: Pointer to boolean, set to the value of the write protect flag.

*esp\_err\_t esp\_flash\_set\_chip\_write\_protect(esp\_flash\_t \*chip, bool write\_protect)*

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `write_protect`: Boolean value for the write protect flag

**Return** `ESP_OK` on success, or a flash error code if operation failed.

```
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const
                                           esp_flash_region_t **out_regions, uint32_t
                                           *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `[out] out_regions`: Pointer to receive a pointer to the array of protectable regions of the chip.
- `[out] out_num_regions`: Pointer to an integer receiving the count of protectable regions in the array returned in `'regions'`.

```
esp_err_t esp_flash_get_protected_region(esp_flash_t *chip, const esp_flash_region_t
                                         *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

**Note** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `[out] out_protected`: Pointer to a flag which is set based on the protected status for this region.

```
esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t
                                         *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

**Return** `ESP_OK` on success, or a flash error code if operation failed.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- `protect`: Write protection flag to set.

```
esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on `buffer`, `address` or `length`.

**Parameters**

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

- `buffer`: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address`: Address on flash to read from. Must be less than `chip->size` field.
- `length`: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

#### Return

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

`esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)`

Write data to the SPI flash chip.

There are no alignment constraints on `buffer`, `address` or `length`.

#### Parameters

- `chip`: Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `address`: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- `length`: Length (in bytes) of data to write.

#### Return

- `ESP_OK` on success,
- `ESP_ERR_NOT_SUPPORTED` if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- Other flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both `address` & `length` must be 16 byte aligned, as this is the encryption block size

#### Return

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted write not supported for this chip.
- `ESP_ERR_INVALID_ARG`: Either the `address`, `buffer` or `length` is invalid.
- or other flash error code from `spi_flash_write_encrypted()`.

#### Parameters

- `chip`: Pointer to identify flash chip. Must be `NULL` (the main flash chip). For other chips, encrypted write is not supported.
- `address`: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- `buffer`: Pointer to a buffer with the data to write.
- `length`: Length (in bytes) of data to write. 16 byte aligned.

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

#### Return

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted read not supported for this chip.
- or other flash error code from `spi_flash_read_encrypted()`.

#### Parameters

- `chip`: Pointer to identify flash chip. Must be `NULL` (the main flash chip). For other chips, encrypted read is not supported.
- `address`: Address on flash to read from.
- `out_buffer`: Pointer to a buffer for the data to read to.

- `length`: Length (in bytes) of data to read.

**static** bool `esp_flash_is_quad_mode` (**const** *esp\_flash\_t* \*`chip`)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return** true if flash works in quad mode, otherwise false

**Parameters**

- `chip`: Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

### Structures

**struct** `esp_flash_region_t`

Structure for describing a region of flash.

### Public Members

uint32\_t `offset`

Start address of this region.

uint32\_t `size`

Size of the region.

**struct** `esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

*esp\_err\_t* (\*`start`) (void \*`arg`)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

*esp\_err\_t* (\*`end`) (void \*`arg`)

Called after completing any flash operation.

*esp\_err\_t* (\*`region_protected`) (void \*`arg`, size\_t `start_addr`, size\_t `size`)

Called before any erase/write operations to check whether the region is limited by the OS

*esp\_err\_t* (\*`delay_us`) (void \*`arg`, uint32\_t `us`)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (\*`get_temp_buffer`) (void \*`arg`, size\_t `request_size`, size\_t \*`out_size`)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (\*`release_temp_buffer`) (void \*`arg`, void \*`temp_buf`)

Called for release temp buffer.

*esp\_err\_t* (\*`check_yield`) (void \*`arg`, uint32\_t `chip_status`, uint32\_t \*`out_request`)

Yield to other tasks. Called during erase operations.

**Return** ESP\_OK means yield needs to be called (got an event to handle), while ESP\_ERR\_TIMEOUT means skip yield.

*esp\_err\_t* (\*`yield`) (void \*`arg`, uint32\_t \*`out_status`)

Yield to other tasks. Called during erase operations.

int64\_t (\*`get_system_time`) (void \*`arg`)

Called for get system time.

**struct esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

*spi\_flash\_host\_inst\_t* \***host**

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

**const spi\_flash\_chip\_t** \***chip\_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

**const esp\_flash\_os\_functions\_t** \***os\_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void \***os\_func\_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

*esp\_flash\_io\_mode\_t* **read\_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32\_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32\_t **chip\_id**

Detected chip id.

uint32\_t **busy** : 1

This flag is used to verify chip's status.

uint32\_t **reserved\_flags** : 31

reserved.

**Macros**

**SPI\_FLASH\_YIELD\_REQ\_YIELD**

**SPI\_FLASH\_YIELD\_REQ\_SUSPEND**

**SPI\_FLASH\_YIELD\_STA\_RESUME**

**Type Definitions**

**typedef struct spi\_flash\_chip\_t spi\_flash\_chip\_t**

**typedef struct esp\_flash\_t esp\_flash\_t**

**Header File**

- [hal/include/hal/spi\\_flash\\_types.h](#)

**Structures**

**struct spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

**Public Members****uint8\_t reserved**

Reserved, must be 0.

**uint8\_t mosi\_len**

Output data length, in bytes.

**uint8\_t miso\_len**

Input data length, in bytes.

**uint8\_t address\_bitlen**

Length of address in bits, set to 0 if command does not need an address.

**uint32\_t address**

Address to perform operation on.

**const uint8\_t \*mosi\_data**

Output data to salve.

**uint8\_t \*miso\_data**

[out] Input data from slave, little endian

**uint32\_t flags**

Flags for this transaction. Set to 0 for now.

**uint16\_t command**

Command to send.

**uint8\_t dummy\_bitlen**

Basic dummy bits to use.

**struct spi\_flash\_sus\_cmd\_conf**

Configuration structure for the flash chip suspend feature.

**Public Members****uint32\_t sus\_mask**

SUS/SUS1/SUS2 bit in flash register.

**uint32\_t cmd\_rdsr : 8**

Read flash status register(2) command.

**uint32\_t sus\_cmd : 8**

Flash suspend command.

**uint32\_t res\_cmd : 8**

Flash resume command.

**uint32\_t reserved : 8**

Reserved, set to 0.

**struct spi\_flash\_host\_inst\_t**

SPI Flash Host driver instance

**Public Members****const struct spi\_flash\_host\_driver\_s \*driver**

Pointer to the implementation function table.

**struct spi\_flash\_host\_driver\_s**

Host driver configuration and context structure.

**Public Members**

*esp\_err\_t* (\***dev\_config**) (*spi\_flash\_host\_inst\_t* \*host)  
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (\***common\_command**) (*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)  
Send an user-defined spi transaction to the device.

*esp\_err\_t* (\***read\_id**) (*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)  
Read flash ID.

void (\***erase\_chip**) (*spi\_flash\_host\_inst\_t* \*host)  
Erase whole flash chip.

void (\***erase\_sector**) (*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)  
Erase a specific sector by its start address.

void (\***erase\_block**) (*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)  
Erase a specific block by its start address.

*esp\_err\_t* (\***read\_status**) (*spi\_flash\_host\_inst\_t* \*host, uint8\_t \*out\_sr)  
Read the status of the flash chip.

*esp\_err\_t* (\***set\_write\_protect**) (*spi\_flash\_host\_inst\_t* \*host, bool wp)  
Disable write protection.

void (\***program\_page**) (*spi\_flash\_host\_inst\_t* \*host, const void \*buffer, uint32\_t address, uint32\_t length)  
Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (\***supports\_direct\_write**) (*spi\_flash\_host\_inst\_t* \*host, const void \*p)  
Check whether given buffer can be directly used to write

int (\***write\_data\_slicer**) (*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)  
Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Return** Length that can be actually written in one `program_page` call

**Parameters**

- `address`: Beginning flash address to write
- `len`: Length request to write
- `align_addr`: Output of the aligned address to write to
- `page_size`: Physical page size of the flash chip

*esp\_err\_t* (\***read**) (*spi\_flash\_host\_inst\_t* \*host, void \*buffer, uint32\_t address, uint32\_t read\_len)  
Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (\***supports\_direct\_read**) (*spi\_flash\_host\_inst\_t* \*host, const void \*p)  
Check whether given buffer can be directly used to read

int (\***read\_data\_slicer**) (*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)  
Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Return** Length that can be actually read in one `read` call

**Parameters**

- `address`: Beginning flash address to read
- `len`: Length request to read
- `align_addr`: Output of the aligned address to read
- `page_size`: Physical page size of the flash chip

uint32\_t (\***host\_status**) (*spi\_flash\_host\_inst\_t* \*host)  
Check the host status, 0:busy, 1:idle, 2:suspended.

```
esp_err_t (*configure_host_io_mode) (spi_flash_host_inst_t *host, uint32_t command,
                                     uint32_t addr_bitlen, int dummy_bitlen_base,
                                     esp_flash_io_mode_t io_mode)
```

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

```
void (*poll_cmd_done) (spi_flash_host_inst_t *host)
    Internal use, poll the HW until the last operation is done.
```

```
esp_err_t (*flush_cache) (spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
```

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

```
void (*check_suspend) (spi_flash_host_inst_t *host)
```

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

```
void (*resume) (spi_flash_host_inst_t *host)
```

Resume flash from suspend manually

```
void (*suspend) (spi_flash_host_inst_t *host)
```

Set flash in suspend status manually

```
esp_err_t (*sus_setup) (spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

### Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**ESP\_FLASH\_SPEED\_MIN**

Lowest speed supported by the driver, currently 5 MHz.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the *io\_mode* with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

### Type Definitions

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

### Enumerations

```
enum esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

**ESP\_FLASH\_5MHZ** = 0

The flash runs under 5MHz.

**ESP\_FLASH\_10MHZ**

The flash runs under 10MHz.

**ESP\_FLASH\_20MHZ**

The flash runs under 20MHz.

**ESP\_FLASH\_26MHZ**

The flash runs under 26MHz.

**ESP\_FLASH\_40MHZ**

The flash runs under 40MHz.

**ESP\_FLASH\_80MHZ**

The flash runs under 80MHz.

**ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is ESP\_FLASH\_SPEED\_MAX-1.

**enum esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

**SPI\_FLASH\_SLOWRD = 0**

Data read using single I/O, some limits on speed.

**SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

**SPI\_FLASH\_DOUT**

Data read using dual I/O.

**SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

**SPI\_FLASH\_QOUT**

Data read using quad I/O.

**SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

**SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is ESP\_FLASH\_READ\_MODE\_MAX-1.

## API Reference - Partition Table

### Header File

- [spi\\_flash/include/esp\\_partition.h](#)

### Functions

*esp\_partition\_iterator\_t* **esp\_partition\_find** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, **const** char \*label)

Find partition based on one or more parameters.

**Return** iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found.

Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

#### Parameters

- *type*: Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer
- *subtype*: Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- *label*: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**const** *esp\_partition\_t* \***esp\_partition\_find\_first** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, **const** char \*label)

Find first partition based on one or more parameters.

**Return** pointer to *esp\_partition\_t* structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

**Parameters**

- *type*: Partition type, one of *esp\_partition\_type\_t* values or an 8-bit unsigned integer
- *subtype*: Partition subtype, one of *esp\_partition\_subtype\_t* values or an 8-bit unsigned integer To find all partitions of given type, use *ESP\_PARTITION\_SUBTYPE\_ANY*.
- *label*: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**const** *esp\_partition\_t* \***esp\_partition\_get** (*esp\_partition\_iterator\_t* iterator)

Get *esp\_partition\_t* structure for given partition.

**Return** pointer to *esp\_partition\_t* structure. This pointer is valid for the lifetime of the application.

**Parameters**

- *iterator*: Iterator obtained using *esp\_partition\_find*. Must be non-NULL.

*esp\_partition\_iterator\_t* **esp\_partition\_next** (*esp\_partition\_iterator\_t* iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Return** NULL if no partition was found, valid *esp\_partition\_iterator\_t* otherwise.

**Parameters**

- *iterator*: Iterator obtained using *esp\_partition\_find*. Must be non-NULL.

void **esp\_partition\_iterator\_release** (*esp\_partition\_iterator\_t* iterator)

Release partition iterator.

**Parameters**

- *iterator*: Iterator obtained using *esp\_partition\_find*. Must be non-NULL.

**const** *esp\_partition\_t* \***esp\_partition\_verify** (**const** *esp\_partition\_t* \*partition)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from *esp\_partition\_get()*, as a test for equality.

**Return**

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp\_partition\_t* structure in flash. This pointer is always valid for the lifetime of the application.

**Parameters**

- *partition*: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

*esp\_err\_t* **esp\_partition\_read** (**const** *esp\_partition\_t* \*partition, *size\_t* src\_offset, void \*dst, *size\_t* size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

**Return** *ESP\_OK*, if data was read successfully; *ESP\_ERR\_INVALID\_ARG*, if *src\_offset* exceeds partition size; *ESP\_ERR\_INVALID\_SIZE*, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**

- *partition*: Pointer to partition structure obtained using *esp\_partition\_find\_first* or *esp\_partition\_get*. Must be non-NULL.
- *dst*: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- *src\_offset*: Address of the data to be read, relative to the beginning of the partition.
- *size*: Size of data to be read, in bytes.

*esp\_err\_t* **esp\_partition\_write** (**const** *esp\_partition\_t* \*partition, size\_t dst\_offset, **const** void \*src, size\_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `spi_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `spi_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

**Note** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Return** `ESP_OK`, if data was written successfully; `ESP_ERR_INVALID_ARG`, if `dst_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

#### Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `size`: Size of data to be written, in bytes.

*esp\_err\_t* **esp\_partition\_read\_raw** (**const** *esp\_partition\_t* \*partition, size\_t src\_offset, void \*dst, size\_t size)

Read data from the partition without any transformation/decryption.

**Note** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Return** `ESP_OK`, if data was read successfully; `ESP_ERR_INVALID_ARG`, if `src_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

#### Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst`: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `src_offset`: Address of the data to be read, relative to the beginning of the partition.
- `size`: Size of data to be read, in bytes.

*esp\_err\_t* **esp\_partition\_write\_raw** (**const** *esp\_partition\_t* \*partition, size\_t dst\_offset, **const** void \*src, size\_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

**Note** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Return** `ESP_OK`, if data was written successfully; `ESP_ERR_INVALID_ARG`, if `dst_offset` exceeds partition size; `ESP_ERR_INVALID_SIZE`, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

#### Parameters

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- `size`: Size of data to be written, in bytes.

*esp\_err\_t* **esp\_partition\_erase\_range** (**const** *esp\_partition\_t* \*partition, size\_t offset, size\_t size)

Erase part of the partition.

**Return** ESP\_OK, if the range was erased successfully; ESP\_ERR\_INVALID\_ARG, if iterator or dst are NULL; ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- `size`: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

```
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size,
                             spi_flash_mmap_memory_t memory, const void **out_ptr,
                             spi_flash_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

**Return** ESP\_OK, if successful

**Parameters**

- `partition`: Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset`: Offset from the beginning of partition where mapping should start.
- `size`: Size of the area to be mapped.
- `memory`: Memory space where the region should be mapped
- `out_ptr`: Output, pointer to the mapped memory region
- `out_handle`: Output, handle which should be used for `spi_flash_munmap` call

```
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP\_ERR\_IMAGE\_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Return**

- ESP\_OK: In case of successful operation.
- ESP\_ERR\_INVALID\_ARG: The size was 0 or the sha\_256 was NULL.
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for sha256 operation.
- ESP\_ERR\_IMAGE\_INVALID: App partition doesn't contain a valid app image.
- ESP\_FAIL: An allocation error occurred.

**Parameters**

- [in] `partition`: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- [out] `sha_256`: Returned SHA-256 digest for a given partition.

```
bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t
                                 *partition_2)
```

Check for the identity of two partitions by SHA-256 digest.

**Return**

- True: In case of the two firmware is equal.
- False: Otherwise

**Parameters**

- [in] `partition_1`: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).

- [in] `partition_2`: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

```
esp_err_t esp_partition_register_external (esp_flash_t *flash_chip, size_t offset, size_t
size, const char *label, esp_partition_type_t
type, esp_partition_subtype_t subtype, const
esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp\_flash\_t* structure) as partitions. This allows using them with components which access SPI flash through the `esp_partition` API.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL is enabled
- ESP\_ERR\_NO\_MEM if memory allocation has failed
- ESP\_ERR\_INVALID\_ARG if the new partition overlaps another partition on the same flash chip
- ESP\_ERR\_INVALID\_SIZE if the partition doesn't fit into the flash chip size

#### Parameters

- `flash_chip`: Pointer to the structure identifying the flash chip
- `offset`: Address in bytes, where the partition starts
- `size`: Size of the partition in bytes
- `label`: Partition name
- `type`: One of the partition types (ESP\_PARTITION\_TYPE\_\*), or an integer. Note that applications can not be booted from external flash chips, so using ESP\_PARTITION\_TYPE\_APP is not supported.
- `subtype`: One of the partition subtypes (ESP\_PARTITION\_SUBTYPE\_\*), or an integer.
- [out] `out_partition`: Output, if non-NULL, receives the pointer to the resulting *esp\_partition\_t* structure

```
esp_err_t esp_partition_deregister_external (const esp_partition_t *partition)
```

Deregister the partition previously registered using `esp_partition_register_external`.

#### Return

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition pointer is not found
- ESP\_ERR\_INVALID\_ARG if the partition comes from the partition table
- ESP\_ERR\_INVALID\_ARG if the partition was not registered using `esp_partition_register_external` function.

#### Parameters

- `partition`: pointer to the partition structure obtained from `esp_partition_register_external`,

### Structures

```
struct esp_partition_t
partition information structure
```

This is not the format in flash, that format is `esp_partition_info_t`.

However, this is the format used by this API.

### Public Members

```
esp_flash_t *flash_chip
SPI flash chip on which the partition resides
```

```
esp_partition_type_t type
partition type (app/data)
```

```
esp_partition_subtype_t subtype
partition subtype
```

`uint32_t` **address**  
starting address of the partition in flash

`uint32_t` **size**  
size of the partition, in bytes

char **label**[17]  
partition label, zero-terminated ASCII string

bool **encrypted**  
flag is set to true if partition is encrypted

### Macros

**ESP\_PARTITION\_SUBTYPE\_OTA** (i)  
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

### Type Definitions

**typedef struct** `esp_partition_iterator_opaque_*` **esp\_partition\_iterator\_t**  
Opaque partition iterator type.

### Enumerations

**enum** `esp_partition_type_t`  
Partition type.

**Note** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

*Values:*

**ESP\_PARTITION\_TYPE\_APP** = 0x00  
Application partition type.

**ESP\_PARTITION\_TYPE\_DATA** = 0x01  
Data partition type.

**enum** `esp_partition_subtype_t`  
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

**Note** These ESP-IDF-defined partition subtypes apply to partitions of type `ESP_PARTITION_TYPE_APP` and `ESP_PARTITION_TYPE_DATA`.

*Values:*

**ESP\_PARTITION\_SUBTYPE\_APP\_FACTORY** = 0x00  
Factory application partition.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN** = 0x10  
Base for OTA partition subtypes.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_0** = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 0  
OTA partition 0.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_1** = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 1  
OTA partition 1.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_2** = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 2  
OTA partition 2.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_3** = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 3  
OTA partition 3.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_4** = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 4  
OTA partition 4.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_5** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 5  
OTA partition 5.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_6** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 6  
OTA partition 6.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_7** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 7  
OTA partition 7.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_8** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 8  
OTA partition 8.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_9** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 9  
OTA partition 9.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_10** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 10  
OTA partition 10.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 11  
OTA partition 11.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 12  
OTA partition 12.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 13  
OTA partition 13.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 14  
OTA partition 14.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 15  
OTA partition 15.

**ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX** = *ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN* + 16  
Max subtype of OTA partition.

**ESP\_PARTITION\_SUBTYPE\_APP\_TEST** = 0x20  
Test application partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_OTA** = 0x00  
OTA selection partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_PHY** = 0x01  
PHY init data partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_NVS** = 0x02  
NVS partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP** = 0x03  
COREDUMP partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS** = 0x04  
Partition for NVS keys.

**ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM** = 0x05  
Partition for emulate eFuse bits.

**ESP\_PARTITION\_SUBTYPE\_DATA\_UNDEFINED** = 0x06  
Undefined (or unspecified) data partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD** = 0x80  
ESPHTTPD partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_FAT** = 0x81  
FAT partition.

**ESP\_PARTITION\_SUBTYPE\_DATA\_SPIFFS** = 0x82  
SPIFFS partition.

**ESP\_PARTITION\_SUBTYPE\_ANY** = 0xff

Used to search for partitions with any subtype.

## API Reference - Flash Encrypt

### Header File

- [bootloader\\_support/include/esp\\_flash\\_encrypt.h](#)

### Functions

**static bool esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Return** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t *src\_addr*, size\_t *data\_length*)

Encrypt-in-place a block of flash sectors.

**Note** This function resets RTC\_WDT between operations with sectors.

**Return** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

#### Parameters

- *src\_addr*: Source offset in flash. Should be multiple of 4096 bytes.
- *data\_length*: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call `esp_efuse_disable_rom_download_mode()` before calling this function.

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

#### Return

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

**Note** This function is called automatically during app startup, it doesn't need to be called from the app.

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

### Enumerations

enum **esp\_flash\_enc\_mode\_t**

*Values:*

**ESP\_FLASH\_ENC\_MODE\_DISABLED**

**ESP\_FLASH\_ENC\_MODE\_DEVELOPMENT**

**ESP\_FLASH\_ENC\_MODE\_RELEASE**

## 2.6.7 SPIFFS Filesystem

### Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

### Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.

### Tools

**spiffsgen.py** `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image\_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base\_dir**: directory for which the SPIFFS image needs to be created.
- **output\_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...  
SPIFFS_IMAGE_DEPENDS := ...  
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_  
↪dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the *image\_size* is required for the standalone invocation, only the *partition* name is required when using `spiffs_create_partition_image` –the image size is automatically obtained from the project’s partition table.

Due to the differences in structure between Make and CMake, it is important to note that: - for Make `spiffs_create_partition_image` must be called from the project Makefile - for CMake `spiffs_create_partition_image` must be called from one of the component CMakeLists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` or `make flash` by specifying `FLASH_IN_PROJECT`. For example,

in Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image, <partition>, <base_dir>))
```

in CMake:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image.

in Make:

```
dep:
    ...

SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image, <partition>, <base_dir>))
```

in CMake:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

+For an example, see [storage/spiffsgen](#).

**mkspiffs** Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size:** 4096 (standard for SPI Flash)
- **Page Size:** 256 (standard for SPI Flash)
- **Image Size:** Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset:** Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-C3 at offset 0x110000, run:

```
python esptool.py --chip esp32c3 --port [port] --baud [baud] write_flash -z_
↪0x110000 spiffs.bin
```

**Notes on which SPIFFS tool to use** The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases: 1. If you want to simply generate a SPIFFS image during the build, `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself. 2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases: 1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`. 2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mk-spiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

### See also

- [Partition Table documentation](#)

### Application Example

An example of using SPIFFS is provided in the [storage/spiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

### High-level API Reference

#### Header File

- [spiffs/include/esp\\_spiffs.h](#)

#### Functions

`esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)`

Register and mount SPIFFS to VFS with given path prefix.

##### Return

- ESP\_OK if success
- ESP\_ERR\_NO\_MEM if objects could not be allocated
- ESP\_ERR\_INVALID\_STATE if already mounted or partition is encrypted
- ESP\_ERR\_NOT\_FOUND if partition for SPIFFS was not found
- ESP\_FAIL if mount or format fails

##### Parameters

- `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

`esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)`

Unregister and unmount SPIFFS from VFS

##### Return

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE already unregistered

##### Parameters

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

bool `esp_spiffs_mounted(const char *partition_label)`

Check if SPIFFS is mounted

##### Return

- true if mounted
- false if not mounted

##### Parameters

- `partition_label`: Optional, label of the partition to check. If not specified, first partition with `subtype=spiffs` is used.

*esp\_err\_t* **esp\_spiffs\_format** (**const** char \**partition\_label*)

Format the SPIFFS partition

**Return**

- `ESP_OK` if successful
- `ESP_FAIL` on error

**Parameters**

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`.

*esp\_err\_t* **esp\_spiffs\_info** (**const** char \**partition\_label*, **size\_t** \**total\_bytes*, **size\_t** \**used\_bytes*)

Get information for SPIFFS

**Return**

- `ESP_OK` if success
- `ESP_ERR_INVALID_STATE` if not mounted

**Parameters**

- `partition_label`: Same label as passed to `esp_vfs_spiffs_register`
- [out] `total_bytes`: Size of the file system
- [out] `used_bytes`: Current used bytes in the file system

## Structures

**struct esp\_vfs\_spiffs\_conf\_t**

Configuration structure for `esp_vfs_spiffs_register`.

### Public Members

**const** char \***base\_path**

File path prefix associated with the filesystem.

**const** char \***partition\_label**

Optional, label of SPIFFS partition to use. If set to `NULL`, first partition with `subtype=spiffs` will be used.

**size\_t** **max\_files**

Maximum files that could be open at the same time.

**bool** **format\_if\_mount\_failed**

If true, it will format the file system if it fails to mount.

## 2.6.8 Virtual filesystem component

### Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as `fopen` and `fprintf`, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. The VFS component will then call the function `open` of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

## FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**Synchronous input/output multiplexing** Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return

- only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.
  6. The `select()` call ends and returns the appropriate results.

**Non-socket VFS drivers** If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:  
    .start_select = &uart_start_select,  
    .end_select = &uart_end_select,  
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

---

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case.

---

Please refer to the reference implementation for the UART peripheral in [vfs/vfs\\_uart.c](#) and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

**Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:**

- [peripherals/uart/uart\\_select](#)
- [system/select](#)

**Socket VFS drivers** A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:  
    .socket_select = &lwip_select,  
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,  
    .stop_socket_select = &lwip_stop_socket_select,  
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,  
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32/vfs\\_lwip.c](#) for a reference socket driver implementation using LWIP.

---

**Note:** If you use `select()` for socket file descriptors only then you can enable the `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` option to reduce the code size and improve performance.

---

---

**Note:** Don't change the socket driver during an active `select()` call or you might experience some undefined behavior.

---

## Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html` does not exist in FS 2, FS 1 will *not* be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/./log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

## File descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `newlib's sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

## Standard IO streams (stdin, stdout, stderr)

If the `menuconfig` option `UART` for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use `UART0` or `UART1` for standard IO. By default, `UART0` is used with 115200 baud rate; TX pin is `GPIO1`; RX pin is `GPIO3`. These parameters can be changed in `menuconfig`.

Writing to `stdout` or `stderr` will send characters to the UART transmit FIFO. Reading from `stdin` will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF ( ' \n ' ) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via `menuconfig`, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

**Standard streams and FreeRTOS tasks** FILE objects for `stdin`, `stdout`, and `stderr` are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in `newlib libc`. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `stdin`, `stdout`, and `stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default `stdin`, `stdout`, or `stderr` using `fclose` will close the FILE stream object, which will affect all other tasks.
- To change the default `stdin`, `stdout`, `stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin(_stdout, _stderr)` before creating the task.

## API Reference

### Header File

### Functions

`ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)`

These functions are to be used in `newlib` syscall table. They will be called by `newlib` when it needs to use any of the syscalls.

`off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)`

`ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)`

`int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)`

`int esp_vfs_close (struct _reent *r, int fd)`

`int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)`

`int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)`

`int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)`

`int esp_vfs_unlink (struct _reent *r, const char *path)`

`int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)`

`int esp_vfs_utime (const char *path, const struct utimbuf *times)`

`esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)`

Register a virtual filesystem for given path prefix.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered.

**Parameters**

- `base_path`: file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP\_VFS\_PATH\_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty `base_path`, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- `vfs`: Pointer to `esp_vfs_t`, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- `ctx`: If `vfs->flags` has ESP\_VFS\_FLAG\_CONTEXT\_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

*esp\_err\_t* **esp\_vfs\_register\_fd\_range** (const *esp\_vfs\_t* \*vfs, void \*ctx, int min\_fd, int max\_fd)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors from the interval `<min_fd; max_fd)`.

This is a special-purpose function intended for registering LWIP sockets to VFS.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

**Parameters**

- `vfs`: Pointer to `esp_vfs_t`. Meaning is the same as for `esp_vfs_register()`.
- `ctx`: Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- `min_fd`: The smallest file descriptor this VFS will use.
- `max_fd`: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

*esp\_err\_t* **esp\_vfs\_register\_with\_id** (const *esp\_vfs\_t* \*vfs, void \*ctx, *esp\_vfs\_id\_t* \*vfs\_id)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors. In comparison with `esp_vfs_register_fd_range`, this function doesn't pre-register an interval of file descriptors. File descriptors can be registered later, by using `esp_vfs_register_fd`.

**Return** ESP\_OK if successful, ESP\_ERR\_NO\_MEM if too many VFSes are registered, ESP\_ERR\_INVALID\_ARG if the file descriptor boundaries are incorrect.

**Parameters**

- `vfs`: Pointer to `esp_vfs_t`. Meaning is the same as for `esp_vfs_register()`.
- `ctx`: Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- `vfs_id`: Here will be written the VFS ID which can be passed to `esp_vfs_register_fd` for registering file descriptors.

*esp\_err\_t* **esp\_vfs\_unregister** (const char \*base\_path)

Unregister a virtual filesystem for given path prefix

**Return** ESP\_OK if successful, ESP\_ERR\_INVALID\_STATE if VFS for given prefix hasn't been registered

**Parameters**

- `base_path`: file prefix previously used in `esp_vfs_register` call

*esp\_err\_t* **esp\_vfs\_register\_fd** (*esp\_vfs\_id\_t* vfs\_id, int \*fd)

Special function for registering another file descriptor for a VFS registered by `esp_vfs_register_with_id`.

**Return** ESP\_OK if the registration is successful, ESP\_ERR\_NO\_MEM if too many file descriptors are registered, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

**Parameters**

- `vfs_id`: VFS identifier returned by `esp_vfs_register_with_id`.
- `fd`: The registered file descriptor will be written to this address.

*esp\_err\_t* **esp\_vfs\_unregister\_fd** (*esp\_vfs\_id\_t* vfs\_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

**Return** ESP\_OK if the registration is successful, ESP\_ERR\_INVALID\_ARG if the arguments are incorrect.

**Parameters**

- `vfs_id`: VFS identifier returned by `esp_vfs_register_with_id`.
- `fd`: File descriptor which should be unregistered.

int **esp\_vfs\_select** (int *nfds*, fd\_set \**readfds*, fd\_set \**writefds*, fd\_set \**errorfds*, struct timeval \**timeout*)

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

**Return** The number of descriptors set in the descriptor sets, or -1 when an error (specified by *errno*) have occurred.

**Parameters**

- *nfds*: Specifies the range of descriptors which should be checked. The first *nfds* descriptors will be checked in each set.
- *readfds*: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- *writefds*: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- *errorfds*: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- *timeout*: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

void **esp\_vfs\_select\_triggered** (*esp\_vfs\_select\_sem\_t sem*)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to *start\_select*.

**Parameters**

- *sem*: semaphore structure which was passed to the driver by the *start\_select* call

void **esp\_vfs\_select\_triggered\_isr** (*esp\_vfs\_select\_sem\_t sem*, BaseType\_t \**woken*)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to *start\_select*.

**Parameters**

- *sem*: semaphore structure which was passed to the driver by the *start\_select* call
- *woken*: is set to *pdTRUE* if the function wakes up a task with higher priority

ssize\_t **esp\_vfs\_pread** (int *fd*, void \**dst*, size\_t *size*, off\_t *offset*)

Implements the VFS layer of POSIX *pread*()

**Return** A positive return value indicates the number of bytes read. -1 is return on failure and *errno* is set accordingly.

**Parameters**

- *fd*: File descriptor used for read
- *dst*: Pointer to the buffer where the output will be written
- *size*: Number of bytes to be read
- *offset*: Starting offset of the read

ssize\_t **esp\_vfs\_pwrite** (int *fd*, const void \**src*, size\_t *size*, off\_t *offset*)

Implements the VFS layer of POSIX *pwrite*()

**Return** A positive return value indicates the number of bytes written. -1 is return on failure and *errno* is set accordingly.

**Parameters**

- *fd*: File descriptor used for write
- *src*: Pointer to the buffer from where the output will be read
- *size*: Number of bytes to write
- *offset*: Starting offset of the write

## Structures

**struct esp\_vfs\_select\_sem\_t**

VFS semaphore type for select()

### Public Members

bool **is\_sem\_local**

type of “sem” is SemaphoreHandle\_t when true, defined by socket driver otherwise

void \***sem**

semaphore instance

**struct esp\_vfs\_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to NULL.

### Public Members

int **flags**

`ESP_VFS_FLAG_CONTEXT_PTR` or `ESP_VFS_FLAG_DEFAULT`

ssize\_t (\***write\_p**) (void \*p, int fd, const void \*data, size\_t size)

Write with context pointer

ssize\_t (\***write**) (int fd, const void \*data, size\_t size)

Write without context pointer

off\_t (\***lseek\_p**) (void \*p, int fd, off\_t size, int mode)

Seek with context pointer

off\_t (\***lseek**) (int fd, off\_t size, int mode)

Seek without context pointer

ssize\_t (\***read\_p**) (void \*ctx, int fd, void \*dst, size\_t size)

Read with context pointer

ssize\_t (\***read**) (int fd, void \*dst, size\_t size)

Read without context pointer

ssize\_t (\***pread\_p**) (void \*ctx, int fd, void \*dst, size\_t size, off\_t offset)

pread with context pointer

ssize\_t (\***pread**) (int fd, void \*dst, size\_t size, off\_t offset)

pread without context pointer

ssize\_t (\***pwrite\_p**) (void \*ctx, int fd, const void \*src, size\_t size, off\_t offset)

pwrite with context pointer

ssize\_t (\***pwrite**) (int fd, const void \*src, size\_t size, off\_t offset)

pwrite without context pointer

int (\***open\_p**) (void \*ctx, const char \*path, int flags, int mode)

open with context pointer

`int (*open) (const char *path, int flags, int mode)`  
open without context pointer

`int (*close_p) (void *ctx, int fd)`  
close with context pointer

`int (*close) (int fd)`  
close without context pointer

`int (*fstat_p) (void *ctx, int fd, struct stat *st)`  
fstat with context pointer

`int (*fstat) (int fd, struct stat *st)`  
fstat without context pointer

`int (*stat_p) (void *ctx, const char *path, struct stat *st)`  
stat with context pointer

`int (*stat) (const char *path, struct stat *st)`  
stat without context pointer

`int (*link_p) (void *ctx, const char *n1, const char *n2)`  
link with context pointer

`int (*link) (const char *n1, const char *n2)`  
link without context pointer

`int (*unlink_p) (void *ctx, const char *path)`  
unlink with context pointer

`int (*unlink) (const char *path)`  
unlink without context pointer

`int (*rename_p) (void *ctx, const char *src, const char *dst)`  
rename with context pointer

`int (*rename) (const char *src, const char *dst)`  
rename without context pointer

`DIR *(*opendir_p) (void *ctx, const char *name)`  
opendir with context pointer

`DIR *(*opendir) (const char *name)`  
opendir without context pointer

`struct dirent *(*readdir_p) (void *ctx, DIR *pdir)`  
readdir with context pointer

`struct dirent *(*readdir) (DIR *pdir)`  
readdir without context pointer

`int (*readdir_r_p) (void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)`  
readdir\_r with context pointer

`int (*readdir_r) (DIR *pdir, struct dirent *entry, struct dirent **out_dirent)`  
readdir\_r without context pointer

`long (*telldir_p) (void *ctx, DIR *pdir)`  
telldir with context pointer

`long (*telldir) (DIR *pdir)`  
telldir without context pointer

`void (*seekdir_p) (void *ctx, DIR *pdir, long offset)`  
seekdir with context pointer

`void (*seekdir) (DIR *pdir, long offset)`  
seekdir without context pointer

`int (*closedir_p) (void *ctx, DIR *pdir)`  
closedir with context pointer

`int (*closedir) (DIR *pdir)`  
closedir without context pointer

`int (*mkdir_p) (void *ctx, const char *name, mode_t mode)`  
mkdir with context pointer

`int (*mkdir) (const char *name, mode_t mode)`  
mkdir without context pointer

`int (*rmdir_p) (void *ctx, const char *name)`  
rmdir with context pointer

`int (*rmdir) (const char *name)`  
rmdir without context pointer

`int (*fcntl_p) (void *ctx, int fd, int cmd, int arg)`  
fcntl with context pointer

`int (*fcntl) (int fd, int cmd, int arg)`  
fcntl without context pointer

`int (*ioctl_p) (void *ctx, int fd, int cmd, va_list args)`  
ioctl with context pointer

`int (*ioctl) (int fd, int cmd, va_list args)`  
ioctl without context pointer

`int (*fsync_p) (void *ctx, int fd)`  
fsync with context pointer

`int (*fsync) (int fd)`  
fsync without context pointer

`int (*access_p) (void *ctx, const char *path, int amode)`  
access with context pointer

`int (*access) (const char *path, int amode)`  
access without context pointer

`int (*truncate_p) (void *ctx, const char *path, off_t length)`  
truncate with context pointer

`int (*truncate) (const char *path, off_t length)`  
truncate without context pointer

`int (*utime_p) (void *ctx, const char *path, const struct utimbuf *times)`  
utime with context pointer

`int (*utime) (const char *path, const struct utimbuf *times)`  
utime without context pointer

`int (*tcsetattr_p) (void *ctx, int fd, int optional_actions, const struct termios *p)`  
tcsetattr with context pointer

`int (*tcsetattr) (int fd, int optional_actions, const struct termios *p)`  
tcsetattr without context pointer

`int (*tcgetattr_p) (void *ctx, int fd, struct termios *p)`  
tcgetattr with context pointer

`int (*tcgetattr) (int fd, struct termios *p)`  
tcgetattr without context pointer

`int (*tcdrain_p) (void *ctx, int fd)`  
tcdrain with context pointer

`int (*tcdrain) (int fd)`  
tcdrain without context pointer

`int (*tcflush_p) (void *ctx, int fd, int select)`  
tcflush with context pointer

`int (*tcflush) (int fd, int select)`  
tcflush without context pointer

`int (*tcflow_p) (void *ctx, int fd, int action)`  
tcflow with context pointer

`int (*tcflow) (int fd, int action)`  
tcflow without context pointer

`pid_t (*tcgetsid_p) (void *ctx, int fd)`  
tcgetsid with context pointer

`pid_t (*tcgetsid) (int fd)`  
tcgetsid without context pointer

`int (*tcsendbreak_p) (void *ctx, int fd, int duration)`  
tcsendbreak with context pointer

`int (*tcsendbreak) (int fd, int duration)`  
tcsendbreak without context pointer

`esp_err_t (*start_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)`  
start\_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

`int (*socket_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)`  
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

`void (*stop_socket_select) (void *sem)`  
called by VFS to interrupt the socket\_select call when select is activated from a non-socket VFS driver; set only for the socket driver

`void (*stop_socket_select_isr) (void *sem, BaseType_t *woken)`  
stop\_socket\_select which can be called from ISR; set only for the socket driver

`void (*get_socket_select_semaphore) (void)`  
end\_select is called to stop the I/O multiplexing and deinitialize the environment created by start\_select for the given VFS

`esp_err_t (*end_select) (void *end_select_args)`  
get\_socket\_select\_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

## Macros

### **MAX\_FDS**

Maximum number of (global) file descriptors.

### **ESP\_VFS\_PATH\_MAX**

Maximum length of path prefix (not including zero terminator)

### **ESP\_VFS\_FLAG\_DEFAULT**

Default value of flags member in *esp\_vfs\_t* structure.

### **ESP\_VFS\_FLAG\_CONTEXT\_PTR**

Flag which indicates that FS needs extra context pointer in syscalls.

## Type Definitions

```
typedef int esp_vfs_id_t
```

## Header File

- `vfs/include/esp_vfs_dev.h`

## Functions

void **esp\_vfs\_dev\_uart\_register** (void)  
add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void **esp\_vfs\_dev\_uart\_set\_rx\_line\_endings** (esp\_line\_endings\_t *mode*)  
Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ( ‘ ’ , LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

**Note** this function is not thread safe w.r.t. reading from UART

### Parameters

- *mode*: line endings expected on UART

void **esp\_vfs\_dev\_uart\_set\_tx\_line\_endings** (esp\_line\_endings\_t *mode*)  
Set the line endings to sent to UART.

This specifies the conversion between newlines ( ‘ ’ , LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

**Note** this function is not thread safe w.r.t. writing to UART

### Parameters

- *mode*: line endings to send to UART

int **esp\_vfs\_dev\_uart\_port\_set\_rx\_line\_endings** (int *uart\_num*, esp\_line\_endings\_t *mode*)  
Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ( ‘ ’ , LF) passed into stdin:

- `ESP_LINE_ENDINGS_CRLF`: convert CRLF to LF
- `ESP_LINE_ENDINGS_CR`: convert CR to LF
- `ESP_LINE_ENDINGS_LF`: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Return** 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

### Parameters

- *uart\_num*: the UART number
- *mode*: line endings to send to UART

int **esp\_vfs\_dev\_uart\_port\_set\_tx\_line\_endings** (int *uart\_num*, esp\_line\_endings\_t *mode*)  
Set the line endings to sent to specified UART.

This specifies the conversion between newlines ( ‘ ’ , LF) on stdout and line endings sent over UART:

- `ESP_LINE_ENDINGS_CRLF`: convert LF to CRLF
- `ESP_LINE_ENDINGS_CR`: convert LF to CR
- `ESP_LINE_ENDINGS_LF`: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Return** 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

**Parameters**

- `uart_num`: the UART number
- `mode`: line endings to send to UART

void **esp\_vfs\_dev\_uart\_use\_nonblocking** (int `uart_num`)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- `uart_num`: UART peripheral number

void **esp\_vfs\_dev\_uart\_use\_driver** (int `uart_num`)

set VFS to use UART driver for reading and writing

**Note** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

**Parameters**

- `uart_num`: UART peripheral number

void **esp\_vfs\_usb\_serial\_jtag\_use\_driver** (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void **esp\_vfs\_usb\_serial\_jtag\_use\_nonblocking** (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

## 2.6.9 Wear Levelling API

### Overview

Most of flash memory and especially SPI flash that is used in ESP32-C3 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in *FAT filesystem*.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

### Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

## Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

## See also

- [FAT Filesystem](#)
- [Partition Table documentation](#)

## Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the [storage/wear\\_levelling](#) directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the [storage/wear\\_levelling/README.md](#) file for more information.

## High level API Reference

### Header Files

- [fatfs/vfs/esp\\_vfs\\_fat.h](#)

### Functions

`esp_err_t esp_vfs_fat_spiflash_mount` (`const` char \**base\_path*, `const` char \**partition\_label*,  
`const` [esp\\_vfs\\_fat\\_mount\\_config\\_t](#) \**mount\_config*,  
[wl\\_handle\\_t](#) \**wl\_handle*)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined `partition_label`. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact.

### Return

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if the partition table does not contain FATFS partition with given label
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

### Parameters

- `base_path`: path where FATFS partition should be mounted (e.g. “/spiflash” )
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS

- [out] `wl_handle`: wear levelling driver handle

**struct esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

### Public Members

bool **format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max\_files**

Max number of open files.

size\_t **allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and  $128 * \text{sector size}$ . For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_unmount** (`const char *base_path`, *wl\_handle\_t* `wl_handle`)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount`.

### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount` hasn't been called

### Parameters

- `base_path`: path where partition should be registered (e.g. `"/spiflash"`)
- `wl_handle`: wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount`

## Mid level API Reference

### Header File

- [wear\\_levelling/include/wear\\_levelling.h](#)

### Functions

*esp\_err\_t* **wl\_mount** (`const esp_partition_t *partition`, *wl\_handle\_t* `*out_handle`)

Mount WL for defined partition.

### Return

- `ESP_OK`, if the allocation was successfully;
- `ESP_ERR_INVALID_ARG`, if WL allocation was unsuccessful;
- `ESP_ERR_NO_MEM`, if there was no memory to allocate WL components;

### Parameters

- `partition`: that will be used for access
- `out_handle`: handle of the WL instance

*esp\_err\_t* **wl\_unmount** (*wl\_handle\_t* `handle`)

Unmount WL for defined partition.

### Return

- `ESP_OK`, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

### Parameters

- `handle`: WL partition handle

*esp\_err\_t* **wl\_erase\_range** (*wl\_handle\_t* `handle`, `size_t start_addr`, `size_t size`)

Erase part of the WL storage.

**Return**

- ESP\_OK, if the range was erased successfully;
- ESP\_ERR\_INVALID\_ARG, if iterator or dst are NULL;
- ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- *handle*: WL handle that are related to the partition
- *start\_addr*: Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- *size*: Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(...)`.

*esp\_err\_t* **wl\_write** (*wl\_handle\_t* *handle*, *size\_t* *dest\_addr*, **const** void \**src*, *size\_t* *size*)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

**Note** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

**Return**

- ESP\_OK, if data was written successfully;
- ESP\_ERR\_INVALID\_ARG, if *dst\_offset* exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- *handle*: WL handle that are related to the partition
- *dest\_addr*: Address where the data should be written, relative to the beginning of the partition.
- *src*: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- *size*: Size of data to be written, in bytes.

*esp\_err\_t* **wl\_read** (*wl\_handle\_t* *handle*, *size\_t* *src\_addr*, void \**dest*, *size\_t* *size*)

Read data from the WL storage.

**Return**

- ESP\_OK, if data was read successfully;
- ESP\_ERR\_INVALID\_ARG, if *src\_offset* exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- *handle*: WL module instance that was initialized before
- *dest*: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- *src\_addr*: Address of the data to be read, relative to the beginning of the partition.
- *size*: Size of data to be read, in bytes.

*size\_t* **wl\_size** (*wl\_handle\_t* *handle*)

Get size of the WL storage.

**Return** usable size, in bytes

**Parameters**

- *handle*: WL module handle that was initialized before

*size\_t* **wl\_sector\_size** (*wl\_handle\_t* *handle*)

Get sector size of the WL instance.

**Return** sector size, in bytes

**Parameters**

- *handle*: WL module handle that was initialized before

**Macros**

**WL\_INVALID\_HANDLE**

**Type Definitions**

```
typedef int32_t w1_handle_t
    wear levelling handle
```

Code examples for this API section are provided in the [storage](#) directory of ESP-IDF examples.

## 2.7 System API

### 2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-C3's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
  - offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.
  - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
  - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
  - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32c3 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: len 0x00000 load 0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
Segment 3: len 0x00000 load 0x3ff80000 file_offs 0x00013d08 SOC_RTC_DRAM
Segment 4: len 0x028e0 load 0x3ffb0000 file_offs 0x00013d10 DRAM

↵0) load

```

For more details on the type of memory segments and their address ranges, see *ESP32-C3 Technical Reference Manual > System and Memory > Internal Memory* [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.
4. If the `hash_appended` field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.
5. If the options `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
  - version word (4 bytes),
  - signature data (64 bytes).

### Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `secure_version` - see *Anti-rollback*.
- `version` - see *App version*. \*
- `project_name` is filled from `PROJECT_NAME`. \*
- `time and date` - compile time and date.
- `idf_ver` - version of ESP-IDF. \*
- `app_elf_sha256` - contains sha256 for the elf application file.

\* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

### Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↪app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

## API Reference

### Header File

- [bootloader\\_support/include/esp\\_app\\_format.h](#)

### Structures

**struct esp\_image\_header\_t**

Main header of binary image.

#### Public Members

**uint8\_t magic**

Magic word `ESP_IMAGE_HEADER_MAGIC`

**uint8\_t segment\_count**

Count of memory segments

**uint8\_t spi\_mode**

flash read mode (`esp_image_spi_mode_t` as `uint8_t`)

**uint8\_t spi\_speed : 4**

flash frequency (`esp_image_spi_freq_t` as `uint8_t`)

**uint8\_t spi\_size : 4**

flash chip size (`esp_image_flash_size_t` as `uint8_t`)

**uint32\_t entry\_addr**

Entry address

**uint8\_t wp\_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to `0xEE=disabled`)

**uint8\_t spi\_pin\_drv[3]**

Drive settings for the SPI flash pins (read by ROM bootloader)

**esp\_chip\_id\_t chip\_id**

Chip identification number

**uint8\_t min\_chip\_rev**

Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use `min_chip_rev_full` instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

**uint16\_t min\_chip\_rev\_full**

Minimal chip revision supported by image, in format: `major * 100 + minor`

`uint16_t max_chip_rev_full`

Maximal chip revision supported by image, in format: major \* 100 + minor

`uint8_t reserved[4]`

Reserved bytes in additional header space, currently unused

`uint8_t hash_appended`

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

**struct esp\_image\_segment\_header\_t**

Header of binary image segment.

### Public Members

`uint32_t load_addr`

Address of segment

`uint32_t data_len`

Length of data

**struct esp\_app\_desc\_t**

Description about application.

### Public Members

`uint32_t magic_word`

Magic word ESP\_APP\_DESC\_MAGIC\_WORD

`uint32_t secure_version`

Secure version

`uint32_t reserv1[2]`

reserv1

`char version[32]`

Application version

`char project_name[32]`

Project name

`char time[16]`

Compile time

`char date[16]`

Compile date

`char idf_ver[32]`

Version IDF

`uint8_t app_elf_sha256[32]`

sha256 of elf file

`uint32_t reserv2[20]`

reserv2

### Macros

**ESP\_IMAGE\_HEADER\_MAGIC**

The magic word for the *esp\_image\_header\_t* structure.

**ESP\_IMAGE\_MAX\_SEGMENTS**

Max count of segments in the image.

**ESP\_APP\_DESC\_MAGIC\_WORD**

The magic word for the `esp_app_desc` structure that is in DROM.

**Enumerations****enum esp\_chip\_id\_t**

ESP chip ID.

*Values:*

**ESP\_CHIP\_ID\_ESP32** = 0x0000

chip ID: ESP32

**ESP\_CHIP\_ID\_ESP32S2** = 0x0002

chip ID: ESP32-S2

**ESP\_CHIP\_ID\_ESP32S3** = 0x0004

chip ID: ESP32-S3

**ESP\_CHIP\_ID\_ESP32C3** = 0x0005

chip ID: ESP32-C3

**ESP\_CHIP\_ID\_INVALID** = 0xFFFF

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

**enum esp\_image\_spi\_mode\_t**

SPI flash mode, used in [esp\\_image\\_header\\_t](#).

*Values:*

**ESP\_IMAGE\_SPI\_MODE\_QIO**

SPI mode QIO

**ESP\_IMAGE\_SPI\_MODE\_QOUT**

SPI mode QOUT

**ESP\_IMAGE\_SPI\_MODE\_DIO**

SPI mode DIO

**ESP\_IMAGE\_SPI\_MODE\_DOUT**

SPI mode DOUT

**ESP\_IMAGE\_SPI\_MODE\_FAST\_READ**

SPI mode FAST\_READ

**ESP\_IMAGE\_SPI\_MODE\_SLOW\_READ**

SPI mode SLOW\_READ

**enum esp\_image\_spi\_freq\_t**

SPI flash clock frequency.

*Values:*

**ESP\_IMAGE\_SPI\_SPEED\_40M**

SPI clock frequency 40 MHz

**ESP\_IMAGE\_SPI\_SPEED\_26M**

SPI clock frequency 26 MHz

**ESP\_IMAGE\_SPI\_SPEED\_20M**

SPI clock frequency 20 MHz

**ESP\_IMAGE\_SPI\_SPEED\_80M** = 0xF

SPI clock frequency 80 MHz

**enum esp\_image\_flash\_size\_t**

Supported SPI flash sizes.

*Values:*

**ESP\_IMAGE\_FLASH\_SIZE\_1MB** = 0  
SPI flash size 1 MB

**ESP\_IMAGE\_FLASH\_SIZE\_2MB**  
SPI flash size 2 MB

**ESP\_IMAGE\_FLASH\_SIZE\_4MB**  
SPI flash size 4 MB

**ESP\_IMAGE\_FLASH\_SIZE\_8MB**  
SPI flash size 8 MB

**ESP\_IMAGE\_FLASH\_SIZE\_16MB**  
SPI flash size 16 MB

**ESP\_IMAGE\_FLASH\_SIZE\_MAX**  
SPI flash size MAX

## 2.7.2 Application Level Tracing

### Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32-C3 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behaviour analysis, see [System Behavior Analysis with SEGGER SystemView](#)

### API Reference

#### Header File

- [app\\_trace/include/esp\\_app\\_trace.h](#)

#### Functions

`esp_err_t esp_apptrace_init` (void)  
Initializes application tracing module.

**Note** Should be called before any `esp_apptrace_xxx` call.

**Return** ESP\_OK on success, otherwise see `esp_err_t`

void `esp_apptrace_down_buffer_config` (uint8\_t \*buf, uint32\_t size)  
Configures down buffer.

**Note** Needs to be called before initiating any data transfer using `esp_apptrace_buffer_get` and `esp_apptrace_write`. This function does not protect internal data by lock.

#### Parameters

- `buf`: Address of buffer to use for down channel (host to target) data.
- `size`: Size of the buffer.

uint8\_t \*`esp_apptrace_buffer_get` ([esp\\_apptrace\\_dest\\_t dest](#), uint32\_t size, uint32\_t tmo)

Allocates buffer for trace data. After data in buffer are ready to be sent off `esp_apptrace_buffer_put` must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

#### Parameters

- `dest`: Indicates HW interface to send data.
- `size`: Size of data to write to trace buffer.

- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_appttrace_buffer_put (esp_appttrace_dest_t dest, uint8_t *ptr, uint32_t tmo)`

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by `esp_appttrace_buffer_get`.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_appttrace_buffer_get`.
- `ptr`: Address of trace buffer to release. Should be the value returned by call to `esp_appttrace_buffer_get`.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_appttrace_write (esp_appttrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)`

Writes data to trace buffer.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to send data.
- `data`: Address of data to write to trace buffer.
- `size`: Size of data to write to trace buffer.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

int `esp_appttrace_vprintf_to (esp_appttrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)`

vprintf-like function to sent log messages to host via specified HW interface.

**Return** Number of bytes written.

**Parameters**

- `dest`: Indicates HW interface to send data.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- `fmt`: Address of format string.
- `ap`: List of arguments.

int `esp_appttrace_vprintf (const char *fmt, va_list ap)`

vprintf-like function to sent log messages to host.

**Return** Number of bytes written.

**Parameters**

- `fmt`: Address of format string.
- `ap`: List of arguments.

`esp_err_t esp_appttrace_flush (esp_appttrace_dest_t dest, uint32_t tmo)`

Flushes remaining data in trace buffer to host.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_appttrace_flush_nolock (esp_appttrace_dest_t dest, uint32_t min_sz, uint32_t tmo)`

Flushes remaining data in trace buffer to host without locking internal data. This is special version of `esp_appttrace_flush` which should be called from panic handler.

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to flush data on.
- `min_sz`: Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

`esp_err_t esp_appttrace_read (esp_appttrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)`

Reads host data from trace buffer.

**Return** ESP\_OK on success, otherwise see esp\_err\_t

**Parameters**

- *dest*: Indicates HW interface to read the data on.
- *data*: Address of buffer to put data from trace buffer.
- *size*: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- *tmo*: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

uint8\_t \***esp\_appttrace\_down\_buffer\_get** (*esp\_appttrace\_dest\_t dest*, uint32\_t \**size*, uint32\_t *tmo*)

Retrieves incoming data buffer if any. After data in buffer are processed esp\_appttrace\_down\_buffer\_put must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

**Parameters**

- *dest*: Indicates HW interface to receive data.
- *size*: Address to store size of available data in down buffer. Must be initialized with requested value.
- *tmo*: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

*esp\_err\_t* **esp\_appttrace\_down\_buffer\_put** (*esp\_appttrace\_dest\_t dest*, uint8\_t \**ptr*, uint32\_t *tmo*)

Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by esp\_appttrace\_down\_buffer\_get.

**Return** ESP\_OK on success, otherwise see esp\_err\_t

**Parameters**

- *dest*: Indicates HW interface to receive data. Should be identical to the same parameter in call to esp\_appttrace\_down\_buffer\_get.
- *ptr*: Address of trace buffer to release. Should be the value returned by call to esp\_appttrace\_down\_buffer\_get.
- *tmo*: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

bool **esp\_appttrace\_host\_is\_connected** (*esp\_appttrace\_dest\_t dest*)

Checks whether host is connected.

**Return** true if host is connected, otherwise false

**Parameters**

- *dest*: Indicates HW interface to use.

void \***esp\_appttrace\_fopen** (*esp\_appttrace\_dest\_t dest*, const char \**path*, const char \**mode*)

Opens file on host. This function has the same semantic as 'fopen' except for the first argument.

**Return** non zero file handle on success, otherwise 0

**Parameters**

- *dest*: Indicates HW interface to use.
- *path*: Path to file.
- *mode*: Mode string. See fopen for details.

int **esp\_appttrace\_fclose** (*esp\_appttrace\_dest\_t dest*, void \**stream*)

Closes file on host. This function has the same semantic as 'fclose' except for the first argument.

**Return** Zero on success, otherwise non-zero. See fclose for details.

**Parameters**

- *dest*: Indicates HW interface to use.
- *stream*: File handle returned by esp\_appttrace\_fopen.

size\_t **esp\_appttrace\_fwrite** (*esp\_appttrace\_dest\_t dest*, const void \**ptr*, size\_t *size*, size\_t *nmemb*, void \**stream*)

Writes to file on host. This function has the same semantic as 'fwrite' except for the first argument.

**Return** Number of written items. See fwrite for details.

**Parameters**

- *dest*: Indicates HW interface to use.
- *ptr*: Address of data to write.
- *size*: Size of an item.

- `nmemb`: Number of items to write.
- `stream`: File handle returned by `esp_appttrace_fopen`.

`size_t esp_appttrace_fread` (*esp\_appttrace\_dest\_t* `dest`, `void *ptr`, `size_t size`, `size_t nmemb`, `void *stream`)

Read file on host. This function has the same semantic as ‘`fread`’ except for the first argument.

**Return** Number of read items. See `fread` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `ptr`: Address to store read data.
- `size`: Size of an item.
- `nmemb`: Number of items to read.
- `stream`: File handle returned by `esp_appttrace_fopen`.

`int esp_appttrace_fseek` (*esp\_appttrace\_dest\_t* `dest`, `void *stream`, `long offset`, `int whence`)

Set position indicator in file on host. This function has the same semantic as ‘`fseek`’ except for the first argument.

**Return** Zero on success, otherwise non-zero. See `fseek` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_appttrace_fopen`.
- `offset`: Offset. See `fseek` for details.
- `whence`: Position in file. See `fseek` for details.

`int esp_appttrace_ftell` (*esp\_appttrace\_dest\_t* `dest`, `void *stream`)

Get current position indicator for file on host. This function has the same semantic as ‘`ftell`’ except for the first argument.

**Return** Current position in file. See `ftell` for details.

**Parameters**

- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_appttrace_fopen`.

`int esp_appttrace_fstop` (*esp\_appttrace\_dest\_t* `dest`)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Return** `ESP_OK` on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to use.

`void esp_gcov_dump` (`void`)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

## Enumerations

`enum esp_appttrace_dest_t`

Application trace data destinations bits.

*Values:*

`ESP_APPTRACE_DEST_JTAG = 1`

JTAG destination.

`ESP_APPTRACE_DEST_TRAX = ESP_APPTRACE_DEST_JTAG`

`xxx_TRAX` name is obsolete, use more common `xxx_JTAG`

`ESP_APPTRACE_DEST_UART0`

UART0 destination.

`ESP_APPTRACE_DEST_MAX = ESP_APPTRACE_DEST_UART0`

`ESP_APPTRACE_DEST_NUM`

## Header File

- [app\\_trace/include/esp\\_sysview\\_trace.h](#)

## Functions

**static** *esp\_err\_t* **esp\_sysview\_flush** (uint32\_t *tmo*)

Flushes remaining data in SystemView trace buffer to host.

**Return** ESP\_OK.

### Parameters

- *tmo*: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

int **esp\_sysview\_vprintf** (**const** char \**format*, va\_list *args*)

vprintf-like function to sent log messages to the host.

**Return** Number of bytes written.

### Parameters

- *format*: Address of format string.
- *args*: List of arguments.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_start** (uint32\_t *tmo*)

Starts SystemView heap tracing.

**Return** ESP\_OK on success, ESP\_ERR\_TIMEOUT if operation has been timed out.

### Parameters

- *tmo*: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_stop** (void)

Stops SystemView heap tracing.

**Return** ESP\_OK.

void **esp\_sysview\_heap\_trace\_alloc** (void \**addr*, uint32\_t *size*, **const** void \**callers*)

Sends heap allocation event to the host.

### Parameters

- *addr*: Address of allocated block.
- *size*: Size of allocated block.
- *callers*: Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

void **esp\_sysview\_heap\_trace\_free** (void \**addr*, **const** void \**callers*)

Sends heap de-allocation event to the host.

### Parameters

- *addr*: Address of de-allocated block.
- *callers*: Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

## 2.7.3 The Async memcpy API

### Overview

ESP32-C3 has a DMA engine which can help to offload internal memory copy operations from the CPU in an asynchronous way.

The async memcpy API wraps all DMA configurations and operations, the signature of [esp\\_async\\_memcpy\(\)](#) is almost the same to the standard libc one.

Thanks to the benefit of the DMA, we don't have to wait for each memory copy to be done before we issue another memcpy request. By the way, it's still possible to know when memcpy is finished by listening in the memcpy callback function.

## Configure and Install driver

`esp_async_memcpy_install()` is used to install the driver with user's configuration. Please note that `async_memcpy` has to be called with the handle returned from `esp_async_memcpy_install()`.

Driver configuration is described in `async_memcpy_config_t`: `backlog`: This is used to configured the maximum number of DMA operation that can be working at the background at the same time. `flags`: This is used to enable some special driver features.

`ASYNC_MEMCPY_DEFAULT_CONFIG` provides a default configuration, which specifies the backlog to 8.

```
async_memcpy_config_t config = ASYNC_MEMCPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 16;
async_memcpy_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcpy_install(&config, &driver)); // install driver,
↳return driver handle
```

## Send memory copy request

`esp_async_memcpy()` is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the `libc` version of `memcpy`, user should also pass a callback to `esp_async_memcpy()`, if it's necessary to be notified when the memory copy is done. The callback is executed in the ISR context, make sure you won't violate the restriction applied to ISR handler.

Besides that, the callback function should reside in IRAM space by applying `IRAM_ATTR` attribute. The prototype of the callback function is `async_memcpy_isr_cb_t`, please note that, the callback function should return true if it wakes up a high priority task by some API like `xSemaphoreGiveFromISR()`.

```
Semphr_Handle_t semphr; //already initialized in somewhere

// Callback implementation, running in ISR context
static IRAM_ATTR bool my_async_memcpy_cb(async_memcpy_t mcp_hdl, async_memcpy_
↳event_t *event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    SemphrGiveInISR(semphr, &high_task_wakeup); // high_task_wakeup set to pdTRUE
↳if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_
↳memcpy_cb, my_semaphore));
//Do something else here
SemphrTake(my_semaphore, ...); //wait until the buffer copy is done
```

## Uninstall driver (optional)

`esp_async_memcpy_uninstall()` is used to uninstall asynchronous `memcpy` driver. It's not necessary to uninstall the driver after each `memcpy` operation. If you know your application won't use this driver anymore, then this API can recycle the memory for you.

## API Reference

### Header File

- [esp\\_system/include/esp\\_async\\_memcpy.h](#)

### Functions

*esp\_err\_t* **esp\_async\_memcpy\_install** (**const** *async\_memcpy\_config\_t* \**config*, *async\_memcpy\_t* \**asmcp*)

Install async memcpy driver.

#### Return

- ESP\_OK: Install async memcpy driver successfully
- ESP\_ERR\_INVALID\_ARG: Install async memcpy driver failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Install async memcpy driver failed because out of memory
- ESP\_FAIL: Install async memcpy driver failed because of other error

#### Parameters

- [in] *config*: Configuration of async memcpy
- [out] *asmcp*: Handle of async memcpy that returned from this API. If driver installation is failed, *asmcp* would be assigned to NULL.

*esp\_err\_t* **esp\_async\_memcpy\_uninstall** (*async\_memcpy\_t* *asmcp*)

Uninstall async memcpy driver.

#### Return

- ESP\_OK: Uninstall async memcpy driver successfully
- ESP\_ERR\_INVALID\_ARG: Uninstall async memcpy driver failed because of invalid argument
- ESP\_FAIL: Uninstall async memcpy driver failed because of other error

#### Parameters

- [in] *asmcp*: Handle of async memcpy driver that returned from `esp_async_memcpy_install`

*esp\_err\_t* **esp\_async\_memcpy** (*async\_memcpy\_t* *asmcp*, void \**dst*, void \**src*, size\_t *n*, *async\_memcpy\_isr\_cb\_t* *cb\_isr*, void \**cb\_args*)

Send an asynchronous memory copy request.

#### Return

- ESP\_OK: Send memory copy request successfully
- ESP\_ERR\_INVALID\_ARG: Send memory copy request failed because of invalid argument
- ESP\_FAIL: Send memory copy request failed because of other error

**Note** The callback function is invoked in interrupt context, never do blocking jobs in the callback.

#### Parameters

- [in] *asmcp*: Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- [in] *dst*: Destination address (copy to)
- [in] *src*: Source address (copy from)
- [in] *n*: Number of bytes to copy
- [in] *cb\_isr*: Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- [in] *cb\_args*: User defined argument to be passed to the callback function

### Structures

**struct** **async\_memcpy\_event\_t**

Type of async memcpy event object.

#### Public Members

void \***data**

Event data

**struct** **async\_memcpy\_config\_t**

Type of async memcpy configuration.

### Public Members

`uint32_t backlog`

Maximum number of streams that can be handled simultaneously

`uint32_t flags`

Extra flags to control async memcpy feature

### Macros

`ASYNC_MEMCPY_DEFAULT_CONFIG()`

Default configuration for async memcpy.

### Type Definitions

`typedef struct async_memcpy_context_t *async_memcpy_t`

Type of async memcpy handle.

`typedef bool (*async_memcpy_isr_cb_t)(async_memcpy_t mcp_hdl, async_memcpy_event_t *event, void *cb_args)`

Type of async memcpy interrupt callback function.

**Return** Whether a high priority task is woken up by the callback function

**Note** User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

#### Parameters

- `mcp_hdl`: Handle of async memcpy
- `event`: Event object, which contains related data, reserved for future
- `cb_args`: User defined arguments, passed from `esp_async_memcpy` function

## 2.7.4 Chip Revision

### Overview

A new chip versioning logic was introduced in new chips. Chips have several eFuse version fields:

- Major wafer version (`WAFER_VERSION_MAJOR` eFuse)
- Minor wafer version (`WAFER_VERSION_MINOR` eFuse)
- Ignore maximal revision (`DISABLE_WAFER_VERSION_MAJOR` eFuse)

The new versioning logic is being introduced to distinguish changes in chips as breaking changes and non-breaking changes. Chips with non-breaking changes can run the same software as the previous chip. The previous chip means that the major version is the same.

If the newly released chip does not have breaking changes, that means it can run the same software as the previous chip, then in that chip we keep the same major version and increment the minor version by 1. Otherwise, if there is a breaking change in the newly released chip, meaning it can not run the same software as the previous chip, then in that chip we increase the major version and set the minor version to 0.

The software supports a number of revisions, from the minimum to the maximum (the min/max configs are defined in Kconfig). If the software is unaware of a new chip (when the chip version is out of range), it will refuse to run on it unless the Ignore maximum revision restrictions bit is set. This bit removes the upper revision limit.

Minimum versions limits the software to only run on a chip revision that is high enough to support some features. Maximum version is the maximum version that is well-supported by current software. When chip version is above the maximum version, software will reject to boot, because it may not work on, or work with risk on the chip.

Adding the major and minor wafer revision make the versioning logic is branchable.

---

**Note:** The previous versioning logic was based on a single eFuse version field (`WAFER_VERSION`). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

---

Using the branched versioning scheme allows us to support more chips in the software without updating the software when a new released compatible chip is used. Thus, the software will be compatible with as many new chip revisions as possible. If the software is no longer compatible with a new chip with breaking changes, the software will abort.

## Revisions

ECO	Revision (Major.Minor)
ECO1	v0.1
ECO2	v0.2
ECO3	v0.3
ECO4	v0.4

Chip Revision  $vX.Y$ , where:

- $X$  means Major wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- $Y$  means Minor wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

The  $vX.Y$  chip version format will be used further instead of the ECO number.

## Representing Revision Requirement Of A Binary Image

The 2nd stage bootloader and the application binary images have the `esp_image_header_t` header, which stores the revision numbers of the chip on which the software can be run. This header has 3 fields related to revisions:

- `min_chip_rev` - Minimal chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32C3_REV_MIN`.
- `min_chip_rev_full` - Minimal chip MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32C3_REV_MIN`.
- `max_chip_rev_full` - Maximal chip revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32C3_REV_MAX_FULL`. It can not be changed by user. Only Espressif can change it when a new version will be supported in IDF.

## Chip Revision APIs

These APIs helps to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32C3_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32C3_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

## Maximal And Minimal Revision Restrictions

The order for checking the minimum and maximum revisions:

1. The 1st stage bootloader (ROM bootloader) does not check minimal and maximal revision fields from `esp_image_header_t` before running the 2nd stage bootloader.

2. The 2nd stage bootloader checks at the initialization phase that bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximal revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Further, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

### Issues

1. If the 2nd stage bootloader is run on the chip revision < minimum revision shown in the image, a reboot occurs. The following message will be printed:

```
Image requires chip rev >= v3.0, but chip is v1.0
```

To resolve this issue:

- make sure the chip you are using is suitable for the software, or use a chip with the required minimum revision or higher.
  - update the software with `CONFIG_ESP32C3_REV_MIN` to get it <= the revision of chip being used
2. If application does not match minimal and maximal chip revisions, a reboot occurs. The following message will be printed:

```
Image requires chip rev <= v2.99, but chip is v3.0
```

To resolve this issue, update the IDF to a newer version that supports the used chip (`CONFIG_ESP32C3_REV_MAX_FULL`). Another way to fix this is to set the Ignore maximal revision bit in eFuse or use a chip that is suitable for the software.

### Backward Compatible With Bootloaders Built By Older ESP-IDF Versions

The old bootloaders (IDF < 5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version.

ESP32-C3 chip support was added in IDF 4.3. The old bootloaders can not read all bits of the wafer version eFuse, it can read only the first 3 low bits. So it means that the old bootloader can not detect chip version correctly. Chips v0.0 - v0.8 will be detected correctly, but other chip versions will be recognized as a version from this range.

Please check the chip version using `esptool chip_id` command.

### API Reference

#### Header File

- [hal/include/hal/efuse\\_hal.h](#)

#### Functions

`uint32_t efuse_hal_chip_revision` (void)

Returns chip version.

**Return** Chip version in format: Major \* 100 + Minor  
`uint32_t efuse_hal_get_major_chip_version` (void)  
Returns major chip version.

`uint32_t efuse_hal_get_minor_chip_version` (void)  
Returns minor chip version.

## 2.7.5 Console

ESP-IDF provides `console` component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

---

**Note:** These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

---

### Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

---

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data can not be used together with the line editing library. If you see `[\n` or similar escape sequence when running `system/console` example instead of a command prompt (e.g. `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and `idf_monitor.py` (which can be invoked using `idf.py monitor` from project directory).

---

Here is an overview of functions provided by `linenoise` library.

**Configuration** `Linenoise` library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

```
linenoiseClearScreen()
```

Clear terminal screen using an escape sequence and position the cursor at the top left corner.

```
linenoiseSetMultiLine()
```

Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

```
linenoiseAllowEmpty()
```

Set whether linenoise library will return a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.

**Main loop** `linenoise()`

In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user's key presses and returns completed line once 'enter' key is pressed. As such, it handles the 'read' part of the loop.

`linenoiseFree()`

This function must be called to release the command line buffer obtained from `linenoise()` function.

**Hints and completions** `linenoiseSetCompletionCallback()`

When user presses 'tab' key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.

console component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

`linenoiseAddCompletion()`

Function to be called by completion callback to inform the library about possible completions of the currently typed command.

`linenoiseSetHintsCallback()`

Whenever user input changes, linenoise invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

`linenoiseSetFreeHintsCallback()`

If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

**History** `linenoiseHistorySetMaxLen()`

This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

`linenoiseHistoryAdd()`

Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

`linenoiseHistorySave()`

Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

`linenoiseHistoryLoad()`

Counterpart to `linenoiseHistorySave()`, loads history from a file.

`linenoiseHistoryFree()`

Releases memory used to store command history. Call this function when done working with linenoise library.

### Splitting of command line into arguments

`console` component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[ abc, def, 1, 20, .3 ]`
- `abc "123 456" def` → `[ abc, 123 456, def ]`
- ``a\ b\\c\"` → `[ a b\c" ]`

### Argument parsing

For argument parsing, `console` component includes `argtable3` library. Please see [tutorial](#) for an introduction to `argtable3`. Github repository also includes [examples](#).

### Command registration and dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses `Argtable3` for argument parsing, hint text can be generated automatically by providing a pointer to `argtable` argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

`esp_console_run()`

This function takes the command line string, splits it into `argc/argv` argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.

`esp_console_register_help_command()`

Adds `help` command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

`esp_console_get_completion()`

Callback function to be used with `linenoiseSetCompletionCallback()` from `linenoise` library. Provides completions to `linenoise` based on the list of registered commands.

`esp_console_get_hint()`

Callback function to be used with `linenoiseSetHintsCallback()` from `linenoise` library. Provides argument hints for registered commands to `linenoise`.

### Initialize console REPL environment

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

### Application Example

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up `linenoise` library, read and handle commands from UART, and store command history in Flash. See `README.md` in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/iperf`.

## API Reference

### Header File

- `console/esp_console.h`

### Functions

`esp_err_t esp_console_init (const esp_console_config_t *config)`  
initialize console module

**Note** Call this once before using other console module features

#### Return

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_ERR_INVALID_ARG` if the configuration is invalid

#### Parameters

- `config`: console configuration

`esp_err_t esp_console_deinit (void)`  
de-initialize console module

**Note** Call this once when done using console module functions

#### Return

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized yet

`esp_err_t esp_console_cmd_register (const esp_console_cmd_t *cmd)`  
Register console command.

#### Return

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_ARG` if command description includes invalid arguments

#### Parameters

- `cmd`: pointer to the command description; can point to a temporary value

`esp_err_t esp_console_run (const char *cmdline, int *cmd_ret)`

Run command line.

#### Return

- ESP\_OK, if command was run
- ESP\_ERR\_INVALID\_ARG, if the command line is empty, or only contained whitespace
- ESP\_ERR\_NOT\_FOUND, if command with given name wasn't registered
- ESP\_ERR\_INVALID\_STATE, if `esp_console_init` wasn't called

#### Parameters

- `cmdline`: command line (command name followed by a number of arguments)
- `[out] cmd_ret`: return code from the command (set if command was run)

`size_t esp_console_split_argv (char *line, char **argv, size_t argv_size)`

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*
```

**Note** Pointers to at most `argv_size - 1` arguments are returned in `argv` array. The pointer after the last one (i.e. `argv[argc]`) is set to NULL.
