5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, use the POSIX `lseek` function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
7. Close all open files.
8. Call the FatFs function `f_mount` for the same drive number, with `NULL FATFS*` argument, to unmount the filesystem.
9. Call the FatFs function `ff_diskio_register()` with `NULL ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the `FATFS` structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount`, `esp_vfs_fat_sdspi_mount` and `esp_vfs_fat_sdcard_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

`esp_err_t esp_vfs_fat_register` (const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

Note: This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Parameters

- **base_path** –path prefix where FATFS should be registered
- **fat_drive** –FATFS drive specification; if only one drive is used, can be an empty string
- **max_files** –maximum number of files which can be open at the same time
- **out_fs** –[out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

`esp_err_t esp_vfs_fat_unregister_path` (const char *base_path)

Un-register FATFS from VFS.

Note: FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Parameters **base_path** –path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()` and `esp_vfs_fat_sdcard_unmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

esp_err_t **esp_vfs_fat_sdmmc_mount** (const char *base_path, const *sdmmc_host_t* *host_config, const void *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

Parameters

- **base_path** –path where partition should be registered (e.g. “/sdcard”)
- **host_config** –Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot_config** –Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to *sdmmc_slot_config_t* structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. (Deprecated) For SPI peripheral, pass a pointer to *sdspi_slot_config_t* structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT()`.
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **out_card** –[out] if not NULL, pointer to the card information structure will be returned via this argument

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdspi_mount** (const char *base_path, const *sdmmc_host_t* *host_config_input, const *sdspi_device_config_t* *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

Parameters

- **base_path** –path where partition should be registered (e.g. “/sdcard”)
- **host_config_input** –Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot_config** –Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **out_card** –[out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’ s not suggested to use more than one card at the same time and unmount one of them in your application.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and `128 * sector size`. For SD cards, sector size is always 512 bytes. For wear_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_sdcard_unmount (const char *base_path, *sdmmc_card_t* *card)

Unmount an SD card from the FAT filesystem and release resources acquired using *esp_vfs_fat_sdmmc_mount()* or *esp_vfs_fat_sdspi_mount()*

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if *esp_vfs_fat_sdmmc_mount* hasn't been called

Using FatFs with VFS in read-only mode

The header file *fatfs/vfs/esp_vfs_fat.h* also defines the convenience functions *esp_vfs_fat_rawflash_mount()* and *esp_vfs_fat_rawflash_unmount()*. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

esp_err_t esp_vfs_fat_rawflash_mount (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

Note: Wear levelling is not used when FAT is mounted in read-only mode using this function.

Parameters

- **base_path** –path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** –label of the partition which should be used
- **mount_config** –pointer to structure with extra parameters for mounting FATFS

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if *esp_vfs_fat_rawflash_mount* was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

esp_err_t esp_vfs_fat_rawflash_unmount (const char *base_path, const char *partition_label)

Unmount FAT filesystem and release resources acquired using *esp_vfs_fat_rawflash_mount*.

Parameters

- **base_path** –path where partition should be registered (e.g. “/spiflash”)
- **partition_label** –label of partition to be unmounted

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if *esp_vfs_fat_spiflash_mount* hasn't been called

FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmhc()`.

void **ff_diskio_register** (BYTE pdrv, const `ff_diskio_impl_t` *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_XXX` functions for driver number pdrv, corresponding function in `discio_impl` for given pdrv will be called.

Parameters

- **pdrv** –drive number
- **discio_impl** –pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (***status**)(unsigned char pdrv)

disk status check function

DRESULT (***read**)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (***write**)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (***ioctl**)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmhc** (unsigned char pdrv, `sdmmc_card_t` *card)

Register SD/MMC diskio driver

Parameters

- **pdrv** –drive number
- **card** –pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

`esp_err_t` **ff_diskio_register_wl_partition** (unsigned char pdrv, `wl_handle_t` flash_handle)

Register spi flash partition

Parameters

- **pdrv** –drive number
- **flash_handle** –handle of the wear levelling partition.

`esp_err_t ff_diskio_register_raw_partition` (unsigned char pdrv, const `esp_partition_t` *part_handle)

Register spi flash partition

Parameters

- **pdrv** –drive number
- **part_handle** –pointer to raw flash partition.

2.6.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#)
- [Flash Download tool](#) (available on Windows only). Just download it, unzip, and follow the instructions inside the *doc* folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on `esp-idf`'s NVS partition utility.

- **Operating System requirements:**
 - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
 - [Python](#)

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
 - You have installed the packages from *requirement.txt*, the file in the root of the `esp-idf` directory.
-

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,      <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

- before and after ‘,’
 - at the end of each line in a CSV file
-

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,....
value1,value2,value3,....
```

Note: The first line in the file should always contain the *key* names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the *value* of the corresponding keys, separated by a comma. If the key has the *REPEAT* tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

value Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

Note: If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

Usage:

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

No.	Parameter	Description
1	-h, --help	show this help message and exit

Commands:

Run mfg_gen.py {command} -h **for** additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption

To generate factory images for each device (Default): Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                             [--keyfile KEYFILE] [--inputkey INPUTKEY]
                             [--outdir OUTDIR]
                             conf values prefix size
```

(continues on next page)

(continued from previous page)

Positional Arguments:		
Parameter	Description	
conf	Path to configuration csv file to parse	
values	Path to values csv file to parse	
prefix	Unique name for each output filename prefix	
size	Size of NVS partition in bytes (must be multiple of 4096)	
Optional Arguments:		
Parameter	Description	
-h, --help	show this help message and exit	
--fileid FILEID	Unique file identifier(any key in values file) for each filename suffix (Default: numeric value(1, 2,3...))	
--version {1,2}	Set multipage blob version.	
	Version 1 - Multipage blob support disabled.	
	Version 2 - Multipage blob support enabled.	
	Default: Version 2	
--keygen	Generates key for encrypting NVS partition	
--inputkey INPUTKEY	File having key for encrypting NVS partition	
--outdir OUTDIR	Output directory to store files created	

(continues on next page)

(continued from previous page)

```
| | (Default: current directory) |
↩ |
+-----+-----+
↩-----+
```

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000 --keygen
```

Note: Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

Note: This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

To generate only encryption keys: Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]

Optional Arguments:
+-----+-----+
↩-----+
| Parameter          | Description |
↩ |
+-----+-----+
| -h, --help        | show this help message and exit |
↩ |
+-----+-----+
| --keyfile KEYFILE | Path to output encryption keys file |
↩ |
+-----+-----+
| --outdir OUTDIR   | Output directory to store files created. |
↩ |
|                   | (Default: current directory) |
↩ |
+-----+-----+
↩-----+
```

(continues on next page)

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

Note: To provide custom target filename use the `-keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

2.6.3 Non-volatile storage library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying storage Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type 'string' and 'blob'. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and values NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`

- zero-terminated string
- variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS iterators Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` returns iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find()` and `nvs_entry_next()` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator()`.

Security, tampering, and robustness NVS is not directly compatible with the ESP32-S3 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-S3 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet

another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when *Flash Encryption* is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the *NVS key partition*. Two partition tables containing the *NVS key partition* are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash_encryption](#) for how to configure and use NVS encryption feature.

NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted* and its size should be the minimum partition size (4KB). Refer to *Partition Tables* for more details. Two additional partition tables which contain the *NVS key partition* are provided under the partition table option (menuconfig->Partition Table). They can be directly used for *NVS Encryption*. The structure of these partitions is depicted below.

-----+-----+-----+-----+-----
XTS encryption key (32)
-----+-----+-----+-----+-----
XTS tweak key (32)
-----+-----+-----+-----+-----
CRC32 (4)
-----+-----+-----+-----+-----

The XTS encryption keys in the *NVS key partition* can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:

When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS key partition*. Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.

2. Use pre-generated key partition:

This option will be required by the user when keys in the *NVS key partition* are not generated by the application. The *NVS key partition* containing the XTS encryption keys can be generated with the help of *NVS Partition Generator Utility*. Then the user can store the pre generated key partition on the flash with help of the following two commands:

- i) Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

- ii) Store the keys in the *NVS key partition* (on the flash) with the help of `parttool.py` (see Partition Tool section in *partition-tables* for more details)

```
parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_  
↪partition offset" write_partition --partition-name="name of nvs_key_  
↪partition" --input "nvs_key partition"
```

Since the key partition is marked as *encrypted* and *Flash Encryption* is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

Encrypted Read/Write The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

Encrypt the default NVS partition: To enable encryption for the default NVS partition no additional steps are necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first *NVS key partition* found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

Encrypt a custom NVS partition: To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

Application Example

You can find code examples in the `storage` directory of ESP-IDF examples:

[storage/nvs_rw_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-S3 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

[storage/nvs_rw_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-S3 module restarts.

- value - tracks the number of the ESP32-S3 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

[storage/nvs_rw_value_cxx](#)

This example does exactly the same as [storage/nvs_rw_value](#), except that it uses the C++ NVS handle class.

Internals

Log of key-value pairs NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and entries NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

Active Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

Structure of a page For now, we assume that flash sector size is 4096 bytes and that ESP32-S3 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via `menuconfig`) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-S3 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32-S3 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

Entry and entry state bitmap Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

Empty (2' b11) Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

Written (2' b10) A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

Erased (2' b00) A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

Structure of entry For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

(continues on next page)

(continued from previous page)

Individual fields in entry structure have the following meanings:

NS Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

Type One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

Span Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

ChunkIndex Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

CRC32 Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

Key Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

Data For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

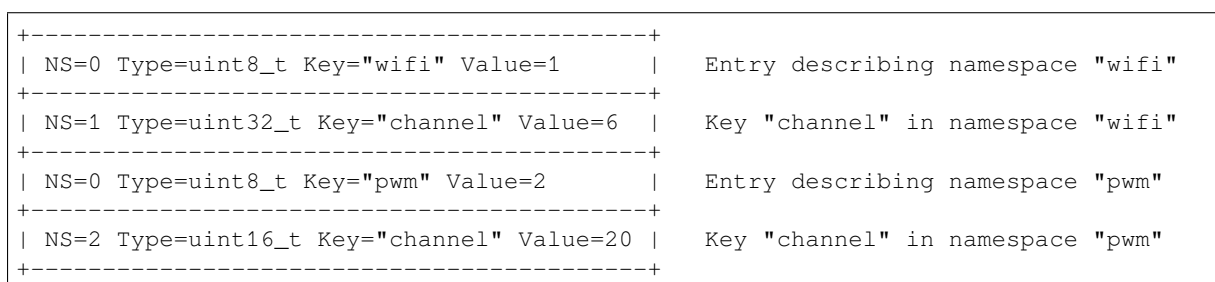

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

Namespaces As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

Item hash list To reduce the number of reads from flash memory, each member of the `Page` class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and `ChunkIndex`. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead

for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- [components/nvs_flash/include/nvs_flash.h](#)

Functions

esp_err_t **nvs_flash_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
- b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from `nvs_flash_read_security_cfg` API (when “NVS_ENCRYPTION” is enabled).
- error codes from `nvs_flash_generate_keys` API (when “NVS_ENCRYPTION” is enabled).
- error codes from `nvs_flash_secure_init_partition` API (when “NVS_ENCRYPTION” is enabled) .

esp_err_t **nvs_flash_init_partition** (const char *partition_label)

Initialize NVS flash storage for the specified partition.

Parameters `partition_label` –[in] Label of the partition. Must be no longer than 16 characters.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_init_partition_ptr** (const *esp_partition_t* *partition)

Initialize NVS flash storage for the partition specified by partition pointer.

Parameters `partition` –[in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Returns

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t **nvs_flash_deinit_partition** (const char *partition_label)

Deinitialize NVS storage for the given NVS partition.

Parameters *partition_label* –[in] Label of the partition

Returns

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t **nvs_flash_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

esp_err_t **nvs_flash_erase_partition** (const char *part_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters *part_name* –[in] Name (label) of the partition which should be erased

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

esp_err_t **nvs_flash_erase_partition_ptr** (const *esp_partition_t* *partition)

Erase custom partition.

Erase all content of specified custom partition.

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters **partition** –[in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init** (*nvs_sec_cfg_t* *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

Parameters **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init_partition** (const char *partition_label, *nvs_sec_cfg_t* *cfg)

Initialize NVS flash storage for the specified partition.

Parameters

- **partition_label** –[in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_generate_keys** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Generate and store NVS keys in the provided esp partition.

Parameters

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

Returns -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from `esp_partition_write/erase` APIs.

esp_err_t **nvs_flash_read_security_cfg** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

Note: Provided partition is assumed to be marked ‘encrypted’ .

Parameters

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

Returns -ESP_OK, if `cfg` was read successfully; -ESP_INVALID_ARG, if `partition` or `cfg`; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

Structures

struct **nvs_sec_cfg_t**

Key for encryption and decryption.

Public Members

uint8_t **eky**[32]

XTS encryption and decryption key

uint8_t **tky**[32]

XTS tweak key

Macros

NVS_KEY_SIZE

Header File

- [components/nvs_flash/include/nvs.h](#)

Functions

`esp_err_t nvs_set_i8` (*nvs_handle_t* handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **value** –[in] The value to set.

Returns

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints

- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs_handle_t* handle, const char *key, uint8_t value)

set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs_handle_t* handle, const char *key, int16_t value)

set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs_handle_t* handle, const char *key, uint16_t value)

set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs_handle_t* handle, const char *key, int32_t value)

set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs_handle_t* handle, const char *key, uint32_t value)

set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs_handle_t* handle, const char *key, int64_t value)

set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs_handle_t* handle, const char *key, uint64_t value)

set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs_handle_t* handle, const char *key, const char *value)

set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

Returns

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get `int8_t` value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Parameters

- **handle** `–[in]` Handle obtained from `nvs_open` function.
- **key** `–[in]` Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_value** `–`Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.

Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

get `uint8_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

get `int16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

get `uint16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`

get `int32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`

get `uint32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)`

get `int64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u64** (*nvs_handle_t* handle, const char *key, uint64_t *out_value)

get uint64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_str** (*nvs_handle_t* handle, const char *key, char *out_value, size_t *length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
// dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
// into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function.
- **key** –[in] Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** –[out] Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** –[inout] A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

Returns

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

esp_err_t **nvs_get_blob** (*nvs_handle_t* handle, const char *key, void *out_value, size_t *length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

esp_err_t **nvs_open** (const char *name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Parameters

- **name** –[in] Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** –[in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

Returns

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

esp_err_t **nvs_open_from_partition** (const char *part_name, const char *name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

Parameters

- **part_name** –[in] Label (name) of the partition of interest for object read/write/erase
- **name** –[in] Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **open_mode** –[in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

Returns

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn't exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn't satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

esp_err_t **nvs_set_blob** (*nvs_handle_t* handle, const char *key, const void *value, size_t length)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set.
- **length** –[in] length of binary value to set, in bytes; Maximum length is 508000 bytes or $(97.6\%$ of the partition size - 4000) bytes whichever is lower.

Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

esp_err_t `nvs_erase_key` (*nvs_handle_t* handle, const char *key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters

- **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

Returns

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- other error codes from the underlying storage driver

esp_err_t `nvs_erase_all` (*nvs_handle_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

esp_err_t `nvs_commit` (*nvs_handle_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

Parameters `handle` **–[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- other error codes from the underlying storage driver

void `nvs_close` (`nvs_handle_t` handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

Parameters `handle` **–[in]** Storage handle to close

`esp_err_t` `nvs_get_stats` (const char *part_name, `nvs_stats_t` *nvs_stats)

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

Parameters

- **part_name** **–[in]** Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` (“nvs”).
- **nvs_stats** **–[out]** Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

Returns

- `ESP_OK` if the changes have been written successfully. Return param `nvs_stats` will be filled.
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label “name” is not found. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` equal to `NULL`.
- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

`esp_err_t` `nvs_get_used_entry_count` (`nvs_handle_t` handle, `size_t` *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs_
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function.
- **used_entries** –[out] Returns amount of used entries from a namespace.

Returns

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` equal to NULL.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

nvs_iterator_t **nvs_entry_find** (const char *part_name, const char *namespace_name, *nvs_type_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified_
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no_
↳other
// element for specified criteria was found.
}
```

Parameters

- **part_name** –[in] Partition name
- **namespace_name** –[in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** –[in] One of `nvs_type_t` values.

Returns Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

nvs_iterator_t **nvs_entry_next** (*nvs_iterator_t* iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Parameters **iterator** **–[in]** Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

Returns NULL if no entry was found, valid `nvs_iterator_t` otherwise.

void **nvs_entry_info** (*`nvs_iterator_t`* iterator, *`nvs_entry_info_t`* *out_info)

Fills *`nvs_entry_info_t`* structure with information about entry pointed to by the iterator.

Parameters

- **iterator** **–[in]** Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- **out_info** **–[out]** Structure to which entry information is copied.

void **nvs_release_iterator** (*`nvs_iterator_t`* iterator)

Release iterator.

Parameters **iterator** **–[in]** Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

Structures

struct **nvs_entry_info_t**

information about entry obtained from `nvs_entry_info` function

Public Members

char **namespace_name**[16]

Namespace to which key-value belong

char **key**[16]

Key of stored key-value pair

`nvs_type_t` **type**

Type of stored key-value pair

struct **nvs_stats_t**

Note: Info about storage space NVS.

Public Members

size_t **used_entries**

Amount of used entries.

size_t **free_entries**

Amount of free entries.

size_t **total_entries**

Amount all available entries.

size_t **namespace_count**

Amount name space.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

Id namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximal length of NVS key name (including null terminator)

Type Definitions

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

typedef struct nvs_opaque_iterator_t ***nvs_iterator_t**
Opaque pointer type representing iterator to nvs entries

Enumerations

enum **nvs_open_mode_t**
Mode of opening the non-volatile storage.

Values:

enumerator **NVS_READONLY**
Read only

enumerator **NVS_READWRITE**
Read and write

enum **nvs_type_t**
Types of variables.

Values:

enumerator **NVS_TYPE_U8**
Type uint8_t

enumerator **NVS_TYPE_I8**
Type int8_t

enumerator **NVS_TYPE_U16**
Type uint16_t

enumerator **NVS_TYPE_I16**
Type int16_t

enumerator **NVS_TYPE_U32**
Type uint32_t

enumerator **NVS_TYPE_I32**
Type int32_t

enumerator **NVS_TYPE_U64**
Type uint64_t

enumerator **NVS_TYPE_I64**
Type int64_t

enumerator **NVS_TYPE_STR**
Type string

enumerator **NVS_TYPE_BLOB**
Type blob

enumerator **NVS_TYPE_ANY**

Must be last

2.6.4 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in *requirements.txt* in the root of the esp-idf directory.

CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the file type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value.	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> is fixed and is not configurable. Any values in these cells are ignored.

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key, type, encoding, value      <-- column header
namespace_name, namespace,,    <-- First entry should be of type "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

Note:**Make sure there are no spaces:**

- before and after ‘,’
- at the end of each line in a CSV file

NVS Entry and Namespace association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of entry*. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to *NVS Encryption* for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to *NVS Encryption* for more details.

Running the utility**Usage:**

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪      |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1   | -h, --help | show this help message and exit |
↪      |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
```

Commands:

(continues on next page)

(continued from previous page)

```

Run nvs_partition_gen.py {command} -h for additional help
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | generate | Generate NVS partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 2 | generate-key | Generate keys for encryption |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 3 | encrypt | Generate NVS encrypted partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+

| 4 | decrypt | Decrypt NVS encrypted partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

To generate NVS partition (Default):**Usage:**

```

python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir_
↪OUTDIR]
                                input output size
Positional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
| input | Path to CSV file to parse |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
| output | Path to output NVS binary file |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
| size | Size of NVS partition in bytes (must be multiple_
↪of 4096) |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
Optional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
| -h, --help | show this help message and exit |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

(continues on next page)

(continued from previous page)

	--version {1,2}		Set multipage blob version.	
↳			Version 1 - Multipage blob support disabled.	
↳			Version 2 - Multipage blob support enabled.	
↳			Default: Version 2	
↳				
↳				
+	-----+	+		+
↳		--outdir OUTDIR	Output directory to store files created	
↳			(Default: current directory)	
↳				
+	-----+	+		+
↳				

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

To generate only encryption keys:

Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                     [--outdir OUTDIR]
```

Optional Arguments:

Parameter	Description
-h, --help	show this help message and exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

To generate encrypted NVS partition:

Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                   [--keyfile KEYFILE] [--inputkey INPUTKEY]
                                   [--outdir OUTDIR]
                                   input output size

Positional Arguments:
+-----+
| Parameter | Description |
+-----+
| input     | Path to CSV file to parse |
+-----+
| output    | Path to output NVS binary file |
+-----+
| size      | Size of NVS partition in bytes (must be multiple of 4096) |
+-----+

Optional Arguments:
+-----+
| Parameter | Description |
+-----+
| -h, --help | show this help message and exit |
+-----+
| --version {1,2} | Set multipage blob version. | |
| | | Version 1 - Multipage blob support disabled. |
| | | Version 2 - Multipage blob support enabled. |
| | | Default: Version 2 |
+-----+
| --keygen | Generates key for encrypting NVS partition |
+-----+
| --keyfile KEYFILE | Path to output encryption keys file |
+-----+
| --inputkey INPUTKEY | File having key for encrypting NVS partition |
+-----+
| --outdir OUTDIR | Output directory to store files created |
+-----+
```

(continues on next page)

(continued from previous page)

```
|                                     | (Default: current directory) |
↔                                     |                               |
+-----+-----+-----+-----+
↔-----+-----+-----+-----+
```

You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↔0x3000 --keygen
```

Note: Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↔0x3000 --keygen --keyfile sample_keys.bin
```

Note: Encryption key of the following format <outdir>/keys/sample_keys.bin is created.

Note: This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↔0x3000 --inputkey sample_keys.bin
```

To decrypt encrypted NVS partition:

Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key_
↔output

Positional Arguments:
+-----+-----+-----+-----+
↔-----+-----+-----+-----+
| Parameter | Description |
↔-----+-----+-----+-----+
| input     | Path to encrypted NVS partition file to parse |
↔-----+-----+-----+-----+
| key       | Path to file having keys for decryption |
↔-----+-----+-----+-----+
| output    | Path to output decrypted binary file |
↔-----+-----+-----+-----+
```

(continues on next page)

(continued from previous page)

```
Optional Arguments:
+-----+-----+
↪-----+
| Parameter          | Description          | ↪
↪-----+
+-----+-----+
| -h, --help        | show this help message and exit | ↪
↪-----+
+-----+-----+
↪-----+
| --outdir OUTDIR   | Output directory to store files created | ↪
↪-----+
|                   | (Default: current directory)           | ↪
↪-----+
+-----+-----+
↪-----+
```

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

Multipage Blob Support Disabled (Version 1): You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --
↪version 1
```

Multipage Blob Support Enabled (Version 2): You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

Note: *Minimum NVS Partition Size needed is 0x3000 bytes.*

Note: *When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.*

Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.6.5 SD/SDIO/MMC Driver

Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc_host.h](#) and [driver/include/driver/sdsp_i_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](#)
- SD SPI host, see [SD SPI Host API](#)

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the [storage/sd_card](#) directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

Combo (memory + IO) cards The driver does not support SD combo cards. Combo cards are treated as IO cards.

Thread safety Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

Protocol layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.

- If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

Using API with eMMC chips From the protocol layer's perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

- The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
- If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the field is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
- If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

Action	Read Function	Write Function
Read and write a single byte using IO_RW_DIRECT (CMD52)	<code>sd-mmc_io_read_byte()</code>	<code>sd-mmc_io_write_byte()</code>
Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode	<code>sd-mmc_io_read_bytes()</code>	<code>sd-mmc_io_write_bytes()</code>
Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode	<code>sd-mmc_io_read_blocks()</code>	<code>sd-mmc_io_write_blocks()</code>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

API Reference

Header File

- `components/sdmmc/include/sdmmc_cmd.h`

Functions

`esp_err_t sdmmc_card_init` (const `sdmmc_host_t`*host, `sdmmc_card_t`*out_card)

Probe and initialize SD/MMC card using given host

Note: Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

Parameters

- host** – pointer to structure defining host controller

- **out_card** –pointer to structure which will receive information about the card when the function completes

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info** (FILE *stream, const *sdmmc_card_t* *card)

Print information about the card to a stream.

Parameters

- **stream** –stream obtained using fopen or fdopen
- **card** –card information structure initialized using sdmmc_card_init

esp_err_t **sdmmc_get_status** (*sdmmc_card_t* *card)

Get status of SD/MMC card

Parameters **card** –pointer to card information structure previously initialized using sdmmc_card_init

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_write_sectors** (*sdmmc_card_t* *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

Parameters

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **src** –pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- **start_sector** –sector where to start writing
- **sector_count** –number of sectors to write

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_read_sectors** (*sdmmc_card_t* *card, void *dst, size_t start_sector, size_t sector_count)

Read given number of sectors from the SD/MMC card

Parameters

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **dst** –pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- **start_sector** –sector where to start reading
- **sector_count** –number of sectors to read

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_byte** (*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t *out_byte)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** –pointer to card information structure previously initialized using sdmmc_card_init
- **function** –IO function number
- **reg** –byte address within IO function
- **out_byte** –[out] output, receives the value read from the card

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_byte** (*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **reg** –byte address within IO function
- **in_byte** –value to be written
- **out_byte** –[out] if not NULL, receives new byte value read from the card (read-after-write).

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_bytes** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where reading starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_bytes** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to write

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts

- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read, must be divisible by the card block size.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to read, must be divisible by the card block size.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_enable_int** (*sdmmc_card_t* *card)

Enable SDIO interrupt in the SDMMC host

Parameters **card** –pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

esp_err_t **sdmmc_io_wait_int** (*sdmmc_card_t* *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ticks** –time to wait for the interrupt, in RTOS ticks

Returns

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

esp_err_t **sdmmc_io_get_cis_data** (*sdmmc_card_t* *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **out_buffer** –Output buffer of the CIS data
- **buffer_size** –Size of the buffer.
- **inout_cis_size** –Mandatory, pointer to a size, input and output.
 - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
 - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

Returns

- **ESP_OK**: on success
- **ESP_ERR_INVALID_RESPONSE**: if the card does not (correctly) support CIS.
- **ESP_ERR_INVALID_SIZE**: **CIS_CODE_END** found, but **buffer_size** is less than required size, which is stored in the **inout_cis_size** then.
- **ESP_ERR_NOT_FOUND**: if the **CIS_CODE_END** not found. Increase input value of **inout_cis_size** or set it to 0, if you still want to search for the end; output value of **inout_cis_size** is invalid in this case.
- and other error code return from **sdmmc_io_read_bytes**

esp_err_t **sdmmc_io_print_cis_info** (uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of an SDIO card.

Note: Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in **sdmmc_io.c** and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

Parameters

- **buffer** – Buffer to parse
- **buffer_size** – Size of the buffer.
- **fp** – File pointer to print to, set to **NULL** to print to stdout.

Returns

- **ESP_OK**: on success
- **ESP_ERR_NOT_SUPPORTED**: if the value from the card is not supported to be parsed.
- **ESP_ERR_INVALID_SIZE**: if the CIS size fields are not correct.

Header File

- [components/driver/include/driver/sdmmc_types.h](#)

Structures

struct **sdmmc_csd_t**

Decoded values from SD card Card Specific Data register

Public Members

int **csd_ver**

CSD structure format

int **mmc_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector_size**

sector size in bytes

int **read_block_len**

block length for reads

int **card_command_class**
Card Command Class for SD

int **tr_speed**
Max transfer speed

struct **sdmmc_cid_t**
Decoded values from SD card Card IDentification register

Public Members

int **mfg_id**
manufacturer identification number

int **oem_id**
OEM/product identification number

char **name**[8]
product name (MMC v1 has the longest)

int **revision**
product revision

int **serial**
product serial number

int **date**
manufacturing date

struct **sdmmc_scr_t**
Decoded values from SD Configuration Register

Public Members

int **sd_spec**
SD Physical layer specification version, reported by card

int **bus_width**
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

struct **sdmmc_ext_csd_t**
Decoded values of Extended Card Specific Data

Public Members

uint8_t **power_class**
Power class used by the card

struct **sdmmc_switch_func_rsp_t**
SD SWITCH_FUNC response buffer

Public Members

uint32_t **data**[512 / 8 / sizeof(uint32_t)]
response data

struct **sdmmc_command_t**
SD/MMC command information

Public Members

uint32_t **opcode**
SD or MMC command index

uint32_t **arg**
SD/MMC command argument

sdmmc_response_t **response**
response buffer

void ***data**
buffer to send or read into

size_t **datalen**
length of data buffer

size_t **blklen**
block length

int **flags**
see below

esp_err_t **error**
error returned from transfer

int **timeout_ms**
response timeout, in milliseconds

struct **sdmmc_host_t**
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t **flags**

flags defining host properties

int **slot**

slot number, to be passed to host functions

int **max_freq_khz**

max frequency supported by the host

float **io_voltage**

I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (***init**)(void)

Host function to initialize the driver

esp_err_t (***set_bus_width**)(int slot, size_t width)

host function to set bus width

size_t (***get_bus_width**)(int slot)

host function to get bus width

esp_err_t (***set_bus_ddr_mode**)(int slot, bool ddr_enable)

host function to set DDR mode

esp_err_t (***set_card_clk**)(int slot, uint32_t freq_khz)

host function to set card clock frequency

esp_err_t (***do_transaction**)(int slot, *sdmmc_command_t* *cmdinfo)

host function to do a transaction

esp_err_t (***deinit**)(void)

host function to deinitialize the driver

esp_err_t (***deinit_p**)(int slot)

host function to deinitialize the driver, called with the `slot`

esp_err_t (***io_int_enable**)(int slot)

Host function to enable SDIO interrupt line

esp_err_t (***io_int_wait**)(int slot, TickType_t timeout_ticks)

Host function to wait for SDIO interrupt line to be active

int **command_timeout_ms**

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct **sdmmc_card_t**

SD/MMC card information structure

Public Members

sdmmc_host_t **host**

Host with which the card is associated

uint32_t **ocr**

OCR (Operation Conditions Register) value

sdmmc_cid_t **cid**

decoded CID (Card IDentification) register value

sdmmc_response_t **raw_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t **csd**

decoded CSD (Card-Specific Data) register value

sdmmc_scr_t **scr**

decoded SCR (SD card Configuration Register) value

sdmmc_ext_csd_t **ext_csd**

decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t **rca**

RCA (Relative Card Address)

uint16_t **max_freq_khz**

Maximum frequency, in kHz, supported by the card

uint32_t **is_mem**

Bit indicates if the card is a memory card

uint32_t **is_sdio**

Bit indicates if the card is an IO card

uint32_t **is_mmc**

Bit indicates if the card is MMC

uint32_t **num_io_functions**

If `is_sdio` is 1, contains the number of IO functions on the card

uint32_t **log_bus_width**

\log_2 (bus width supported by card)

uint32_t **is_ddr**

Card supports DDR mode

uint32_t **reserved**

Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT

host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT

host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT

host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI

host supports SPI protocol

SDMMC_HOST_FLAG_DDR

host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG

host `deinit` function called with the slot argument

SDMMC_FREQ_DEFAULT

SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED

SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING

SD/MMC probing speed

SDMMC_FREQ_52M

MMC 52MHz speed

SDMMC_FREQ_26M

MMC 26MHz speed

Type Definitions

```
typedef uint32_t sdmmc_response_t[4]
```

SD/MMC command response buffer

2.6.6 SPI Flash API

Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The `spi_flash` component also has higher-level API functions which work with partitions defined in the *partition table*.

Different from the API before IDF v4.0, the functionality of *esp_flash_** APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of through the cache connected to the SPI0 peripheral, most *esp_flash_** APIs go through other SPI peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.

However due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after IDF v4.0 are no longer *atomic*. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

Kconfig option [*CONFIG_SPI_FLASH_USE_LEGACY_IMPL*](#) can be used to switch *spi_flash_** functions back to the implementation before ESP-IDF v4.0. However, the code size may get bigger if you use the new API and the old API at the same time.

Encrypted reads and writes use the old implementation, even if [*CONFIG_SPI_FLASH_USE_LEGACY_IMPL*](#) is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for features of flash chips

Quad/Dual mode chips Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don't need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Optional Features

Optional features for flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

Note:

- The features listed above needs to be supported by both esp chips and flash chips.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
 - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
-

Attention: This document only shows that IDF code has supported the features of those flash chips. It's not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume ESP Chips List:

1. ESP32C3

Flash Chips List:

1. XM25QxxC series.

Flash unique ID Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

ALL

Flash Chips List:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

Note: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:

1. ESP32S3

Flash Chips (name & ID) List:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

Attention: It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

Note: To know how to configure menuconfig for a board with different Flash and PSRAM, please refer to the [SPI Flash and External SPI RAM Configuration](#)

ESP Chips List:

1. ESP32S3

Flash Chips List:

1. MX25UM25645G

32-bit Address Flash Chips Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:

ALL ESP Chips support this.

Flash Chips List:

1. W25Q256
2. GD25Q256

There are some features that are not supported by all flash models, or not supported by all Espressif chips. These features include:

- OPI flash - means that flash supports octal mode.
- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16MB) that needs longer address to access.
- High performance mode (HPM) - means that flash works under high frequency which is higher than 80MHz.
- Flash unique ID - means that flash supports its unique 64-bits ID.

If you want to use these features, you need to ensure ESP32-S3 supports this feature, and ALL the flash chips in your product have this feature. For more details, refer [Optional features for flash](#).

Users can also customize their own flash chip driver, see [Overriding Default Chip Drivers](#) for more details.

Warning: Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
 - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
 - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
 - `CMakeLists.txt` and `linker.lf` files
 Modify the files above properly.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
 1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
 2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support `suspend` and `read unique id`).
 3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom_flash_driver](#).

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib          spi_flash          COMPONENT_LIB)
set_property(TARGET      ${spi_flash_lib}        APPEND          PROPERTY      INTER-
FACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>>)
```
5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

Example See also [storage/custom_flash_driver](#).

Initializing a flash device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of *partition-specific functions*.

SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

Concurrency Constraints for flash on SPI1

Concurrency Constraints for flash on SPI1 The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-S3, these caches must be disabled while reading/writing/erasing.

When the caches are disabled This means that all CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur. If you use the API functions documented here, then the caches will be disabled automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

To avoid reading flash cache accidentally, when one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state, and all non-IRAM-safe interrupts are disabled on all CPUs until the flash operation completes.

See also [OS functions](#), [SPI Bus Lock](#).

IRAM-Safe Interrupt Handlers If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the [interrupt handler is registered](#).

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to place code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

Note: When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

Attention: The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See [Concurrency Constraints for flash on SPI1](#) for more details.

Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

Note: Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

Memory mapping API

ESP32-S3 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

Note: `mmap` is supported by cache, so it can only be used on main flash.

SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

Host driver The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-S3 memory-spi functionalities. However due to the speed limitations of ESP32-S3, the HAL layer can't provide high-speed implementations to some reading commands (So we didn't do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access to the flash regardless of the low-level hardware.

Chip driver The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS functions Currently the OS function layer provides entries of a lock and delay.

The lock (see *SPI Bus Lock*) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may requires to use the bus monopolized during a period. (especially when the device doesn't have CS wire, or the wire is controlled by the software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

See also

- *Partition Table documentation*
- *Over The Air Update (OTA) API* provides high-level API for updating app firmware stored in flash.
- *Non-Volatile Storage (NVS) API* provides a structured API for storing small pieces of data in SPI flash.

Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (*CONFIG_FREERTOS_UNICORE* enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

Functions

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Parameters

- **out_chip** –Pointer to hold the initialized chip.
- **config** –Configuration of the chips to initialize.

Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the `config` is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`

Remove a SPI Flash device from the SPI bus.

Parameters **chip** –The flash device to remove.

Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

Structures

struct `esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

Public Members

`spi_host_device_t` **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

`esp_flash_io_mode_t` **io_mode**

IO mode to read from the Flash.

`esp_flash_speed_t` **speed**

Speed of the Flash clock.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

Header File

- [components/spi_flash/include/esp_flash.h](#)

Functions

esp_err_t **esp_flash_init** (*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note: Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

Note: If the `chip->drv` pointer is NULL, chip `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized** (const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns true if set, otherwise false.

esp_err_t **esp_flash_read_id** (*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_id** –[out] Pointer to receive ID value.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size** (*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_size** –[out] Detected size in bytes.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id** (*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **out_id** –[out] Pointer to receive unique ID value.

Returns

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn't support read id.

esp_err_t **esp_flash_erase_chip** (*esp_flash_t* *chip)

Erase flash chip contents.

Parameters **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region** (*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **start** –Address to start erasing flash. Must be sector aligned.
- **len** –Length of region to erase. Must also be sector aligned.

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect** (*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

Note: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **write_protected** –[out] Pointer to boolean, set to the value of the write protect flag.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect** (*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **write_protect** –Boolean value for the write protect flag

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions** (const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** –[out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** –[out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions' .

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

Note: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(...).
- **out_protected** –[out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

Note: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(...).
- **protect** –Write protection flag to set.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read** (*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Note: If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **buffer** –Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** –Address on flash to read from. Must be less than chip->size field.
- **length** –Length (in bytes) of data to read.

Returns

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write** (*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **address** –Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).

- **buffer** –Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** –Length (in bytes) of data to write.

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted** (*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

Note: Both address & length must be 16 byte aligned, as this is the encryption block size

Parameters

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** –Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write.
- **length** –Length (in bytes) of data to write. 16 byte aligned.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

esp_err_t **esp_flash_read_encrypted** (*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Parameters

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** –Address on flash to read from.
- **out_buffer** –Pointer to a buffer for the data to read to.
- **length** –Length (in bytes) of data to read.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

static inline bool **esp_flash_is_quad_mode** (const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

`uint32_t offset`

Start address of this region.

`uint32_t size`

Size of the region.

struct `esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

`esp_err_t (*start)(void *arg)`

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

`esp_err_t (*end)(void *arg)`

Called after completing any flash operation.

`esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)`

Called before any erase/write operations to check whether the region is limited by the OS

`esp_err_t (*delay_us)(void *arg, uint32_t us)`

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

`void (*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)`

Called for get temp buffer when buffer from application cannot be directly read into/write from.

`void (*release_temp_buffer)(void *arg, void *temp_buf)`

Called for release temp buffer.

`esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)`

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

`esp_err_t (*yield)(void *arg, uint32_t *out_status)`

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

struct `esp_flash_t`

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific "host_driver" structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp_flash_os_functions_t* ***os_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void ***os_func_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

esp_flash_io_mode_t **read_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32_t **chip_id**

Detected chip id.

uint32_t **busy**

This flag is used to verify chip's status.

uint32_t **hpm_dummy_ena**

This flag is used to verify whether flash works under HPM status.

uint32_t **reserved_flags**

reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

Type Definitions

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

typedef struct *esp_flash_t* **esp_flash_t**

Header File

- [components/hal/include/hal/spi_flash_types.h](#)

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to salve.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**

Read flash status register(2) command.

uint32_t **sus_cmd**

Flash suspend command.

uint32_t **res_cmd**

Flash resume command.

uint32_t **reserved**

Reserved, set to 0.

struct **spi_flash_encryption_t**

Structure for flash encryption operations.

Public Members

void (***flash_encryption_enable**)(void)

Enable the flash encryption.

void (***flash_encryption_disable**)(void)

Disable the flash encryption.

void (***flash_encryption_data_prepare**)(uint32_t address, const uint32_t *buffer, uint32_t size)

Prepare flash encryption before operation.

Note: address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.

Param buffer Data for programming

Param size Size to program.

void (***flash_encryption_done**)(void)

flash data encryption operation is done.

void (***flash_encryption_destroy**)(void)

Destroy encrypted result

bool (***flash_encryption_check**)(uint32_t address, uint32_t length)

Check if is qualified to encrypt the buffer

Param address the address of written flash partition.

Param length Buffer size.

struct **spi_flash_host_inst_t**

SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* ***driver**

Pointer to the implementation function table.

struct **spi_flash_host_driver_s**

Host driver configuration and context structure.

Public Members

esp_err_t (***dev_config**)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (***common_command**)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (***read_id**)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (***erase_chip**)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (***erase_sector**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (***erase_block**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (***read_status**)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (***set_write_protect**)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (***program_page**)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (***supports_direct_write**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether given buffer can be directly used to write

int (***write_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write

Param len Length request to write

Param align_addr Output of the aligned address to write to

Param page_size Physical page size of the flash chip

Return Length that can be actually written in one `program_page` call

esp_err_t (***read**)(*spi_flash_host_inst_t* *host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (***supports_direct_read**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether given buffer can be directly used to read

int (***read_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read

Param len Length request to read

Param align_addr Output of the aligned address to read

Param page_size Physical page size of the flash chip

Return Length that can be actually read in one `read` call

uint32_t (***host_status**)(*spi_flash_host_inst_t* *host)

Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (***configure_host_io_mode**)(*spi_flash_host_inst_t* *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, *esp_flash_io_mode_t* io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (***poll_cmd_done**)(*spi_flash_host_inst_t* *host)

Internal use, poll the HW until the last operation is done.

esp_err_t (***flush_cache**)(*spi_flash_host_inst_t* *host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (***check_suspend**)(*spi_flash_host_inst_t* *host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (***resume**)(*spi_flash_host_inst_t* *host)

Resume flash from suspend manually

void (***suspend**)(*spi_flash_host_inst_t* *host)

Set flash in suspend status manually

```
esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16

Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO

Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

ESP_FLASH_SPEED_MIN

Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_CONFIG_CONF_BITS

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

Enumerations

```
enum esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator **ESP_FLASH_5MHZ**

The flash runs under 5MHz.

enumerator **ESP_FLASH_10MHZ**

The flash runs under 10MHz.

enumerator **ESP_FLASH_20MHZ**

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

API Reference - Partition Table

Header File

- `components/spi_flash/include/esp_partition.h`

Functions

`esp_partition_iterator_t esp_partition_find` (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, `const char *label`)

Find partition based on one or more parameters.

Parameters

- **type** –Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

Returns iterator which can be used to enumerate all the partitions found, or `NULL` if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

`const esp_partition_t *esp_partition_find_first` (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, `const char *label`)

Find first partition based on one or more parameters.

Parameters

- **type** –Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

Returns pointer to `esp_partition_t` structure, or `NULL` if no partition is found. This pointer is valid for the lifetime of the application.

`const esp_partition_t *esp_partition_get` (`esp_partition_iterator_t` iterator)

Get `esp_partition_t` structure for given partition.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

Returns pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

`esp_partition_iterator_t esp_partition_next` (`esp_partition_iterator_t` iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

Returns `NULL` if no partition was found, valid `esp_partition_iterator_t` otherwise.

`void esp_partition_iterator_release` (`esp_partition_iterator_t` iterator)

Release partition iterator.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. The iterator is allowed to be `NULL`, so it is not necessary to check its value before calling this function.

`const esp_partition_t *esp_partition_verify` (`const esp_partition_t *partition`)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from *esp_partition_get()*, as a test for equality.

Parameters **partition** –Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp_partition_t* structure in flash. This pointer is always valid for the lifetime of the application.

esp_err_t **esp_partition_read** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

Parameters

- **partition** –Pointer to partition structure obtained using *esp_partition_find_first* or *esp_partition_get*. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if *src_offset* exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using *esp_partition_erase_range* function.

Partitions marked with an encryption flag will automatically be written via the *spi_flash_write_encrypted()* function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the *spi_flash_write_encrypted()* function for more details. Unencrypted partitions do not have this restriction.

Note: Prior to writing to flash memory, make sure it has been erased with *esp_partition_erase_range* call.

Parameters

- **partition** –Pointer to partition structure obtained using *esp_partition_find_first* or *esp_partition_get*. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if *dst_offset* exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_read_raw** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

Note: This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write_raw** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Note: This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

Note: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

esp_err_t **esp_partition_erase_range** (const *esp_partition_t* *partition, size_t offset, size_t size)

Erase part of the partition.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

Returns ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or `dst` are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_mmap** (const *esp_partition_t* *partition, size_t offset, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where mapping should start.
- **size** –Size of the area to be mapped.
- **memory** –Memory space where the region should be mapped
- **out_ptr** –Output, pointer to the mapped memory region
- **out_handle** –Output, handle which should be used for `spi_flash_munmap` call

Returns ESP_OK, if successful

esp_err_t **esp_partition_get_sha256** (const *esp_partition_t* *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters

- **partition** –[in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** –[out] Returned SHA-256 digest for a given partition.

Returns

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn't contain a valid app image.
- ESP_FAIL: An allocation error occurred.

bool **esp_partition_check_identity** (const *esp_partition_t* *partition_1, const *esp_partition_t* *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters

- **partition_1** –[in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** –[in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns

- True: In case of the two firmware is equal.
- False: Otherwise

esp_err_t **esp_partition_register_external** (*esp_flash_t* *flash_chip, size_t offset, size_t size, const char *label, *esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const *esp_partition_t* **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp_flash_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp_partition* API.

Parameters

- **flash_chip** –Pointer to the structure identifying the flash chip
- **offset** –Address in bytes, where the partition starts
- **size** –Size of the partition in bytes
- **label** –Partition name
- **type** –One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** –One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** –[out] Output, if non-NULL, receives the pointer to the resulting *esp_partition_t* structure

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn't fit into the flash chip size

esp_err_t **esp_partition_deregister_external** (const *esp_partition_t* *partition)

Deregister the partition previously registered using *esp_partition_register_external*.

Parameters **partition** –pointer to the partition structure obtained from *esp_partition_register_external*,

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using *esp_partition_register_external* function.

Structures

struct **esp_partition_t**

partition information structure

This is not the format in flash, that format is *esp_partition_info_t*.

However, this is the format used by this API.

Public Members

esp_flash_t ***flash_chip**

SPI flash chip on which the partition resides

esp_partition_type_t **type**

partition type (app/data)

esp_partition_subtype_t **subtype**

partition subtype

uint32_t **address**
starting address of the partition in flash

uint32_t **size**
size of the partition, in bytes

char **label**[17]
partition label, zero-terminated ASCII string

bool **encrypted**
flag is set to true if partition is encrypted

Macros

ESP_PARTITION_SUBTYPE_OTA (i)
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef struct esp_partition_iterator_opaque_ ***esp_partition_iterator_t**
Opaque partition iterator type.

Enumerations

enum **esp_partition_type_t**
Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator **ESP_PARTITION_TYPE_APP**
Application partition type.

enumerator **ESP_PARTITION_TYPE_DATA**
Data partition type.

enumerator **ESP_PARTITION_TYPE_ANY**
Used to search for partitions with any type.

enum **esp_partition_subtype_t**
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

Note: These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**

Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**

Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**

OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**

OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**

OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**

OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**

OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**

OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**

OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**

OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**

OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**

OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**

OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**

OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**

OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**

OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**

OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**

OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**

Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**

Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**

OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**

PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**

NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**

COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**

Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**

Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**

FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**

SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**

Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

- [components/bootloader_support/include/esp_flash_encrypt.h](#)

Functions

static inline bool **esp_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update** (void)

esp_err_t **esp_flash_encrypt_region** (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

Note: This function resets RTC_WDT between operations with sectors.

Parameters

- **src_addr** –Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** –Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

Returns ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt** (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t **esp_get_flash_encryption_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

Returns

void **esp_flash_encryption_init_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

Note: This function is called automatically during app startup, it doesn't need to be called from the app.

esp_err_t **esp_flash_encryption_enable_secure_features** (void)

Set all secure eFuse features related to flash encryption.

Returns

- ESP_OK - Successfully

void **esp_flash_encryption_set_release_mode** (void)

Switches Flash Encryption from “Development” to “Release” .

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator **ESP_FLASH_ENC_MODE_DISABLED**

enumerator **ESP_FLASH_ENC_MODE_DEVELOPMENT**

enumerator **ESP_FLASH_ENC_MODE_RELEASE**

2.6.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. [here](#)) and in the official [SPIFFS github repository](#). The issue can be partially mitigated by the [SPIFFS configuration](#).
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
- When ESP32 experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official SPIFFS [FAQ](https://github.com/pellepl/spiffs/wiki/FAQ) <<https://github.com/pellepl/spiffs/wiki/FAQ>>.

Tools

spiffsgen.py `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_
→dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image`—the image size is automatically obtained from the project's partition table.

Due to the differences in structure between Make and CMake, it is important to note that:

- for Make `spiffs_create_partition_image` must be called from the project Makefile
- for CMake `spiffs_create_partition_image` must be called from one of the component CMake-Lists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` or `make flash` by specifying `FLASH_IN_PROJECT`. For example,

in Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image.

in Make:

```
dep:
    ...
```

(continues on next page)

(continued from previous page)

```
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see [storage/spiffsgen](#).

mkspiffs Another tool for creating SPIFFS partition images is [mkspiffs](#). Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size:** 4096 (standard for SPI Flash)
- **Page Size:** 256 (standard for SPI Flash)
- **Image Size:** Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset:** Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-S3 at offset 0x110000, run:

```
python esptool.py --chip esp32s3 --port [port] --baud [baud] write_flash -z_
→0x110000 spiffs.bin
```

Notes on which SPIFFS tool to use The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

See also

- [Partition Table documentation](#)

Application Example

An example of using SPIFFS is provided in the [storage/spiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- `components/spiffs/include/esp_spiffs.h`

Functions

esp_err_t **esp_vfs_spiffs_register** (const *esp_vfs_spiffs_conf_t* *conf)

Register and mount SPIFFS to VFS with given path prefix.

Parameters *conf* –Pointer to *esp_vfs_spiffs_conf_t* configuration structure

Returns

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

esp_err_t **esp_vfs_spiffs_unregister** (const char *partition_label)

Unregister and unmount SPIFFS from VFS

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`.

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

bool **esp_spiffs_mounted** (const char *partition_label)

Check if SPIFFS is mounted

Parameters *partition_label* –Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

Returns

- true if mounted
- false if not mounted

esp_err_t **esp_spiffs_format** (const char *partition_label)

Format the SPIFFS partition

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`.

Returns

- ESP_OK if successful
- ESP_FAIL on error

esp_err_t **esp_spiffs_info** (const char *partition_label, size_t *total_bytes, size_t *used_bytes)

Get information for SPIFFS

Parameters

- *partition_label* –Same label as passed to `esp_vfs_spiffs_register`
- *total_bytes* –[out] Size of the file system
- *used_bytes* –[out] Current used bytes in the file system

Returns

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

esp_err_t **esp_spiffs_check** (const char *partition_label)

Check integrity of SPIFFS

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

Structures

struct **esp_vfs_spiffs_conf_t**

Configuration structure for `esp_vfs_spiffs_register`.

Public Members

const char ***base_path**

File path prefix associated with the filesystem.

const char ***partition_label**

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t **max_files**

Maximum files that could be open at the same time.

bool **format_if_mount_failed**

If true, it will format the file system if it fails to mount.

2.6.8 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as `fopen` and `fprintf`, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. The VFS component will then call the function `open` of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

Synchronous input/output multiplexing Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

Non-socket VFS drivers If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

Note: `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- [peripherals/uart/uart_select](#)
- [system/select](#)

Socket VFS drivers A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32/vfs_lwip.c](#) for a reference socket driver implementation using LWIP.

Note: If you use `select()` for socket file descriptors only then you can enable the `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` option to reduce the code size and improve performance.

Note: Don't change the socket driver during an active `select()` call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html` does not exist in FS 2, FS 1 will *not* be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (`/`) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (`.`) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/../log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

File descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `newlib's sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

Standard IO streams (stdin, stdout, stderr)

If the `menuconfig` option `UART` for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use `UART0` or `UART1` for standard IO. By default, `UART0` is used with 115200 baud rate; TX pin is `GPIO1`; RX pin is `GPIO3`. These parameters can be changed in `menuconfig`.

Writing to `stdout` or `stderr` will send characters to the UART transmit FIFO. Reading from `stdin` will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (`'\n'`) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via `menuconfig`, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

Standard streams and FreeRTOS tasks `FILE` objects for `stdin`, `stdout`, and `stderr` are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in `newlib libc`. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `stdin`, `stdout`, and `stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default `stdin`, `stdout`, or `stderr` using `fclose` will close the FILE stream object, which will affect all other tasks.
- To change the default `stdin`, `stdout`, `stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin(_stdout, _stderr)` before creating the task.

Event fds

`eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC`, `EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and the write the `eventfd` in an interrupt handler.

Note that creating an `eventfd` with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

Functions

`ssize_t esp_vfs_write` (`struct _reent *r`, `int fd`, `const void *data`, `size_t size`)

These functions are to be used in `newlib syscall` table. They will be called by `newlib` when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (`struct _reent *r`, `int fd`, `off_t size`, `int mode`)

`ssize_t esp_vfs_read` (`struct _reent *r`, `int fd`, `void *dst`, `size_t size`)

`int esp_vfs_open` (`struct _reent *r`, `const char *path`, `int flags`, `int mode`)

`int esp_vfs_close` (`struct _reent *r`, `int fd`)

`int esp_vfs_fstat` (`struct _reent *r`, `int fd`, `struct stat *st`)

`int esp_vfs_stat` (`struct _reent *r`, `const char *path`, `struct stat *st`)

`int esp_vfs_link` (`struct _reent *r`, `const char *n1`, `const char *n2`)

`int esp_vfs_unlink` (`struct _reent *r`, `const char *path`)

`int esp_vfs_rename` (`struct _reent *r`, `const char *src`, `const char *dst`)

`int esp_vfs_utime` (`const char *path`, `const struct utimbuf *times`)

esp_err_t **esp_vfs_register** (const char *base_path, const *esp_vfs_t* *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

- **base_path** –file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/” . For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0” . In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** –Pointer to *esp_vfs_t*, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’ t assume ownership of this pointer.
- **ctx** –If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t **esp_vfs_register_fd_range** (const *esp_vfs_t* *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

- **vfs** –Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** –Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **min_fd** –The smallest file descriptor this VFS will use.
- **max_fd** –Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_register_with_id** (const *esp_vfs_t* *vfs, void *ctx, *esp_vfs_id_t* *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’ t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Parameters

- **vfs** –Pointer to *esp_vfs_t*. Meaning is the same as for esp_vfs_register().
- **ctx** –Pointer to context structure. Meaning is the same as for esp_vfs_register().
- **vfs_id** –Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t **esp_vfs_unregister** (const char *base_path)

Unregister a virtual filesystem for given path prefix

Parameters **base_path** –file prefix previously used in esp_vfs_register call

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’ t been registered

esp_err_t **esp_vfs_unregister_with_id** (*esp_vfs_id_t* vfs_id)

Unregister a virtual filesystem with the given index

Parameters **vfs_id** –The VFS ID returned by esp_vfs_register_with_id

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’ t been registered

esp_err_t **esp_vfs_register_fd** (*esp_vfs_id_t* vfs_id, int *fd)

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Parameters

- **vfs_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** –The registered file descriptor will be written to this address.

Returns `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

esp_err_t **esp_vfs_register_fd_with_local_fd** (*esp_vfs_id_t* vfs_id, int local_fd, bool permanent, int *fd)

Special function for registering another file descriptor with given `local_fd` for a VFS registered by `esp_vfs_register_with_id`.

Parameters

- **vfs_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **local_fd** –The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- **permanent** –Whether the fd should be treated as permanent (not removed after close())
- **fd** –The registered file descriptor will be written to this address.

Returns `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

esp_err_t **esp_vfs_unregister_fd** (*esp_vfs_id_t* vfs_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

Parameters

- **vfs_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** –File descriptor which should be unregistered.

Returns `ESP_OK` if the registration is successful, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

int **esp_vfs_select** (int nfd, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX `select()` for VFS.

Parameters

- **nfd** –Specifies the range of descriptors which should be checked. The first `nfd` descriptors will be checked in each set.
- **readfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** –If not NULL, then points to `timeval` structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

Returns The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

void **esp_vfs_select_triggered** (*esp_vfs_select_sem_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

Parameters **sem** –semaphore structure which was passed to the driver by the `start_select` call

void **esp_vfs_select_triggered_isr** (*esp_vfs_select_sem_t* sem, BaseType_t *woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

Parameters

- **sem** – semaphore structure which was passed to the driver by the `start_select` call
- **woken** – is set to `pdTRUE` if the function wakes up a task with higher priority

`ssize_t esp_vfs_pread` (int fd, void *dst, size_t size, off_t offset)

Implements the VFS layer of POSIX `pread()`

Parameters

- **fd** – File descriptor used for read
- **dst** – Pointer to the buffer where the output will be written
- **size** – Number of bytes to be read
- **offset** – Starting offset of the read

Returns A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

`ssize_t esp_vfs_pwrite` (int fd, const void *src, size_t size, off_t offset)

Implements the VFS layer of POSIX `pwrite()`

Parameters

- **fd** – File descriptor used for write
- **src** – Pointer to the buffer from where the output will be read
- **size** – Number of bytes to write
- **offset** – Starting offset of the write

Returns A positive return value indicates the number of bytes written. -1 is return on failure and `errno` is set accordingly.

Structures

struct `esp_vfs_select_sem_t`

VFS semaphore type for `select()`

Public Members

bool `is_sem_local`

type of “sem” is `SemaphoreHandle_t` when true, defined by socket driver otherwise

void *`sem`

semaphore instance

struct `esp_vfs_t`

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to `NULL`.

Public Members

int **flags**

ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (***write_p**)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (***write**)(int fd, const void *data, size_t size)

Write without context pointer

off_t (***lseek_p**)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (***lseek**)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (***read_p**)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (***read**)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (***pread_p**)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (***pread**)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (***pwrite_p**)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer

ssize_t (***pwrite**)(int fd, const void *src, size_t size, off_t offset)

pwrite without context pointer

int (***open_p**)(void *ctx, const char *path, int flags, int mode)

open with context pointer

int (***open**)(const char *path, int flags, int mode)

open without context pointer

int (***close_p**)(void *ctx, int fd)

close with context pointer

int (***close**)(int fd)

close without context pointer

int (***fstat_p**)(void *ctx, int fd, struct *stat* *st)

fstat with context pointer

int (***fstat**)(int fd, struct *stat* *st)

fstat without context pointer

int (***stat_p**)(void *ctx, const char *path, struct *stat* *st)

stat with context pointer

int (***stat**)(const char *path, struct *stat* *st)

stat without context pointer

int (***link_p**)(void *ctx, const char *n1, const char *n2)

link with context pointer

int (***link**)(const char *n1, const char *n2)

link without context pointer

int (***unlink_p**)(void *ctx, const char *path)

unlink with context pointer

int (***unlink**)(const char *path)

unlink without context pointer

int (***rename_p**)(void *ctx, const char *src, const char *dst)

rename with context pointer

int (***rename**)(const char *src, const char *dst)

rename without context pointer

DIR **(*opendir_p)**(void *ctx, const char *name)

opendir with context pointer

DIR **(*opendir)**(const char *name)

opendir without context pointer

struct dirent **(*readdir_p)**(void *ctx, DIR *pdir)

readdir with context pointer

struct dirent **(*readdir)**(DIR *pdir)

readdir without context pointer

int (***readdir_r_p**)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r with context pointer

int (***readdir_r**)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)

readdir_r without context pointer

long (***telldir_p**)(void *ctx, DIR *pdir)

telldir with context pointer

`long (*telldir)(DIR *pdir)`
tell`dir` without context pointer

`void (*seekdir_p)(void *ctx, DIR *pdir, long offset)`
seek`dir` with context pointer

`void (*seekdir)(DIR *pdir, long offset)`
seek`dir` without context pointer

`int (*closedir_p)(void *ctx, DIR *pdir)`
close`dir` with context pointer

`int (*closedir)(DIR *pdir)`
close`dir` without context pointer

`int (*mkdir_p)(void *ctx, const char *name, mode_t mode)`
mk`dir` with context pointer

`int (*mkdir)(const char *name, mode_t mode)`
mk`dir` without context pointer

`int (*rmdir_p)(void *ctx, const char *name)`
rm`dir` with context pointer

`int (*rmdir)(const char *name)`
rm`dir` without context pointer

`int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)`
fcnt`l` with context pointer

`int (*fcntl)(int fd, int cmd, int arg)`
fcnt`l` without context pointer

`int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)`
ioct`l` with context pointer

`int (*ioctl)(int fd, int cmd, va_list args)`
ioct`l` without context pointer

`int (*fsync_p)(void *ctx, int fd)`
fsyn`c` with context pointer

`int (*fsync)(int fd)`
fsyn`c` without context pointer

`int (*access_p)(void *ctx, const char *path, int amode)`
access with context pointer

int (***access**)(const char *path, int amode)

access without context pointer

int (***truncate_p**)(void *ctx, const char *path, off_t length)

truncate with context pointer

int (***truncate**)(const char *path, off_t length)

truncate without context pointer

int (***ftruncate_p**)(void *ctx, int fd, off_t length)

ftruncate with context pointer

int (***ftruncate**)(int fd, off_t length)

ftruncate without context pointer

int (***utime_p**)(void *ctx, const char *path, const struct utimbuf *times)

utime with context pointer

int (***utime**)(const char *path, const struct utimbuf *times)

utime without context pointer

int (***tcsetattr_p**)(void *ctx, int fd, int optional_actions, const struct termios *p)

tcsetattr with context pointer

int (***tcsetattr**)(int fd, int optional_actions, const struct termios *p)

tcsetattr without context pointer

int (***tcgetattr_p**)(void *ctx, int fd, struct termios *p)

tcgetattr with context pointer

int (***tcgetattr**)(int fd, struct termios *p)

tcgetattr without context pointer

int (***tcdrain_p**)(void *ctx, int fd)

tcdrain with context pointer

int (***tcdrain**)(int fd)

tcdrain without context pointer

int (***tcflush_p**)(void *ctx, int fd, int select)

tcflush with context pointer

int (***tcflush**)(int fd, int select)

tcflush without context pointer

int (***tcflow_p**)(void *ctx, int fd, int action)

tcflow with context pointer

int (***tcflow**)(int fd, int action)

tcflow without context pointer

pid_t (***tcgetsid_p**)(void *ctx, int fd)

tcgetsid with context pointer

pid_t (***tcgetsid**)(int fd)

tcgetsid without context pointer

int (***tcsendbreak_p**)(void *ctx, int fd, int duration)

tcsendbreak with context pointer

int (***tcsendbreak**)(int fd, int duration)

tcsendbreak without context pointer

esp_err_t (***start_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (***socket_select**)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (***stop_socket_select**)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (***stop_socket_select_isr**)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver

void (***get_socket_select_semaphore**)(void)

end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (***end_select**)(void *end_select_args)

get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS

Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX

Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT

Default value of flags member in *esp_vfs_t* structure.

ESP_VFS_FLAG_CONTEXT_PTR

Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

```
typedef int esp_vfs_id_t
```

Header File

- [components/vfs/include/esp_vfs_dev.h](#)

Functions

```
void esp_vfs_dev_uart_register (void)
```

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

```
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
```

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (‘ ‘ , LF) passed into stdin:

- **ESP_LINE_ENDINGS_CRLF**: convert CRLF to LF
- **ESP_LINE_ENDINGS_CR**: convert CR to LF
- **ESP_LINE_ENDINGS_LF**: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters mode –line endings expected on UART

```
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
```

Set the line endings to sent to UART.

This specifies the conversion between newlines (‘ ‘ , LF) on stdout and line endings sent over UART:

- **ESP_LINE_ENDINGS_CRLF**: convert LF to CRLF
- **ESP_LINE_ENDINGS_CR**: convert LF to CR
- **ESP_LINE_ENDINGS_LF**: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters mode –line endings to send to UART

int **esp_vfs_dev_uart_port_set_rx_line_endings** (int uart_num, esp_line_endings_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (‘ ‘ , LF) passed into stdin:

- **ESP_LINE_ENDINGS_CRLF**: convert CRLF to LF
- **ESP_LINE_ENDINGS_CR**: convert CR to LF
- **ESP_LINE_ENDINGS_LF**: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters

- **uart_num** –the UART number
- **mode** –line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by errno) have occurred.

int **esp_vfs_dev_uart_port_set_tx_line_endings** (int uart_num, esp_line_endings_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (‘ ‘ , LF) on stdout and line endings sent over UART:

- **ESP_LINE_ENDINGS_CRLF**: convert LF to CRLF
- **ESP_LINE_ENDINGS_CR**: convert LF to CR
- **ESP_LINE_ENDINGS_LF**: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

- **uart_num** –the UART number
- **mode** –line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by errno) have occurred.

void **esp_vfs_dev_uart_use_nonblocking** (int uart_num)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters **uart_num** –UART peripheral number

void **esp_vfs_dev_uart_use_driver** (int uart_num)

set VFS to use UART driver for reading and writing

Note: application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

Parameters **uart_num** –UART peripheral number

void **esp_vfs_usb_serial_jtag_use_driver** (void)
set VFS to use USB-SERIAL-JTAG driver for reading and writing

Note: application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

void **esp_vfs_usb_serial_jtag_use_nonblocking** (void)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Header File

- [components/vfs/include/esp_vfs_eventfd.h](#)

Functions

esp_err_t **esp_vfs_eventfd_register** (const *esp_vfs_eventfd_config_t* *config)

Registers the event vfs.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t **esp_vfs_eventfd_unregister** (void)

Unregisters the event vfs.

Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn't been registered

int **eventfd** (unsigned int initval, int flags)

Structures

struct **esp_vfs_eventfd_config_t**

Eventfd vfs initialization settings.

Public Members

size_t **max_fds**

The maximum number of eventfds supported

Macros

EFD_SUPPORT_ISR

ESP_VFS_EVENTD_CONFIG_DEFAULT ()

2.6.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32-S3 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in *FAT filesystem*.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the [storage/wear_levelling](#) directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the [storage/wear_levelling/README.md](#) file for more information.

High level API Reference

Header Files

- [fatfs/vfs/esp_vfs_fat.h](#)

Functions

esp_err_t **esp_vfs_fat_spiflash_mount** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config, *wl_handle_t* *wl_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

Parameters

- **base_path** –path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** –label of the partition which should be used
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **wl_handle** –[out] wear levelling driver handle

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max_files**

Max number of open files.

size_t **allocation_unit_size**

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t **esp_vfs_fat_spiflash_unmount** (const char *base_path, *wl_handle_t* wl_handle)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount`.

Parameters

- **base_path** –path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** –wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_spiflash_mount` hasn't been called

Mid level API Reference

Header File

- `components/wear_levelling/include/wear_levelling.h`

Functions

esp_err_t **wl_mount** (const *esp_partition_t* *partition, *wl_handle_t* *out_handle)

Mount WL for defined partition.

Parameters

- **partition** –that will be used for access
- **out_handle** –handle of the WL instance

Returns

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

esp_err_t **wl_unmount** (*wl_handle_t* handle)

Unmount WL for defined partition.

Parameters **handle** –WL partition handle

Returns

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

esp_err_t **wl_erase_range** (*wl_handle_t* handle, *size_t* start_addr, *size_t* size)

Erase part of the WL storage.

Parameters

- **handle** –WL handle that are related to the partition
- **start_addr** –Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(...)`.

Returns

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

esp_err_t **wl_write** (*wl_handle_t* handle, *size_t* dest_addr, const void *src, *size_t* size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

Note: Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

Parameters

- **handle** –WL handle that are related to the partition
- **dest_addr** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

Returns

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)`

Read data from the WL storage.

Parameters

- **handle** –WL module instance that was initialized before
- **dest** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_addr** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

Returns

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

`size_t wl_size (wl_handle_t handle)`

Get size of the WL storage.

Parameters **handle** –WL module handle that was initialized before

Returns usable size, in bytes

`size_t wl_sector_size (wl_handle_t handle)`

Get sector size of the WL instance.

Parameters **handle** –WL module handle that was initialized before

Returns sector size, in bytes

Macros

WL_INVALID_HANDLE

Type Definitions

```
typedef int32_t wl_handle_t
```

wear levelling handle

Code examples for this API section are provided in the [storage](#) directory of ESP-IDF examples.

2.7 System API

2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.

2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-S3's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

- offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.
- offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
- offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
- ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32s3 image_info build/app.bin
```

```
esptool.py v2.3.1

↵0) load
```

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.
4. If the `hash_appended` field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.
5. If the options `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
 - version word (4 bytes),
 - signature data (64 bytes).

Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `secure_version` - see [Anti-rollback](#).
- `version` - see [App version](#). *
- `project_name` is filled from `PROJECT_NAME`. *
- `time` and `date` - compile time and date.
- `idf_ver` - version of ESP-IDF. *
- `app_elf_sha256` - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↵app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

API Reference

Header File

- `components/bootloader_support/include/esp_app_format.h`

Structures

struct **esp_image_header_t**

Main header of binary image.

Public Members

uint8_t **magic**

Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t **segment_count**

Count of memory segments

uint8_t **spi_mode**

flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t **spi_speed**

flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t **spi_size**

flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t **entry_addr**

Entry address

uint8_t **wp_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t **spi_pin_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t **chip_id**

Chip identification number

uint8_t **min_chip_rev**

Minimum chip revision supported by image

uint8_t **reserved**[8]

Reserved bytes in additional header space, currently unused

uint8_t **hash_appended**

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct **esp_image_segment_header_t**

Header of binary image segment.

Public Members

uint32_t **load_addr**
Address of segment

uint32_t **data_len**
Length of data

struct **esp_app_desc_t**
Description about application.

Public Members

uint32_t **magic_word**
Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t **secure_version**
Secure version

uint32_t **reserv1**[2]
reserv1

char **version**[32]
Application version

char **project_name**[32]
Project name

char **time**[16]
Compile time

char **date**[16]
Compile date

char **idf_ver**[32]
Version IDF

uint8_t **app_elf_sha256**[32]
sha256 of elf file

uint32_t **reserv2**[20]
reserv2

Macros

ESP_IMAGE_HEADER_MAGIC
The magic word for the *esp_image_header_t* structure.

ESP_IMAGE_MAX_SEGMENTS

Max count of segments in the image.

ESP_APP_DESC_MAGIC_WORD

The magic word for the `esp_app_desc` structure that is in DROM.

Enumerations

enum **esp_chip_id_t**

ESP chip ID.

Values:

enumerator **ESP_CHIP_ID_ESP32**

chip ID: ESP32

enumerator **ESP_CHIP_ID_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP_CHIP_ID_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP_CHIP_ID_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP_CHIP_ID_ESP32H2**

chip ID: ESP32-H2

enumerator **ESP_CHIP_ID_INVALID**

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

enum **esp_image_spi_mode_t**

SPI flash mode, used in [esp_image_header_t](#).

Values:

enumerator **ESP_IMAGE_SPI_MODE_QIO**

SPI mode QIO

enumerator **ESP_IMAGE_SPI_MODE_QOUT**

SPI mode QOUT

enumerator **ESP_IMAGE_SPI_MODE_DIO**

SPI mode DIO

enumerator **ESP_IMAGE_SPI_MODE_DOUT**

SPI mode DOUT

enumerator **ESP_IMAGE_SPI_MODE_FAST_READ**

SPI mode FAST_READ

enumerator **ESP_IMAGE_SPI_MODE_SLOW_READ**

SPI mode SLOW_READ

enum **esp_image_spi_freq_t**

SPI flash clock frequency.

Values:

enumerator **ESP_IMAGE_SPI_SPEED_40M**

SPI clock frequency 40 MHz

enumerator **ESP_IMAGE_SPI_SPEED_26M**

SPI clock frequency 26 MHz

enumerator **ESP_IMAGE_SPI_SPEED_20M**

SPI clock frequency 20 MHz

enumerator **ESP_IMAGE_SPI_SPEED_80M**

SPI clock frequency 80 MHz

enum **esp_image_flash_size_t**

Supported SPI flash sizes.

Values:

enumerator **ESP_IMAGE_FLASH_SIZE_1MB**

SPI flash size 1 MB

enumerator **ESP_IMAGE_FLASH_SIZE_2MB**

SPI flash size 2 MB

enumerator **ESP_IMAGE_FLASH_SIZE_4MB**

SPI flash size 4 MB

enumerator **ESP_IMAGE_FLASH_SIZE_8MB**

SPI flash size 8 MB

enumerator **ESP_IMAGE_FLASH_SIZE_16MB**

SPI flash size 16 MB

enumerator **ESP_IMAGE_FLASH_SIZE_32MB**

SPI flash size 32 MB

enumerator **ESP_IMAGE_FLASH_SIZE_64MB**

SPI flash size 64 MB

enumerator **ESP_IMAGE_FLASH_SIZE_128MB**

SPI flash size 128 MB

enumerator **ESP_IMAGE_FLASH_SIZE_MAX**

SPI flash size MAX

2.7.2 Application Level Tracing

Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32-S3 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behaviour analysis, see [System Behavior Analysis with SEGGER System View](#)

API Reference

Header File

- [components/app_trace/include/esp_app_trace.h](#)

Functions

`esp_err_t esp_apptrace_init` (void)

Initializes application tracing module.

Note: Should be called before any `esp_apptrace_xxx` call.

Returns ESP_OK on success, otherwise see `esp_err_t`

void `esp_apptrace_down_buffer_config` (uint8_t *buf, uint32_t size)

Configures down buffer.

Note: Needs to be called before initiating any data transfer using `esp_apptrace_buffer_get` and `esp_apptrace_write`. This function does not protect internal data by lock.

Parameters

- **buf** –Address of buffer to use for down channel (host to target) data.
- **size** –Size of the buffer.

uint8_t *`esp_apptrace_buffer_get` (`esp_apptrace_dest_t` dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. After data in buffer are ready to be sent off `esp_apptrace_buffer_put` must be called to indicate it.

Parameters

- **dest** –Indicates HW interface to send data.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

`esp_err_t esp_apptrace_buffer_put` (`esp_apptrace_dest_t` dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by `esp_apptrace_buffer_get`.

Parameters

- **dest** –Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apptrace_buffer_get`.

- **ptr** –Address of trace buffer to release. Should be the value returned by call to `esp_appttrace_buffer_get`.
- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t `esp_appttrace_write` (*esp_appttrace_dest_t* dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

Parameters

- **dest** –Indicates HW interface to send data.
- **data** –Address of data to write to trace buffer.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

int `esp_appttrace_vprintf_to` (*esp_appttrace_dest_t* dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to sent log messages to host via specified HW interface.

Parameters

- **dest** –Indicates HW interface to send data.
- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
- **fmt** –Address of format string.
- **ap** –List of arguments.

Returns Number of bytes written.

int `esp_appttrace_vprintf` (const char *fmt, va_list ap)

vprintf-like function to sent log messages to host.

Parameters

- **fmt** –Address of format string.
- **ap** –List of arguments.

Returns Number of bytes written.

esp_err_t `esp_appttrace_flush` (*esp_appttrace_dest_t* dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

Parameters

- **dest** –Indicates HW interface to flush data on.
- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t `esp_appttrace_flush_nolock` (*esp_appttrace_dest_t* dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is special version of `esp_appttrace_flush` which should be called from panic handler.

Parameters

- **dest** –Indicates HW interface to flush data on.
- **min_sz** –Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

esp_err_t `esp_appttrace_read` (*esp_appttrace_dest_t* dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

Parameters

- **dest** –Indicates HW interface to read the data on.
- **data** –Address of buffer to put data from trace buffer.

- **size** –Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

uint8_t ***esp_appttrace_down_buffer_get** (*esp_appttrace_dest_t* dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. After data in buffer are processed esp_appttrace_down_buffer_put must be called to indicate it.

Parameters

- **dest** –Indicates HW interface to receive data.
- **size** –Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns non-NULL on success, otherwise NULL.

esp_err_t **esp_appttrace_down_buffer_put** (*esp_appttrace_dest_t* dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by esp_appttrace_down_buffer_get.

Parameters

- **dest** –Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_appttrace_down_buffer_get.
- **ptr** –Address of trace buffer to release. Should be the value returned by call to esp_appttrace_down_buffer_get.
- **tmo** –Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

bool **esp_appttrace_host_is_connected** (*esp_appttrace_dest_t* dest)

Checks whether host is connected.

Parameters **dest** –Indicates HW interface to use.

Returns true if host is connected, otherwise false

void ***esp_appttrace_fopen** (*esp_appttrace_dest_t* dest, const char *path, const char *mode)

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **path** –Path to file.
- **mode** –Mode string. See fopen for details.

Returns non zero file handle on success, otherwise 0

int **esp_appttrace_fclose** (*esp_appttrace_dest_t* dest, void *stream)

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by esp_appttrace_fopen.

Returns Zero on success, otherwise non-zero. See fclose for details.

size_t **esp_appttrace_fwrite** (*esp_appttrace_dest_t* dest, const void *ptr, size_t size, size_t nmemb, void *stream)

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **ptr** –Address of data to write.
- **size** –Size of an item.
- **nmemb** –Number of items to write.

- **stream** –File handle returned by `esp_apprace_fopen`.

Returns Number of written items. See `fwrite` for details.

size_t **esp_apprace_fread** (*esp_apprace_dest_t* dest, void *ptr, size_t size, size_t nmemb, void *stream)

Read file on host. This function has the same semantic as ‘`fread`’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **ptr** –Address to store read data.
- **size** –Size of an item.
- **nmemb** –Number of items to read.
- **stream** –File handle returned by `esp_apprace_fopen`.

Returns Number of read items. See `fread` for details.

int **esp_apprace_fseek** (*esp_apprace_dest_t* dest, void *stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as ‘`fseek`’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by `esp_apprace_fopen`.
- **offset** –Offset. See `fseek` for details.
- **whence** –Position in file. See `fseek` for details.

Returns Zero on success, otherwise non-zero. See `fseek` for details.

int **esp_apprace_ftell** (*esp_apprace_dest_t* dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as ‘`ftell`’ except for the first argument.

Parameters

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by `esp_apprace_fopen`.

Returns Current position in file. See `ftell` for details.

int **esp_apprace_fstop** (*esp_apprace_dest_t* dest)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Parameters **dest** –Indicates HW interface to use.

Returns `ESP_OK` on success, otherwise see `esp_err_t`

void **esp_gcov_dump** (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum **esp_apprace_dest_t**

Application trace data destinations bits.

Values:

enumerator **ESP_APPTRACE_DEST_JTAG**

JTAG destination.

enumerator **ESP_APPTRACE_DEST_TRAX**

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator **ESP_APPTRACE_DEST_UART0**

UART0 destination.

enumerator **ESP_APPTRACE_DEST_MAX**

enumerator **ESP_APPTRACE_DEST_NUM**

Header File

- [components/app_trace/include/esp_sysview_trace.h](#)

Functions

static inline *esp_err_t* **esp_sysview_flush** (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

Parameters **tmo** –Timeout for operation (in us). Use **ESP_APPTRACE_TMO_INFINITE** to wait indefinitely.

Returns **ESP_OK**.

int **esp_sysview_vprintf** (const char *format, va_list args)

vprintf-like function to sent log messages to the host.

Parameters

- **format** –Address of format string.
- **args** –List of arguments.

Returns Number of bytes written.

esp_err_t **esp_sysview_heap_trace_start** (uint32_t tmo)

Starts SystemView heap tracing.

Parameters **tmo** –Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

Returns **ESP_OK** on success, **ESP_ERR_TIMEOUT** if operation has been timed out.

esp_err_t **esp_sysview_heap_trace_stop** (void)

Stops SystemView heap tracing.

Returns **ESP_OK**.

void **esp_sysview_heap_trace_alloc** (void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

Parameters

- **addr** –Address of allocated block.
- **size** –Size of allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be **CONFIG_HEAP_TRACING_STACK_DEPTH**.

void **esp_sysview_heap_trace_free** (void *addr, const void *callers)

Sends heap de-allocation event to the host.

Parameters

- **addr** –Address of de-allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be **CONFIG_HEAP_TRACING_STACK_DEPTH**.

2.7.3 The Async memcpy API

Overview

ESP32-S3 has a DMA engine which can help to offload internal memory copy operations from the CPU in a asynchronous way.

The async memcopy API wraps all DMA configurations and operations, the signature of `esp_async_memcopy()` is almost the same to the standard libc one.

Thanks to the benefit of the DMA, we don't have to wait for each memory copy to be done before we issue another memcopy request. By the way, it's still possible to know when memcopy is finished by listening in the memcopy callback function.

Configure and Install driver

`esp_async_memcopy_install()` is used to install the driver with user's configuration. Please note that async memcopy has to be called with the handle returned from `esp_async_memcopy_install()`.

Driver configuration is described in `async_memcopy_config_t`: `backlog`: This is used to configured the maximum number of DMA operation that can be working at the background at the same time. `sram_trans_align`: Declare SRAM alignment for both data address and copy size, set to zero if the data has no restriction in alignment. If set to a quadruple value (i.e. 4X), the driver will enable the burst mode internally, which is helpful for some performance related application. `psram_trans_align`: Declare PSRAM alignment for both data address and copy size. User has to give it a valid value (only 16, 32, 64 are supported) if the destination of memcopy is located in PSRAM. The default alignment (i.e. 16) will be applied if it's set to zero. Internally, the driver configures the size of block used by DMA to access PSRAM, according to the alignment. `flags`: This is used to enable some special driver features.

`ASYNC_MEMCOPY_DEFAULT_CONFIG` provides a default configuration, which specifies the backlog to 8.

```
async_memcopy_config_t config = ASYNC_MEMCOPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 16;
async_memcopy_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcopy_install(&config, &driver)); // install driver,
↳return driver handle
```

Send memory copy request

`esp_async_memcopy()` is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the libc version of `memcpy`, user should also pass a callback to `esp_async_memcopy()`, if it's necessary to be notified when the memory copy is done. The callback is executed in the ISR context, make sure you won't violate the the restriction applied to ISR handler.

Besides that, the callback function should reside in IRAM space by applying `IRAM_ATTR` attribute. The prototype of the callback function is `async_memcopy_isr_cb_t`, please note that, the callback function should return true if it wakes up a high priority task by some API like `xSemaphoreGiveFromISR()`.

```
Semphr_Handle_t semphr; //already initialized in somewhere

// Callback implementation, running in ISR context
static IRAM_ATTR bool my_async_memcpy_cb(async_memcopy_t mcp_hdl, async_memcopy_
↳event_t *event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    SemphrGiveInISR(semphr, &high_task_wakeup); // high_task_wakeup set to pdTRUE
↳if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_
↳memcpy_cb, my_semaphore));
```

(continues on next page)

(continued from previous page)

```
//Do something else here
SemphrTake(my_semaphore, ...); //wait until the buffer copy is done
```

Uninstall driver (optional)

`esp_async_memcpy_uninstall()` is used to uninstall asynchronous memcpy driver. It's not necessary to uninstall the driver after each memcpy operation. If you know your application won't use this driver anymore, then this API can recycle the memory for you.

API Reference

Header File

- `components/esp_hw_support/include/esp_async_memcpy.h`

Functions

`esp_err_t esp_async_memcpy_install` (const `async_memcpy_config_t` *config, `async_memcpy_t` *asmcp)

Install async memcpy driver.

Parameters

- **config** –[in] Configuration of async memcpy
- **asmcp** –[out] Handle of async memcpy that returned from this API. If driver installation is failed, asmcp would be assigned to NULL.

Returns

- `ESP_OK`: Install async memcpy driver successfully
- `ESP_ERR_INVALID_ARG`: Install async memcpy driver failed because of invalid argument
- `ESP_ERR_NO_MEM`: Install async memcpy driver failed because out of memory
- `ESP_FAIL`: Install async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy_uninstall` (`async_memcpy_t` asmcp)

Uninstall async memcpy driver.

Parameters **asmcp** –[in] Handle of async memcpy driver that returned from `esp_async_memcpy_install`

Returns

- `ESP_OK`: Uninstall async memcpy driver successfully
- `ESP_ERR_INVALID_ARG`: Uninstall async memcpy driver failed because of invalid argument
- `ESP_FAIL`: Uninstall async memcpy driver failed because of other error

`esp_err_t esp_async_memcpy` (`async_memcpy_t` asmcp, void *dst, void *src, size_t n, `async_memcpy_isr_cb_t` cb_isr, void *cb_args)

Send an asynchronous memory copy request.

Note: The callback function is invoked in interrupt context, never do blocking jobs in the callback.

Parameters

- **asmcp** –[in] Handle of async memcpy driver that returned from `esp_async_memcpy_install`
- **dst** –[in] Destination address (copy to)
- **src** –[in] Source address (copy from)
- **n** –[in] Number of bytes to copy
- **cb_isr** –[in] Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.

- **cb_args** –[in] User defined argument to be passed to the callback function

Returns

- **ESP_OK**: Send memory copy request successfully
- **ESP_ERR_INVALID_ARG**: Send memory copy request failed because of invalid argument
- **ESP_FAIL**: Send memory copy request failed because of other error

Structures

struct **async_memcpy_event_t**

Type of async memcpy event object.

Public Members

void ***data**

Event data

struct **async_memcpy_config_t**

Type of async memcpy configuration.

Public Members

uint32_t **backlog**

Maximum number of streams that can be handled simultaneously

size_t **sram_trans_align**

DMA transfer alignment (both in size and address) for SRAM memory

size_t **psram_trans_align**

DMA transfer alignment (both in size and address) for PSRAM memory

uint32_t **flags**

Extra flags to control async memcpy feature

Macros

ASYNC_MEMCPY_DEFAULT_CONFIG ()

Default configuration for async memcpy.

Type Definitions

typedef struct async_memcpy_context_t ***async_memcpy_t**

Type of async memcpy handle.

typedef bool (***async_memcpy_isr_cb_t**)(*async_memcpy_t* mcp_hdl, *async_memcpy_event_t* *event, void *cb_args)

Type of async memcpy interrupt callback function.

Note: User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

- Param mcp_hdl** Handle of async memcopy
Param event Event object, which contains related data, reserved for future
Param cb_args User defined arguments, passed from `esp_async_memcopy` function
Return Whether a high priority task is woken up by the callback function

2.7.4 Console

ESP-IDF provides `console` component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

Note: These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data can not be used together with the line editing library. If you see `[\n` or similar escape sequence when running `system/console` example instead of a command prompt (e.g. `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and `idf_monitor.py` (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

Configuration `Linenoise` library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

linenoiseClearScreen() Clear terminal screen using an escape sequence and position the cursor at the top left corner.

linenoiseSetMultiLine() Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

linenoiseAllowEmpty() Set whether `linenoise` library will return a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.

linenoiseSetMaxLineLen() Set maximum length of the line for `linenoise` library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4kB.

Main loop

linenoise() In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user's key presses and returns completed line once 'enter' key is pressed. As such, it handles the 'read' part of the loop.

linenoiseFree() This function must be called to release the command line buffer obtained from `linenoise()` function.

Hints and completions

linenoiseSetCompletionCallback() When user presses 'tab' key, `linenoise` library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired. `console` component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

linenoiseAddCompletion() Function to be called by completion callback to inform the library about possible completions of the currently typed command.

linenoiseSetHintsCallback() Whenever user input changes, `linenoise` invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

linenoiseSetFreeHintsCallback() If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

History

linenoiseHistorySetMaxLen() This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

linenoiseHistoryAdd() `Linenoise` does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

linenoiseHistorySave() Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

linenoiseHistoryLoad() Counterpart to `linenoiseHistorySave()`, loads history from a file.

linenoiseHistoryFree() Releases memory used to store command history. Call this function when done working with `linenoise` library.

Splitting of command line into arguments

`console` component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using \ (backslash) character.
- Other escape sequences which are recognized are \\ (which produces literal backslash) and \", which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123 456, def]`
- ``a\ b\\c\"` → `[a b\c"]`

Argument parsing

For argument parsing, `console` component includes `argtable3` library. Please see [tutorial](#) for an introduction to `argtable3`. Github repository also includes [examples](#).

Command registration and dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses `Argtable3` for argument parsing, hint text can be generated automatically by providing a pointer to `argtable` argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

`esp_console_run()` This function takes the command line string, splits it into `argc/argv` argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.

`esp_console_register_help_command()` Adds `help` command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

`esp_console_get_completion()` Callback function to be used with `linenoiseSetCompletionCallback()` from `linenoise` library. Provides completions to `linenoise` based on the list of registered commands.

`esp_console_get_hint()` Callback function to be used with `linenoiseSetHintsCallback()` from `linenoise` library. Provides argument hints for registered commands to `linenoise`.

Initialize console REPL environment

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in `init` state until you call `esp_console_start_repl()`.

Application Example

Example application illustrating usage of the `console` component is available in [system/console](#) directory. This example shows how to initialize UART and VFS functions, set up `linenoise` library, read and handle commands from UART, and store command history in Flash. See [README.md](#) in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, [peripherals/i2c/i2c_tools](#), [wifi/iperf](#).

API Reference

Header File

- [components/console/esp_console.h](#)

Functions

esp_err_t **esp_console_init** (const *esp_console_config_t* *config)

initialize console module

Note: Call this once before using other console module features

Parameters **config** –console configuration

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

esp_err_t **esp_console_deinit** (void)

de-initialize console module

Note: Call this once when done using console module functions

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

esp_err_t **esp_console_cmd_register** (const *esp_console_cmd_t* *cmd)

Register console command.

Parameters **cmd** –pointer to the command description; can point to a temporary value

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

esp_err_t **esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

Parameters

- **cmdline** –command line (command name followed by a number of arguments)
- **cmd_ret** –[out] return code from the command (set if command was run)

Returns

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn't registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn't called

size_t **esp_console_split_argv** (char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```

* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*

```

Note: Pointers to at most `argv_size - 1` arguments are returned in `argv` array. The pointer after the last one (i.e. `argv[argc]`) is set to `NULL`.

Parameters

- **line** –pointer to buffer to parse; it is modified in place
- **argv** –array where the pointers to arguments are written
- **argv_size** –number of elements in `argv_array` (max. number of arguments)

Returns number of arguments found (`argc`)

void **esp_console_get_completion** (const char *buf, *linenoiseCompletions* *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

Parameters

- **buf** –the string typed by the user
- **lc** –linenoiseCompletions to be filled in

const char ***esp_console_get_hint** (const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because `linenoiseHintsCallback` is defined as returning a `char*` instead of `const char*`.

Parameters

- **buf** –line typed by the user
- **color** –[out] ANSI color code to be used when displaying the hint
- **bold** –[out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. `linenoiseSetFreeHintsCallback` should not be used).

esp_err_t **esp_console_register_help_command** (void)

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE`, if `esp_console_init` wasn't called

esp_err_t **esp_console_new_repl_uart** (const *esp_console_dev_uart_config_t* *dev_config, const *esp_console_repl_config_t* *repl_config, *esp_console_repl_t* **ret_repl)

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

Note: This is a all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
 - Configures the stdin/stdout to go through the UART driver
 - Initializes `linenoise`
 - Spawn new thread to run REPL in the background
-

Parameters

- **dev_config** `–[in]` UART device configuration
- **repl_config** `–[in]` REPL configuration
- **ret_repl** `–[out]` return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

`esp_err_t esp_console_new_repl_usb_cdc` (const `esp_console_dev_usb_cdc_config_t` *dev_config, const `esp_console_repl_config_t` *repl_config, `esp_console_repl_t` **ret_repl)

Establish a console REPL environment over USB CDC.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

Note: This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes `linenoise`
 - Spawn new thread to run REPL in the background
-

Parameters

- **dev_config** `–[in]` USB CDC configuration
- **repl_config** `–[in]` REPL configuration
- **ret_repl** `–[out]` return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

`esp_err_t esp_console_start_repl` (`esp_console_repl_t` *repl)

Start REPL environment.

Note: Once the REPL got started, it won't be stopped until user call `repl->del(repl)` to destroy the REPL environment.

Parameters **repl** `–[in]` REPL handle returned from `esp_console_new_repl_XXX`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

struct **esp_console_config_t**

Parameters for console initialization.

Public Members

size_t **max_cmdline_length**

length of command line buffer, in bytes

size_t **max_cmdline_args**

maximum number of command line arguments to parse

int **hint_color**

ASCII color code of hint text.

int **hint_bold**

Set to 1 to print hint text in bold.

struct **esp_console_repl_config_t**

Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t **max_history_len**

maximum length for the history

const char ***history_save_path**

file path used to save history commands, set to NULL won't save to file system

uint32_t **task_stack_size**

repl task stack size

uint32_t **task_priority**

repl task priority

const char ***prompt**

prompt (NULL represents default: "esp> ")

size_t **max_cmdline_length**

maximum length of a command line. If 0, default value will be used

struct **esp_console_dev_uart_config_t**

Parameters for console device: UART.

Public Members

int **channel**

UART channel number (count from zero)

int **baud_rate**

Communication baud rate.

int **tx_gpio_num**

GPIO number for TX path, -1 means using default one.

int **rx_gpio_num**

GPIO number for RX path, -1 means using default one.

struct **esp_console_dev_usb_cdc_config_t**

Parameters for console device: USB CDC.

Note: It' s an empty structure for now, reserved for future

struct **esp_console_cmd_t**

Console command description.

Public Members

const char ***command**

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

const char ***help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to `esp_console_deinit`. If not set, the command will not be listed in 'help' output.

const char ***hint**

Hint text, usually lists possible arguments. If set to NULL, and 'argtable' field is non-NULL, hint will be generated automatically

esp_console_cmd_func_t **func**

Pointer to a function which implements the command.

void ***argtable**

Array or structure of pointers to `arg_xxx` structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an `arg_end`. Only used for the duration of `esp_console_cmd_register` call.

struct **esp_console_repl_s**

Console REPL base structure.

Public Members

esp_err_t (*del)(*esp_console_repl_t* *repl)

Delete console REPL environment.

Param repl [in] REPL handle returned from `esp_console_new_repl_xxx`

Return

- ESP_OK on success
- ESP_FAIL on errors

Macros

ESP_CONSOLE_CONFIG_DEFAULT ()

Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT ()

Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT ()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT ()

Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (***esp_console_cmd_func_t**)(int argc, char **argv)

Console command main function.

Param argc number of arguments

Param argv array with argc entries, each pointing to a zero-terminated string argument

Return console command return code, 0 indicates “success”

typedef struct *esp_console_repl_s* **esp_console_repl_t**

Type defined for console REPL.

2.7.5 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware description

The ESP32-S3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see *ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]. Some eFuse bits are available for user applications.

ESP32-S3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used entirely for system purposes;
- EFUSE_BLK2 is used entirely for system purposes;

- EFUSE_BLK3 or EFUSE_BLK_USER_DATA can be used for user purposes;
- EFUSE_BLK4 or EFUSE_BLK_KEY0 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK5 or EFUSE_BLK_KEY1 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK6 or EFUSE_BLK_KEY2 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK7 or EFUSE_BLK_KEY3 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK8 or EFUSE_BLK_KEY4 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK9 or EFUSE_BLK_KEY5 can be used as key (for secure_boot or flash_encryption) or for user purposes;
- EFUSE_BLK10 or EFUSE_BLK_SYS_DATA_PART2 is reserved for system purposes.

Each block is divided into 8 32-bits registers.

eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool *efuse_table_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility will check with the *common* CSV file.

CSV files:

- common (*esp_efuse_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by [CONFIG_EFUSE_CUSTOM_TABLE](#)) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_
↪count(1..256), comment
```

Individual params in CSV file the following meanings:

field_name Name of field. The prefix *ESP_EFUSE_* will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see *MAC_FACTORY* field in the common table). The *field_name* supports structured format using *.* to show that the field belongs to another field (see *WR_DIS* and *RD_DIS* in the common table).

efuse_block Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK10.

bit_start Start bit number (0..255). The *bit_start* field can be omitted. In this case, it will be set to *bit_start* + *bit_count* from the previous record, if it has the same *efuse_block*. Otherwise (if *efuse_block* is different, or this is the first entry), an error will be generated.

bit_count The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be *MAX_BLK_LEN* in this case, the field length will have the maximum block length.

comment This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field will available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

Structured efuse fields

<code>WR_DIS,</code>	<code>EFUSE_BLK0,</code>	<code>0,</code>	<code>32,</code>	<code>Write protection</code>
<code>WR_DIS.RD_DIS,</code>	<code>EFUSE_BLK0,</code>	<code>0,</code>	<code>1,</code>	<code>Write protection for</code>
<code>↔RD_DIS</code>				
<code>WR_DIS.FIELD_1,</code>	<code>EFUSE_BLK0,</code>	<code>1,</code>	<code>1,</code>	<code>Write protection for</code>
<code>↔FIELD_1</code>				
<code>WR_DIS.FIELD_2,</code>	<code>EFUSE_BLK0,</code>	<code>2,</code>	<code>4,</code>	<code>Write protection for</code>
<code>↔FIELD_2 (includes B1 and B2)</code>				
<code>WR_DIS.FIELD_2.B1,</code>	<code>EFUSE_BLK0,</code>	<code>2,</code>	<code>2,</code>	<code>Write protection for</code>
<code>↔FIELD_2.B1</code>				
<code>WR_DIS.FIELD_2.B2,</code>	<code>EFUSE_BLK0,</code>	<code>4,</code>	<code>2,</code>	<code>Write protection for</code>
<code>↔FIELD_2.B2</code>				
<code>WR_DIS.FIELD_3,</code>	<code>EFUSE_BLK0,</code>	<code>5,</code>	<code>1,</code>	<code>Write protection for</code>
<code>↔FIELD_3</code>				
<code>WR_DIS.FIELD_3.ALIAS,</code>	<code>EFUSE_BLK0,</code>	<code>5,</code>	<code>1,</code>	<code>Write protection for</code>
<code>↔FIELD_3 (just a alias for WR_DIS.FIELD_3)</code>				
<code>WR_DIS.FIELD_4,</code>	<code>EFUSE_BLK0,</code>	<code>7,</code>	<code>1,</code>	<code>Write protection for</code>
<code>↔FIELD_4</code>				

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and can not be out of the parent' s range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The IDF names for structured efuse fields should be unique. The `efuse_table_gen` tool will generate the final names where the dot will be replaced by `_`. The names for using in IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.

efuse_table_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (`esp_efuse_table.csv`). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a *common* files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32s3/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32s3` create:

- `esp_efuse_table.c` file.
- In `include` folder `esp_efuse_table.c` file.

To generate a `custom` files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32s3/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_
↳custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In `include` folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

Supported coding scheme

Coding schemes are used to protect against data corruption. ESP32-S3 supports two coding schemes:

- None. EFUSE_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE_BLK0 can be written many times.
- RS. EFUSE_BLK1 - EFUSE_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software will encode the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use the `batch writing` mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as "1".
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as "1".
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.

- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

eFuse API for keys

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an ESP_EFUSE_KEY_PURPOSE_x field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like ESP_EFUSE_KEY_PURPOSE_XTS_AES... are used for flash encryption.

The purposes like ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST... are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- `esp_efuse_get_purpose_field()` - Returns a pointer to a key purpose for an eFuse key block.
- `esp_efuse_get_key()` - Returns a pointer to a key block.
- `esp_efuse_set_key_purpose()` - Sets a key purpose for an eFuse key block.
- `esp_efuse_set_keypurpose_dis_write()` - Sets a write protection of the key purpose field for an eFuse key block.
- `esp_efuse_find_unused_key_block()` - Search for an unused key block and return the first one found.
- `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32s3/esp_efuse_table.csv --info
eFuse coding scheme: NONE
#      field_name      efuse_block      bit_start      bit_count
1      WR_DIS_FLASH_CRYPT_CNT      EFUSE_BLK0      2              1
2      WR_DIS_BLK1      EFUSE_BLK0      7              1
3      WR_DIS_BLK2      EFUSE_BLK0      8              1
4      WR_DIS_BLK3      EFUSE_BLK0      9              1
5      RD_DIS_BLK1      EFUSE_BLK0      16             1
```

EFUSE_BLK1

[0 255]

EFUSE_BLK2

[0 255]

EFUSE_BLK3

[0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for_↵
↵Espressif)

Parsing eFuse CSV input file \$IDF_PATH/components/efuse/esp32s3/esp_efuse_table.

↵csv ...

Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: `field_name`, `efuse_block`, `bit_start`, `bit_count`, comment.
3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

Debug eFuse & Unit tests

Virtual eFuses The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the `partition_table` should have the `efuse` partition. `partition.csv`: "efuse_em, data, efuse, , 0x2000, ". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test `secure_boot` and `flash_encryption` features with this option).

espefuse.py `esptool` includes a useful tool for reading/writing ESP32-S3 eFuse bits - [espefuse.py](#).

espefuse.py v3.1-dev

```

Header File

- [components/efuse/include/esp_efuse.h](#)

Functions

esp_err_t **esp_efuse_read_field_blob** (const *esp_efuse_desc_t* *field[], void *dst, size_t dst_size_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **dst** –[out] A pointer to array that will contain the result of reading.
- **dst_size_bits** –[in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

bool **esp_efuse_read_field_bit** (const *esp_efuse_desc_t* *field[])

Read a single bit eFuse field as a boolean value.

Note: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

Note: If assertions are enabled and the parameter is invalid, execution will abort

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters **field** –[in] A pointer to the structure describing the fields of efuse.

Returns

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

esp_err_t **esp_efuse_read_field_cnt** (const *esp_efuse_desc_t* *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1” .

If the bits are set not sequentially, they will still be counted.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **out_cnt** –[out] A pointer that will contain the number of programmed as “1” bits.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

esp_err_t **esp_efuse_write_field_blob** (const *esp_efuse_desc_t* *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “`esp_efuse_get_field_size()`” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Parameters

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **src** –[in] A pointer to array that contains the data for writing.
- **src_size_bits** –[in] The number of bits required to write.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_field_cnt` (const `esp_efuse_desc_t` *field[], size_t cnt)

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, `ESP_ERR_EFUSE_CNT_IS_FULL` error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Parameters

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **cnt** –[in] Required number of programmed as “1” bits.

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.

`esp_err_t esp_efuse_write_field_bit` (const `esp_efuse_desc_t` *field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling `esp_efuse_write_field_cnt()` with the `cnt` parameter equal to 1, except that it will return `ESP_OK` if the field is already set to 1.

Parameters **field** –[in] Pointer to the structure describing the efuse field.

Returns

- `ESP_OK`: The operation was successfully completed, or the bit was already set to value 1.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments, including if the efuse field is not 1 bit wide.

`esp_err_t esp_efuse_set_write_protect` (`esp_efuse_block_t` blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Parameters **blk** –[in] Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`esp_err_t esp_efuse_set_read_protect` (`esp_efuse_block_t` blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

Parameters **blk** –[in] Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

int `esp_efuse_get_field_size` (const `esp_efuse_desc_t` *field[])

Returns the number of bits used by field.

Parameters **field** –[in] A pointer to the structure describing the fields of efuse.

Returns Returns the number of bits used by field.

uint32_t **esp_efuse_read_reg** (esp_efuse_block_t blk, unsigned int num_reg)

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **blk** –[in] Block number of eFuse.
- **num_reg** –[in] The register number in the block.

Returns Value of register

esp_err_t **esp_efuse_write_reg** (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

Parameters

- **blk** –[in] Block number of eFuse.
- **num_reg** –[in] The register number in the block.
- **val** –[in] Value to write.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

esp_efuse_coding_scheme_t **esp_efuse_get_coding_scheme** (esp_efuse_block_t blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

Parameters **blk** –[in] Block number of eFuse.

Returns Return efuse coding scheme for blocks

esp_err_t **esp_efuse_read_block** (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to efuse block starting at the offset and the required size.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters

- **blk** –[in] Block number of eFuse.
- **dst_key** –[in] A pointer to array that will contain the result of reading.
- **offset_in_bits** –[in] Start bit in block.
- **size_bits** –[in] The number of bits required to read.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_block** (esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)

Write key to efuse block starting at the offset and the required size.

Parameters

- **blk** –[in] Block number of eFuse.
- **src_key** –[in] A pointer to array that contains the key for writing.
- **offset_in_bits** –[in] Start bit in block.
- **size_bits** –[in] The number of bits required to write.

Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

uint32_t **esp_efuse_get_pkg_ver** (void)

Returns chip package from efuse.

Returns chip package

void **esp_efuse_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

Note: This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

esp_err_t **esp_efuse_disable_rom_download_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

Note: Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

Note: If ROM Download Mode is already disabled, this function does nothing and returns success.

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t **esp_efuse_set_rom_log_scheme** (*esp_efuse_rom_log_scheme_t* log_scheme)

Set boot ROM log scheme via eFuse.

Note: By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

Parameters **log_scheme** –Supported ROM log scheme

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme

- `ESP_ERR_INVALID_STATE` This eFuse is write protected or has been burned already

esp_err_t **esp_efuse_enable_rom_secure_download_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

Note: If Secure Download mode is already enabled, this function does nothing and returns success.

Note: Disabling the ROM Download Mode also disables Secure Download Mode.

Returns

- `ESP_OK` If the eFuse was successfully burned, or had already been burned.
- `ESP_ERR_INVALID_STATE` ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

uint32_t **esp_efuse_read_secure_version** (void)

Return secure_version from efuse field.

Returns Secure version from efuse field

bool **esp_efuse_check_secure_version** (uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

Parameters `secure_version` – Secure version from app.

Returns

- True: If version of app is equal or more then secure_version from efuse.

esp_err_t **esp_efuse_update_secure_version** (uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

Parameters `secure_version` – [in] Secure version from app.

Returns

- `ESP_OK`: Successful.
- `ESP_FAIL`: secure version of app cannot be set to efuse field.
- `ESP_ERR_NOT_SUPPORTED`: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t **esp_efuse_batch_write_begin** (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call `begin()` then perform as usually the necessary operations read and write and at the end call `commit()` to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last `commit()` function. The number of `begin()` functions should be equal to the number of `commit()` functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```

// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.

```

Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns

- ESP_OK: Successful.

esp_err_t **esp_efuse_batch_write_cancel** (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

esp_err_t **esp_efuse_batch_write_commit** (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

bool **esp_efuse_block_is_empty** (esp_efuse_block_t block)

Checks that the given block is empty.

Returns

- True: The block is empty.
- False: The block is not empty or was an error.

bool **esp_efuse_get_key_dis_read** (esp_efuse_block_t block)

Returns a read protection for the key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key block is read protected False: The key block is readable.

esp_err_t **esp_efuse_set_key_dis_read** (esp_efuse_block_t block)

Sets a read protection for the key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_key_dis_write** (esp_efuse_block_t block)

Returns a write protection for the key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key block is write protected False: The key block is writeable.

esp_err_t **esp_efuse_set_key_dis_write** (esp_efuse_block_t block)

Sets a write protection for the key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_key_block_unused** (esp_efuse_block_t block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

Parameters **block** –key block to check.

Returns

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool **esp_efuse_find_purpose** (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)

Find a key block with the particular purpose set.

Parameters

- **purpose** –[in] Purpose to search for.
- **block** –[out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

Returns

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool **esp_efuse_get_keypurpose_dis_write** (esp_efuse_block_t block)

Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t **esp_efuse_get_key_purpose** (esp_efuse_block_t block)

Returns the current purpose set for an efuse key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

const esp_efuse_desc_t****esp_efuse_get_purpose_field** (esp_efuse_block_t block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use esp_efuse_read_field_blob() or esp_efuse_get_key_purpose().

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const esp_efuse_desc_t****esp_efuse_get_key** (esp_efuse_block_t block)

Returns a pointer to a key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

esp_err_t **esp_efuse_set_key_purpose** (esp_efuse_block_t block, esp_efuse_purpose_t purpose)

Sets a key purpose for an efuse key block.

Parameters

- **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- **purpose** –[in] Key purpose.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_set_keypurpose_dis_write** (esp_efuse_block_t block)

Sets a write protection of the key purpose field for an efuse key block.

Parameters **block** –[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_efuse_block_t **esp_efuse_find_unused_key_block** (void)

Search for an unused key block and return the first one found.

See esp_efuse_key_block_unused for a description of an unused key block.

Returns First unused key block, or EFUSE_BLK_KEY_MAX if no unused key block is found.

unsigned **esp_efuse_count_unused_key_blocks** (void)

Return the number of unused efuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX.

bool **esp_efuse_get_digest_revoke** (unsigned num_digest)

Returns the status of the Secure Boot public key digest revocation bit.

Parameters **num_digest** –[in] The number of digest in range 0..2

Returns

- True: If key digest is revoked,
- False; If key digest is not revoked.

esp_err_t **esp_efuse_set_digest_revoke** (unsigned num_digest)

Sets the Secure Boot public key digest revocation bit.

Parameters num_digest –[in] The number of digest in range 0..2

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool **esp_efuse_get_write_protect_of_digest_revoke** (unsigned num_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

Parameters num_digest –[in] The number of digest in range 0..2

Returns True: The revocation bit is write protected. False: The revocation bit is writeable.

esp_err_t **esp_efuse_set_write_protect_of_digest_revoke** (unsigned num_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

Parameters num_digest –[in] The number of digest in range 0..2

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_key** (esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key, size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Parameters

- **block** –[in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- **purpose** –[in] Purpose to set for this key. Purpose must be already unset.
- **key** –[in] Pointer to data to write.
- **key_size_bytes** –[in] Bytes length of data to write.

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_efuse_write_keys** (const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

Parameters

- **purposes** –[in] Array of purposes (purpose[number_of_keys]).
- **keys** –[in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- **number_of_keys** –[in] The number of keys to write (up to 6 keys).

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t **esp_secure_boot_read_key_digests** (ets_secure_boot_key_digests_t *trusted_keys)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

Parameters *trusted_keys* –[out] The number of digest in range 0..2

Returns

- ESP_OK: Successful.
- ESP_FAIL: If *trusted_keys* is NULL or there is no valid digest.

esp_err_t **esp_efuse_check_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

Note: Refers to ESP32-C3 only.

Returns

- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

Structures

struct **esp_efuse_desc_t**

Type definition for an eFuse field.

Public Members

esp_efuse_block_t **efuse_block**

Block of eFuse

uint8_t **bit_start**

Start bit [0..255]

uint16_t **bit_count**

Length of bit field [1..-]

Macros

ESP_ERR_EFUSE

Base error code for efuse api.

ESP_OK_EFUSE_CNT

OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL

Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG

Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING

Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS

Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

Enumerations

enum **esp_efuse_rom_log_scheme_t**

Type definition for ROM log scheme.

Values:

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_ON**

Always enable ROM logging

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**

ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**

ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**

Disable ROM logging permanently

2.7.6 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see [Error Handling](#).

For the full list of error codes defined in ESP-IDF, see [Error Code Reference](#).

API Reference

Header File

- `components/esp_common/include/esp_err.h`

Functions

const char ***esp_err_to_name** (*esp_err_t* code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters **code** –esp_err_t error code

Returns string error message

const char ***esp_err_to_name_r** (*esp_err_t* code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Parameters

- **code** –esp_err_t error code
- **buf** –[out] buffer where the error message should be written
- **buflen** –Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Returns buf containing the string error message

Macros

ESP_OK

esp_err_t value indicating success (no error)

ESP_FAIL

Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM

Out of memory

ESP_ERR_INVALID_ARG

Invalid argument

ESP_ERR_INVALID_STATE

Invalid state

ESP_ERR_INVALID_SIZE

Invalid size

ESP_ERR_NOT_FOUND

Requested resource not found

ESP_ERR_NOT_SUPPORTED

Operation or feature not supported

ESP_ERR_TIMEOUT

Operation timed out

ESP_ERR_INVALID_RESPONSE

Received response was invalid

ESP_ERR_INVALID_CRC

CRC or checksum was invalid

ESP_ERR_INVALID_VERSION

Version was invalid

ESP_ERR_INVALID_MAC

MAC address was invalid

ESP_ERR_NOT_FINISHED

There are items remained to retrieve

ESP_ERR_WIFI_BASE

Starting number of WiFi error codes

ESP_ERR_MESH_BASE

Starting number of MESH error codes

ESP_ERR_FLASH_BASE

Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE

Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE

Starting number of Memory Protection API error codes

ESP_ERROR_CHECK (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn't terminating the program.

Type Definitions

```
typedef int esp_err_t
```

2.7.7 ESP HTTPS OTA**Overview**

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It's an abstraction layer over existing OTA APIs.

Application Example

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using `partial_http_download` with `max_http_request_size` of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer [Secure OTA Updates Without Secure boot](#)

API Reference

Header File

- `components/esp_https_ota/include/esp_https_ota.h`

Functions

`esp_err_t esp_https_ota` (const `esp_http_client_config_t` *config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

Note: This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

Parameters `config` –[in] pointer to `esp_http_client_config_t` structure.

Returns

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's `app_update` component.

`esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)`

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to `NULL`.

Note: This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

Parameters

- `ota_config` –[in] pointer to `esp_https_ota_config_t` structure
- `handle` –[out] pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

Returns

- `ESP_OK`: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `app_update` component and `esp_http_client` component in esp-idf.

`esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)`

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
- `ESP_OK`: OTA update was successful
- `ESP_FAIL`: OTA update failed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's `app_update` component.

`bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)`

Checks if complete data was received or not.

Note: This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- false
- true

esp_err_t `esp_https_ota_finish` (*esp_https_ota_handle_t* `https_ota_handle`)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

Note: If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

esp_err_t `esp_https_ota_abort` (*esp_https_ota_handle_t* `https_ota_handle`)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

Note: `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

esp_err_t `esp_https_ota_get_img_desc` (*esp_https_ota_handle_t* `https_ota_handle`, *esp_app_desc_t* `*new_app_info`)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

Note: This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

Parameters

- `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure
- `new_app_info` –[out] pointer to an allocated `esp_app_desc_t` structure

Returns

- `ESP_ERR_INVALID_ARG`: Invalid arguments

- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

int **esp_https_ota_get_image_len_read** (*esp_https_ota_handle_t* https_ota_handle)

This function returns OTA image data read so far.

Note: This API should be called only if `esp_https_ota_perform()` has been called atleast once or if `esp_https_ota_get_img_desc` has been called before.

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- -1 On failure
- total bytes read so far

int **esp_https_ota_get_image_size** (*esp_https_ota_handle_t* https_ota_handle)

This function returns OTA image total size.

Note: This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

Parameters `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

Returns

- -1 On failure or chunked encoding
- total bytes of image

Structures

struct **esp_https_ota_config_t**

ESP HTTPS OTA configuration.

Public Members

const *esp_http_client_config_t* ***http_config**

ESP HTTP client configuration

http_client_init_cb_t **http_client_init_cb**

Callback after ESP HTTP client is initialised

bool **bulk_flash_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial_http_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max_http_request_size**

Maximum request size for partial HTTP download

Macros

`ESP_ERR_HTTPS_OTA_BASE`

`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

Type Definitions

```
typedef void *esp_https_ota_handle_t
```

```
typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)
```

2.7.8 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain `libc`. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc. are implemented using pthreads (via GCC `libstdc++`). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`.

Note: If calling a standard `libc` or C++ sleep function, such as `usleep` defined in `unistd.h`, then the task will only block and yield the CPU if the sleep time is longer than *one FreeRTOS tick period*. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a *custom API*.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- `pthread_create()` - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. - Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until `pthread_join()` is called on it.
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
- `pthread_equal()`

Thread Attributes

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn't need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

Once

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

Note: This function can be called from tasks created using either pthread or FreeRTOS APIs

Mutexes POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

Note: These functions can be called from tasks created using either pthread or FreeRTOS APIs

Condition Variables

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see [CONFIG_FREERTOS_HZ](#)). Timeouts may be delayed up to one tick period after the requested timeout.

Note: These functions can be called from tasks created using either `pthread` or FreeRTOS APIs

Read/Write Locks

- `pthread_rwlock_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_unlock()`

Static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

Note: These functions can be called from tasks created using either `pthread` or FreeRTOS APIs. Note also that the current `pthread` reader-writer-locks implementation is based on the condition variable API. The performance is not optimal when locking only for a minimal amount of time like e.g. accessing a simple variable. In these cases with minimal locking time, a simple mutex might be faster.

Thread-Specific Data

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

Note: These functions can be called from tasks created using either `pthread` or FreeRTOS APIs

Note: There are other options for thread local storage in ESP-IDF, including options with higher performance. See [Thread Local Storage](#).

Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a *feature request on GitHub* <<https://github.com/espressif/esp-idf/issues>> with the details.

ESP-IDF Extensions

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`)

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_thread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator's configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

Examples

- [system/pthread](#) demonstrates using the pthreads API to create threads
- [cxx/pthread](#) demonstrates using C++ Standard Library functions with threads

API Reference

Header File

- [components/pthread/include/esp_thread.h](#)

Functions

`esp_thread_cfg_t esp_thread_get_default_config` (void)

Creates a default pthread configuration based on the values set via menuconfig.

Returns A default configuration structure.

`esp_err_t esp_thread_set_cfg` (const `esp_thread_cfg_t` *cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent `pthread_create()` call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

Note: Passing non-NULL attributes to `pthread_create()` will override the `stack_size` parameter set using this API

Parameters `cfg` –The pthread config parameters

Returns

- `ESP_OK` if configuration was successfully set
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_ARG` if `stack_size` is less than `PTHREAD_STACK_MIN`

`esp_err_t esp_thread_get_cfg` (`esp_thread_cfg_t` *p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

Parameters `p` –Pointer to the pthread config structure that will be updated with the currently configured parameters

Returns

- `ESP_OK` if the configuration was available
- `ESP_ERR_NOT_FOUND` if a configuration wasn't previously set

`esp_err_t esp_thread_init` (void)

Initialize pthread library.

Structures

struct `esp_thread_cfg_t`

pthread configuration structure that influences pthread creation

Public Members

size_t `stack_size`

The stack size of the pthread.

size_t `prio`

The thread's priority.

bool `inherit_cfg`

Inherit this configuration further.

const char *`thread_name`

The thread name.

int `pin_to_core`

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros

`PTHREAD_STACK_MIN`

2.7.9 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers –code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more [here](#). Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed [here](#).
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that [here](#).
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
↳specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is
↳needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
↳specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to
↳the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
↳some point in time
    // the event loop executes the event handler registered to the posted event,
↳in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but
↳posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event);
```

(continues on next page)

```

...

// 6. Deleting an unneeded event loop
esp_event_loop_delete(loop_handle);
}

```

Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

Note: In IDF, the base identifiers for system events are uppercase and are postfixed with `_EVENT`. For example, the base for wifi events is declared and defined as `WIFI_EVENT`, the ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID's, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```

enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}

```

Default Event Loop

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
<code>esp_event_loop_create()</code>	<code>esp_event_loop_create_default()</code>
<code>esp_event_loop_delete()</code>	<code>esp_event_loop_delete_default()</code>
<code>esp_event_handler_register_with()</code>	<code>esp_event_handler_register()</code>
<code>esp_event_handler_unregister_with()</code>	<code>esp_event_handler_unregister()</code>
<code>esp_event_post_to()</code>	<code>esp_event_post()</code>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, `ESP_EVENT_ANY_ID` - handler executes when any event with base <event base> gets posted to the loop
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE`, `MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

Handler Registration and Handler Dispatch Order The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also gets executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

Event loop profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

Application Example

Examples on using the `esp_event` library can be found in [system/esp_event](#). The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- [NMEA Parser](#) , which will decode the statements received from GPS.

API Reference

Header File

- [components/esp_event/include/esp_event.h](#)

Functions

esp_err_t **esp_event_loop_create** (const *esp_event_loop_args_t* *event_loop_args, *esp_event_loop_handle_t* *event_loop)

Create a new event loop.

Parameters

- **event_loop_args** –[in] configuration structure for the event loop to create
- **event_loop** –[out] handle to the created event loop

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete** (*esp_event_loop_handle_t* event_loop)

Delete an existing event loop.

Parameters **event_loop** –[in] event loop to delete, must not be NULL

Returns

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_create_default** (void)

Create default event loop.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

esp_err_t **esp_event_loop_delete_default** (void)

Delete the default event loop.

Returns

- ESP_OK: Success
- Others: Fail

esp_err_t **esp_event_loop_run** (*esp_event_loop_handle_t* event_loop, TickType_t ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on

the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, `ESP_OK` is returned and not `ESP_ERR_TIMEOUT`, since it is normal behavior.

Note: encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

Parameters

- **event_loop** –[in] event loop to dispatch posted events from, must not be NULL
- **ticks_to_run** –[in] number of ticks to run the loop

Returns

- `ESP_OK`: Success
- Others: Fail

`esp_err_t esp_event_handler_register` (`esp_event_base_t` event_base, `int32_t` event_id, `esp_event_handler_t` event_handler, `void *event_handler_arg`)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

Note: This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

Note: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

Parameters

- **event_base** –[in] the base id of the event to register the handler for
- **event_id** –[in] the id of the event to register the handler for
- **event_handler** –[in] the handler function which gets called when the event is dispatched
- **event_handler_arg** –[in] data, aside from event data, that is passed to the handler when it is called

Returns

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id

- Others: Fail

esp_err_t **esp_event_handler_register_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

Note: This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

Note: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

Parameters

- **event_loop** –[in] the event loop to register this handler function to, must not be NULL
- **event_base** –[in] the base id of the event to register the handler for
- **event_id** –[in] the id of the event to register the handler for
- **event_handler** –[in] the handler function which gets called when the event is dispatched
- **event_handler_arg** –[in] data, aside from event data, that is passed to the handler when it is called

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

esp_err_t **esp_event_handler_instance_register_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler, void *event_handler_arg, *esp_event_handler_instance_t* *instance)

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

Note: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

Parameters

- **event_loop** –[in] the event loop to register this handler function to, must not be NULL
- **event_base** –[in] the base id of the event to register the handler for
- **event_id** –[in] the id of the event to register the handler for
- **event_handler** –[in] the handler function which gets called when the event is dispatched
- **event_handler_arg** –[in] data, aside from event data, that is passed to the handler when it is called
- **instance** –[out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,  
                                             esp_event_handler_t event_handler, void  
                                             *event_handler_arg,  
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

Note: the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

Parameters

- **event_base** –[in] the base id of the event to register the handler for
- **event_id** –[in] the id of the event to register the handler for
- **event_handler** –[in] the handler function which gets called when the event is dispatched
- **event_handler_arg** –[in] data, aside from event data, that is passed to the handler when it is called
- **instance** –[out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

esp_err_t **esp_event_handler_unregister** (*esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_register() when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

Note: This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister() instead.

Note: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters

- **event_base** –[in] the base of the event with which to unregister the handler
- **event_id** –[in] the id of the event with which to unregister the handler
- **event_handler** –[in] the handler to unregister

Returns ESP_OK success

Returns ESP_ERR_INVALID_ARG invalid combination of event base and event id

Returns others fail

esp_err_t **esp_event_handler_unregister_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_t* event_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp_event_handler_unregister, except the additional specification of the event loop to unregister the handler with.

Note: This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister_with() instead.

Parameters

- **event_loop** –[in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** –[in] the base of the event with which to unregister the handler
- **event_id** –[in] the id of the event with which to unregister the handler
- **event_handler** –[in] the handler to unregister

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

esp_err_t **esp_event_handler_instance_unregister_with** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, *esp_event_handler_instance_t* instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

Note: When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters

- **event_loop** –[in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** –[in] the base of the event with which to unregister the handler
- **event_id** –[in] the id of the event with which to unregister the handler
- **instance** –[in] the instance object of the registration to be unregistered

Returns

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

`esp_err_t esp_event_handler_instance_unregister` (`esp_event_base_t` event_base, `int32_t` event_id, `esp_event_handler_instance_t` instance)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

Parameters

- **event_base** –[in] the base of the event with which to unregister the handler
- **event_id** –[in] the id of the event with which to unregister the handler
- **instance** –[in] the instance object of the registration to be unregistered

Returns

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

`esp_err_t esp_event_post` (`esp_event_base_t` event_base, `int32_t` event_id, `void *event_data`, `size_t` event_data_size, `TickType_t` ticks_to_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Parameters

- **event_base** –[in] the event base that identifies the event
- **event_id** –[in] the event id that identifies the event
- **event_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –[in] the size of the event data
- **ticks_to_wait** –[in] number of ticks to block on a full event queue

Returns

- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

esp_err_t **esp_event_post_to** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

Parameters

- **event_loop** –[in] the event loop to post to, must not be NULL
- **event_base** –[in] the event base that identifies the event
- **event_id** –[in] the event id that identifies the event
- **event_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –[in] the size of the event data
- **ticks_to_wait** –[in] number of ticks to block on a full event queue

Returns

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

esp_err_t **esp_event_isr_post** (*esp_event_base_t* event_base, int32_t event_id, void *event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of esp_event_post for posting events from interrupt handlers.

Note: this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Parameters

- **event_base** –[in] the event base that identifies the event
- **event_id** –[in] the event id that identifies the event
- **event_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –[in] the size of the event data; max is 4 bytes
- **task_unblocked** –[out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is executed.

Returns

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

esp_err_t **esp_event_isr_post_to** (*esp_event_loop_handle_t* event_loop, *esp_event_base_t* event_base, int32_t event_id, void *event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

Note: this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

Note: when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

Parameters

- **event_loop** –[in] the event loop to post to, must not be NULL
- **event_base** –[in] the event base that identifies the event
- **event_id** –[in] the event id that identifies the event
- **event_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** –[in] the size of the event data
- **task_unblocked** –[out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

Returns

- `ESP_OK`: Success
- `ESP_FAIL`: Event queue for the loop full
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

`esp_err_t esp_event_dump` (FILE *file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler
  ...

where:

event loop
  format: address,name rx:total_recieved dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_recieved - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue
↳being full

handler
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function
    base,id - the event specified by event base and id this handler
↳executes

```

(continues on next page)

(continued from previous page)

<pre>total_invoked - number of times this handler has been invoked total_runtime - total amount of time used for invoking this handler</pre>

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Parameters `file` `-[in]` the file stream to output to

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

Structures

struct `esp_event_loop_args_t`

Configuration for creating event loops.

Public Members

`int32_t queue_size`

size of the event loop queue

`const char *task_name`

name of the event loop task; if NULL, a dedicated task is not created for event loop

`UBaseType_t task_priority`

priority of the event loop task, ignored if task name is NULL

`uint32_t task_stack_size`

stack size of the event loop task, ignored if task name is NULL

`BaseType_t task_core_id`

core to which the event loop task is pinned to, ignored if task name is NULL

Header File

- [components/esp_event/include/esp_event_base.h](#)

Macros

`ESP_EVENT_DECLARE_BASE` (id)

`ESP_EVENT_DEFINE_BASE` (id)

`ESP_EVENT_ANY_BASE`

register handler for any event base

`ESP_EVENT_ANY_ID`

register handler for any event id

Type Definitions

typedef const char ***esp_event_base_t**

unique pointer to a subsystem that exposes events

typedef void ***esp_event_loop_handle_t**

a number that identifies an event with respect to a base

typedef void (***esp_event_handler_t**)(void *event_handler_arg, *esp_event_base_t* event_base, int32_t event_id, void *event_data)

function called when an event is posted to the queue

typedef void ***esp_event_handler_instance_t**

context identifying an instance of a registered event handler

Legacy event loop

API Reference

Header File

- [components/esp_event/include/esp_event_legacy.h](#)

Functions

esp_err_t **esp_event_send** (*system_event_t* *event)

Send a event to event task.

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

Note: This API is part of the legacy event system. New code should use event library API in esp_event.h

Parameters **event** –Event to send

Returns ESP_OK : succeed

Returns others : fail

esp_err_t **esp_event_send_internal** (*esp_event_base_t* event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)

Send a event to event task.

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

Note: This API is used by WiFi Driver only.

Parameters

- **event_base** –[in] the event base that identifies the event
- **event_id** –[in] the event id that identifies the event
- **event_data** –[in] the data, specific to the event occurrence, that gets passed to the handler

- **event_data_size** –[in] the size of the event data
 - **ticks_to_wait** –[in] number of ticks to block on a full event queue
- Returns** ESP_OK : succeed
Returns others : fail

esp_err_t **esp_event_process_default** (*system_event_t* *event)

Default event handler for system events.

This function performs default handling of system events. When using `esp_event_loop` APIs, it is called automatically before invoking the user-provided callback function.

Applications which implement a custom event loop must call this function as part of event processing.

Note: This API is part of the legacy event system. New code should use event library API in `esp_event.h`

- Parameters** **event** –pointer to event to be handled
Returns ESP_OK if an event was handled successfully

void **esp_event_set_default_eth_handlers** (void)

Install default event handlers for Ethernet interface.

Note: This API is part of the legacy event system. New code should use event library API in `esp_event.h`

void **esp_event_set_default_wifi_handlers** (void)

Install default event handlers for Wi-Fi interfaces (station and AP)

Note: This API is part of the legacy event system. New code should use event library API in `esp_event.h`

esp_err_t **esp_event_loop_init** (*system_event_cb_t* cb, void *ctx)

Initialize event loop.

Create the event handler and task

Note: This API is part of the legacy event system. New code should use event library API in `esp_event.h`

Parameters

- **cb** –application specified event callback, it can be modified by call `esp_event_set_cb`
- **ctx** –reserved for user

Returns

- ESP_OK: succeed
- others: fail

system_event_cb_t **esp_event_loop_set_cb** (*system_event_cb_t* cb, void *ctx)

Set application specified event callback function.

Attention 1. If `cb` is NULL, means application don't need to handle. If `cb` is not NULL, it will be call when an event is received, after the default event callback is completed

Note: This API is part of the legacy event system. New code should use event library API in `esp_event.h`

Parameters

- **cb** –application callback function
- **ctx** –argument to be passed to callback

Returns old callback

Unions

union **system_event_info_t**

#include <esp_event_legacy.h> Union of all possible system_event argument structures

Public Members

system_event_sta_connected_t **connected**

ESP32 station connected to AP

system_event_sta_disconnected_t **disconnected**

ESP32 station disconnected to AP

ESP32 ethernet lost IP and the IP is reset to 0
- enumerator **SYSTEM_EVENT_MAX**
Number of members in this enum

2.7.10 FreeRTOS

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Note: ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

- For more information about the SMP changes of ESP-IDF FreeRTOS, see [ESP-IDF FreeRTOS \(SMP\)](#)
- For more information about the features added to ESP-IDF FreeRTOS, see [FreeRTOS Additions](#).

Configuration

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various `#define config...` macros to `FreeRTOSConfig.h`. Through these macros, the kernel's scheduling behavior and various kernel features can be enabled or disabled. **However, in ESP-IDF FreeRTOS, the `FreeRTOSConfig.h` file is considered a private and must not be modified by users.** Any FreeRTOS configuration that is exposed to the user will be done so via `menuconfig`.

ESP-IDF FreeRTOS can be configured in the project configuration menu (`idf.py menuconfig`) under `Component Config/FreeRTOS`. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see [Project Configuration](#)

- `CONFIG_FREERTOS_UNICORE` will run ESP-IDF FreeRTOS only on CPU0. Note that this is **not equivalent to running Vanilla FreeRTOS**. Furthermore, this option may affect behavior of components other than `freertos`. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to [ESP-IDF FreeRTOS Single Core](#). Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION` will trigger a halt in functions in ESP-IDF FreeRTOS that have not been fully tested in an SMP context.
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER` will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

ESP-IDF FreeRTOS Applications

Unlike Vanilla FreeRTOS, users must not call `vTaskStartScheduler()`. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined `void app_main(void)` function.

- Typically, users would spawn the rest of their applications task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

The `main` task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

Table 8: List of Tasks Created During Startup

Task Name	Affinity	Priority	Description
Main Task (<code>main</code>)	CPU0	1	Task that simply calls <code>app_main</code> . This task will self delete when <code>app_main</code> returns
Idle Tasks (<code>IDLEx</code>)	CPU0 and CPU1	0	Idle tasks created for (and pinned to) each CPU
IPC Tasks (<code>ipcx</code>)	CPU0 and CPU1	24	IPC tasks created for (and pinned to) each CPU. IPC tasks are used to implement the IPC feature. See <i>Inter-Processor Call</i> for more details.

Task API

Header File

- [components/freertos/include/freertos/task.h](#)

Functions

`BaseType_t xTaskCreatePinnedToCore` (`TaskFunction_t pvTaskCode`, `const char *const pcName`, `const uint32_t usStackDepth`, `void *const pvParameters`, `UBaseType_t uxPriority`, `TaskHandle_t *const pvCreatedTask`, `const BaseType_t xCoreID`)

Create a new task with a specified affinity.

This function is similar to `xTaskCreate`, but allows setting task affinity in SMP system.

Parameters

- **`pvTaskCode`** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- **`pcName`** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **`usStackDepth`** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **`pvParameters`** –Pointer that will be used as the parameter for the task being created.
- **`uxPriority`** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- **`pvCreatedTask`** –Used to pass back a handle by which the created task can be referenced.
- **`xCoreID`** –If the value is `tskNO_AFFINITY`, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than `(portNUM_PROCESSORS - 1)` will cause the function to fail.

Returns `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

`static inline BaseType_t xTaskCreate` (`TaskFunction_t pvTaskCode`, `const char *const pcName`, `const uint32_t usStackDepth`, `void *const pvParameters`, `UBaseType_t uxPriority`, `TaskHandle_t *const pxCreatedTask`)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for ( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter
    ↪ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared
    ↪static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have
    ↪been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    ↪PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

Note: If program uses thread local variables (ones specified with “`__thread`” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **usStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `(2 | portPRIVILEGE_BIT)`.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

TaskHandle_t **xTaskCreateStaticPinnedToCore** (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **pxStackBuffer** –Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask_t, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID** –If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

Returns If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

static inline *TaskHandle_t* **xTaskCreateStatic** (TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see <http://www.freertos.org/a00111.html>). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;
```

(continues on next page)

(continued from previous page)

```

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,          // Function that implements the task.
        "NAME",            // Text name for the task.
        STACK_SIZE,       // Stack size in bytes, not words.
        ( void * ) 1,     // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,           // Array to use as the task's stack.
        &xTaskBuffer );   // Variable to hold the task's data_
→structure.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

```

Note: If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **puxStackBuffer** –Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated

dynamically.

Returns If neither `pxStackBuffer` or `pxTaskBuffer` are NULL, then the task will be created and `pdPASS` is returned. If either `pxStackBuffer` or `pxTaskBuffer` are NULL then the task will not be created and `errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY` is returned.

`BaseType_t` **xTaskCreateRestricted** (const `TaskParameters_t` *const `pxTaskDefinition`, `TaskHandle_t` *`pxCreatedTask`)

Only available when `configSUPPORT_DYNAMIC_ALLOCATION` is set to 1.

`xTaskCreateRestricted()` should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See `xTaskCreateRestrictedStatic()` for a version that does not use any dynamic memory allocation.

return `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

Example usage:

```
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,          // pvTaskCode - the function that implements the task.
    "ATask",        // pcName - just a text name for the task to assist debugging.
    100,            // usStackDepth - the stack size DEFINED IN WORDS.
    NULL,           // pvParameters - passed into the task function as the function_
    ↪parameters.
    ( 1UL | portPRIVILEGE_BIT ), // uxPriority - task priority, set the_
    ↪portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS_
    ↪documentation
    // for full information.
    {
        // Base address          Length  Parameters
        { cReadWriteArray,      32,    portMPU_REGION_READ_WRITE },
        { cReadOnlyArray,       32,    portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128,   portMPU_REGION_PRIVILEGED_READ_
    ↪WRITE }
    }
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle
    // is requested (the second parameter is not NULL) but in this case just for
    // demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle
    // and/or timer task.

```

(continues on next page)

(continued from previous page)

```

for( ;; );
}

```

Parameters

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

BaseType_t **xTaskCreateRestrictedStatic** (const TaskParameters_t *const pxTaskDefinition, TaskHandle_t *pxCreatedTask)

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the task's data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used to hold the task's data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```

// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,          // pvTaskCode - the function that implements the task.
    "ATask",        // pcName - just a text name for the task to assist debugging.
    100,            // usStackDepth - the stack size DEFINED IN BYTES.
    NULL,           // pvParameters - passed into the task function as the function_
    ↪parameters.
    ( 1UL | portPRIVILEGE_BIT ), // uxPriority - task priority, set the_
    ↪portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS_
    ↪documentation
    // for full information.
    {
        // Base address          Length  Parameters
        { cReadWriteArray,      32,    portMPU_REGION_READ_WRITE },
        { cReadOnlyArray,       32,    portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128,   portMPU_REGION_PRIVILEGED_READ_
    ↪WRITE }
    }

    &xTaskBuffer; // Holds the task's data structure.

```

(continues on next page)

(continued from previous page)

```

};

int main( void )
{
TaskHandle_t xHandle;

// Create a task from the const structure defined above. The task handle
// is requested (the second parameter is not NULL) but in this case just for
// demonstration purposes as its not actually used.
xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

// Start the scheduler.
vTaskStartScheduler();

// Will only get here if there was insufficient memory to create the idle
// and/or timer task.
for( ;; );
}

```

Parameters

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPPORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask_t - which is then used to hold the task's data structure.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

void **vTaskAllocateMPURegions** (*TaskHandle_t* xTask, const MemoryRegion_t *const pxRegions)

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```

// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
// Base address      Length      Parameters
{ ucOneKByte,      1024,      portMPU_REGION_READ_WRITE },
{ 0,                0,         0 },
{ 0,                0,         0 }
};

void vATask( void *pvParameters )
{
// This task was created such that it has access to certain regions of
// memory as defined by the MPU configuration. At some point it is
// desired that these MPU regions are replaced with that defined in the
// xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
// for this purpose. NULL is used as the task handle to indicate that this
// function should modify the MPU regions of the calling task.
vTaskAllocateMPURegions( NULL, xAltRegions );

// Now the task can continue its function, but from this point on can only

```

(continues on next page)

(continued from previous page)

```

// access its stack and the ucOneKByte array (unless any other statically
// defined or shared regions have been declared elsewhere).
}

```

Parameters

- **xTask** –The handle of the task being updated.
- **pxRegions** –A pointer to an MemoryRegion_t structure that contains the new memory region definitions.

void **vTaskDelete** (*TaskHandle_t* xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete (). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete ().

Example usage:

```

void vOtherFunction( void )
{
TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}

```

Parameters **xTaskToDelete** –The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **vTaskDelay** (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```

void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}

```

Parameters **xTicksToDelay** –The amount of time, in tick periods, that the calling task should block.

BaseType_t xTaskDelayUntil (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay()` by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```

// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}

```

Parameters

- **pxPreviousWakeTime** –Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first

use (see the example below). Following this the variable is automatically updated within `xTaskDelayUntil()`.

- **xTimeIncrement** –The cycle time period. The task will be unblocked at time `*pxPreviousWakeTime + xTimeIncrement`. Calling `xTaskDelayUntil` with the same `xTimeIncrement` parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be `pdTRUE` if the task was delayed and `pdFALSE` otherwise. A task will not be delayed if the next expected wake time is in the past.

`BaseType_t xTaskAbortDelay (TaskHandle_t xTask)`

`INCLUDE_xTaskAbortDelay` must be defined as 1 in `FreeRTOSConfig.h` for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when `vTaskDelay()` is called, or an event on an object, such as when `xQueueReceive()` or `ulTaskNotifyTake()` is called. If the handle of a task that is in the Blocked state is used in a call to `xTaskAbortDelay()` then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

Parameters `xTask` –The handle of the task to remove from the Blocked state.

Returns If the task referenced by `xTask` was not in the Blocked state then `pdFAIL` is returned. Otherwise `pdPASS` is returned.

`UBaseType_t uxTaskPriorityGet (const TaskHandle_t xTask)`

`INCLUDE_uxTaskPriorityGet` must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

Parameters **xTask** –Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

Returns The priority of xTask.

UBaseType_t **uxTaskPriorityGetFromISR** (const *TaskHandle_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState **eTaskGetState** (*TaskHandle_t* xTask)

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

Parameters **xTask** –Handle of the task to be queried.

Returns The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo** (*TaskHandle_t* xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSize, *eTaskState* eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

Parameters

- **xTask** –Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** –A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSize** –The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSize parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSize is not set to pdFALSE;
- **eState** –The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t

structure. To obtain state information then set `eState` to `eInvalid` - otherwise the value passed in `eState` will be reported as the task state in the `TaskStatus_t` structure.

void **vTaskPrioritySet** (*TaskHandle_t* xTask, UBaseType_t uxNewPriority)

`INCLUDE_vTaskPrioritySet` must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

Parameters

- **xTask** –Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** –The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle_t* xTaskToSuspend)

`INCLUDE_vTaskSuspend` must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend()` twice on the same task still only requires one call to `vTaskResume()` to ready the suspended task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...
```

(continues on next page)

(continued from previous page)

```

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Suspend ourselves.
vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}

```

Parameters **xTaskToSuspend** –Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume** (*TaskHandle_t* xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Resume the suspended task ourselves.
vTaskResume( xHandle );

// The created task will once again get microcontroller processing
// time in accordance with its priority within the system.
}

```

Parameters **xTaskToResume** –Handle to the task being readied.

BaseType_t **xTaskResumeFromISR** (*TaskHandle_t* xTaskToResume)

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Parameters **xTaskToResume** –Handle to the task being readied.

Returns pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

void **vTaskStartScheduler** (void)

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

NOTE: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:

```
void vFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler ();

    // Will not get here unless a task calls vTaskEndScheduler ()
}
```

void **vTaskEndScheduler** (void)

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was called, as if vTaskStartScheduler () had just returned.

See the demo application file main.c in the demo/PC directory for an example that uses vTaskEndScheduler ().

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port.c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

```
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}
```

(continues on next page)

(continued from previous page)

```

        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler ();
    }
}

void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler ();

    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}

```

void **vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling `vTaskSuspendAll ()` the calling task will continue to execute without risk of being swapped out until a call to `xTaskResumeAll ()` has been made.

API functions that have the potential to cause a context switch (for example, `vTaskDelayUntil()`, `xQueueSend()`, etc.) must not be called while the scheduler is suspended.

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}

```

BaseType_t **xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to `vTaskSuspendAll()`.

`xTaskResumeAll()` only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to `vTaskSuspend()`.

Example usage:

```
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}
```

Returns If resuming the scheduler caused a context switch then `pdTRUE` is returned, otherwise `pdFALSE` is returned.

`TickType_t` **xTaskGetTickCount** (void)

Returns The count of ticks since `vTaskStartScheduler` was called.

`TickType_t` **xTaskGetTickCountFromISR** (void)

This is a version of `xTaskGetTickCount()` that is safe to be called from an ISR - provided that `TickType_t` is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

Returns The count of ticks since `vTaskStartScheduler` was called.

`UBaseType_t` **uxTaskGetNumberOfTasks** (void)

Returns The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char ***pcTaskGetName** (*TaskHandle_t* xTaskToQuery)

Returns The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t **xTaskGetHandle** (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Returns The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t **uxTaskGetStackHighWaterMark** (*TaskHandle_t* xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

uint8_t ***pxTaskGetStackStart** (*TaskHandle_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

Parameters **xTask** –Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

Returns A pointer to the start of the stack.

void **vTaskSetApplicationTaskTag** (*TaskHandle_t* xTask, *TaskHookFunction_t* pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters

- **xTask** –Handle of the task to set the hook function for Passing xTask as NULL has the effect of setting the calling tasks hook function.
- **pxHookFunction** –Pointer to the hook function.

TaskHookFunction_t **xTaskGetApplicationTaskTag** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t **xTaskGetApplicationTaskTagFromISR** (*TaskHandle_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** –Pointer value to set.

void ***pvTaskGetThreadLocalStoragePointer** (*TaskHandle_t* xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

- **xTaskToQuery** –Task to get thread local storage pointer for
- **xIndex** –The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

Returns Pointer value

void **vTaskSetThreadLocalStoragePointerAndDelCallback** (*TaskHandle_t* xTaskToSet, BaseType_t xIndex, void *pvValue, *TlsDeleteCallbackFunction_t* pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** –Pointer value to set.

- **pvDelCallback** –Function to call to dispose of the local storage pointer when the task is deleted.

void **vApplicationGetIdleTaskMemory** (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

- **ppxIdleTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** –A handle to a statically allocated Stack buffer for this idle task
- **pulIdleTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t **xTaskCallApplicationTaskHook** (*TaskHandle_t* xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters

- **xTask** –Handle of the task to call the hook for.
- **pvParameter** –Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t **xTaskGetIdleTaskHandle** (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType_t **uxTaskGetSystemState** (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
```

(continues on next page)

(continued from previous page)

```

// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
↪ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter_
↪/ ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
↪ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%\r\n",
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }

            pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
        }

        // The array is no longer needed, free the memory it consumes.
        vPortFree( pxTaskStatusArray );
    }
}

```

Parameters

- **pxTaskStatusArray** –A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** –The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** –If configGENERATE_RUN_TIME_STATS is set to 1 in FreeR-

TOSConfig.h then `*pulTotalRunTime` is set by `uxTaskGetSystemState()` to the total run time (as defined by the run time stats clock, see <https://www.FreeRTOS.org/rtos-run-time-stats.html>) since the target booted. `pulTotalRunTime` can be set to NULL to omit the total run time information.

Returns The number of `TaskStatus_t` structures that were populated by `uxTaskGetSystemState()`. This should equal the number returned by the `uxTaskGetNumberOfTasks()` API function, but will be zero if the value passed in the `uxArraySize` parameter was too small.

void **vTaskList** (char *pcWriteBuffer)

List all the current tasks.

`configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskList()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays task names, states and stack usage.

`vTaskList()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskList()`.

Parameters `pcWriteBuffer` –A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **vTaskGetRunTimeStats** (char *pcWriteBuffer)

Get the state of running tasks as a string

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. Calling `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskGetRunTimeStats()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

`vTaskGetRunTimeStats()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

Parameters `pcWriteBuffer` –A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

`uint32_t` **ulTaskGetIdleRunTimeCounter** (void)

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. While `uxTaskGetSystemState()` and `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, `ulTaskGetIdleRunTimeCounter()` returns the total execution time of just the idle task.

Returns The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`BaseType_t` **xTaskGenericNotify** (*TaskHandle_t* xTaskToNotify, `UBaseType_t` uxIndexToNotify, `uint32_t` ulValue, *eNotifyAction* eAction, `uint32_t` *pulPreviousNotificationValue)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotify()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotify()` is equivalent to calling `xTaskNotifyIndexed()` with the `uxIndexToNotify` parameter set to 0.

eSetBits - The target notification value is bitwise ORed with `ulValue`. `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eIncrement - The target notification value is incremented. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eSetValueWithOverwrite - The target notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to `ulValue` and `xTaskNotifyIndexed()` will return `pdPASS`. If the task being notified already had a notification pending at the same array index then no action is performed and `pdFAIL` is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

Parameters

- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.
- **ulValue** –Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** –Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:
- **pdPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

Returns Dependent on the value of `eAction`. See the description of the `eAction` parameter.

```
BaseType_t xTaskGenericNotifyFromISR (TaskHandle_t xTaskToNotify, UBaseType_t
                                     uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction,
                                     uint32_t *pulPreviousNotificationValue, BaseType_t
                                     *pxHigherPriorityTaskWoken)
```

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

A version of `xTaskNotifyIndexed()` that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyFromISR()` is equivalent to calling `xTaskNotifyIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

eSetBits - The task's notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

eIncrement - The task's notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

eSetValueWithOverwrite - The task's notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task's notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.

eNoAction - The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

Parameters

- **uxIndexToNotify** - The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyFromISR()` does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **ulValue** - Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** - Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:
- **pxHigherPriorityTaskWoken** - `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.
- **pulPreviousNotificationValue** - Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

Returns Dependent on the value of `eAction`. See the description of the `eAction` parameter.

BaseType_t **xTaskGenericNotifyWait** (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

Parameters

- **uxIndexToWaitOn** –The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** –Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task is marked as waiting for a new notification (provided a notification is not already pending). Optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.
- **ulBitsToClearOnExit** –If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- **pulNotificationValue** –Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **xTicksToWait** –The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

void **vTaskGenericNotifyGiveFromISR** (*TaskHandle_t* xTaskToNotify, *UBaseType_t* uxIndexToNotify, *BaseType_t* *pxHigherPriorityTaskWoken)

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGiveFromISR()` does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** –`vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher

than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

`uint32_t ulTaskGenericNotifyTake` (`UBaseType_t uxIndexToWaitOn`, `BaseType_t xClearCountOnExit`, `TickType_t xTicksToWait`)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`ulTaskNotifyTakeIndexed()` is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the `xSemaphoreTake()` API function, the equivalent action that instead uses a task notification is `ulTaskNotifyTakeIndexed()`.

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the `xTaskNotifyGiveIndexed()` macro, or `xTaskNotifyIndex()` function with the `eAction` parameter set to `eIncrement`.

`ulTaskNotifyTakeIndexed()` can either clear the task's notification value at the array index specified by the `uxIndexToWaitOn` parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for the task's notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as `xTaskNotifyWaitIndexed()` will return when a notification is pending, `ulTaskNotifyTakeIndexed()` will return when the task's notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyTake()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `ulTaskNotifyTake()` is equivalent to calling `ulTaskNotifyTakeIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

Parameters

- **`uxIndexToWaitOn`** –The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **`xClearCountOnExit`** –if `xClearCountOnExit` is `pdFALSE` then the task's notification value is decremented when the function exits. In this way the notification value acts

like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** –The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when `ulTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

Returns The task's notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

`BaseType_t xTaskGenericNotifyStateClear` (*TaskHandle_t* xTask, `UBaseType_t` uxIndexToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **xTask** –The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task's handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task's name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** –The index within the target task's array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

Returns `pdTRUE` if the task's notification state was set to `eNotWaitingNotification`, otherwise `pdFALSE`.

`uint32_t ulTaskGenericNotifyValueClear` (*TaskHandle_t* xTask, `UBaseType_t` uxIndexToClear, `uint32_t` ulBitsToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

`ulTaskNotifyValueClearIndexed()` clears the bits specified by the `ulBitsToClear` bit mask in the notification value at array index `uxIndexToClear` of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyValueClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `ulTaskNotifyValueClear()` is equivalent to calling `ulTaskNotifyValueClearIndexed()` with the `uxIndexToClear` parameter set to 0.

Parameters

- **xTask** –The handle of the RTOS task that will have bits in one of its notification values cleared. Set `xTask` to `NULL` to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task’s name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** –The index within the target task’s array of notification values in which to clear the bits. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyValueClear()` does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** –Bit mask of the bits to clear in the notification value of `xTask`. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set `ulBitsToClear` to `0xffffffff` (`UINT_MAX` on 32-bit architectures) to clear the notification value to 0. Set `ulBitsToClear` to 0 to query the task’s notification value without clearing any bits.

Returns The value of the target task’s notification value before the bits specified by `ulBitsToClear` were cleared.

`void vTaskSetTimeoutState (Timeout_t *const pxTimeout)`

`BaseType_t xTaskCheckForTimeout (Timeout_t *const pxTimeout, TickType_t *const pxTicksToWait)`

Determines if `pxTicksToWait` ticks has passed since a time was captured using a call to `vTaskSetTimeoutState()`. The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeout()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.
```

```
size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    Timeout_t xTimeout;
```

```
    // Initialize xTimeout. This records the time at which this function
    // was entered.
    vTaskSetTimeoutState( &xTimeout );
```

```
    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
```

```
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
```

(continues on next page)

(continued from previous page)

```

// any time that has been spent in the Blocked state within this
// function so far to ensure the total amount of time spent in the
// Blocked state does not exceed MAX_TIME_TO_WAIT.
if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
{
    //Timed out before the wanted number of bytes were available,
    // exit the loop.
    break;
}

// Wait for a maximum of xTicksToWait ticks to be notified that the
// receive interrupt has placed more data into the buffer.
ulTaskNotifyTake( pdTRUE, xTicksToWait );
}

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                             pucBuffer,
                                             uxWantedBytes );

return uxReceived;
}

```

See also:

<https://www.FreeRTOS.org/xTaskCheckForTimeOut.html>

Parameters

- **pxTimeOut** –The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** –The number of ticks to check for timeout i.e. if `pxTicksToWait` ticks have passed since `pxTimeOut` was last updated (either by `vTaskSetTimeOutState()` or `xTaskCheckForTimeOut()`), the timeout has occurred. If the timeout has not occurred, `pxTicksToWait` is updated to reflect the number of remaining ticks.

Returns If timeout has occurred, `pdTRUE` is returned. Otherwise `pdFALSE` is returned and `pxTicksToWait` is updated to reflect the number of remaining ticks.

`BaseType_t` **xTaskCatchUpTicks** (`TickType_t` `xTicksToCatchUp`)

tskMPU_REGION_DEVICE_MEMORY

tskDEFAULT_INDEX_TO_NOTIFY

tskNO_AFFINITY

tskIDLE_PRIORITY

Defines the priority used by the idle task. This must not be modified.

taskYIELD ()

Macro for forcing a context switch.

taskENTER_CRITICAL ()

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note: This may alter the stack (depending on the portable implementation) so must be used with care!

taskENTER_CRITICAL_FROM_ISR ()

taskENTER_CRITICAL_ISR ()

taskEXIT_CRITICAL ()

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note: This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR (x)

taskEXIT_CRITICAL_ISR ()

taskDISABLE_INTERRUPTS ()

Macro to disable all maskable interrupts.

taskENABLE_INTERRUPTS ()

Macro to enable microcontroller interrupts.

taskSCHEDULER_SUSPENDED

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

vTaskDelayUntil (pxPreviousWakeTime, xTimeIncrement)

xTaskNotify (xTaskToNotify, ulValue, eAction)

xTaskNotifyIndexed (xTaskToNotify, uxIndexToNotify, ulValue, eAction)

xTaskNotifyAndQuery (xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task's prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQueryIndexed (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)

xTaskNotifyFromISR (xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

xTaskNotifyIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

xTaskNotifyAndQueryIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQueryFromISR (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the

`xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

Parameters

- **`xTaskToNotify`** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

Returns `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

`xTaskNotifyGive` (`xTaskToNotify`)

`vTaskNotifyGiveFromISR` (`xTaskToNotify`, `pxHigherPriorityTaskWoken`)

`vTaskNotifyGiveIndexedFromISR` (`xTaskToNotify`, `uxIndexToNotify`, `pxHigherPriorityTaskWoken`)

`ulTaskNotifyTake` (`xClearCountOnExit`, `xTicksToWait`)

`ulTaskNotifyTakeIndexed` (`uxIndexToWaitOn`, `xClearCountOnExit`, `xTicksToWait`)

`xTaskNotifyStateClear` (`xTask`)

`xTaskNotifyStateClearIndexed` (`xTask`, `uxIndexToClear`)

`ulTaskNotifyValueClear` (`xTask`, `ulBitsToClear`)

`ulTaskNotifyValueClearIndexed` (`xTask`, `uxIndexToClear`, `ulBitsToClear`)

Type Definitions

```
typedef struct tskTaskControlBlock *TaskHandle_t
```

```
typedef BaseType_t (*TaskHookFunction_t)(void*)
```

Defines the prototype to which the application task hook function must conform.

```
typedef void (*TlsDeleteCallbackFunction_t)(int, void*)
```

Prototype of local storage pointer deletion callback.

Enumerations

enum **eTaskState**

Task states returned by eTaskGetState.

Values:

enumerator **eRunning**

enumerator **eReady**

enumerator **eBlocked**

enumerator **eSuspended**

enumerator **eDeleted**

enumerator **eInvalid**

enum **eNotifyAction**

Values:

enumerator **eNoAction**

enumerator **eSetBits**

enumerator **eIncrement**

enumerator **eSetValueWithOverwrite**

enumerator **eSetValueWithoutOverwrite**

enum **eSleepModeStatus**

Possible return values for eTaskConfirmSleepModeStatus().

Values:

enumerator **eAbortSleep**

enumerator **eStandardSleep**

enumerator **eNoTasksWaitingTimeout**

Queue API

Header File

- [components/freertos/include/freertos/queue.h](#)

Functions

BaseType_t **xQueueGenericSend** (*QueueHandle_t* xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, queueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, queueSEND_TO_BACK );
    }

    // ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** –Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t **xQueuePeek** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a

```

(continues on next page)

(continued from previous page)

```

// message is not immediately available.
if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
    // pcRxdMessage now points to the struct AMessage variable posted
    // by vATask, but the item still remains on the queue.
}
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueuePeekFromISR** (*QueueHandle_t* xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Parameters

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueReceive** (*QueueHandle_t* xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

```

(continues on next page)

(continued from previous page)

```

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// ...

// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueReceive( xQueue, &( pRxedMessage ), ( TickType_t ) 10 ) )
        {
            // pRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }

    // ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

Returns `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

`UBaseType_t uxQueueMessagesWaiting` (const *QueueHandle_t* xQueue)

Return the number of messages stored in a queue.

Parameters **xQueue** –A handle to the queue being queried.

Returns The number of messages available in the queue.

`UBaseType_t uxQueueSpacesAvailable` (const *QueueHandle_t* xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

Parameters **xQueue** –A handle to the queue being queried.

Returns The number of spaces available in the queue.

void **vQueueDelete** (*QueueHandle_t* xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters **xQueue** –A handle to the queue to be deleted.

BaseType_t **xQueueGenericSendFromISR** (*QueueHandle_t* xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWokenByPost;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWokenByPost = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post each byte.
xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
→ queueSEND_TO_BACK );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
taskYIELD_YIELD_FROM_ISR();
}
}
```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] `xQueueGenericSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueGenericSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** –Can take the value `queueSEND_TO_BACK` to place the item at the back of the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

Returns `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

BaseType_t **xQueueGiveFromISR** (*QueueHandle_t* xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t **xQueueReceiveFromISR** (*QueueHandle_t* xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
char cValueToPost;
const TickType_t xTicksToWait = ( TickType_t )0xff;

// Create a queue capable of containing 10 characters.
xQueue = xQueueCreate( 10, sizeof( char ) );
if( xQueue == 0 )
{
// Failed to create the queue.
}

// ...

// Post some characters that will be used within an ISR.  If the queue
// is full then this task will block for xTicksToWait ticks.
cValueToPost = 'a';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue
// becomes full.

cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
BaseType_t xTaskWokenByReceive = pdFALSE;
char cRxdChar;

while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
↪xTaskWokenByReceive) )
{
// A character was received.  Output the character now.
vOutputCharacter( cRxdChar );

// If removing the character from the queue woke the task that was
// posting onto the queue cTaskWokenByReceive will have been set to
// pdTRUE.  No matter how many times this loop iterates only one
// task will be woken.
}

if( cTaskWokenByPost != ( char ) pdFALSE;
{
taskYIELD ();
}
}

```

(continues on next page)

```
}

```

Parameters

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** –[out] A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t **xQueueIsQueueEmptyFromISR** (const *QueueHandle_t* xQueue)

BaseType_t **xQueueIsQueueFullFromISR** (const *QueueHandle_t* xQueue)

UBaseType_t **uxQueueMessagesWaitingFromISR** (const *QueueHandle_t* xQueue)

void **vQueueAddToRegistry** (*QueueHandle_t* xQueue, const char *pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

Parameters

- **xQueue** –The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** –The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

Parameters **xQueue** –The handle of the queue being removed from the registry.

const char ***pcQueueGetName** (*QueueHandle_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue's handle.

Parameters **xQueue** –The handle of the queue the name of which will be returned.

Returns If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

QueueHandle_t **xQueueGenericCreate** (const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueHandle_t **xQueueGenericCreateStatic** (const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueSetHandle_t **xQueueCreateSet** (const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

Parameters **uxEventQueueLength** –Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to $(5 + 12 + 1)$, or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to $(1 + 1 + 1)$, or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to $(5 + 3)$, or 8.

Returns If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType_t **xQueueAddToSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

Parameters

- **xQueueOrSemaphore** –The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** –The handle of the queue set to which the queue or semaphore is being added.

Returns If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

BaseType_t **xQueueRemoveFromSet** (*QueueSetMemberHandle_t* xQueueOrSemaphore, *QueueSetHandle_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Parameters

- **xQueueOrSemaphore** –The handle of the queue or semaphore being removed from the queue set (cast to an *QueueSetMemberHandle_t* type).
- **xQueueSet** –The handle of the queue set in which the queue or semaphore is included.

Returns If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

QueueSetMemberHandle_t **xQueueSelectFromSet** (*QueueSetHandle_t* xQueueSet, const TickType_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Parameters

- **xQueueSet** –The queue set on which the task will (potentially) block.
- **xTicksToWait** –The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

Returns xQueueSelectFromSet() will return the handle of a queue (cast to a *QueueSetMemberHandle_t* type) contained in the queue set that contains data, or the handle of a semaphore (cast to a *QueueSetMemberHandle_t* type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

QueueSetMemberHandle_t **xQueueSelectFromSetFromISR** (*QueueSetHandle_t* xQueueSet)

A version of xQueueSelectFromSet() that can be used from an ISR.

Macros

xQueueCreate (uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

```

Parameters

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

Returns If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

xQueueCreateStatic (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.

```

(continues on next page)

(continued from previous page)

```

StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                            ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                            &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                            &xQueueBuffer ); // The buffer that will hold the

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}

```

Parameters

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** –If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- **pxQueueBuffer** –Must point to a variable of type StaticQueue_t, which will be used to hold the queue's data structure.

Returns If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

xQueueSendToFront (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

```

(continues on next page)

(continued from previous page)

```

struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

```

(continues on next page)

```

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=_
↳pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS_
↪)
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the
    // value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
    // A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    // The value read should be the last value written, even though the
    // queue was already full when the value was written.
    if( ulValReceived != 100 )
    {
        // Error!
    }

    // ...
}
```

Parameters

- **xQueue** –The handle of the queue to which the data is being sent.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

Returns `xQueueOverwrite()` is a macro that calls `xQueueGenericSend()`, and therefore has the same return values as `xQueueSendToFront()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwrite()` will write to the queue even when the queue is already full.

xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
 BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
portYIELD_FROM_ISR ();
}
}
```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while ( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
portYIELD_FROM_ISR ();
}
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```

QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwriteFromISR() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

```

(continues on next page)

(continued from previous page)

```

void vAnInterruptHandler( void )
{
// xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
BaseType_t xHigherPriorityTaskWoken = pdFALSE;
uint32_t ulVarToSend, ulValReceived;

// Write the value 10 to the queue using xQueueOverwriteFromISR().
ulVarToSend = 10;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// The queue is full, but calling xQueueOverwriteFromISR() again will still
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPriorityTaskWoken == pdTRUE )
{
// Writing to the queue caused a task to unblock and the unblocked task
// has a priority higher than or equal to the priority of the currently
// executing task (the task this interrupt interrupted). Perform a
↪context
// switch so this interrupt returns directly to the unblocked task.
portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
// Actual macro used here is port specific.
portYIELD_FROM_ISR ();
}
}

```

Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueReset (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

Type Definitions

```
typedef struct QueueDefinition *QueueHandle_t
```

```
typedef struct QueueDefinition *QueueSetHandle_t
```

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

```
typedef struct QueueDefinition *QueueSetMemberHandle_t
```

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH

semSEMAPHORE_QUEUE_ITEM_LENGTH

semGIVE_BLOCK_TIME

vSemaphoreCreateBinary (xSemaphore)

xSemaphoreCreateBinary ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old `vSemaphoreCreateBinary()` macro is now deprecated in favour of this `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’ .

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

xSemaphoreCreateBinaryStatic (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
    // xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

Parameters

- **pxStaticSemaphore** – Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

Returns If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

xSemaphoreTake (xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

param xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

param xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore.  If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource.  Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

```

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

xSemaphoreTakeRecursive (xMutex, xBlockTime)

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{

```

(continues on next page)

```

// Create the mutex to guard a shared resource.
xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex.  If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex.  In real
            // code these would not be just sequential calls as this would make
            // no sense.  Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times.  Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure.  This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

```

Parameters

- **xMutex** –A handle to the mutex being obtained. This is the handle returned by `xSemaphoreCreateRecursiveMutex()`;
- **xBlockTime** –The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then `xSemaphoreTakeRecursive()` will return immediately no matter what the value of `xBlockTime`.

Returns `pdTRUE` if the semaphore was obtained. `pdFALSE` if `xBlockTime` expired without the semaphore becoming available.

xSemaphoreGive (xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`. and obtained us-

ing `sSemaphoreTake()`.

This macro must not be used from an ISR. See `xSemaphoreGiveFromISR()` for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using `xSemaphoreCreateRecursiveMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.

            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

Parameters

- **xSemaphore** – A handle to the semaphore being released. This is the handle returned when the semaphore was created.

Returns `pdTRUE` if the semaphore was released. `pdFALSE` if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive (xMutex)

Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to `xSemaphoreCreateRecursiveMutex()`;

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in `FreeRTOSConfig.h` for this macro to be available.

This macro must not be used on mutexes created using `xSemaphoreCreateMutex()`.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex.  If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex.  In real
            // code these would not be just sequential calls as this would make
            // no sense.  Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times.  Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound.  This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

```

Parameters

- **xMutex** –A handle to the mutex being released, or ‘given’. This is the handle returned by xSemaphoreCreateMutex();

Returns pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.

            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
```

(continues on next page)

(continued from previous page)

```

// ISR uses port specific syntax. Check the demo task for your port
// to find the syntax required.
}
}

```

Parameters

- **xSemaphore** –A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** –xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

Parameters

- **xSemaphore** –A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** –[out] xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

xSemaphoreCreateMutex ()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}

```

Returns If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

```

Parameters

- **pxMutexBuffer** –Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

Returns If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateRecursiveMutex()

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <http://www.freertos.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Returns xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

xSemaphoreCreateRecursiveMutexStatic() (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex.

`xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore **MUST ALWAYS** ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

Parameters

- **pxStaticSemaphore** –Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

Returns If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If `pxMutexBuffer` was `NULL` then `NULL` is returned.

xSemaphoreCreateCounting (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Parameters

- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.

Returns Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}
```

Parameters

- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** –Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

Returns If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters

- **xSemaphore** –A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

Type Definitions

```
typedef QueueHandle_t SemaphoreHandle_t
```

Timer API**Header File**

- [components/freertos/include/freertos/timers.h](#)

Functions

TimerHandle_t **xTimerCreate** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction)

TimerHandle_t xTimerCreate(const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
* int32_t lArrayIndex;
```

(continues on next page)

(continued from previous page)

```

* const int32_t xMaxExpiryCountBeforeStopping = 10;
*
* // Optionally do something if the pxTimer parameter is NULL.
* configASSERT( pxTimer );
*
* // Which timer expired?
* lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
* // Increment the number of times that pxTimer has expired.
* lExpireCounters[ lArrayIndex ] += 1;
*
* // If the timer has expired 10 times then stop it from running.
* if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
* {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
* }
* }
*
* void main( void )
* {
*     int32_t x;
*
*     // Create then start some timers. Starting the timers before the
*     ↪ scheduler
*     // has been started means the timers will start running immediately that
*     // the scheduler starts.
*     for( x = 0; x < NUM_TIMERS; x++ )
*     {
*         xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
*     ↪ not used by the kernel.
*                                     ( 100 * x ), // The timer period
*     ↪ in ticks.
*                                     pdTRUE, // The timers will
*     ↪ auto-reload themselves when they expire.
*                                     ( void * ) x, // Assign each timer
*     ↪ a unique id equal to its array index.
*                                     vTimerCallback // Each timer calls
*     ↪ the same callback when it expires.
*                                     );
*
*         if( xTimers[ x ] == NULL )
*         {
*             // The timer was not created.
*         }
*         else
*         {
*             // Start the timer. No block time is specified, and even if one
*     ↪ was
*             // it would be ignored because the scheduler has not yet been
*             // started.
*             if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*             {
*                 // The timer could not be set into the Active state.
*             }
*         }
*     }
*
*     // ...
*     // Create tasks here.

```

(continues on next page)

(continued from previous page)

```

* // ...
*
* // Starting the scheduler will start the timers running as they have
* already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

Parameters

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);” .

Returns If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

TimerHandle_t **xTimerCreateStatic** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, *TimerCallbackFunction_t* pxCallbackFunction, StaticTimer_t *pxTimerBuffer)

```
TimerHandle_t xTimerCreateStatic(const char * const pcTimerName, TickType_t xTimerPeriodInTicks,
UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction, Static-
Timer_t *pxTimerBuffer );
```

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```

*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*     UBaseType_t *puxVariableToIncrement;
*     BaseType_t xReturned;
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(
↳xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
* void main( void )
* {
*     // Create the software time. xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function. The parameter is a
↳pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure. If the parameter is passed as NULL then the structure
↳will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1", // Text name for the task.
↳ Helps debugging only. Not used by FreeRTOS.
*     xTimerPeriod, // The period of the
↳timer in ticks.
*     pdTRUE, // This is an auto-reload
↳timer.
*     ( void * ) &uxVariableToIncrement, // A
↳variable incremented by the software timer's callback function
*     prvTimerCallback, // The function to
↳execute when the timer expires.
*     &xTimerBuffer ); // The buffer that will
↳hold the software timer structure.
*
*     // The scheduler has not started yet so a block time is not used.
*     xReturned = xTimerStart( xTimer, 0 );
*
*     // ...
*     // Create tasks here.
*     // ...

```

(continues on next page)

```

*
* // Starting the scheduler will start the timers running as they have
* ↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

Parameters

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);” .
- **pxTimerBuffer** –Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

Returns If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

```

void *pvTimerGetTimerID (const TimerHandle_t xTimer)
void *pvTimerGetTimerID( TimerHandle_t xTimer );

```

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

Parameters **xTimer** –The timer being queried.

Returns The ID assigned to the timer being queried.

```

void vTimerSetTimerID ( TimerHandle_t xTimer, void *pvNewID)
void vTimerSetTimerID( TimerHandle_t xTimer, void *pvNewID );

```

Sets the ID assigned to the timer.

IDs are assigned to timers using the `pvTimerID` parameter of the call to `xTimerCreated()` that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

Parameters

- **xTimer** –The timer being updated.
- **pvNewID** –The ID to assign to the timer.

BaseType_t **xTimerIsTimerActive** (*TimerHandle_t* xTimer)

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     →equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

Parameters **xTimer** –The timer being queried.

Returns `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

TaskHandle_t **xTimerGetTimerDaemonTaskHandle** (void)

`xTimerGetTimerDaemonTaskHandle()` is only available if `INCLUDE_xTimerGetTimerDaemonTaskHandle` is set to 1 in `FreeRTOSConfig.h`.

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

BaseType_t **xTimerPendFunctionCallFromISR** (*PendedFunction_t* xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken);

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with 'Timer').

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
*
* // The callback function that will execute in the context of the daemon_
* →task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*     // ...Perform the processing here...
* }
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )_
* →xInterfaceToService, &xHigherPriorityTaskWoken );
*
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
*
```

Parameters

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** –The value of the callback function' s first parameter. The parameter has a `void *` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void *`, or the `void *` can be used to point to a structure.
- **ulParameter2** –The value of the callback function' s second parameter.

- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using `configTIMER_TASK_PRIORITY` in `FreeRTOSConfig.h`) is higher than the priority of the currently running task (the task the interrupt interrupted) then `*pxHigherPriorityTaskWoken` will be set to `pdTRUE` within `xTimerPendFunctionCallFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `*pxHigherPriorityTaskWoken` must be initialised to `pdFALSE`. See the example code below.

Returns `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

```
BaseType_t xTimerPendFunctionCall (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)
```

```
BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait );
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with ‘Timer’).

Parameters

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** –The value of the callback function’ s first parameter. The parameter has a `void *` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void *`, or the `void *` can be used to point to a structure.
- **ulParameter2** –The value of the callback function’ s second parameter.
- **xTicksToWait** –Calling this function will result in a message being sent to the timer daemon task on a queue. `xTicksToWait` is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

Returns `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

```
const char *pcTimerGetName (TimerHandle_t xTimer)
const char * const pcTimerGetName( TimerHandle_t xTimer );
```

Returns the name that was assigned to a timer when the timer was created.

Parameters **xTimer** –The handle of the timer being queried.

Returns The name assigned to the timer specified by the `xTimer` parameter.

```
void vTimerSetReloadMode (TimerHandle_t xTimer, const UBaseType_t uxAutoReload)
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );
```

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters

- **xTimer** –The handle of the timer being updated.
- **uxAutoReload** –If `uxAutoReload` is set to `pdTRUE` then the timer will expire repeatedly with a frequency set by the timer’ s period (see the `xTimerPeriodInTicks` parameter of the `xTimerCreate()` API function). If `uxAutoReload` is set to `pdFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.

```
UBaseType_t uxTimerGetReloadMode (TimerHandle_t xTimer)
UBaseType_t uxTimerGetReloadMode( TimerHandle_t xTimer );
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters **xTimer** –The handle of the timer being queried.

Returns If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t **xTimerGetPeriod** (*TimerHandle_t* xTimer)

TickType_t xTimerGetPeriod(TimerHandle_t xTimer);

Returns the period of a timer.

Parameters **xTimer** –The handle of the timer being queried.

Returns The period of the timer in ticks.

TickType_t **xTimerGetExpiryTime** (*TimerHandle_t* xTimer)

TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer);

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

Parameters **xTimer** –The handle of the timer being queried.

Returns If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

void **vApplicationGetTimerTaskMemory** (StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

- **ppxTimerTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** –A handle to a statically allocated Stack buffer for this idle task
- **pulTimerTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

xTimerStart (xTimer, xTicksToWait)

BaseType_t xTimerStart(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStart()` starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerStart()` has equivalent functionality to the `xTimerReset()` API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after `xTimerStart()` was called, where 'n' is the timers defined period.

It is valid to call `xTimerStart()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerStart()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStart()` to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

Parameters

- **xTimer** –The handle of the timer being started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStart()` was called. `xTicksToWait` is ignored if `xTimerStart()` is called before the scheduler is started.

Returns `pdFAIL` will be returned if the start command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStart()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerStop (xTimer, xTicksToWait)

BaseType_t xTimerStop(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerStop()` stops a timer that was previously started using either of the `The xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` or `xTimerChangePeriodFromISR()` API functions.

Stopping a timer ensures the timer is not in the active state.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerStop()` to be available.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

Parameters

- **xTimer** –The handle of the timer being stopped.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when `xTimerStop()` was called. `xTicksToWait` is ignored if `xTimerStop()` is called before the scheduler is started.

Returns `pdFAIL` will be returned if the stop command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerChangePeriod (xTimer, xNewPeriod, xTicksToWait)

```
BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerChangePeriod()` changes the period of a timer that was previously created using the `xTimerCreate()` API function.

`xTimerChangePeriod()` can be called to change the period of an active or dormant state timer.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerChangePeriod()` to be available.

Example usage:

```
* // This function assumes xTimer has already been created.  If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted.  If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     ↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is already active - delete it.
*         xTimerDelete( xTimer );
*     }
*     else
*     {
*         // xTimer is not active, change its period to 500ms.  This will also
*         // cause the timer to start.  Block for a maximum of 100 ticks if the
*         // change period command cannot immediately be sent to the timer
*         // command queue.
*         if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==
*         ↪pdPASS )
*         {
*             // The command was successfully sent.
*         }
*     }
*     else
```

(continues on next page)

```

*      {
*          // The command could not be sent, even after waiting for 100
↳ticks
*          // to pass. Take appropriate action here.
*      }
*  }
* }
*

```

Parameters

- **xTimer** –The handle of the timer that is having its period changed.
- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

Returns pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerDelete (xTimer, xTicksToWait)

BaseType_t xTimerDelete(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

Parameters

- **xTimer** –The handle of the timer being deleted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

Returns pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerReset (xTimer, xTicksToWait)

```
BaseType_t xTimerReset( TimerHandle_t xTimer, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerReset() was called, where 'n' is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds_
↳pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
*     int32_t x;
```

(continues on next page)

(continued from previous page)

```

* // Create then start the one-shot timer that is responsible for turning
* // the back-light off if no keys are pressed within a 5 second period.
* xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a
↳text name, not used by the kernel.
* ( 5000 / portTICK_PERIOD_MS), // The
↳timer period in ticks.
* pdFALSE, // The timer
↳is a one-shot timer.
* 0, // The id is
↳not used by the callback so can take any value.
* vBacklightTimerCallback // The
↳callback function that switches the LCD back-light off.
* );
*
* if( xBacklightTimer == NULL )
* {
* // The timer was not created.
* }
* else
* {
* // Start the timer. No block time is specified, and even if one was
* // it would be ignored because the scheduler has not yet been
* // started.
* if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
* {
* // The timer could not be set into the Active state.
* }
* }
*
* // ...
* // Create tasks here.
* // ...
*
* // Starting the scheduler will start the timer running as it has already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

Parameters

- **xTimer** –The handle of the timer being reset/started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStartFromISR (xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerStartFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```

* // This scenario assumes xBacklightTimer has already been created.  When a
* // key is pressed, an LCD back-light is switched on.  If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off.  In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer.  In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed.  Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then restart the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity.  This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=_
↳pdPASS )
*     {
*         // The start command was not executed successfully.  Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed.  The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler.  Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*

```

Parameters

- **xTimer** –The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling

`xTimerStartFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerStartFromISR()` function. If `xTimerStartFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns `pdFAIL` will be returned if the start command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStartFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerStopFromISR (`xTimer`, `pxHigherPriorityTaskWoken`)

`BaseType_t xTimerStopFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);`

A version of `xTimerStop()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*   BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*   // The interrupt has occurred - simply stop the timer.
*   // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*   // (within this function). As this is an interrupt service routine, only
*   // FreeRTOS API functions that end in "FromISR" can be used.
*   if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
*   {
*       // The stop command was not executed successfully. Take appropriate
*       // action here.
*   }
*
*   // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*   // should be performed. The syntax required to perform a context switch
*   // from inside an ISR varies from port to port, and from compiler to
*   // compiler. Inspect the demos for the port you are using to find the
*   // actual syntax required.
*   if( xHigherPriorityTaskWoken != pdFALSE )
*   {
*       // Call the interrupt safe yield function here (actual function
*       // depends on the FreeRTOS port being used).
*   }
* }
*
```

Parameters

- **xTimer** –The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStopFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStopFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken`

will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerChangePeriodFromISR (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

```
BaseType_t xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t
*pxHigherPriorityTaskWoken );
```

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - change the period of xTimer to 500ms.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
* {
* // The command to change the timers period was not executed
* // successfully. Take appropriate action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

Parameters

- **xTimer** –The handle of the timer that is having its period changed.
- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue,

so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns `pdFAIL` will be returned if the command to change the timers period could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

xTimerResetFromISR (`xTimer`, `pxHigherPriorityTaskWoken`)

`BaseType_t xTimerResetFromISR(TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken);`

A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
*     {
*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
```

(continues on next page)

(continued from previous page)

```

*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
*     // Call the interrupt safe yield function here (actual function
*     // depends on the FreeRTOS port being used).
* }
* }
*

```

Parameters

- **xTimer** –The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Type Definitions

```
typedef struct tmrTimerControl *TimerHandle_t
```

```
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

```
typedef void (*PendedFunction_t)(void*, uint32_t)
```

Event Group API**Header File**

- [components/freertos/include/freertos/event_groups.h](#)

Functions

EventGroupHandle_t **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using xEventGroupCreateStatic() then

the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Returns If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See <https://www.FreeRTOS.org/a00111.html>

EventGroupHandle_t **xEventGroupCreateStatic** (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event group is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;
```

(continues on next page)

(continued from previous page)

```
// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

Parameters **pxEventGroupBuffer** –pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

Returns If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

EventBits_t **xEventGroupWaitBits** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup,    // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait
        for.            pdTRUE,          // BIT_0 and BIT_4 should be cleared before
        returning.     pdFALSE,        // Don't wait for both bits, either bit will
        do.             xTicksToWait ); // Wait a maximum of 100ms for either bit to
        be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}
```

Parameters

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xClearOnExit** –If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- **xWaitForAllBits** –If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- **xTicksToWait** –The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set.

Returns The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

EventBits_t **xEventGroupClearBits** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
        // called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else
```

(continues on next page)

(continued from previous page)

```

{
    // Neither bit 0 nor bit 4 were set in the first place.
}
}

```

Parameters

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns The value of the event group before the specified bits were cleared.

EventBits_t **xEventGroupSetBits** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 );// The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set. It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}

```

Parameters

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

Returns The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

EventBits_t **xEventGroupSync** (*EventGroupHandle_t* xEventGroup, const *EventBits_t* uxBitsToSet, const *EventBits_t* uxBitsToWaitFor, *TickType_t* xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```
// Bits used by the three tasks.
#define TASK_0_BIT      ( 1 << 0 )
#define TASK_1_BIT      ( 1 << 1 )
#define TASK_2_BIT      ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
        // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, ↵
        ↵xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call
            // to xEventGroupSync() timed out.
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

```

Parameters

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToSet** –The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xTicksToWait** –The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

Returns The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

EventBits_t **xEventGroupGetBitsFromISR** (*EventGroupHandle_t* xEventGroup)

A version of `xEventGroupGetBits()` that can be called from an ISR.

Parameters **xEventGroup** –The event group being queried.

Returns The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

void **vEventGroupDelete** (*EventGroupHandle_t* xEventGroup)

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

Parameters `xEventGroup` –The event group being deleted.

Macros

xEventGroupClearBitsFromISR (`xEventGroup`, `uxBitsToClear`)

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
                xEventGroup, // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

Parameters

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

Returns If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

xEventGroupSetBitsFromISR (`xEventGroup`, `uxBitsToSet`, `pxHigherPriorityTaskWoken`)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4   // The bits being set.
                &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}

```

Parameters

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

Returns If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Parameters

- **xEventGroup** –The event group being queried.

Returns The event group bits at the time xEventGroupGetBits() was called.

Type Definitions

```
typedef struct EventGroupDef_t *EventGroupHandle_t
```

```
typedef TickType_t EventBits_t
```

Stream Buffer API

Header File

- `components/freertos/include/freertos/stream_buffer.h`

Functions

`size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)`

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

*****NOTE***:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

Parameters

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.

- **pvTxData** –A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-MAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

Returns The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size_t **xStreamBufferSendFromISR** (*StreamBufferHandle_t* xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
```

(continues on next page)

(continued from previous page)

```

// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

Parameters

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.
- **pvTxData** –A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

Returns The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

size_t **xStreamBufferReceive** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

*****NOTE***:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( StreamBuffer_t xStreamBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
// Wait in the Blocked state (so not using any CPU processing time) for a
// maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
// available.
xReceivedBytes = xStreamBufferReceive( xStreamBuffer,

```

(continues on next page)

(continued from previous page)

```

( void * ) ucRxData,
sizeof( ucRxData ),
xBlockTime );

if( xReceivedBytes > 0 )
{
    // A ucRxData contains another xReceievedBytes bytes of data, which can
    // be processed here....
}
}

```

Parameters

- **xStreamBuffer** –The handle of the stream buffer from which bytes are to be received.
- **pvRxData** –A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

Returns The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle_t* xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
( void * ) ucRxData,
sizeof( ucRxData ),
&xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
    }
}

```

(continues on next page)

```

    // Process the stream here....
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

Parameters

- **xStreamBuffer** –The handle of the stream buffer from which a stream is being received.
- **pvRxData** –A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete** (*StreamBufferHandle_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

Parameters **xStreamBuffer** –The handle of the stream buffer to be deleted.

BaseType_t **xStreamBufferIsFull** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

Parameters **xStreamBuffer** –The handle of the stream buffer being queried.

Returns If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferIsEmpty** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

Parameters **xStreamBuffer** –The handle of the stream buffer being queried.

Returns If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReset** (*StreamBufferHandle_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

Parameters **xStreamBuffer** –The handle of the stream buffer being reset.

Returns If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

Parameters **xStreamBuffer** –The handle of the stream buffer being queried.

Returns The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t **xStreamBufferBytesAvailable** (*StreamBufferHandle_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

Parameters **xStreamBuffer** –The handle of the stream buffer being queried.

Returns The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle_t* xStreamBuffer, size_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

Parameters

- **xStreamBuffer** –The handle of the stream buffer being updated.
- **xTriggerLevel** –The new trigger level for the stream buffer.

Returns If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xStreamBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t **xStreamBufferReceiveCompletedFromISR** (*StreamBufferHandle_t* xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

Parameters

- **xStreamBuffer** –The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Macros

xStreamBufferCreate (xBufferSizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
// There was not enough heap memory space available to create the
// stream buffer.
}
else
{
// The stream buffer was created successfully and can now be used.
}
}
```

Parameters

- **xBufferSizeBytes** –The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

Returns If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

xStreamBufferCreateStatic (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```
// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                              xTriggerLevel,
                                              ucBufferStorage,
                                              &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.

    // Other code that uses the stream buffer can go here.
}
```

Parameters

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.

- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** –Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** –Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer's data structure.

Returns If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

Message Buffer API

Header File

- [components/freertos/include/freertos/message_buffer.h](#)

Macros

xMessageBufferCreate (xBufferSizeBytes)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
}
```

(continues on next page)

(continued from previous page)

```

else
{
    // The message buffer was created successfully and can now be used.
}

```

Parameters

- **xBufferSizeBytes** –The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

Returns If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

xMessageBufferCreateStatic (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                                ucBufferStorage,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}

```

Parameters

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucMessage-BufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).

- **pucMessageBufferStorageArea** –Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** –Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer's data structure.

Returns If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticmessageBuffer are NULL then NULL is returned.

xMessageBufferSend (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

Parameters

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.

- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** –The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

xMessageBufferSendFromISR (xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer' s free space, and is copied into the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

(continues on next page)

(continued from previous page)

```

}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

Parameters

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.
- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message' s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The number of bytes actually written to the message buffer. If the message buffer didn' t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive the next message from the message buffer. Wait in the Blocked
// state (so not using any CPU processing time) for a maximum of 100ms for
// a message to become available.
xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );

if( xReceivedBytes > 0 )
{
    // A ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
}
}

```

Parameters

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.
- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

xMessageBufferReceiveFromISR (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

NOTE: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-

FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.
- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

Returns The length, in bytes, of the message read from the message buffer, if any.

vMessageBufferDelete (xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-

BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

Parameters

- **xMessageBuffer** –The handle of the message buffer to be deleted.

xMessageBufferIsFull (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

Returns If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferIsEmpty (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

Returns If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReset (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

Parameters

- **xMessageBuffer** –The handle of the message buffer being reset.

Returns If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

xMessageBufferSpaceAvailable (xMessageBuffer)

Returns the number of bytes of free space in the message buffer.

Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

Returns The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message's length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

xMessageBufferSpacesAvailable (xMessageBuffer)

xMessageBufferNextLengthBytes (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

Returns The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

xMessageBufferSendCompletedFromISR (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to

arrive then the `sbSEND_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbSEND_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

Parameters

- **xMessageBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferSendCompletedFromISR()`. If calling `xMessageBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

xMessageBufferReceiveCompletedFromISR (`xMessageBuffer`, `pxHigherPriorityTaskWoken`)

For advanced users only.

The `sbRECEIVE_COMPLETED()` macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbRECEIVE_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbRECEIVE_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

Parameters

- **xMessageBuffer** –The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** –*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

Returns If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

Type Definitions

```
typedef void *MessageBufferHandle_t
```

Type by which message buffers are referenced. For example, a call to `xMessageBufferCreate()` returns an `MessageBufferHandle_t` variable that can then be used as a parameter to `xMessageBufferSend()`, `xMessageBufferReceive()`, etc.

2.7.11 FreeRTOS Additions

This document describes the additional features added to ESP-IDF FreeRTOS. This document is split into the following parts:

Contents

- *FreeRTOS Additions*
 - *Overview*
 - *Ring Buffers*

- [Hooks](#)
- [TLSP Deletion Callbacks](#)
- [Component Specific Properties](#)
- [API Reference](#)

Overview

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However, various new features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers:** Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **Hooks:** ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric among both CPUs.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks:** TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties:** Currently added only one component specific property `ORIG_INCLUDE_PATH`.

Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items *must also be returned* to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

No-Split buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. *Only this buffer type allows you to get the data item address and write to the item by yourself*. Refer the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

Allow-Split buffers will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

Note: No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

Note: Each item stored in No-Split or Allow-Split buffers will **require an additional 8 bytes for a header**. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

Usage The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it.

```

#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↪TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```

#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))

...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when_
↪we copy
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates retrieving and returning an item from a **No-Split ring buffer** using `xRingbufferReceive()` and `vRingbufferReturnItem()`

```

...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from an **Allow-Split ring buffer** using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

```

...

//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
 BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↳*)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from a **byte buffer** using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```

...

//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000), sizeof(tx_item));

//Check received data

```

(continues on next page)

(continued from previous page)

```

if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`

Note: Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

Sending to Ring Buffer The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes **18, 3, and 27 bytes** are sent respectively to a **buffer of 128 bytes**.

Fig. 27: Sending items to No-Split or Allow-Split ring buffers

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

Fig. 28: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

Using `SendAcquire` and `SendComplete` Items in No-Split buffers are acquired (by `SendAcquire`) in strict FIFO order and must be sent to the buffer by `SendComplete` for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling `SendComplete`, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling `SendComplete` for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when `SendAcquire` and `SendComplete` don't happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then `SendAcquire` is called to acquire space of 20, 8, 24 bytes on the ring buffer.

Fig. 29: `SendAcquire`/`SendComplete` items in No-Split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by `SendComplete` in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if `SendComplete` is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

Wrap around The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes with 56 bytes of free space that wraps around** and a sent item of **28 bytes**.

Fig. 30: Wrap around in No-Split buffers

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Fig. 31: Wrap around in Allow-Split buffers

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

Note: Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

Fig. 32: Wrap around in byte buffers

Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

Retrieving/Returning The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Fig. 33: Retrieving/Returning items in No-Split and Allow-Split ring buffers

Fig. 34: Retrieving/Returning data in byte buffers

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

Ring Buffers with Queue Sets Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
```

(continues on next page)

(continued from previous page)

```

    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_
↳TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //Handle item
    ...
} else {
    ...
}

```

Ring Buffers with Static Allocation The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer's data structure of type `StaticRingbuffer_t`
- The ring buffer's storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

Note: When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```

#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE    400    //32-bit aligned size
#define BUFFER_TYPE    RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↳malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE,
↳MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↳storage, buffer_struct);

```

(continues on next page)

```
...  
  
//Delete the ring buffer after used  
vRingbufferDelete(handle);  
  
//Manually free all blocks of memory  
free(buffer_struct);  
free(buffer_storage);
```

Priority Inversion Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the **highest priority task will always be serviced first**. However due to the usage of binary semaphores in the ring buffer's underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a **gap in the critical section** which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the **semaphore being acquired by the second-highest priority task** waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

Hooks

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

Vanilla FreeRTOS Hooks Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as **Legacy Hooks** in ESP-IDF FreeRTOS. To enable legacy hooks, [CONFIG_FREERTOS_LEGACY_HOOKS](#) should be enabled in *project configuration menu*.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32-S3 is dual-core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

ESP-IDF Idle and Tick Hooks For some use-cases it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time.

Furthermore, due to the dual-core nature of the ESP32-S3, it may be necessary for some applications to have separate hooks for each core.

Therefore, ESP-IDF provides its own hooks API in addition to the legacy hooks provided by vanilla FreeRTOS.

The ESP-IDF tick and idle hooks are registered at run time. Each tick hook and idle hook must be registered to a specific CPU. When the idle task runs or a tick interrupt occurs on a particular CPU, the CPU will run each of its registered idle hook and tick hook in turn.

Note: Tick interrupt stays active whilst cache is disabled and hence `vApplicationTickHook()` (legacy case) or ESP-IDF tick hooks must be placed in internal RAM. Please refer to the [SPI flash API documentation](#) for more details.

TLSP Deletion Callbacks

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to...

- set a task's TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task's TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task's lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP's associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible
- The callback is called shortly before a deleted task's memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

API Reference

Ring Buffer API

Header File

- `components/esp_ringbuf/include/freertos/ringbuf.h`

Functions

RingbufHandle_t **xRingbufferCreate** (size_t xBufferSize, *RingbufferType_t* xBufferType)

Create a ring buffer.

Note: xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

Parameters

- **xBufferSize** –[in] Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers
- **xBufferType** –[in] Type of ring buffer, see documentation.

Returns A handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateNoSplit** (size_t xItemSize, size_t xItemNum)

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

Parameters

- **xItemSize** –[in] Size of each item to be put into the ring buffer
- **xItemNum** –[in] Maximum number of items the buffer needs to hold simultaneously

Returns A *RingbufHandle_t* handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t **xRingbufferCreateStatic** (size_t xBufferSize, *RingbufferType_t* xBufferType, uint8_t *pucRingbufferStorage, *StaticRingbuffer_t* *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

Note: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

Parameters

- **xBufferSize** –[in] Size of the buffer in bytes.
- **xBufferType** –[in] Type of ring buffer, see documentation
- **pucRingbufferStorage** –[in] Pointer to the ring buffer' s storage area. Storage area must of the same size as specified by xBufferSize
- **pxStaticRingbuffer** –[in] Pointed to a struct of type *StaticRingbuffer_t* which will be used to hold the ring buffer' s data structure

Returns A handle to the created ring buffer

BaseType_t **xRingbufferSend** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –[in] Size of data to insert.
- **xTicksToWait** –[in] Ticks to wait for room in the ring buffer.

Returns

- pdTRUE if succeeded

- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendFromISR** (*RingbufHandle_t* xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

Note: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –[in] Size of data to insert.
- **pxHigherPriorityTaskWoken** –[out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` when the ring buffer does not have space.

BaseType_t **xRingbufferSendAcquire** (*RingbufHandle_t* xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it timesout.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

Note: Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

Parameters

- **xRingbuffer** –[in] Ring buffer to allocate the memory
- **ppvItem** –[out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** –[in] Size of item to acquire.
- **xTicksToWait** –[in] Ticks to wait for room in the ring buffer.

Returns

- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendComplete** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

Note: Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

Parameters

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to item in allocated memory to insert.

Returns

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void ***xRingbufferReceive** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

Note: A call to `vRingbufferReturnItem()` is required after this to free the item retrieved.

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***xRingbufferReceiveFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

Note: A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

Note: Byte buffers do not allow multiple retrievals before returning an item

Note: Two calls to `RingbufferReceiveFromISR()` are required if the bytes wrap around the end of the ring buffer.

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

BaseType_t **xRingbufferReceiveSplit** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retried. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note: Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **ppvHeadItem** –[out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –[out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –[out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –[out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.

Returns

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

BaseType_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle_t* xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

Note: Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **ppvHeadItem** –[out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –[out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –[out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –[out] Pointer to size of second part (unmodified if item is not split)

Returns

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

void ***xRingbufferReceiveUpTo** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

Note: A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Note: Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.
- **xMaxSize** –[in] Maximum number of bytes to return.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void ***xRingbufferReceiveUpToFromISR** (*RingbufHandle_t* xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

Note: A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

Note: This function should only be called on byte buffers

Note: Byte buffers do not allow multiple retrievals before returning an item

Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** –[in] Maximum number of bytes to return.

Returns

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

void **vRingbufferReturnItem** (*RingbufHandle_t* xRingbuffer, void *pvItem)

Return a previously-retrieved item to the ring buffer.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- **xRingbuffer** –[in] Ring buffer the item was retrieved from
- **pvItem** –[in] Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle_t* xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

Note: If a split item is retrieved, both parts should be returned by calling this function twice

Parameters

- **xRingbuffer** –[in] Ring buffer the item was retrieved from
- **pvItem** –[in] Item that was received earlier
- **pxHigherPriorityTaskWoken** –[out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void **vRingbufferDelete** (*RingbufHandle_t* xRingbuffer)

Delete a ring buffer.

Note: This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

Parameters **xRingbuffer** –[in] Ring buffer to delete

size_t **xRingbufferGetMaxItemSize** (*RingbufHandle_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note: The max item size for a no-split buffer is limited to $((\text{buffer_size}/2) - \text{header_size})$. This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

Parameters **xRingbuffer** –[in] Ring buffer to query

Returns Maximum size, in bytes, of an item that can be placed in a ring buffer.

size_t **xRingbufferGetCurFreeSize** (*RingbufHandle_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Note: An empty no-split buffer has a max current free size for an item that is limited to $((\text{buffer_size}/2) - \text{header_size})$. See API reference for `xRingbufferGetMaxItemSize()`.

Warning: This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent Send

Parameters **xRingbuffer** –[in] Ring buffer to query

Returns Current free size, in bytes, available for an entry

BaseType_t **xRingbufferAddToQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Add the ring buffer's read semaphore to a queue set.

The ring buffer's read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer's read semaphore to a queue set.

Parameters

- **xRingbuffer** –[in] Ring buffer to add to the queue set
- **xQueueSet** –[in] Queue set to add the ring buffer's read semaphore to

Returns

- pdTRUE on success, pdFALSE otherwise

BaseType_t **xRingbufferCanRead** (*RingbufHandle_t* xRingbuffer, *QueueSetMemberHandle_t* xMember)

Check if the selected queue set member is the ring buffer's read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

Parameters

- **xRingbuffer** –[in] Ring buffer which should be checked
- **xMember** –[in] Member returned from xQueueSelectFromSet

Returns

- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

BaseType_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle_t* xRingbuffer, *QueueSetHandle_t* xQueueSet)

Remove the ring buffer's read semaphore from a queue set.

This specifically removes a ring buffer's read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

Parameters

- **xRingbuffer** –[in] Ring buffer to remove from the queue set
- **xQueueSet** –[in] Queue set to remove the ring buffer's read semaphore from

Returns

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo** (*RingbufHandle_t* xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)

Get information about ring buffer status.

Get information of the a ring buffer's current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

Parameters

- **xRingbuffer** –[in] Ring buffer to remove from the queue set
- **uxFree** –[out] Pointer use to store free pointer position
- **uxRead** –[out] Pointer use to store read pointer position
- **uxWrite** –[out] Pointer use to store write pointer position
- **uxAcquire** –[out] Pointer use to store acquire pointer position
- **uxItemsWaiting** –[out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

Parameters **xRingbuffer** –Ring buffer to show

Structures

struct `xSTATIC_RINGBUFFER`

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Type Definitions

```
typedef void *RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

Enumerations

```
enum RingbufferType_t
```

Values:

```
enumerator RINGBUF_TYPE_NOSPLIT
```

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

```
enumerator RINGBUF_TYPE_ALLOWSPLIT
```

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

```
enumerator RINGBUF_TYPE_BYTEBUF
```

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

```
enumerator RINGBUF_TYPE_MAX
```

Hooks API**Header File**

- [components/esp_system/include/esp_freertos_hooks.h](#)

Functions

```
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb,  
                                                  UBaseType_t cpuid)
```

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Parameters

- **new_idle_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

Returns

- ESP_OK: Callback registered to the specified core' s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core' s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_idle_hook** (*esp_freertos_idle_cb_t* new_idle_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Parameters **new_idle_cb** –[in] Callback to be called

Returns

- ESP_OK: Callback registered to the calling core' s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core' s idle hook to register callback

esp_err_t **esp_register_freertos_tick_hook_for_cpu** (*esp_freertos_tick_cb_t* new_tick_cb, UBaseType_t cpuid)

Register a callback to be called from the specified core' s tick hook.

Parameters

- **new_tick_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

Returns

- ESP_OK: Callback registered to specified core' s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core' s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

esp_err_t **esp_register_freertos_tick_hook** (*esp_freertos_tick_cb_t* new_tick_cb)

Register a callback to be called from the calling core' s tick hook.

Parameters **new_tick_cb** –[in] Callback to be called

Returns

- ESP_OK: Callback registered to the calling core' s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core' s tick hook to register the callback

void **esp_deregister_freertos_idle_hook_for_cpu** (*esp_freertos_idle_cb_t* old_idle_cb, UBaseType_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

Parameters

- **old_idle_cb** –[in] Callback to be unregistered
- **cpuid** –[in] id of the core

void **esp_deregister_freertos_idle_hook** (*esp_freertos_idle_cb_t* old_idle_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

Parameters `old_idle_cb` –[in] Callback to be unregistered

void `esp_deregister_freertos_tick_hook_for_cpu` (`esp_freertos_tick_cb_t` `old_tick_cb`,
UBaseType_t `cpuid`)

Unregister a tick callback from the tick hook of the specified core.

Parameters

- `old_tick_cb` –[in] Callback to be unregistered
- `cpuid` –[in] id of the core

void `esp_deregister_freertos_tick_hook` (`esp_freertos_tick_cb_t` `old_tick_cb`)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

Parameters `old_tick_cb` –[in] Callback to be unregistered

Type Definitions

```
typedef bool (*esp_freertos_idle_cb_t)(void)
```

```
typedef void (*esp_freertos_tick_cb_t)(void)
```

2.7.12 Heap Memory Allocation

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32-S3 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, *DMA-Capable Memory* or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32-S3 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be *32-bit aligned*.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see *Memory Types*.

It's also possible to connect external SPI RAM to the ESP32-S3 - *external RAM* can be integrated into the ESP32-S3's memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `cpp:func:heap_caps_malloc_default(size)`. This will allocate memory with capability `MALLOC_CAP_DEFAULT`, which is byte-addressable.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

DRAM At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

Note: At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

IRAM At startup, the IRAM heap contains all instruction memory which is not used by the app executable code.

The `idf.py size` command can be used to find the amount of IRAM used by the app.

D/IRAM Some memory in the ESP32-S3 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

Finding available heap See [Heap Information](#).

Special Capabilities

DMA-Capable Memory Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can't do for a normal `malloc()` call. This can help to use all the available memory in the ESP32-S3.

Memory allocated with `MALLOC_CAP_32BIT` can *only* be accessed via 32-bit reads and writes, any other type of access will generate a fatal `LoadStoreError` exception.

External SPI Memory When *external RAM* is enabled, external SPI RAM under 4MiB in size can be allocated using standard `malloc` calls, or via `heap_caps_malloc (MALLOC_CAP_SPIRAM)`, depending on configuration. See *Configuring External RAM* for more details.

Thread Safety

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the *Heap Memory Debugging* page:

- *Heap Information* (free space, etc.)
- *Heap Corruption Detection*
- *Heap Tracing* (memory leak detection, monitoring, etc.)

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the *multi_heap* functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling `multi_heap_malloc()` or `multi_heap_calloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular `multi_heap` instance.

API Reference - Heap Allocation

Header File

- `components/heap/include/esp_heap_caps.h`

Functions

`esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)`

registers a callback function to be invoked if a memory allocation operation fails

Parameters `callback` – caller defined callback to be invoked

Returns `ESP_OK` if callback was registered.

`void *heap_caps_malloc (size_t size, uint32_t caps)`

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to `libc malloc()`, for capability-aware memory.

Parameters

- **size** – Size, in bytes, of the amount of memory to allocate

- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_free** (void *ptr)

Free memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc free()`, for capability-aware memory.

In IDF, `free(p)` is equivalent to `heap_caps_free(p)`.

Parameters **ptr** –Pointer to memory previously returned from `heap_caps_malloc()` or `heap_caps_realloc()`. Can be NULL.

void ***heap_caps_realloc** (void *ptr, size_t size, uint32_t caps)

Reallocate memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc realloc()`, for capability-aware memory.

In IDF, `realloc(p, s)` is equivalent to `heap_caps_realloc(p, s, MALLOC_CAP_8BIT)`.

‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, `realloc` can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

Parameters

- **ptr** –Pointer to previously allocated memory, or NULL for a new allocation.
- **size** –Size of the new buffer requested, or 0 to free the buffer.
- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory desired for the new allocation.

Returns Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

void ***heap_caps_aligned_alloc** (size_t alignment, size_t size, uint32_t caps)

Allocate a aligned chunk of memory which has the given capabilities.

Equivalent semantics to `libc aligned_alloc()`, for capability-aware memory.

Parameters

- **alignment** –How the pointer received needs to be aligned must be a power of two
- **size** –Size, in bytes, of the amount of memory to allocate
- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_aligned_free** (void *ptr)

Used to deallocate memory previously allocated with `heap_caps_aligned_alloc`.

Note: This function is deprecated, please consider using `heap_caps_free()` instead

Parameters **ptr** –Pointer to the memory allocated

void ***heap_caps_aligned_calloc** (size_t alignment, size_t n, size_t size, uint32_t caps)

Allocate a aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Parameters

- **alignment** –How the pointer received needs to be aligned must be a power of two
- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_malloc** (size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_malloc(p, MALLOC_CAP_8BIT).

Parameters

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

size_t **heap_caps_get_total_size** (uint32_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

Parameters caps –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

Returns total size in bytes

size_t **heap_caps_get_free_size** (uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

Parameters caps –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

Returns Amount of free bytes in the regions

size_t **heap_caps_get_minimum_free_size** (uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities.

Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

Parameters caps –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

Returns Amount of free bytes in the regions

size_t **heap_caps_get_largest_free_block** (uint32_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of s for which heap_caps_malloc(s, caps) will succeed.

Parameters caps –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

Returns Size of largest free block in bytes.

void **heap_caps_get_info** (*multi_heap_info_t* *info, uint32_t caps)

Get heap info for all regions with the given capabilities.

Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for *multi_heap_info_t*, except that minimum_free_bytes has the same caveats described in heap_caps_get_minimum_free_size().

Parameters

- **info** –Pointer to a structure which will be filled with relevant heap metadata.
- **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_print_heap_info** (uint32_t caps)

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

Parameters **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

bool **heap_caps_check_integrity_all** (bool print_errors)

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

Parameters **print_errors** –Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity** (uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

Parameters

- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory
- **print_errors** –Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity_addr** (intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

Note: The entire heap region around the address is checked, not only the adjacent heap blocks.

Parameters

- **addr** –Address in memory. Check for corruption in region containing this address.
- **print_errors** –Print specific errors if heap corruption is found.

Returns True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap_caps_malloc_extmem_enable** (size_t limit)

Enable `malloc()` in external memory and set limit below which `malloc()` attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

Parameters **limit** –Limit, in bytes.

void ***heap_caps_malloc_prefer** (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

Parameters

- **size** –Size, in bytes, of the amount of memory to allocate
- **num** –Number of variable paramters

Returns A pointer to the memory allocated on success, NULL on failure

void ***heap_caps_realloc_prefer** (void *ptr, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Parameters

- **ptr** –Pointer to previously allocated memory, or NULL for a new allocation.
- **size** –Size of the new buffer requested, or 0 to free the buffer.
- **num** –Number of variable paramters

Returns Pointer to a new buffer of size ‘size’ , or NULL if allocation failed.

void ***heap_caps_calloc_prefer** (size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Parameters

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **num** –Number of variable paramters

Returns A pointer to the memory allocated on success, NULL on failure

void **heap_caps_dump** (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters **caps** –Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void **heap_caps_dump_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

size_t **heap_caps_get_allocated_size** (void *ptr)

Return the size that a particular pointer was allocated with.

Note: The app will crash with an assertion failure if the pointer is not valid.

Parameters `ptr` –Pointer to currently allocated heap memory. Must be a pointer value previously returned by `heap_caps_malloc`, `malloc`, `calloc`, etc. and not yet freed.

Returns Size of the memory allocated at this block.

Macros

MALLOC_CAP_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

MALLOC_CAP_32BIT

Memory must allow for aligned 32-bit data accesses.

MALLOC_CAP_8BIT

Memory must allow for 8/16/...-bit data accesses.

MALLOC_CAP_DMA

Memory must be able to accessed by DMA.

MALLOC_CAP_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

MALLOC_CAP_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)

MALLOC_CAP_PID4

Memory must be mapped to PID4 memory space (PIDs are not currently used)

MALLOC_CAP_PID5

Memory must be mapped to PID5 memory space (PIDs are not currently used)

MALLOC_CAP_PID6

Memory must be mapped to PID6 memory space (PIDs are not currently used)

MALLOC_CAP_PID7

Memory must be mapped to PID7 memory space (PIDs are not currently used)

MALLOC_CAP_SPIRAM

Memory must be in SPI RAM.

MALLOC_CAP_INTERNAL

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

MALLOC_CAP_DEFAULT

Memory can be returned in a non-capability-specific memory allocation (e.g. `malloc()`, `calloc()`) call.

MALLOC_CAP_IRAM_8BIT

Memory must be in IRAM and allow unaligned access.

MALLOC_CAP_RETENTION

Memory must be able to accessed by retention DMA.

MALLOC_CAP_RTCRAM

Memory must be in RTC fast memory.

MALLOC_CAP_INVALID

Memory can't be used / list end marker.

Type Definitions

```
typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
```

callback called when a allocation operation fails, if registered

Param size in bytes of failed allocation

Param caps capabilities requested of failed allocation

Param function_name function which generated the failure

API Reference - Initialisation**Header File**

- [components/heap/include/esp_heap_caps_init.h](#)

Functions

void **heap_caps_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap_caps_enable_nonos_stack_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t **heap_caps_add_region** (intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

Parameters

- **start** –Start address of new region.
- **end** –End address of new region.

Returns ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn't reside in a known region, or any error returned by heap_caps_add_region_with_caps().

esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

Parameters

- **caps** –Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start** –Start address of new region.
- **end** –End address of new region.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- [components/heap/include/multi_heap.h](#)

Functions

void *multi_heap_aligned_alloc (*multi_heap_handle_t* heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

Parameters

- **heap** –Handle to a registered heap.
- **size** –size in bytes of memory chunk
- **alignment** –how the memory must be aligned

Returns pointer to the memory allocated, NULL on failure

void *multi_heap_malloc (*multi_heap_handle_t* heap, size_t size)
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

Parameters

- **heap** –Handle to a registered heap.
- **size** –Size of desired buffer.

Returns Pointer to new memory, or NULL if allocation fails.

void multi_heap_aligned_free (*multi_heap_handle_t* heap, void *p)
free() a buffer aligned in a given heap.

Note: This function is deprecated, consider using multi_heap_free() instead

Parameters

- **heap** –Handle to a registered heap.

- **p** –NULL, or a pointer previously returned from `multi_heap_aligned_alloc()` for the same heap.

void **multi_heap_free** (*multi_heap_handle_t* heap, void *p)

`free()` a buffer in a given heap.

Semantics are the same as standard `free()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

Parameters

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

void ***multi_heap_realloc** (*multi_heap_handle_t* heap, void *p, size_t size)

`realloc()` a buffer in a given heap.

Semantics are the same as standard `realloc()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

Parameters

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- **size** –Desired new size for buffer.

Returns New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

size_t **multi_heap_get_allocated_size** (*multi_heap_handle_t* heap, void *p)

Return the size that a particular pointer was allocated with.

Parameters

- **heap** –Handle to a registered heap.
- **p** –Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

Returns Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

multi_heap_handle_t **multi_heap_register** (void *start, size_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

Parameters

- **start** –Start address of the memory to use for a new heap.
- **size** –Size (in bytes) of the new heap.

Returns Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

void **multi_heap_set_lock** (*multi_heap_handle_t* heap, void *lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters

- **heap** –Handle to a registered heap.
- **lock** –Optional pointer to a locking structure to associate with this heap.

void **multi_heap_dump** (*multi_heap_handle_t* heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters **heap** –Handle to a registered heap.

bool **multi_heap_check** (*multi_heap_handle_t* heap, bool print_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

Parameters

- **heap** –Handle to a registered heap.
- **print_errors** –If true, errors will be printed to stderr.

Returns true if heap is valid, false otherwise.

size_t **multi_heap_free_size** (*multi_heap_handle_t* heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single `malloc()` may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

Parameters **heap** –Handle to a registered heap.

Returns Number of free bytes.

size_t **multi_heap_minimum_free_size** (*multi_heap_handle_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime “low water mark” of possible values returned from `multi_free_heap_size()`, for the specified heap.

Parameters **heap** –Handle to a registered heap.

Returns Number of free bytes.

void **multi_heap_get_info** (*multi_heap_handle_t* heap, *multi_heap_info_t* *info)

Return metadata about a given heap.

Fills a *multi_heap_info_t* structure with information about the specified heap.

Parameters

- **heap** –Handle to a registered heap.
- **info** –Pointer to a structure to fill with heap metadata.

Structures

struct **multi_heap_info_t**

Structure to access heap metadata via `multi_heap_get_info`.

Public Members

size_t **total_free_bytes**

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

`size_t total_allocated_bytes`

Total bytes allocated to data in the heap.

`size_t largest_free_block`

Size of largest free block in the heap. This is the largest malloc-able size.

`size_t minimum_free_bytes`

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

`size_t allocated_blocks`

Number of (variable size) blocks allocated in the heap.

`size_t free_blocks`

Number of (variable size) free blocks in the heap.

`size_t total_blocks`

Total number of (variable size) blocks in the heap.

Type Definitions

```
typedef struct multi_heap_info *multi_heap_handle_t
```

Opaque handle to a registered heap.

2.7.13 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting *heap information*, *detecting heap corruption*, and *tracing memory leaks*. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the [Heap Memory Allocation](#) page.

Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,

Assertions The heap implementation (`multi_heap.c`, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under `Compiler options` -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It's also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time a allocation operation fails.

Additionally user can enable a generation of a system abort if allocation operation fails by following the steps below: - In the project configuration menu, navigate to `Component config` -> `Heap Memory Debugging` and select `Abort if memory allocation fails` option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below show how to register a allocation failure callback:

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_
↳*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↳", function_name, requested_size, caps);
}

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↳failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a `CORRUPT HEAP:` message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging *Configuration* level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time

that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.

- Based on the memory address which is being corrupted, you can use *JTAG debugging* to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don't have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. For example `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don't know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, *heap tracing* in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See *Heap Tracing To Find Heap Corruption* for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

Configuration Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under `Component config` there is a menu `Heap memory debugging`. The setting `CONFIG_HEAP_CORRUPTION_DETECTION` can be set to one of three levels:

Basic (no poisoning) This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap's internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

Light Impact At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is `0xABBA1234` (3412BAAB in byte order), and the tail canary word is `0xBAAD5678` (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word `0xABBA1234`. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word `0xBAAD5678`.

Different values usually indicate buffer underrun or overrun, respectively.

Comprehensive This level incorporates the “light impact” detection features plus additional checks for uninitialized-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

Crashes in Comprehensive Mode If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug” .) The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for *Light Impact* mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in [system/heap_task_tracking](#)

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or *related functions* to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode Once you've identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see [CONFIG_HEAP_TRACING_DEST](#)).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in
↳internal RAM

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller↳
↳0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:52

8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller↳
↳0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:29

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.
↳blink.c:52

40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using *IDF Monitor* to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

- `XX bytes` is number of bytes allocated
- `@ 0x...` is the heap address returned from `malloc/calloc`.
- `CPU x` is the CPU (0 or 1) running when the allocation was made.
- `ccount 0x...` is the `CCOUNT` (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- `caller 0x...` gives the call stack of the call to `malloc()/free()`, as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under `Heap Memory Debugging` -> `Enable heap tracing` -> `Heap tracing stack depth`. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each `heap_trace_record_t` record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

Host-Based Mode Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to `Component settings` -> `Heap Memory Debugging` -> `CONFIG_HEAP_TRACING_DEST` and select `Host-Based`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> `CONFIG_APPTRACE_DESTINATION` and select `Trace memory`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> `FreeRTOS SystemView Tracing` and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all `mallocs/frees` in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
}
```

(continues on next page)

(continued from previous page)

```

...
}

```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

Note: In order to use this feature you need OpenOCD version *v0.10.0-esp32-20181105* or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special gdbinit file:

```

target remote :3333

mon reset halt
flushregs

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c

```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command `xtensa-esp32s3-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:

```

Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '['/tmp/heap.svdat']'...

Heap Tracing To Find Heap Corruption Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it's quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses `stdio` - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the `libc`. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- `components/heap/include/esp_heap_trace.h`

Functions

esp_err_t **heap_trace_init_standalone** (*heap_trace_record_t* *record_buffer, size_t num_records)

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

Parameters

- **record_buffer** –Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- **num_records** –Size of the heap trace buffer, as number of record structures.

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

esp_err_t **heap_trace_init_tohost** (void)

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

Returns

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

esp_err_t **heap_trace_start** (*heap_trace_mode_t* mode)

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

Note: `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

Note: Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

Parameters **mode** –Mode for tracing.

- `HEAP_TRACE_ALL` means all heap allocations and frees are traced.
- `HEAP_TRACE_LEAKS` means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- `ESP_OK` Tracing is started.

esp_err_t **heap_trace_stop** (void)

Stop heap tracing.

Returns

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped..

esp_err_t **heap_trace_resume** (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

Returns

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

size_t **heap_trace_get_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

esp_err_t **heap_trace_get** (*size_t* index, *heap_trace_record_t* *record)

Return a raw record from the heap trace buffer.

Note: It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode record indexing may skip entries unless heap tracing is stopped first.

Parameters

- **index** –Index (zero-based) of the record to return.
- **record** –[out] Record where the heap trace record will be copied.

Returns

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

void **heap_trace_dump** (void)

Dump heap trace record data to stdout.

Note: It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode the dump may skip entries unless heap tracing is stopped first.

Structures

struct **heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void ***address**

Address which was allocated.

size_t **size**

Size of the allocation.

void ***allocated_by[0]**

Call stack of the caller which allocated the memory.

void ***freed_by[0]**

Call stack of the caller which freed the memory (all zero if not freed.)

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Enumerations

enum **heap_trace_mode_t**

Values:

enumerator **HEAP_TRACE_ALL**

enumerator **HEAP_TRACE_LEAKS**

2.7.14 High Resolution Timer

Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the [CONFIG_ESP_TIMER_INTERRUPT_LEVEL](#) option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

`esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, `esp_timer` uses a 64-bit hardware timer, where the implementation depends on [CONFIG_ESP_TIMER_IMPL](#). Available options are:

- SYSTIMER

Timer callbacks can be dispatched by two methods:

- `ESP_TIMER_TASK`
- `ESP_TIMER_ISR`. Available only if [CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD](#) is enabled (by default disabled).

ESP_TIMER_TASK. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

ESP_TIMER_ISR. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

Callback functions

Timer callbacks which are processed by ESP_TIMER_ISR method should not call the context switch call - `portYIELD_FROM_ISR()`, instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

`esp_timer` during the light sleep

During light sleep, the `esp_timer` counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the `esp_timer` counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with *automatic light sleep* (see [Power Management APIs](#)) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by `esp_timers`. Timers with `skip_unhandled_events` option will not wake up the system.

Handling callbacks

`esp_timer` is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

Obtaining Current Time

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of `esp_timer` APIs: [system/esp_timer](#).

API Reference

Header File

- [components/esp_timer/include/esp_timer.h](#)

Functions

`esp_err_t esp_timer_early_init` (void)

Minimal initialization of `esp_timer`.

This function can be called very early in startup process, after this call only `esp_timer_get_time` function can be used.

Note: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

Returns

- `ESP_OK` on success

`esp_err_t esp_timer_init` (void)

Initialize `esp_timer` library.

Note: This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs. Before calling this function, `esp_timer_early_init` must be called by the startup code.

Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed

- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

esp_err_t **esp_timer_deinit** (void)

De-initialize esp_timer library.

Note: Normally this function should not be called from applications

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

esp_err_t **esp_timer_create** (const *esp_timer_create_args_t* *create_args, *esp_timer_handle_t* *out_handle)

Create an esp_timer instance.

Note: When done using the timer, delete it with esp_timer_delete function.

Parameters

- **create_args** –Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** –[out] Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

esp_err_t **esp_timer_start_once** (*esp_timer_handle_t* timer, uint64_t timeout_us)

Start one-shot timer.

Timer should not be running when this function is called.

Parameters

- **timer** –timer handle created using esp_timer_create
- **timeout_us** –timer timeout, in microseconds relative to the current moment

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_start_periodic** (*esp_timer_handle_t* timer, uint64_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

Parameters

- **timer** –timer handle created using esp_timer_create
- **period** –timer period, in microseconds

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

esp_err_t **esp_timer_stop** (*esp_timer_handle_t* timer)

Stop the timer.

This function stops the timer previously started using `esp_timer_start_once` or `esp_timer_start_periodic`.

Parameters **timer** –timer handle created using `esp_timer_create`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

esp_err_t **esp_timer_delete** (*esp_timer_handle_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

Parameters **timer** –timer handle allocated using `esp_timer_create`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

int64_t **esp_timer_get_time** (void)

Get time in microseconds since boot.

Returns number of microseconds since underlying timer has been started

int64_t **esp_timer_get_next_alarm** (void)

Get the timestamp when the next timeout is expected to occur.

Returns Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

int64_t **esp_timer_get_next_alarm_for_wake_up** (void)

Get the timestamp when the next timeout is expected to occur skipping those which have `skip_unhandled_events` flag.

Returns Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

esp_err_t **esp_timer_dump** (FILE *stream)

Dump the list of timers to a stream.

If `CONFIG_ESP_TIMER_PROFILING` option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

```
name period alarm times_armed times_triggered total_callback_run_time
```

where:

`name` —timer name (if `CONFIG_ESP_TIMER_PROFILING` is defined), or timer pointer `period` —period of timer, in microseconds, or 0 for one-shot timer `alarm` - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if `CONFIG_ESP_TIMER_PROFILING` is defined:

`times_armed` —number of times the timer was armed via `esp_timer_start_X` `times_triggered` - number of times the callback was called `total_callback_run_time` - total time taken by callback to execute, across all calls

Parameters **stream** –stream (such as `stdout`) to dump the information to

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

bool **esp_timer_is_active** (*esp_timer_handle_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

Parameters `timer` –timer handle created using `esp_timer_create`

Returns

- 1 if timer is still active
- 0 if timer is not active.

Structures

struct `esp_timer_create_args_t`

Timer configuration passed to `esp_timer_create`.

Public Members

esp_timer_cb_t **callback**

Function to call when timer expires.

void ***arg**

Argument to pass to the callback.

esp_timer_dispatch_t **dispatch_method**

Call the callback from task or from ISR.

const char ***name**

Timer name, used in `esp_timer_dump` function.

bool **skip_unhandled_events**

Skip unhandled events for periodic timers.

Type Definitions

typedef struct esp_timer ***esp_timer_handle_t**

Opaque type representing a single `esp_timer`.

typedef void (***esp_timer_cb_t**)(void *arg)

Timer callback function type.

Param arg pointer to opaque user-specific data

Enumerations

enum **esp_timer_dispatch_t**

Method for dispatching timer callback.

Values:

enumerator **ESP_TIMER_TASK**

Callback is called from timer task.

enumerator **ESP_TIMER_MAX**

Count of the methods for dispatching timer callback.

2.7.15 Inter-Processor Call

Note: The IPC is an **Inter-Processor Call** and **NOT Inter-Process Communication** as found on other operating systems.

Overview

Due to the dual core nature of the ESP32-S3, there are instances where a certain callback must be run in the context of a particular CPU such as:

- When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU's interrupt source as well).
- On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
- Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see [High-Level Interrupts](#) for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

IPC in Task Context

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU's IPC task.

When using IPCs in a task context, users need to consider the following:

- IPC callbacks should ideally be simple and short. **An IPC callback should avoid attempting to block or yield.**
- The IPC tasks are created at the highest possible priority (i.e., `configMAX_PRIORITIES - 1`) thus the callback should also run at that priority as a result. However, [CONFIG_ESP_IPC_USES_CALLERS_PRIORITY](#) is enabled by default which will temporarily lower the priority of the target CPU's IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via [CONFIG_ESP_IPC_TASK_STACK_SIZE](#).
- The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

API Usage Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`
- The callback should avoid attempting to block or yield as this will result in the target CPU's IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling `vTaskPrioritySet(NULL, x)`).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback's execution has completed, or return immediately once the callback's execution has started.

- [esp_ipc_call\(\)](#) will trigger an IPC call on the target CPU. This function will block until the target CPU's IPC task **begins** execution of the callback.
- [esp_ipc_call_blocking\(\)](#) will trigger an IPC on the target CPU. This function will block until the target CPU's IPC task **completes** execution of the callback.

IPC in ISR Context

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a *High Priority Interrupt* context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` option
- **When the callback executes:**
 - The calling CPU will disable interrupts of level 3 and lower
 - Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

API Usage High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
- **The callback is invoked via the `CALLX0` instruction with register windowing disabled, thus the callback:**
 - Must not call any register window related instructions (e.g., `entry` and `retw`).
 - Must not call other C functions as register windowing is disabled
- The callback should be placed in IRAM at a 4-byte aligned address
- **(On invocation of/after returning from) the callback, the registers `a2`, `a3`, `a4` are (saved/restored) automatically through the `CALLX0` instruction.**
 - `a2` will contain the `void *arg` of the callback
 - `a3/a4` are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU's cycle count.

```
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
// use only a2, a3 and a4 regs here.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret
```

```
unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void_
↪*)cycle_count);
```

Note: The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the [system/ipc/ipc_isr](#).

Note: For more examples of High Priority Interrupt IPC callbacks, see [components/esp_ipc/src/esp_ipc_isr/esp_ipc_isr_routines.S](#) and [:components/esp_system/test/test_ipc_isr.S](#)

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.
- `esp_ipc_isr_release_other_cpu()` resumes the target CPU.

Header File

- [components/esp_ipc/include/esp_ipc.h](#)

Functions

`esp_err_t esp_ipc_call` (uint32_t cpu_id, `esp_ipc_func_t` func, void *arg)

Execute a callback on a given CPU.

Execute a given callback on a particular CPU. The callback must be of type “`esp_ipc_func_t`” and will be invoked in the context of the target CPU’s IPC task.

- This function will block the target CPU’s IPC task has begun execution of the callback
- If another IPC call is ongoing, this function will block until the ongoing IPC call completes
- The stack size of the IPC task can be configured via the `CONFIG_ESP_IPC_TASK_STACK_SIZE` option

Note: In single-core mode, returns `ESP_ERR_INVALID_ARG` for `cpu_id` 1.

Parameters

- `cpu_id` –[in] CPU where the given function should be executed (0 or 1)
- `func` –[in] Pointer to a function of type `void func(void* arg)` to be executed
- `arg` –[in] Arbitrary argument of type `void*` to be passed into the function

Returns

- `ESP_ERR_INVALID_ARG` if `cpu_id` is invalid
- `ESP_ERR_INVALID_STATE` if the FreeRTOS scheduler is not running
- `ESP_OK` otherwise

`esp_err_t esp_ipc_call_blocking` (uint32_t cpu_id, `esp_ipc_func_t` func, void *arg)

Execute a callback on a given CPU until and block until it completes.

This function is identical to `esp_ipc_call()` except that this function will block until the execution of the callback completes.

Note: In single-core mode, returns `ESP_ERR_INVALID_ARG` for `cpu_id` 1.

Parameters

- **cpu_id** –[in] CPU where the given function should be executed (0 or 1)
- **func** –[in] Pointer to a function of type void func(void* arg) to be executed
- **arg** –[in] Arbitrary argument of type void* to be passed into the function

Returns

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

Type Definitions

```
typedef void (*esp_ipc_func_t)(void *arg)
```

IPC Callback.

A callback of this type should be provided as an argument when calling esp_ipc_call() or esp_ipc_call_blocking().

Header File

- [components/esp_ipc/include/esp_ipc_isr.h](#)

Functions

```
void esp_ipc_isr_asm_call (esp_ipc_isr_func_t func, void *arg)
```

Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

Note: This function is not available in single-core mode.

Parameters

- **func** –[in] Pointer to a function of type void func(void* arg) to be executed
- **arg** –[in] Arbitrary argument of type void* to be passed into the function

```
void esp_ipc_isr_asm_call_blocking (esp_ipc_isr_func_t func, void *arg)
```

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

Note: This function is not available in single-core mode.

Parameters

- **func** –[in] Pointer to a function of type void func(void* arg) to be executed
- **arg** –[in] Arbitrary argument of type void* to be passed into the function

```
void esp_ipc_isr_stall_other_cpu (void)
```

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

- This function is internally implemented using IPC ISR
- This function is used for DPORT workaround.
- If the stall feature is paused using `esp_ipc_isr_stall_pause()`, this function will have no effect

Note: This function is not available in single-core mode.

Note: It is the caller's responsibility to avoid deadlocking on spinlocks

void **esp_ipc_isr_release_other_cpu** (void)

Release the other CPU.

This function will release the other CPU that was previously stalled from calling `esp_ipc_isr_stall_other_cpu()`

- This function is used for DPORT workaround.
- If the stall feature is paused using `esp_ipc_isr_stall_pause()`, this function will have no effect

Note: This function is not available in single-core mode.

void **esp_ipc_isr_stall_pause** (void)

Pause the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to `esp_ipc_isr_stall_other_cpu()` and `esp_ipc_isr_release_other_cpu()` will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

void **esp_ipc_isr_stall_abort** (void)

Abort a CPU stall.

This function will abort any stalling routine of the other CPU due to a previous call to `esp_ipc_isr_stall_other_cpu()`. This function aborts the stall in a non-recoverable manner, thus should only be called in case of a `panic()`.

- This function is used in panic handling code

void **esp_ipc_isr_stall_resume** (void)

Resume the CPU stall feature.

This function will resume the CPU stall feature that was previously paused by calling `esp_ipc_isr_stall_pause()`. Once resumed, calls to `esp_ipc_isr_stall_other_cpu()` and `esp_ipc_isr_release_other_cpu()` will have effect again.

Type Definitions

typedef void (***esp_ipc_isr_func_t**)(void *arg)

IPC ISR Callback.

A callback of this type should be provided as an argument when calling `esp_ipc_isr_asm_call()` or `esp_ipc_isr_asm_call_blocking()`.

2.7.16 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as *printf*. The given function can be called inside the shared stack space which is a callback function deferred by calling *esp_execute_shared_stack_function()*, passing that function as parameter

Usage

esp_execute_shared_stack_function() takes four arguments, a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack, a pointer to the top of stack used to that fuction, the size in bytes of stack and, a pointer to a user function where the shared stack space will reside, after calling the function, the user defined function will be deferred as a callback where functions can be called using the user allocated space without taking space from current task stack.

The usage may looks like the code below:

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we wanting to call printf using a separated stack space
//allowing app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                     shared_stack,
                                     8192,
                                     external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File

- [components/esp_system/include/esp_expression_with_stack.h](#)

Functions

void **esp_execute_shared_stack_function** (*SemaphoreHandle_t* lock, void *stack, size_t stack_size, *shared_stack_function* function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters

- **lock** –Mutex object to protect in case of shared stack
- **stack** –Pointer to user allocated stack
- **stack_size** –Size of current stack in bytes
- **function** –pointer to the shared stack function to be executed

Macros

ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions

```
typedef void (*shared_stack_function)(void)
```

2.7.17 Interrupt allocation

Overview

The ESP32-S3 has two cores, with 32 interrupts. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The `esp_intr_alloc()` abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling `esp_intr_alloc()` (or `esp_intr_alloc_intrstatus()`). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc()` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let's say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB's ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

Multicore issues

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32-S3 but outside the Xtensa cores themselves. Most ESP32-S3 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

Internal peripheral interrupts Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in `esp_intr_alloc.h` as `ETS_INTERNAL_*_INTR_SOURCE`.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it's not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc()` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

External Peripheral Interrupts The remaining interrupt sources are from external peripherals. These are defined in `soc/soc.h` as `ETS_*_INTR_SOURCE`.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

IRAM-Safe Interrupt Handlers

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the [SPI flash API documentation](#) for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it *very carefully*. There usually exist two ways to stop an interrupt from being triggered: *disable the source* or *mask peripheral interrupt status*. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt.** Please note that leaving some status bits unhandled without masking them, while

disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

API Reference

Header File

- [components/esp_hw_support/include/esp_intr_alloc.h](#)

Functions

esp_err_t **esp_intr_mark_shared** (int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

Parameters

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)
- **is_in_iram** –Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

Returns ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_reserve** (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

Parameters

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)

Returns ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

esp_err_t **esp_intr_alloc** (int source, int flags, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

Parameters

- **source** –The interrupt source. One of the ETS*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL*_INTR_SOURCE sources as defined in this header.
- **flags** –An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret_handle** –Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
ESP_OK otherwise

esp_err_t **esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, *intr_handler_t* handler, void *arg, *intr_handle_t* *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as `esp_intr_alloc`, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

Parameters

- **source** –The interrupt source. One of the `ETS_*_INTR_SOURCE` interrupt mux sources, as defined in `soc/soc.h`, or one of the internal `ETS_INTERNAL_*_INTR_SOURCE` sources as defined in this header.
- **flags** –An ORred mask of the `ESP_INTR_FLAG_*` defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is `ESP_INTR_FLAG_SHARED`, it will allocate a shared interrupt of level 1. Setting `ESP_INTR_FLAG_INTRDISABLED` will return from this function with the interrupt disabled.
- **intrstatusreg** –The address of an interrupt status register
- **intrstatusmask** –A mask. If a read of address `intrstatusreg` has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret_handle** –Pointer to an `intr_handle_t` to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

Returns `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid.
`ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
`ESP_OK` otherwise

esp_err_t **esp_intr_free** (*intr_handle_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

Note: When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

Parameters **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

Returns `ESP_ERR_INVALID_ARG` the handle is NULL
`ESP_FAIL` failed to release this handle
`ESP_OK` otherwise

int **esp_intr_get_cpu** (*intr_handle_t* handle)

Get CPU number an interrupt is tied to.

Parameters **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

Returns The core number where the interrupt is allocated

int **esp_intr_get_intno** (*intr_handle_t* handle)

Get the allocated interrupt for a certain handle.

Parameters **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

Returns The interrupt number

esp_err_t **esp_intr_disable** (*intr_handle_t* handle)

Disable the interrupt associated with the handle.

Note:

- For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
 - When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.
-

Parameters **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_enable** (*intr_handle_t* handle)

Enable the interrupt associated with the handle.

Note: For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

Parameters **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

esp_err_t **esp_intr_set_in_iram** (*intr_handle_t* handle, bool is_in_iram)

Set the “in IRAM” status of the handler.

Note: Does not work on shared interrupts.

Parameters

- handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- is_in_iram** –Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

Returns ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

void **esp_intr_noniram_disable** (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void **esp_intr_noniram_enable** (void)

Re-enable interrupts disabled by `esp_intr_noniram_disable`.

void **esp_intr_enable_source** (int inum)

enable the interrupt source based on its number

Parameters **inum** –interrupt number from 0 to 31

void **esp_intr_disable_source** (int inum)

disable the interrupt source based on its number

Parameters **inum** –interrupt number from 0 to 31

static inline int **esp_intr_flags_to_level** (int flags)

Get the lowest interrupt level from the flags.

Parameters flags –The same flags that pass to `esp_intr_alloc_intrstatus` API

Macros

ESP_INTR_FLAG_LEVEL1

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling `esp_intr_alloc*` needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2

Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3

Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4

Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5

Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6

Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI

Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED

Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE

Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM

ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED

Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED

Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH

High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK

Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

ETS_INTERNAL_TIMER1_INTR_SOURCE

Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE

Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE

Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE

Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE

Int source for profiling.

ETS_INTERNAL_UNUSED_INTR_SOURCE

Interrupt is not assigned to any source.

ETS_INTERNAL_INTR_SOURCE_OFF

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

ESP_INTR_ENABLE (inum)

Enable interrupt by interrupt number

ESP_INTR_DISABLE (inum)

Disable interrupt by interrupt number

Type Definitions

```
typedef void (*intr_handler_t)(void *arg)
```

Function prototype for interrupt handler function

```
typedef struct intr_handle_data_t intr_handle_data_t
```

Interrupt handler associated data structure

```
typedef intr_handle_data_t *intr_handle_t
```

Handle to an interrupt handler

2.7.18 Logging library

Overview

The logging library provides two ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`.

- Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime:** all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

Note: The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_
↳* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. `ESP_DRAM_LOGE`. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

Note: Inside critical sections interrupts are disabled so it's only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it's possible to log in these situations, it's better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_
↪VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR);           // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN);        // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO);       // enable INFO logs from DHCP client
```

Note: The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling `esp_log_level("*", level)`.

Logging to Host via JTAG By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section [Logging to Host](#).

Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s [examples](#) directory. The most relevant examples that deal with logging are the following:

- [system/ota](#)
- [storage/sd_card](#)
- [protocols/https_request](#)

API Reference

Header File

- [components/log/include/esp_log.h](#)

Functions

void **esp_log_level_set** (const char *tag, *esp_log_level_t* level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function can not raise log level above the level set using `CONFIG_LOG_MAXIMUM_LEVEL` setting in `menuconfig`.

To raise log level above the default one for a given file, define `LOG_LOCAL_LEVEL` to one of the `ESP_LOG_*` values, before including `esp_log.h` in this file.

Parameters

- **tag** –Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value “*” resets log level for all tags to the given value.
- **level** –Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

esp_log_level_t **esp_log_level_get** (const char *tag)

Get log level for given tag, can be used to avoid expensive log statements.

Parameters tag –Tag of the log to query current level. Must be a non-NULL zero terminated string.

Returns The current log level for the given tag

vprintf_like_t **esp_log_set_vprintf** (*vprintf_like_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

Note: Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

Parameters **func** –new Function used for output. Must have same signature as vprintf.

Returns func old Function used for output.

uint32_t **esp_log_timestamp** (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

Returns timestamp, in milliseconds

char ***esp_log_system_timestamp** (void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss” . The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will still print the RTOS tick time.

Returns timestamp, in “HH:MM:SS.sss”

uint32_t **esp_log_early_timestamp** (void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

Returns timestamp, in milliseconds

void **esp_log_write** (*esp_log_level_t* level, const char *tag, const char *format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp_log_writev** (*esp_log_level_t* level, const char *tag, const char *format, va_list args)

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See also:

esp_log_write()

Macros**ESP_LOG_BUFFER_HEX_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```

W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74
↪2c 20 |ESP32 is great, |
W (195) log_example: 0x3ffb4290 77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20
↪77 69 |working along wi|
W (205) log_example: 0x3ffb42a0 74 68 20 74 68 65 20 49 44 46 2e 00
↪ |th the IDF..|

```

It is highly recommend to use terminals with over 102 text width.

Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes
- **level** –level of the log

ESP_LOG_BUFFER_HEX (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

See also:

esp_log_buffer_hex_level

Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes

ESP_LOG_BUFFER_CHAR (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See also:

esp_log_buffer_char_level

Parameters

- **tag** –description tag

- **buffer** –Pointer to the buffer array
- **buff_len** –length of buffer in bytes

portGET_ARGUMENT_COUNT_INNER (zero, one, count, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. log at ESP_LOG_ERROR level.

See also:

`printf,ESP_LOGE,ESP_DRAM_LOGE`

ESP_EARLY_LOGE (tag, format, ...)

In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##_VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##_VA_ARGS__`.

ESP_EARLY_LOGW (tag, format, ...)

macro to output logs in startup code at ESP_LOG_WARN level.

See also:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

ESP_EARLY_LOGI (tag, format, ...)

macro to output logs in startup code at ESP_LOG_INFO level.

See also:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

ESP_EARLY_LOGD (tag, format, ...)

macro to output logs in startup code at ESP_LOG_DEBUG level.

See also:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

ESP_EARLY_LOGV (tag, format, ...)

macro to output logs in startup code at ESP_LOG_VERBOSE level.

See also:

`ESP_EARLY_LOGE,ESP_LOGE,printf`

_ESP_LOG_EARLY_ENABLED (log_level)

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)

ESP_LOGW (tag, format, ...)

ESP_LOGI (tag, format, ...)

ESP_LOGD (tag, format, ...)

ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)

runtime macro to output logs at a specified level.

See also:

`printf`

Parameters

- **tag** –tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** –level of the output log.
- **format** –format of the output log. see `printf`
- **...** –variables to be replaced into the log. see `printf`

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`.

See also:

`printf`, `ESP_LOG_LEVEL`

ESP_DRAM_LOGE (tag, format, ...)

Macro to output logs when the cache is disabled. log at `ESP_LOG_ERROR` level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`, where TAG is a char* that points to a str in the DRAM.

See also:

`ESP_EARLY_LOGE`, the log level cannot be changed per-tag, however `esp_log_level_set("...", level)` will set the default level which controls these log lines also.

See also:

`esp_rom_printf`, `ESP_LOGE`

Note: Unlike normal logging macros, it's possible to use this macro when interrupts are disabled or inside an ISR.

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_WARN` level.

See also:

`ESP_DRAM_LOGW`, `ESP_LOGW`, `esp_rom_printf`

ESP_DRAM_LOGI (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See also:

ESP_DRAM_LOGI,ESP_LOGI, esp_rom_printf

ESP_DRAM_LOGD (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See also:

ESP_DRAM_LOGD,ESP_LOGD, esp_rom_printf

ESP_DRAM_LOGV (tag, format, ...)

macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See also:

ESP_DRAM_LOGV,ESP_LOGV, esp_rom_printf

Type Definitions

typedef int (***vprintf_like_t**)(const char*, va_list)

Enumerations

enum **esp_log_level_t**

Log level.

Values:

enumerator **ESP_LOG_NONE**

No log output

enumerator **ESP_LOG_ERROR**

Critical errors, software module can not recover on its own

enumerator **ESP_LOG_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP_LOG_INFO**

Information messages which describe normal flow of events

enumerator **ESP_LOG_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP_LOG_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.7.19 Miscellaneous System APIs

Software reset

To perform software reset of the chip, `esp_restart()` function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, `esp_register_shutdown_handler()` function is provided to register a routine which needs to be called prior to restart (when done by `esp_restart()`). This is similar to the functionality of `atexit` POSIX function.

Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.

Heap memory

Two heap memory related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using `malloc` family of functions. For further information about heap memory see [Heap Memory Allocation](#).

MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()` function.

In ESP-IDF these addresses are calculated from a single *Base MAC address*. By default, the Espressif base MAC address is used. This MAC is pre-programmed into ESP32-S3 eFuse from the factory.

Interface	MAC address (4 universally administered, default)	MAC address (2 universally administered)
Wi-Fi Station	<code>base_mac</code>	<code>base_mac</code>
Wi-Fi SoftAP	<code>base_mac</code> , +1 to the last octet	<i>Local MAC</i> derived from Wi-Fi Station MAC)
Bluetooth	<code>base_mac</code> , +2 to the last octet	<code>base_mac</code> , +1 to the last octet
Ethernet	<code>base_mac</code> , +3 to the last octet	<i>Local MAC</i> (derived from Bluetooth MAC)

Note: The default [configuration](#) is 4 universally administered MAC addresses, and this is recommended when using Espressif-provided MAC addresses.

Note: ESP32-S3 has no integrated Ethernet MAC, but it's still possible to calculate an Ethernet MAC address. This MAC address can only be used with an external interface such as a SPI-Ethernet device, see [Ethernet](#).

Custom Base MAC The default Base MAC is pre-programmed by Espressif in eFuse BLK1. To set a custom Base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Configure the option `CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC, according to the table above.

Note: It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface, after network initialization. It's recommended to use the Base MAC approach documented here instead, to avoid the possibility of the original MAC address briefly appearing on the network before it is changed.

Custom MAC address in eFuse When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:

Field	# of bits	Range of bits
MAC address	48	200:248

Note: The eFuse BLK3 uses RS-coding during a burn operation it means that all eFuse fields in this block must be burnt at the same time.

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

Local vs Universal MAC addresses ESP32-S3 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The specific calculations to derive an interface's MAC address from the base MAC address is shown in the table above..

When using a custom MAC address scheme, it's possible that not all interfaces can be assigned a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network, only.

See [this article](#) for the definition of local and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (meaning: the supplied "universal" MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

Chip version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

SDK version

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
#endif
```

App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set `PROJECT_VER` variable in your project CMakeLists.txt/Makefile:

- In application CMakeLists.txt put `set(PROJECT_VER "0.1.0.1")` before including `project.cmake`.

(For legacy GNU Make build system: in application Makefile put `PROJECT_VER = "0.1.0.1"` before including `project.mk`.)

If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise if `PROJECT_VER` variable is not set in the project then it will be retrieved from either `$(PROJECT_PATH)/version.txt` file (if present) else using `git describe` command. If neither is available then `PROJECT_VER` will be set to "1". Application can make use of this by calling `esp_ota_get_app_description()` or `esp_ota_get_partition_description()` functions.

API Reference

Header File

- `components/esp_system/include/esp_system.h`

Functions

`esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

Parameters `handle` –function to execute on restart

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the handler has already been registered
- `ESP_ERR_NO_MEM` if no more shutdown handler slots are available

esp_err_t **esp_unregister_shutdown_handler** (*shutdown_handler_t* handle)

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn't been registered before

void **esp_restart** (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

esp_reset_reason_t **esp_reset_reason** (void)

Get reason of last reset.

Returns See description of `esp_reset_reason_t` for explanation of each value.

uint32_t **esp_get_free_heap_size** (void)

Get the size of available heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Returns Available heap size, in bytes.

uint32_t **esp_get_free_internal_heap_size** (void)

Get the size of available internal heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

Returns Available internal heap size, in bytes.

uint32_t **esp_get_minimum_free_heap_size** (void)

Get the minimum heap that has ever been available.

Returns Minimum free heap ever available

void **esp_system_abort** (const char *details)

Trigger a software abort.

Parameters `details` –Details that will be displayed during panic handling.

Type Definitions

typedef void (***shutdown_handler_t**)(void)

Shutdown handler type

Enumerations

enum **esp_reset_reason_t**

Reset reasons.

Values:

enumerator **ESP_RST_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP_RST_POWERON**

Reset due to power-on event.

enumerator **ESP_RST_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP_RST_SW**

Software reset via esp_restart.

enumerator **ESP_RST_PANIC**

Software reset due to exception/panic.

enumerator **ESP_RST_INT_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP_RST_TASK_WDT**

Reset due to task watchdog.

enumerator **ESP_RST_WDT**

Reset due to other watchdogs.

enumerator **ESP_RST_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP_RST_SDIO**

Reset over SDIO.

Header File

- [components/esp_common/include/esp_idf_version.h](#)

Functions

const char ***esp_get_idf_version** (void)

Return full IDF version string, same as ‘git describe’ output.

Note: If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

Returns constant string from IDF_VER

Macros

ESP_IDF_VERSION_MAJOR

Major version number (X.x.x)

ESP_IDF_VERSION_MINOR

Minor version number (x.X.x)

ESP_IDF_VERSION_PATCH

Patch version number (x.x.X)

ESP_IDF_VERSION_VAL (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

ESP_IDF_VERSION

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

2.7.20 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the *Partition Table* of the device with at least two “OTA app slot” partitions (i.e. `ota_0` and `ota_1`) and an “OTA Data Partition” .

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the *Partition Table* of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually `ota_0`) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.

- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application it is written to the `otadata` partition. The partition contains a `ota_seq` counter which is a pointer to the slot (`ota_0`, `ota_1`, ...) from which the application will be selected for boot.

App OTA State States control the process of selecting a boot app:

States	Restriction of selecting a boot app in bootloader
ESP_OTA_IMG_VALID	No restriction. Will be selected.
ESP_OTA_IMG_UNDEFINED	No restriction. Will be selected.
ESP_OTA_IMG_INVALID	Will not be selected.
ESP_OTA_IMG_ABORTED	Will not be selected.
ESP_OTA_IMG_NEW	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.
ESP_OTA_IMG_PENDING_VERIFY	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected and the state will change to ESP_OTA_IMG_ABORTED.

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and ESP_OTA_IMG_NEW and ESP_OTA_IMG_PENDING_VERIFY states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

Rollback Process The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state ESP_OTA_IMG_NEW. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the ESP_OTA_IMG_PENDING_VERIFY state if it is set, then it will be written to ESP_OTA_IMG_ABORTED.
- The bootloader selects a new application to boot so that the state is not set as ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED.
- The bootloader checks the selected application for ESP_OTA_IMG_NEW state if it is set, then it will be written to ESP_OTA_IMG_PENDING_VERIFY. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to ESP_OTA_IMG_ABORTED (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (ESP_OTA_IMG_PENDING_VERIFY state).
- If the self-test fails then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set ESP_OTA_IMG_INVALID state.
- If the application has not been confirmed, the state remains ESP_OTA_IMG_PENDING_VERIFY, and the next boot it will be changed to ESP_OTA_IMG_ABORTED. That will prevent re-boot of this application. There will be a rollback to the previous working application.

Unexpected Reset If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

Bootimg invalid/aborted apps Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the otadata.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

Where the states are set A brief description of where the states are set:

- `ESP_OTA_IMG_VALID` state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- `ESP_OTA_IMG_UNDEFINED` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- `ESP_OTA_IMG_NEW` state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- `ESP_OTA_IMG_INVALID` state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- `ESP_OTA_IMG_ABORTED` state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- `ESP_OTA_IMG_PENDING_VERIFY` state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has `ESP_OTA_IMG_NEW` state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.

- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the `ESP_OTA_IMG_VALID` state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen due to the device may not have any bootable apps then it will return `ESP_ERR_OTA_ROLLBACK_FAILED` error and stay in the `ESP_OTA_IMG_PENDING_VERIFY` state.
- The next update of app is possible if a running app is in the `ESP_OTA_IMG_VALID` state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than running app you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```

....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) ==
↪false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a
↪secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }

                image_header_was_checked = true;

                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
    }
}
....

```

Restrictions:

- The number of bits in the `secure_version` field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option.
- Anti-rollback only works if the encoding scheme for efuse is set to NONE.
- The partition table should not have a factory partition, only two of the app.

security_version:

- In application image it is stored in `esp_app_desc` structure. The number is set `CONFIG_BOOTLOADER_APP_SECURE_VERSION`.

Secure OTA Updates Without Secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` and `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

OTA Tool (otatool.py)

The component `app_update` provides a tool `otatool.py` for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (`read_otadata`)
- erase otadata partition, effectively resetting device to factory app (`erase_otadata`)
- switch OTA partitions (`switch_ota_partition`)
- erasing OTA partition (`erase_ota_partition`)
- write to OTA partition (`write_ota_partition`)
- read contents of OTA partition (`read_ota_partition`)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool's Python API and command-line interface, respectively.

Python API Before anything else, make sure that the `otatool` module is imported.

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py_
↳ lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir) # this enables Python to find otatool module
from otatool import * # import all names inside otatool module
```

The starting point for using the tool's Python API to do is create a `OtatoolTarget` object:

```
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

Command-line Interface The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - these are arguments that are needed for executing the main_
↳ command (partool.py), mostly pertaining to the target device
- subcommand - this is the operation to be performed
- subcommand-args - these are arguments that are specific to the chosen operation
```

```
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying `-help` as argument:

```
# Display possible subcommands and show main command argument descriptions
otatool.py --help

# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

Application Example

End-to-end example of OTA firmware update workflow: [system/ota](#).

API Reference

Header File

- `components/app_update/include/esp_ota_ops.h`

Functions

const [esp_app_desc_t](#) ***esp_ota_get_app_description** (void)

Return `esp_app_desc` structure. This structure includes app version.

Return description for running app.

Returns Pointer to `esp_app_desc` structure.

int **esp_ota_get_app_elf_sha256** (char *dst, size_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Parameters

- **dst** –Destination buffer
- **size** –Size of the buffer

Returns Number of bytes written to `dst` (including null terminator)

[esp_err_t](#) **esp_ota_begin** (const [esp_partition_t](#) *partition, size_t image_size, [esp_ota_handle_t](#) *out_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass `OTA_SIZE_UNKNOWN` which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until `esp_ota_end()` is called with the returned handle.

Note: If the rollback option is enabled and the running application has the `ESP_OTA_IMG_PENDING_VERIFY` state then it will lead to the `ESP_ERR_OTA_ROLLBACK_INVALID_STATE` error. Confirm the running app before to run download a new app, use `esp_ota_mark_app_valid_cancel_rollback()` function for it (this should be done as early as possible when you first download a new application).

Parameters

- **partition** –Pointer to info for partition which will receive the OTA update. Required.
- **image_size** –Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or `OTA_SIZE_UNKNOWN`, the entire partition is erased.
- **out_handle** –On success, returns a handle which should be used for subsequent `esp_ota_write()` and `esp_ota_end()` calls.

Returns

- `ESP_OK`: OTA operation commenced successfully.
- `ESP_ERR_INVALID_ARG`: partition or out_handle arguments were NULL, or partition doesn't point to an OTA app partition.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_OTA_PARTITION_CONFLICT`: Partition holds the currently running firmware, cannot update in place.
- `ESP_ERR_NOT_FOUND`: Partition argument not found in partition table.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: The OTA data partition contains invalid data.
- `ESP_ERR_INVALID_SIZE`: Partition doesn't fit in configured flash size.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_ROLLBACK_INVALID_STATE`: If the running app has not confirmed state. Before performing an update, the application must be valid.

esp_err_t **esp_ota_write** (*esp_ota_handle_t* handle, const void *data, size_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Parameters

- **handle** –Handle obtained from `esp_ota_begin`
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes.

Returns

- `ESP_OK`: Data was written to flash successfully.
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

esp_err_t **esp_ota_write_with_offset** (*esp_ota_handle_t* handle, const void *data, size_t size, uint32_t offset)

Write OTA update data to partition.

This function can write data in non contiguous manner. If flash encryption is enabled, data should be 16 byte aligned.

Note: While performing OTA, if the packets arrive out of order, `esp_ota_write_with_offset()` can be used to write data in non contiguous manner. Use of `esp_ota_write_with_offset()` in combination with `esp_ota_write()`

is not recommended.

Parameters

- **handle** –Handle obtained from `esp_ota_begin`
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes
- **offset** –Offset in flash partition

Returns

- `ESP_OK`: Data was written to flash successfully.
- `ESP_ERR_INVALID_ARG`: handle is invalid.
- `ESP_ERR_OTA_VALIDATE_FAILED`: First byte of image contains invalid app image magic byte.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- `ESP_ERR_OTA_SELECT_INFO_INVALID`: OTA data partition has invalid contents

esp_err_t **esp_ota_end** (*esp_ota_handle_t* handle)

Finish OTA update and validate newly written app image.

Note: After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

Parameters **handle** –Handle obtained from `esp_ota_begin()`.

Returns

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

esp_err_t **esp_ota_abort** (*esp_ota_handle_t* handle)

Abort OTA update, free the handle and memory associated with it.

Parameters **handle** –obtained from `esp_ota_begin()`.

Returns

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

esp_err_t **esp_ota_set_boot_partition** (const *esp_partition_t* *partition)

Configure OTA data for a new boot partition.

Note: If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

Parameters **partition** –Pointer to info for partition containing app image to boot.

Returns

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was NULL or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.

- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

const *esp_partition_t* ***esp_ota_get_boot_partition** (void)

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

Returns Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_running_partition** (void)

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

Returns Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const *esp_partition_t* ***esp_ota_get_next_update_partition** (const *esp_partition_t* *start_from)

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

Parameters **start_from** –If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

Returns Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

esp_err_t **esp_ota_get_partition_description** (const *esp_partition_t* *partition, *esp_app_desc_t* *app_desc)

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

Parameters

- **partition** –[in] Pointer to app partition. (only app partition)
- **app_desc** –[out] Structure of info about app.

Returns

- `ESP_OK` Successful.
- `ESP_ERR_NOT_FOUND` `app_desc` structure is not found. Magic word is incorrect.
- `ESP_ERR_NOT_SUPPORTED` Partition is not application.
- `ESP_ERR_INVALID_ARG` Arguments is NULL or if partition's offset exceeds partition size.
- `ESP_ERR_INVALID_SIZE` Read would go out of bounds of the partition.

- or one of error codes from lower-level flash driver.

`uint8_t esp_ota_get_app_partition_count` (void)

Returns number of ota partitions provided in partition table.

Returns

- Number of OTA partitions

`esp_err_t esp_ota_mark_app_valid_cancel_rollback` (void)

This function is called to indicate that the running app is working well.

Returns

- ESP_OK: if successful.

`esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot` (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

Returns

- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

`const esp_partition_t *esp_ota_get_last_invalid_partition` (void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Returns partition.

`esp_err_t esp_ota_get_state_partition` (const `esp_partition_t` *partition, `esp_ota_img_states_t` *ota_state)

Returns state for given partition.

Parameters

- **partition** –[in] Pointer to partition.
- **ota_state** –[out] state of partition (if this partition has a record in otadata).

Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have otadata or state was not found for given partition.

`esp_err_t esp_ota_erase_last_boot_app_partition` (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Returns

- ESP_OK: Successful, otherwise ESP_ERR.

`bool esp_ota_check_rollback_is_possible` (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Returns

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

esp_err_t **esp_ota_revoke_secure_boot_public_key** (*esp_ota_secure_boot_public_key_index_t* index)

Revokes the old signature digest. To be called in the application after the rollback logic.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3 where upto 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When key #N-1 used to sign an app is invalidated, an OTA update is to be sent with an app signed with key #N-1 & Key #N. After successfully booting the OTA app should call this function to revoke Key #N-1.

Parameters **index** -- The index of the signature block to be revoked

Returns

- ESP_OK: If revocation is successful.
- ESP_ERR_INVALID_ARG: If the index of the public key to be revoked is incorrect.
- ESP_FAIL: If secure boot v2 has not been enabled.

Macros

OTA_SIZE_UNKNOWN

Used for esp_ota_begin() if new image size is unknown

OTA_WITH_SEQUENTIAL_WRITES

Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

ESP_ERR_OTA_BASE

Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT

Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID

Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED

Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER

Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE

Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t **esp_ota_handle_t**

Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

Enumerations

enum `esp_ota_secure_boot_public_key_index_t`

Secure Boot V2 public key indexes.

Values:

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_0`

Points to the 0th index of the Secure Boot v2 public key

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_1`

Points to the 1st index of the Secure Boot v2 public key

enumerator `SECURE_BOOT_PUBLIC_KEY_INDEX_2`

Points to the 2nd index of the Secure Boot v2 public key

Debugging OTA Failure

Fig. 35: How to Debug When OTA Fails (click to enlarge)

2.7.21 Performance Monitor

The Performance Monitor component provides APIs to use ESP32-S3 internal performance counters to profile functions and applications.

Application Example

An example which combines performance monitor is provided in `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.

High level API Reference

Header Files

- `perfmon/include/perfmon.h`

API Reference

Header File

- `components/perfmon/include/xtensa_perfmon_access.h`

Functions

`esp_err_t xtensa_perfmon_init` (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)

Init Performance Monitor.

Initialize performance monitor register with define values

Parameters

- **id** –[in] performance counter number
- **select** –[in] select value from PMCTRLx register
- **mask** –[in] mask value from PMCTRLx register
- **kernelcnt** –[in] kernelcnt value from PMCTRLx register
- **tracelevel** –[in] tracelevel value from PMCTRLx register

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

`esp_err_t xtensa_perfmon_reset` (int id)

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

Parameters **id** –[in] performance counter number

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

void `xtensa_perfmon_start` (void)

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

void `xtensa_perfmon_stop` (void)

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

uint32_t `xtensa_perfmon_value` (int id)

Read PM counter.

Read value of defined PM counter.

Parameters **id** –[in] performance counter number

Returns

- Performance counter value

esp_err_t **xtensa_perfmon_overflow** (int id)

Read PM overflow state.

Read overflow value of defined PM counter.

Parameters **id** –[in] performance counter number

Returns

- ESP_OK if there is no overflow (overflow = 0)
- ESP_FAIL if overflow occur (overflow = 1)

void **xtensa_perfmon_dump** (void)

Dump PM values.

Dump all PM register to the console.

Header File

- [components/perfmon/include/xtensa_perfmon_apis.h](#)

Functions

esp_err_t **xtensa_perfmon_exec** (const *xtensa_perfmon_config_t* *config)

Execute PM.

Execute performance counter for dedicated function with defined parameters

Parameters **config** –[in] pointer to the configuration structure

Returns

- ESP_OK if no errors
- ESP_ERR_INVALID_ARG if one of the required parameters not defined
- ESP_FAIL - counter overflow

void **xtensa_perfmon_view_cb** (void *params, uint32_t select, uint32_t mask, uint32_t value)

Dump PM results.

Callback to dump perfmon result to a FILE* stream specified in *perfmon_config_t::callback_params*. If *callback_params* is set to NULL, will print to stdout

Parameters

- **params** –[in] used parameters passed from configuration (*callback_params*). This parameter expected as FILE* handle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- **select** –[in] select value for current counter
- **mask** –[in] mask value for current counter
- **value** –[in] counter value for current counter

Structures

struct **xtensa_perfmon_config**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

Public Members

int **repeat_count**

how much times function will be called before the callback will be repeated

float **max_deviation**

Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void ***call_params**

This pointer will be passed to the call_function as a parameter

void (***call_function**)(void *params)

pointer to the function that have to be called

void (***callback**)(void *params, uint32_t select, uint32_t mask, uint32_t value)

pointer to the function that will be called with result parameters

void ***callback_params**

parameter that will be passed to the callback

int **tracelevel**

trace level for all counters. In case of negative value, the filter will be ignored. If it's ≥ 0 , then the perfmon will count only when interrupt level $>$ tracelevel. It's useful to monitor interrupts.

uint32_t **counters_size**

amount of counter in the list

const uint32_t ***select_mask**

list of the select/mask parameters

Type Definitions

typedef struct *xtensa_perfmon_config* **xtensa_perfmon_config_t**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

2.7.22 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32s3_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default `REF_TICK` clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (`true/false`).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32S3_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

Note: Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

Note: In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the [Sleep Modes](#) documentation can be used to trigger wakeup from the light sleep state.

For example, the `EXT0` and `EXT1` wakeup sources can be used to wake up the chip via a GPIO.

Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32-S3 supports three types of locks described in the table below.

Lock	Description
<code>ESP_PM_CPU_FREQ_MAX</code>	Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code> . For ESP32-S3, this value can be set to 80 MHz, 160 MHz, or 240 MHz.
<code>ESP_PM_APB_FREQ_MAX</code>	Requests the APB frequency to be at the maximum supported value. For ESP32-S3, this is 80 MHz.
<code>ESP_PM_NO_LIGHT_SLEEP</code>	Disables automatic switching to light sleep.

ESP32-S3 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP32S3_DEFAULT_CPU_FREQ_MHZ`.

Max CPU Frequency Set	Lock Acquisition	CPU and APB Frequencies
240	ESP_PM_CPU_FREQ_MAX acquired	CPU: 240 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>
160	ESP_PM_CPU_FREQ_MAX acquired	CPU: 160 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>
80	Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <code>esp_pm_configure()</code>

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with *High resolution timer* APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

To skip unnecessary wake-up you can consider initializing an `esp_timer` with the `skip_unhandled_events` option as true. Timers with this flag will not wake up the system and it helps to reduce consumption.

Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK is used as a clock source. See *use_ref_tick* member of *uart_config_t*.
- **LEDC**: if REF_TICK is used as a clock source. See *ledc_timer_config()* function.
- **RMT**: if REF_TICK or XTAL is used as a clock source. See *flags* member of *rmt_config_t* and macro *RMT_CHANNEL_FLAGS_AWARE_DFS*.

Currently, the following peripheral drivers are aware of DFS and will use the *ESP_PM_APB_FREQ_MAX* lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APLL clock is used, then it will use the *ESP_PM_NO_LIGHT_SLEEP* lock)
- SDMMC

The following drivers will hold the *ESP_PM_APB_FREQ_MAX* lock while the driver is enabled:

- **SPI slave**: between calls to *spi_slave_initialize()* and *spi_slave_free()*.
- **Ethernet**: between calls to *esp_eth_driver_install()* and *esp_eth_driver_uninstall()*.
- **WiFi**: between calls to *esp_wifi_start()* and *esp_wifi_stop()*. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **TWAI**: between calls to *twai_driver_install()* and *twai_driver_uninstall()*.
- **Bluetooth**: between calls to *esp_bt_controller_enable()* and *esp_bt_controller_disable()*. If Bluetooth modem sleep is enabled, the *ESP_PM_APB_FREQ_MAX* lock will be released for the periods of time when radio is disabled. However the *ESP_PM_NO_LIGHT_SLEEP* lock will still be held.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- Timer group
- MCPWM

API Reference

Header File

- [components/esp_pm/include/esp_pm.h](#)

Functions

esp_err_t **esp_pm_configure** (const void *config)

Set implementation-specific power management configuration.

Parameters *config* –pointer to implementation-specific configuration structure (e.g. *esp_pm_config_esp32*)

Returns

- *ESP_OK* on success
- *ESP_ERR_INVALID_ARG* if the configuration values are not correct
- *ESP_ERR_NOT_SUPPORTED* if certain combination of values is not supported, or if *CONFIG_PM_ENABLE* is not enabled in *sdkconfig*

esp_err_t **esp_pm_get_configuration** (void *config)

Get implementation-specific power management configuration.

Parameters *config* –pointer to implementation-specific configuration structure (e.g. *esp_pm_config_esp32*)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the pointer is null

esp_err_t **esp_pm_lock_create** (*esp_pm_lock_type_t* lock_type, int arg, const char *name, *esp_pm_lock_handle_t* *out_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.

Parameters

- **lock_type** –Power management constraint which the lock should control
- **arg** –argument, value depends on lock_type, see `esp_pm_lock_type_t`
- **name** –arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the `esp_pm_dump_locks` function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out_handle** –[out] handle returned from this function. Use this handle when calling `esp_pm_lock_delete`, `esp_pm_lock_acquire`, `esp_pm_lock_release`. Must not be NULL.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure can not be allocated
- ESP_ERR_INVALID_ARG if out_handle is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_acquire** (*esp_pm_lock_handle_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to `esp_pm_lock_create`, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

Parameters **handle** –handle obtained from `esp_pm_lock_create` function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_release** (*esp_pm_lock_handle_t* handle)

Release the lock taken using `esp_pm_lock_acquire`.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if `esp_pm_lock_acquire` is called a number of times, `esp_pm_lock_release` has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other `esp_pm_lock_*` functions for the same handle.

Parameters **handle** –handle obtained from `esp_pm_lock_create` function

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if lock is not acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t **esp_pm_lock_delete** (*esp_pm_lock_handle_t* handle)

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

Parameters `handle` –handle obtained from `esp_pm_lock_create` function

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the `handle` argument is `NULL`
- `ESP_ERR_INVALID_STATE` if the lock is still acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

esp_err_t **esp_pm_dump_locks** (FILE *stream)

Dump the list of all locks to `stderr`.

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

Parameters `stream` –stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

Type Definitions

```
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```

Opaque handle to the power management lock.

Enumerations

```
enum esp_pm_lock_type_t
```

Power management constraints.

Values:

enumerator **ESP_PM_CPU_FREQ_MAX**

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

enumerator **ESP_PM_APB_FREQ_MAX**

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

enumerator **ESP_PM_NO_LIGHT_SLEEP**

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- `components/esp_pm/include/esp32s3/pm.h`

Structures

struct **esp_pm_config_esp32s3_t**

Power management config for ESP32.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

Public Members

int **max_freq_mhz**

Maximum CPU frequency, in MHz

int **min_freq_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light_sleep_enable**

Enter light sleep when no locks are taken

2.7.23 Random Number Generation

ESP32-S3 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF *Second stage bootloader* is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the *ESP32-S3 Technical Reference Manual > Random Number Generator (RNG)* [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, Wi-Fi or Bluetooth.

Note: The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

Note: If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

Secondary Entropy

ESP32-S3 RNG contains a secondary entropy source, based on sampling an asynchronous 8MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the [Dieharder](#) random number test suite without the main entropy source enabled (test input was created by concatenating short samples from a continuously resetting ESP32-S3). However, it is currently only guaranteed that true random numbers will be produced when the main entropy source is also enabled as described above.

API Reference

Header File

- [components/esp_hw_support/include/esp_random.h](#)

Functions

uint32_t **esp_random** (void)

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

Returns Random value between 0 and U_INT32_MAX

void **esp_fill_random** (void *buf, size_t len)

Fill a buffer with random bytes from hardware RNG.

Note: This function is implemented via calls to `esp_random()`, so the same constraints apply.

Parameters

- **buf** –Pointer to buffer to fill with random numbers.
- **len** –Length of buffer in bytes

Header File

- [components/bootloader_support/include/bootloader_random.h](#)

Functions

void **bootloader_random_enable** (void)

Enable an entropy source for RNG if RF is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be used from app code early during operation, if true random numbers are required before RF is initialised. Consult ESP-IDF Programming Guide “Random Number Generation” section for details.

void **bootloader_random_disable** (void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after `bootloader_random_enable()` and before RF features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

void **bootloader_fill_random** (void *buffer, size_t length)

Fill buffer with ‘length’ random bytes.

Note: If this function is being called from app code only, and never from the bootloader, then it’s better to call `esp_fill_random()`.

Parameters

- **buffer** –Pointer to buffer
- **length** –This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling `esp_fill_random()` internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is `NULL`, and equal to `buflen` otherwise.

2.7.24 Sleep Modes

Overview

ESP32-S3 is capable of light sleep and deep sleep power saving modes.

In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from `APB_CLK` are powered off. The only parts of the chip which can still be powered on are:

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory
- RTC slow memory

Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using `esp_sleep_enable_x_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see [Power Management APIs](#)). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (`esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

Wakeup sources

Timer RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW_CLK.

For details on RTC clock options, see *ESP32-S3 Technical Reference Manual > ULP Coprocessor* [PDF].

This wakeup mode doesn't require RTC peripherals or RTC memories to be powered on during sleep.

`esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

Touch pad RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

`esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

External wakeup (ext0) RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.

Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions, before calling `esp_sleep_start()`.

`esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

Warning: After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using `rtc_gpio_deinit(gpio_num)` function.

External wakeup (ext1) RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if all the selected pins are low (ESP_EXT1_WAKEUP_ALL_LOW)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using `rtc_gpio_*` functions, before entering sleep:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpiopulldown_en(gpio_num);
```

Warning: After wake up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using `rtc_gpio_deinit(gpio_num)` function.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

ULP coprocessor wakeup ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

GPIO wakeup (light sleep only) In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

Warning: Before entering light sleep mode, check if any GPIO pin to be driven is part of the VDD_SPI power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD_SPI power domain. If they are configured to remain high during light sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

UART wakeup (light sleep only) When ESP32-S3 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32-S3 to trigger wakeup, before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

Power-down of RTC peripherals and memories

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

If some variables in the program are placed into RTC slow memory (for example, using `RTC_DATA_ATTR` attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

Power-down of Flash

By default, to avoid potential issues, `esp_light_sleep_start()` function will **not** power down flash. To be more specific, it takes time to power down the flash and during this period the system may be woken up, which then actually powers up the flash before this flash could be powered down completely. As a result, there is a chance that the flash may not work properly.

So, in theory, it's ok if you only wake up the system after the flash is completely powered down. However, in reality, the flash power-down period can be hard to predict (for example, this period can be much longer when you add filter capacitors to the flash's power supply circuit) and uncontrollable (for example, the asynchronous wake-up signals make the actual sleep time uncontrollable).

Warning: If a filter capacitor is added to your flash power supply circuit, please do everything possible to avoid powering down flash.

Therefore, it's recommended not to power down flash when using ESP-IDF. For power-sensitive applications, it's recommended to use Kconfig option `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` to reduce the power consumption of the flash during light sleep, instead of powering down the flash.

It is worth mentioning that PSRAM has a similar Kconfig option `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`.

However, for those who have fully understood the risk and are still willing to power down the flash to further reduce the power consumption, please check the following mechanisms:

- Setting Kconfig option `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` only powers down the flash when the RTC timer is the only wake-up source **and** the sleep time is longer than the flash power-down period.
- Calling `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` powers down flash when the RTC timer is not enabled as a wakeup source **or** the sleep time is longer than the flash power-down period.

Note:

- ESP-IDF does not provide any mechanism that can power down the flash in all conditions when light sleep.
 - `esp_deep_sleep_start()` function will force power down flash regardless of user configuration.
-

Entering light sleep

`esp_light_sleep_start()` function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

Entering deep sleep

`esp_deep_sleep_start()` function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

Configuring IOs

Some ESP32-S3 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```
rtc_gpio_isolate(GPIO_NUM_12);
```

UART output handling

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

Checking sleep wakeup cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad, it is possible to identify touch pad which has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify pin which has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

Disable sleep wakeup source

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

Application Example

Implementation of basic functionality of deep sleep is shown in [protocols/sntp](#) example, where ESP module is periodically waken up to retrieve time from NTP server.

More extensive example in [system/deep_sleep](#) illustrates usage of various deep sleep wakeup triggers and ULP co-processor programming.

API Reference

Header File

- [components/esp_hw_support/include/esp_sleep.h](#)

Functions

`esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)`

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

Note: This function does not modify wake up configuration in RTC. It will be performed in `esp_sleep_start` function.

Parameters `source` -- number of source to disable of type `esp_sleep_source_t`

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if trigger was not active

esp_err_t `esp_sleep_enable_ulp_wakeup` (void)

Enable wakeup by ULP coprocessor.

Note: On ESP32, ULP wakeup source cannot be used when `RTC_PERIPH` power domain is forced, to be powered on (`ESP_PD_OPTION_ON`) or when `ext0` wakeup source is used.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if additional current by touch (`CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT`) is enabled.
- `ESP_ERR_INVALID_STATE` if ULP co-processor is not enabled or if wakeup triggers conflict

esp_err_t `esp_sleep_enable_timer_wakeup` (uint64_t time_in_us)

Enable wakeup by timer.

Parameters `time_in_us` --time before wakeup, in microseconds

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if value is out of range (TBD)

esp_err_t `esp_sleep_enable_touchpad_wakeup` (void)

Enable wakeup by touch sensor.

Note: On ESP32, touch wakeup source can not be used when `RTC_PERIPH` power domain is forced to be powered on (`ESP_PD_OPTION_ON`) or when `ext0` wakeup source is used.

Note: The FSM mode of the touch button should be configured as the timer trigger mode.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if additional current by touch (`CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT`) is enabled.
- `ESP_ERR_INVALID_STATE` if wakeup triggers conflict

touch_pad_t `esp_sleep_get_touchpad_wakeup_status` (void)

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return `TOUCH_PAD_MAX`;

Returns touch pad which caused wakeup

bool `esp_sleep_is_valid_wakeup_gpio` (*gpio_num_t* gpio_num)

Returns true if a GPIO number is valid for use as wakeup source.

Note: For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

Parameters `gpio_num` –Number of the GPIO to test for wakeup source capability

Returns True if this GPIO number will be accepted as a sleep wakeup source.

esp_err_t `esp_sleep_enable_ext0_wakeup` (*gpio_num_t* gpio_num, int level)

Enable wakeup using a pin.

This function uses external wakeup feature of RTC_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

Note: This function does not modify pin configuration. The pin is configured in `esp_sleep_start`, immediately before entering sleep mode.

Note: On ESP32, ext0 wakeup source can not be used together with touch or ULP wakeup sources.

Parameters

- `gpio_num` –GPIO number used as wakeup source. Only GPIOs which have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- `level` –input level which will trigger wakeup (0=low, 1=high)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t `esp_sleep_enable_ext1_wakeup` (uint64_t mask, *esp_sleep_ext1_wakeup_mode_t* mode)

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

Note: This function does not modify pin configuration. The pins are configured in `esp_sleep_start`, immediately before entering sleep mode.

Note: internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function.

Parameters

- `mask` –bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- `mode` –select logic function used to determine wakeup condition:
 - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
 - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

esp_err_t **esp_sleep_enable_gpio_wakeup** (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

Note: On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

esp_err_t **esp_sleep_enable_uart_wakeup** (int uart_num)

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

Note: ESP32 does not support wakeup from UART2.

Parameters `uart_num` –UART port to wake up from

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

esp_err_t **esp_sleep_enable_wifi_wakeup** (void)

Enable wakeup by WiFi MAC.

Returns

- ESP_OK on success

esp_err_t **esp_sleep_disable_wifi_wakeup** (void)

Disable wakeup by WiFi MAC.

Returns

- ESP_OK on success

uint64_t **esp_sleep_get_ext1_wakeup_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

Returns bit mask, if GPIO_n caused wakeup, BIT(n) will be set

esp_err_t **esp_sleep_pd_config** (*esp_sleep_pd_domain_t* domain, *esp_sleep_pd_option_t* option)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP_PD_OPTION_AUTO.

Parameters

- **domain** –power domain to configure
- **option** –power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

void **esp_deep_sleep_start** (void)

Enter deep sleep with the configured wakeup options.

This function does not return.

esp_err_t **esp_light_sleep_start** (void)

Enter light sleep with the configured wakeup options.

Returns

- ESP_OK on success (returned after wakeup)
- ESP_ERR_SLEEP_REJECT sleep request is rejected(wakeup source set before the sleep request)
- ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

void **esp_deep_sleep** (uint64_t time_in_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to `esp_deep_sleep_enable_timer_wakeup` followed by a call to `esp_deep_sleep_start`.

`esp_deep_sleep` does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- `esp_bluedroid_disable`
- `esp_bt_controller_disable`
- `esp_wifi_stop`

This function does not return.

Note: The device will wake up immediately if the deep-sleep time is set to 0

Parameters `time_in_us` –deep-sleep time, unit: microsecond

esp_sleep_wakeup_cause_t **esp_sleep_get_wakeup_cause** (void)

Get the wakeup source which caused wakeup from sleep.

Returns cause of wake up from last sleep (deep sleep or light sleep)

void **esp_wake_deep_sleep** (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp_set_deep_sleep_wake_stub** (*esp_deep_sleep_wake_stub_fn_t* new_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

esp_deep_sleep_wake_stub_fn_t **esp_get_deep_sleep_wake_stub** (void)

Get current wake from deep sleep stub.

Returns Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp_default_wake_deep_sleep** (void)

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

void **esp_deep_sleep_disable_rom_logging** (void)

Disable logging from the ROM code after deep sleep.

Using LSB of `RTC_STORE4`.

esp_err_t **esp_sleep_cpu_pd_low_init** (bool enable)

CPU Power down low-level initialize.

Parameters *enable* –enable or disable CPU power down during light sleep

Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` not enough retention memory

void **esp_sleep_config_gpio_isolate** (void)

Configure to isolate all GPIO pins in sleep state.

void **esp_sleep_enable_gpio_switch** (bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

Parameters *enable* –decide whether to switch status or not

Type Definitions

typedef *esp_sleep_source_t* **esp_sleep_wakeup_cause_t**

typedef void (***esp_deep_sleep_wake_stub_fn_t**)(void)

Function type for stub to run on wake from sleep.

Enumerations

enum **esp_sleep_ext1_wakeup_mode_t**

Logic function used for EXT1 wakeup mode.

Values:

enumerator **ESP_EXT1_WAKEUP_ALL_LOW**

Wake the chip when all selected GPIOs go low.

enumerator **ESP_EXT1_WAKEUP_ANY_HIGH**

Wake the chip when any of the selected GPIOs go high.

enum **esp_sleep_pd_domain_t**

Power domains which can be powered down in sleep mode.

Values:

enumerator **ESP_PD_DOMAIN_RTC_PERIPH**

RTC IO, sensors and ULP co-processor.

enumerator **ESP_PD_DOMAIN_RTC_SLOW_MEM**

RTC slow memory.

enumerator **ESP_PD_DOMAIN_RTC_FAST_MEM**

RTC fast memory.

enumerator **ESP_PD_DOMAIN_XTAL**

XTAL oscillator.

enumerator **ESP_PD_DOMAIN_CPU**

CPU core.

enumerator **ESP_PD_DOMAIN_RTC8M**

Internal 8M oscillator.

enumerator **ESP_PD_DOMAIN_VDDSDIO**

VDD_SDIO.

enumerator **ESP_PD_DOMAIN_MAX**

Number of domains.

enum **esp_sleep_pd_option_t**

Power down options.

Values:

enumerator **ESP_PD_OPTION_OFF**

Power down the power domain in sleep mode.

enumerator **ESP_PD_OPTION_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP_PD_OPTION_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**

Sleep wakeup cause.

Values:

enumerator **ESP_SLEEP_WAKEUP_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP_SLEEP_WAKEUP_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

enumerator **ESP_SLEEP_WAKEUP_EXT0**

Wakeup caused by external signal using `RTC_IO`.

enumerator **ESP_SLEEP_WAKEUP_EXT1**

Wakeup caused by external signal using `RTC_CNTL`.

enumerator **ESP_SLEEP_WAKEUP_TIMER**

Wakeup caused by timer.

enumerator **ESP_SLEEP_WAKEUP_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP_SLEEP_WAKEUP_ULP**

Wakeup caused by ULP program.

enumerator **ESP_SLEEP_WAKEUP_GPIO**

Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator **ESP_SLEEP_WAKEUP_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP_SLEEP_WAKEUP_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP_SLEEP_WAKEUP_BT**

Wakeup caused by BT (light sleep only)

enum [**anonymous**]

Values:

enumerator **ESP_ERR_SLEEP_REJECT**

enumerator **ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION**

2.7.25 Watchdogs

Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled

using [Project Configuration Menu](#), however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

Interrupt watchdog The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn't blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can't get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as "Interrupt wdt timeout on CPU0" or "Interrupt wdt timeout on CPU1" (as applicable).

Configuration The interrupt watchdog is enabled by default via the [CONFIG_ESP_INT_WDT](#) configuration flag. The timeout is configured by setting [CONFIG_ESP_INT_WDT_TIMEOUT_MS](#). The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see [CONFIG_FREERTOS_HZ](#)).

Tuning If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it's possible to increase the [CONFIG_ESP_INT_WDT_TIMEOUT_MS](#) setting instead.

Task Watchdog Timer The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle task, however any task can subscribe to be watched by the TWDT. Each watched task must 'reset' the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function [esp_task_wdt_isr_user_handler](#) in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling [esp_task_wdt_init\(\)](#) which will configure the hardware timer. A task can then subscribe to the TWDT using [esp_task_wdt_add\(\)](#) in order to be watched. Each subscribed task must periodically call [esp_task_wdt_reset\(\)](#) to reset the TWDT. Failure by any subscribed tasks to periodically call [esp_task_wdt_reset\(\)](#) indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using [esp_task_wdt_delete\(\)](#). A task that has been unsubscribed should no longer call [esp_task_wdt_reset\(\)](#). Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling [esp_task_wdt_deinit\(\)](#).

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolise the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_add()` at any time.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.

JTAG and watchdogs While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenale them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-S3 is connected to OpenOCD via JTAG.

XTAL32K Watchdog Timer (XTWDT) The XTAL32K watchdog makes sure the (optional) external 32 KHz crystal or oscillator is functioning correctly.

When `XTAL32K_CLK` works as the clock source of `RTC_SLOW_CLK` and stops oscillating, the XTAL32K watchdog timer will detect this and generate an interrupt. It also provides functionality for automatically switching over to the internal, but less accurate oscillator as the `RTC_SLOW_CLK` source.

Since the switch to the backup clock is done in hardware it can also happen during deep sleep. This means that even if `XTAL32K_CLK` stops functioning while the chip in deep sleep, waiting for a timer to expire, it will still be able to wake-up as planned.

If the `XTAL32K_CLK` starts functioning normally again, you can call `esp_xt_wdt_restore_clk` to switch back to this clock source and re-enable the watchdog timer.

Configuration When the external 32KHz crystal or oscillator is selected (`CONFIG_ESP32S3_RTC_CLK_SRC`) the XTAL32K watchdog can be enabled via the `CONFIG_ESP_XT_WDT` configuration flag. The timeout is configured by setting `CONFIG_ESP_XT_WDT_TIMEOUT`. The automatic backup clock functionality is enabled via the ref:`CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE` configuration.

Interrupt Watchdog API Reference

Header File

- `esp_system/include/esp_int_wdt.h`

Functions

void `esp_int_wdt_init` (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

Task Watchdog API Reference

A full example using the Task Watchdog is available in esp-idf: [system/task_watchdog](#)

Header File

- [components/esp_system/include/esp_task_wdt.h](#)

Functions

esp_err_t **esp_task_wdt_init** (uint32_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT's timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add()`.

Note: `esp_task_wdt_init()` must only be called after the scheduler started

Parameters

- **timeout** *–[in]* Timeout period of TWDT in seconds
- **panic** *–[in]* Flag that controls whether the panic handler will be executed when the TWDT times out

Returns

- ESP_OK: Initialization was successful
- ESP_ERR_NO_MEM: Initialization failed due to lack of memory

esp_err_t **esp_task_wdt_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

Returns

- ESP_OK: TWDT successfully deinitialized
- ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
- ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

esp_err_t **esp_task_wdt_add** (*TaskHandle_t* handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to be called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

Parameters **handle** *–[in]* Handle of the task. Input NULL to subscribe the current running task to the TWDT

Returns

- ESP_OK: Successfully subscribed the task to the TWDT
- ESP_ERR_INVALID_ARG: Error, the task is already subscribed
- ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

esp_err_t **esp_task_wdt_reset** (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to

reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

Returns

- `ESP_OK`: Successfully reset the TWDT on behalf of the currently running task
- `ESP_ERR_NOT_FOUND`: Error, the current running task has not subscribed to the TWDT
- `ESP_ERR_INVALID_STATE`: Error, the TWDT has not been initialized yet

`esp_err_t esp_task_wdt_delete` (*TaskHandle_t* handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`. If the task is an IDLE task, this function will automatically disable the calling of `esp_task_wdt_reset()` from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

Parameters `handle` –[in] Handle of the task. Input NULL to unsubscribe the current running task.

Returns

- `ESP_OK`: Successfully unsubscribed the task from the TWDT
- `ESP_ERR_INVALID_ARG`: Error, the task is already unsubscribed
- `ESP_ERR_INVALID_STATE`: Error, the TWDT has not been initialized yet

`esp_err_t esp_task_wdt_status` (*TaskHandle_t* handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

Parameters `handle` –[in] Handle of the task. Input NULL to query the current running task.

Returns :

- `ESP_OK`: The task is currently subscribed to the TWDT
- `ESP_ERR_NOT_FOUND`: The task is currently not subscribed to the TWDT
- `ESP_ERR_INVALID_STATE`: The TWDT is not initialized, therefore no tasks can be subscribed

2.7.26 System Time

Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an *RTC Clock Source* and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.
- **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the `APB_CLK` clock source (typically 80 MHz), which has a frequency deviation of less than ± 10 ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32S3_TIME_SYSCALL` in project configuration.

RTC Clock Source

The RTC timer has the following clock sources:

- Internal 150kHz RC oscillator (default): Features lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- External 32kHz crystal: Requires a 32kHz crystal to be connected to the 32K_XP and 32K_XN pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
- External 32kHz oscillator at 32K_XN pin: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of $0.1 < V_{cm} < 0.5 \times V_{amp}$, where V_{amp} is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin.
- Internal 8.5MHz oscillator, divided by 256 (~33kHz): Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32S3_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K_XN pin sources can be found in Section *Crystal Oscillator* of [ESP32 Hardware Design Guidelines](#).

Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

* -To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();

localtime_r(&now, &timeinfo);
```

(continues on next page)

(continued from previous page)

```
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH` updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in `protocols/sntp` directory.

Timezones

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the TZ environment variable to the correct value depending on the device location. The format of the time string is the same as described in the [GNU libc documentation](#) (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

API Reference

Header File

- `components/lwip/include/apps/esp_sntp.h`

Functions

void **sntp_sync_time** (struct timeval *tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

Parameters `tv` –Time received from SNTP server.

void **sntp_set_sync_mode** (*sntp_sync_mode_t* sync_mode)

Set the sync mode.

Allowable two mode: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

Parameters `sync_mode` –Sync mode.

sntp_sync_mode_t **sntp_get_sync_mode** (void)

Get set sync mode.

Returns `SNTP_SYNC_MODE_IMMED`: Update time immediately.

`SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

sntp_sync_status_t **sntp_get_sync_status** (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

Returns `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`:

Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void **sntp_set_sync_status** (*sntp_sync_status_t* sync_status)

Set status of time sync.

Parameters `sync_status` –status of time sync (see `sntp_sync_status_t`)

void **sntp_set_time_sync_notification_cb** (*sntp_sync_time_cb_t* callback)

Set a callback function for time synchronization notification.

Parameters `callback` –a callback function

void **sntp_set_sync_interval** (uint32_t interval_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function, otherwise, it will be applied after the last interval expired.

Parameters `interval_ms` –The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32_t **sntp_get_sync_interval** (void)

Get the sync interval of SNTP operation.

Returns the sync interval

bool **sntp_restart** (void)

Restart SNTP.

Returns True - Restart False - SNTP was not initialized yet

Type Definitions

typedef void (***sntp_sync_time_cb_t**)(struct timeval *tv)

SNTP callback function for notifying about time sync event.

Param tv Time received from SNTP server.

Enumerations

enum **sntp_sync_mode_t**

SNTP time update mode.

Values:

enumerator **SNTP_SYNC_MODE_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP_SYNC_MODE_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp_sync_status_t**

SNTP sync status.

Values:

enumerator **SNTP_SYNC_STATUS_RESET**

enumerator **SNTP_SYNC_STATUS_COMPLETED**

enumerator **SNTP_SYNC_STATUS_IN_PROGRESS**

2.7.27 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

API Reference

Header File

- [components/esp_rom/include/esp_rom_sys.h](#)

Functions

int **esp_rom_printf** (const char *fmt, ...)

Print formatted string to console device.

Note: float and long long data are not supported!

Parameters

- **fmt** –Format string
- ... –Additional arguments, depending on the format string

Returns int: Total number of characters written on success; A negative number on failure.

void **esp_rom_delay_us** (uint32_t us)

Pauses execution for us microseconds.

Parameters **us** –Number of microseconds to pause

void **esp_rom_install_channel_putc** (int channel, void (*putc)(char c))

esp_rom_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp_rom_printf.

Parameters

- **channel** –Channel number (starting from 1)
- **putc** –Function pointer to the putc implementation. Set NULL can disconnect esp_rom_printf with putc.

void **esp_rom_install_uart_printf** (void)

Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putc(1, esp_rom_uart_putc)

soc_reset_reason_t **esp_rom_get_reset_reason** (int cpu_no)

Get reset reason of CPU.

Parameters **cpu_no** –CPU number

Returns Reset reason code (see in soc/reset_reasons.h)

Code examples for this API section are provided in the [system](#) directory of ESP-IDF examples.

2.8 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the [build system guide](#).
- *Kconfig* options can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.8.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Code Reference](#) contains the list of error codes returned by ESP-IDF components.

2.8.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn't support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

2.8.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as *hal* only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

2.8.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

2.8.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [versions page](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components —provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system [renaming mechanism](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.

- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don't fall into the categories below.

- *Private APIs.*
- *Components in example projects.*
- Features clearly marked as “beta” , “preview” , or “experimental” .
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of *Kconfig* options in `menuconfig`.
- Location and names of example projects.

2.9 Project Configuration

2.9.1 Introduction

ESP-IDF uses `kconfiglib` which is a Python-based extension to the `Kconfig` system which provides a compile-time project configuration mechanism. `Kconfig` is based around options of several types: integer, string, boolean. `Kconfig` files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see `Kconfig` and `kconfiglib` extensions.

2.9.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sd-kconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with `make menuconfig`.)

2.9.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the `sdkconfig` file. Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see *Custom `sdkconfig.defaults`*.

2.9.4 Kconfig Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of `conf-idf` which causes that Windows line endings are not recognized after a backslash).

Format checker

`tools/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn't some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.9.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. *Deprecated options and their replacements* are automatically generated by `confgen.py`.

2.9.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from `Kconfig` files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

SDK tool configuration

Contains:

- `CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`
- `CONFIG_SDK_TOOLPREFIX`

- [CONFIG_SDK_PYTHON](#)
- [CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS](#)

CONFIG_SDK_TOOLPREFIX

Compiler toolchain path/prefix

Found in: SDK tool configuration

The prefix/path that is used to call the toolchain. The default setting assumes a crosstool-ng gcc setup that is in your PATH.

Default value:

- “xtensa-esp32s3-elf- “

CONFIG_SDK_PYTHON

Python interpreter

Found in: SDK tool configuration

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)

Default value:

- “python”

CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES

‘make’ warns on undefined variables

Found in: SDK tool configuration

Adds `-warn-undefined-variables` to `MAKEFLAGS`. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.

(Note: this option is used with the legacy GNU Make build system only.)

Default value:

- Yes (enabled)

CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS

Toolchain supports `time_t` wide 64-bits

Found in: SDK tool configuration

Enable this option in case you have a custom toolchain which supports `time_t` wide 64-bits. This option checks `time_t` is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits `time_t`.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide `time_t`. This will change in a future major release, but currently 64-bit `time_t` requires a custom built toolchain.

Default value:

- No (disabled)

Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`

CONFIG_APP_BUILD_TYPE

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL)) (APP_BUILD_TYPE_ELF_RAM)

Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: Application manager

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

Default value:

- Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: Application manager

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: Application manager

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER_FROM_CONFIG

Get the project version from Kconfig

Found in: Application manager

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER

Project version

Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG

Project version

Default value:

- 1 if *CONFIG_APP_PROJECT_VER_FROM_CONFIG*

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: Application manager

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

Range:

- from 8 to 64

Default value:

- 16

Bootloader config

Contains:

- [CONFIG_BOOTLOADER_LOG_LEVEL](#)
- [CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION](#)
- [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)
- [CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE](#)
- [CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT](#)
- [CONFIG_BOOTLOADER_APP_TEST](#)
- [CONFIG_BOOTLOADER_FACTORY_RESET](#)
- [CONFIG_BOOTLOADER_HOLD_TIME_GPIO](#)
- [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP](#)
- [CONFIG_BOOTLOADER_WDT_ENABLE](#)
- [CONFIG_BOOTLOADER_VDDSDIO_BOOST](#)

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

Found in: Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

Found in: Bootloader config

Specify how much output to see in bootloader logs.

Available options:

- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

Found in: [Bootloader config](#)

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

Found in: [Bootloader config](#)

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Default value:

- 4 if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

Default value:

- “nvs” if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: [Bootloader config](#)

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

Default value:

- No (disabled) if [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_TEST](#)

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

Range:

- from 0 to 39 if [CONFIG_BOOTLOADER_APP_TEST](#)

Default value:

- 18 if [CONFIG_BOOTLOADER_APP_TEST](#)

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: [Bootloader config](#)

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Default value:

- 5 if [CONFIG_BOOTLOADER_FACTORY_RESET](#) || [CONFIG_BOOTLOADER_APP_TEST](#)

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

Found in: [Bootloader config](#)

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

Found in: [Bootloader config](#)

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE

Allows RTC watchdog disable in user code

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_WDT_ENABLE](#)

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app's own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_WDT_ENABLE](#)

Verify that this parameter is correct and more than the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

Range:

- from 0 to 120000

Default value:

- 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

Found in: [Bootloader config](#)

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

Default value:

- No (disabled) if [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#) > [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD](#) option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:

- 0 if [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#) > [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:

- from 1 to 16 if [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

Default value:

- 16 if [CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK](#)

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version(only test)

Found in: `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

Default value:

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

Found in: `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:

- No (disabled) if `(CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT`

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

Reserve RTC FAST memory for custom purposes

Found in: [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE

Size in bytes for custom purposes

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

Default value:

- 0 if [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

Found in: [Bootloader config](#)

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON’ T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:

- Yes (enabled)

Security features

Contains:

- [CONFIG_SECURE_BOOT_INSECURE](#)
- [CONFIG_SECURE_SIGNED_APPS_SCHEME](#)
- [CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP](#)

- [CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE](#)
- [CONFIG_SECURE_FLASH_ENC_ENABLED](#)
- [CONFIG_SECURE_BOOT](#)
- *Potentially insecure options*
- [CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT](#)
- [CONFIG_SECURE_BOOT_VERIFICATION_KEY](#)
- [CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES](#)
- [CONFIG_SECURE_UART_ROM_DL_MODE](#)
- [CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT](#)

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: [Security features](#)

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: [Security features](#)

Select the Secure App signing scheme. Depends on the Chip Revision. There are two options: 1. ECDSA based secure boot scheme. (Only choice for Secure Boot V1) Supported in ESP32 and ESP32-ECO3. 2. The RSA based secure boot scheme. (Only choice for Secure Boot V2) Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3.

Available options:

- ECDSA ([CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME](#))
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
Refer to the documentation before enabling.
- RSA ([CONFIG_SECURE_SIGNED_APPS_RSA_SCHEME](#))
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: [Security features](#)

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:

- Yes (enabled) if [CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT](#)

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

Found in: [Security features](#)

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:

- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

Found in: [Security features](#) > [CONFIG_SECURE_BOOT](#)

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3 ECO3. Secure Boot V1 is the AES based secure boot scheme. Supported in ESP32 and ESP32-ECO3.

Available options:

- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

Found in: [Security features](#)

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

Found in: [Security features](#) > [CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES](#)

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

Default value:

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

Found in: Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE

Enable Aggressive key revoke strategy

Found in: Security features

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

Found in: Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_FLASH_ENC_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

Found in: Security features

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

Default value:

- No (disabled)

CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated AES-XTS key

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

Size of generated AES-XTS key.

AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block. AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:

- *CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS*
- *CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION*
- *CONFIG_SECURE_BOOT_ALLOW_JTAG*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE*
- *CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS*
- *CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED*

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

Found in: Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

Found in: Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a `BLOCK` is read-protected, the application will read all zeros from that block

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

Found in: Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

Found in: [Security features](#) > [Potentially insecure options](#)

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

Found in: [Security features](#) > [Potentially insecure options](#)

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

Found in: [Security features](#)

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

Found in: [Security features](#)

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`SECURE_DISABLE_ROM_DL_MODE`)

If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.

Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`SECURE_ENABLE_SECURE_ROM_DL_MODE`)

If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.

Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).

Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.

Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.

It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (`SECURE_INSECURE_ALLOW_DL_MODE`)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option **SHOULD NOT BE ENABLED** for production use cases.

Boot ROM Behavior

Contains:

- [*CONFIG_BOOT_ROM_LOG_SCHEME*](#)

CONFIG_BOOT_ROM_LOG_SCHEME

Permanently change Boot ROM output

Found in: [*Boot ROM Behavior*](#)

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (`BOOT_ROM_LOG_ALWAYS_ON`)
Always print ROM logs, this is the default behavior.
- Permanently disable logging (`BOOT_ROM_LOG_ALWAYS_OFF`)
Don't print ROM logs.
- Log on GPIO High (`BOOT_ROM_LOG_ON_GPIO_HIGH`)
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (`BOOT_ROM_LOG_ON_GPIO_LOW`)
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- [*CONFIG_ESPTOOLPY_MONITOR_BAUD*](#)

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_BAUD`
- `CONFIG_ESPTOOLPY_PORT`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_OCT_FLASH`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
- `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_COMPRESSED`

CONFIG_ESPTOOLPY_PORT

Default serial port

Found in: Serial flasher config

The serial port that's connected to the ESP chip. This can be overridden by setting the `ESPPORT` environment variable.

This value is ignored when using the CMake-based build system or `idf.py`.

Default value:

- `"/dev/ttyUSB0"`

CONFIG_ESPTOOLPY_BAUD

Default baud rate

Found in: Serial flasher config

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the `ESPBAUD` variable.

This value is ignored when using the CMake-based build system or `idf.py`.

Available options:

- 115200 baud (`ESPTOOLPY_BAUD_115200B`)
- 230400 baud (`ESPTOOLPY_BAUD_230400B`)
- 921600 baud (`ESPTOOLPY_BAUD_921600B`)
- 2Mbaud (`ESPTOOLPY_BAUD_2MB`)
- Other baud rate (`ESPTOOLPY_BAUD_OTHER`)

CONFIG_ESPTOOLPY_BAUD_OTHER_VAL

Other baud rate value

Found in: Serial flasher config

Default value:

- 115200

CONFIG_ESPTOOLPY_COMPRESSED

Use compressed upload

Found in: Serial flasher config

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.

Default value:

- Yes (enabled)

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

Found in: Serial flasher config

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

Default value:

- No (disabled)

CONFIG_ESPTOOLPY_OCT_FLASH

Enable Octal Flash

Found in: Serial flasher config

Default value:

- No (disabled)

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

Found in: Serial flasher config

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

Found in: Serial flasher config

Available options:

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

Found in: Serial flasher config

The SPI flash frequency to be used.

Available options:

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)

- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

Found in: Serial flasher config

SPI flash size, in megabytes

Available options:

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_FLASHSIZE_DETECT

Detect flash size when flashing bootloader

Found in: Serial flasher config

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Default value:

- Yes (enabled)

CONFIG_ESPTOOLPY_BEFORE

Before flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

CONFIG_ESPTOOLPY_MONITOR_BAUD

‘idf.py monitor’ baud rate

Found in: *Serial flasher config*

Baud rate to use when running ‘idf.py monitor’ or ‘make monitor’ to view serial output from a running chip.

If “Same as UART Console baud rate” is chosen then the value will follow the “UART Console baud rate” config item.

Can override by setting the MONITORBAUD environment variable.

Available options:

- Same as UART console baud rate (ESPTOOLPY_MONITOR_BAUD_CONSOLE)
- 9600 bps (ESPTOOLPY_MONITOR_BAUD_9600B)
- 57600 bps (ESPTOOLPY_MONITOR_BAUD_57600B)
- 115200 bps (ESPTOOLPY_MONITOR_BAUD_115200B)
- 230400 bps (ESPTOOLPY_MONITOR_BAUD_230400B)
- 921600 bps (ESPTOOLPY_MONITOR_BAUD_921600B)
- 2 Mbps (ESPTOOLPY_MONITOR_BAUD_2MB)
- Custom baud rate (ESPTOOLPY_MONITOR_BAUD_OTHER)

CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL

Custom baud rate value

Found in: *Serial flasher config*

Default value:

- 115200

Partition Table

Contains:

- *CONFIG_PARTITION_TABLE_CUSTOM_FILENAME*
- *CONFIG_PARTITION_TABLE_MD5*
- *CONFIG_PARTITION_TABLE_OFFSET*
- *CONFIG_PARTITION_TABLE_TYPE*

CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: *Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large.csv`
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota.csv`
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
Specify the path to the partition table CSV to use for your project.
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`
- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`
- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

Default value:

- “partitions.csv”

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

Found in: [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition

offsets blank in the CSV file.

Default value:

- “0x8000”

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

Found in: Partition Table

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

Default value:

- Yes (enabled) if ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

Compiler options

Contains:

- [CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL](#)
- [CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT](#)
- [CONFIG_COMPILER_DISABLE_GCC8_WARNINGS](#)
- [CONFIG_COMPILER_DUMP_RTL_FILES](#)
- [CONFIG_COMPILER_WARN_WRITE_STRINGS](#)
- [CONFIG_COMPILER_CXX_EXCEPTIONS](#)
- [CONFIG_COMPILER_CXX_RTTI](#)
- [CONFIG_COMPILER_OPTIMIZATION](#)
- [CONFIG_COMPILER_HIDE_PATHS_MACROS](#)
- [CONFIG_COMPILER_STACK_CHECK_MODE](#)

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOTLOADER_COMPILER_OPTIMIZATION` setting.

Available options:

- Debug (-Og) (`COMPILER_OPTIMIZATION_DEFAULT`)
- Optimize for size (-Os) (`COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`COMPILER_OPTIMIZATION_NONE`)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: *Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: *Compiler options*

If enabled, the error messages will be discarded in following check macros: -
ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE -
ESP_EXIT_ON_FALSE

Default value:

- No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

Found in: *Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

Found in: *Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Default value:

- No (disabled)

Contains:

- [CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE](#)

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

Found in: [Compiler options](#) > [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

Default value:

- 0 if [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

Found in: [Compiler options](#)

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

Default value:

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

Found in: [Compiler options](#)

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (`COMPILER_STACK_CHECK_MODE_NONE`)
- Normal (`COMPILER_STACK_CHECK_MODE_NORM`)
- Strong (`COMPILER_STACK_CHECK_MODE_STRONG`)
- Overall (`COMPILER_STACK_CHECK_MODE_ALL`)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable -Wwrite-strings warning flag

Found in: [Compiler options](#)

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

Default value:

- No (disabled)

CONFIG_COMPILER_DISABLE_GCC8_WARNINGS

Disable new warnings introduced in GCC 6 - 8

Found in: [Compiler options](#)

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don't appear with GCC 5.

Default value:

- No (disabled)

CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

Found in: [Compiler options](#)

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

Application Level Tracing Contains:

- *CONFIG_APPTRACE_DESTINATION*
- *FreeRTOS System View Tracing*
- *CONFIG_APPTRACE_GCOV_ENABLE*
- *CONFIG_APPTRACE_BUF_SIZE*
- *CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX*
- *CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH*
- *CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO*

CONFIG_APPTRACE_DESTINATION

Data Destination

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (APPTRACE_DEST_JTAG)
- None (APPTRACE_DEST_NONE)

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: [Component config](#) > [Application Level Tracing](#)

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: [Component config](#) > [Application Level Tracing](#)

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the apptrace buffer

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the memory buffer for trace data in bytes.

CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

FreeRTOS SystemView Tracing Contains:

- [CONFIG_APPTRACE_SV_ENABLE](#)

CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) ([APPTRACE_SV_TS_SOURCE_CCOUNT](#))
- Timer 0, Group 0 ([APPTRACE_SV_TS_SOURCE_TIMER_00](#))
- Timer 1, Group 0 ([APPTRACE_SV_TS_SOURCE_TIMER_01](#))
- Timer 0, Group 1 ([APPTRACE_SV_TS_SOURCE_TIMER_10](#))
- Timer 1, Group 1 ([APPTRACE_SV_TS_SOURCE_TIMER_11](#))
- esp_timer high resolution timer ([APPTRACE_SV_TS_SOURCE_ESP_TIMER](#))

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE

ISR Enter Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE

ISR Exit Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE

ISR Exit to Scheduler Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

Found in: Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

ESP-ASIO Contains:

- *CONFIG_ASIO_SSL_SUPPORT*

CONFIG_ASIO_SSL_SUPPORT

Enable SSL/TLS support of ASIO

Found in: Component config > ESP-ASIO

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

Default value:

- No (disabled)

CONFIG_ASIO_SSL_LIBRARY_CHOICE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT

The ASIO support multiple backend TLS libraries. Currently the mbedTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- esp-openssl (ASIO_USE_ESP_OPENSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO_USE_ESP_WOLFSSL)

Bluetooth Contains:

- *Bluedroid Options*
- *CONFIG_BT_ENABLED*
- *NimBLE Options*

CONFIG_BT_ENABLED

Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

Bluetooth controller Contains:

- `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP`
- `CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL`
- `CONFIG_BT_CTRL_BLE_MAX_ACT`
- `CONFIG_BT_CTRL_BLE_SCAN_DUPL`
- `CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB`
- `CONFIG_BT_CTRL_HW_CCA_VAL`
- `CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_CTRL_CE_LENGTH_TYPE`
- `CONFIG_BT_CTRL_RX_ANTENNA_INDEX`
- `CONFIG_BT_CTRL_TX_ANTENNA_INDEX`
- `CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX`
- `CONFIG_BT_CTRL_AGC_RECORRECT_EN`
- `CONFIG_BT_CTRL_HCI_MODE_CHOICE`
- `CONFIG_BT_CTRL_HW_CCA`
- *MODEM SLEEP Options*
- `CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_CTRL_ADV_DUP_FILT_MAX`

CONFIG_BT_CTRL_BLE_MAX_ACT

BLE Max Instances

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

BLE maximum instances of bluetooth controller.

Range:

- from 1 to 10 if `CONFIG_BT_ENABLED`

Default value:

- 10 if `CONFIG_BT_ENABLED`

CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB

BLE static ACL TX buffer numbers

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

Range:

- from 0 to 12 if `CONFIG_BT_ENABLED`

Default value:

- 0 if `CONFIG_BT_ENABLED`

CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE

The cpu core which bluetooth controller run

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`BT_CTRL_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`BT_CTRL_PINNED_TO_CORE_1`)

CONFIG_BT_CTRL_HCI_MODE_CHOICE

HCI mode

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Specify HCI mode as VHCI or UART(H4)

Available options:

- VHCI (BT_CTRL_HCI_MODE_VHCI)
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3, too.
- UART(H4) (BT_CTRL_HCI_MODE_UART_H4)
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

CONFIG_BT_CTRL_ADV_DUP_FILT_MAX

The maximum number of 5.0 extend duplicate scan filter

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

The maximum number of suplicate scan filter

Range:

- from 1 to 500 if *CONFIG_BT_ENABLED*

Default value:

- 30 if *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_HW_CCA

HW CCA check enable

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

It enables HW CCA feature in controller

Default value:

- No (disabled) if *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_HW_CCA_VAL

CCA threshold value

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

Range:

- from 20 to 60 if *CONFIG_BT_ENABLED*

Default value:

- 20 if *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_CE_LENGTH_TYPE

Connection event length determination method

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Specify connection event length determination

Available options:

- ORIGINAL (BT_CTRL_CE_LENGTH_TYPE_ORIG)
- Use CE parameter for HCI command (BT_CTRL_CE_LENGTH_TYPE_CE)
- Use Espressif self-defined method (BT_CTRL_CE_LENGTH_TYPE_SD)

CONFIG_BT_CTRL_TX_ANTENNA_INDEX

default Tx antenna used

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

Specify default Tx antenna used for bluetooth

Available options:

- Antenna 0 (BT_CTRL_TX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_TX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_RX_ANTENNA_INDEX

default Rx antenna used

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

Specify default Rx antenna used for bluetooth

Available options:

- Antenna 0 (BT_CTRL_RX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_RX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL

BLE default Tx power level

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

Specify default Tx power level

Available options:

- -24dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N24)
- -21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N21)
- -18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N18)
- -15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N15)
- -12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N12)
- **-9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N9)
- **-6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N6)
- **-3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N3)
- 0dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N0)
- **+3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P3)
- **+6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P6)
- **+9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P9)
- +12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P12)
- +15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P15)
- +18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)
- +21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

Default value:

- Yes (enabled) if [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#)

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

Range:

- from 50 to 1000 if [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#) && [CONFIG_BT_ENABLED](#)

Default value:

- 100 if [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#) && [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD

BLE adv lost event threshold value

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#)

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

Range:

- from 1 to 1000 if [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#) && [CONFIG_BT_ENABLED](#)

Default value:

- 20 if [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#) && [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_BLE_SCAN_DUPL

BLE Scan Duplicate Options

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

This select enables parameters setting of BLE scan duplicate.

Default value:

- Yes (enabled) if [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_SCAN_DUPL_TYPE

Scan Duplicate Type

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#)

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The

last way is “Scan Duplicate By Advertising Data” . This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (BT_CTRL_SCAN_DUPL_TYPE_DEVICE)
This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA)
This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE)
This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && *CONFIG_BT_ENABLED*

Default value:

- 100 if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN

Special duplicate scan mechanism for BLE Mesh scan

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL

This enables the BLE scan duplicate for special BLE Mesh scan.

Default value:

- No (disabled) if *CONFIG_BT_CTRL_BLE_SCAN_DUPL* && *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_BLE_SCAN_DUPL > CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if *CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN* && *CONFIG_BT_ENABLED*

Default value:

- 100 if *CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN* && *CONFIG_BT_ENABLED*

CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#)

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
Disable the limitation on max tx/rx time for Coded-PHY connection

MODEM SLEEP Options Contains:

- [CONFIG_BT_CTRL_MODEM_SLEEP](#)
- [CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP](#)

CONFIG_BT_CTRL_MODEM_SLEEP

Bluetooth modem sleep

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#)

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

Default value:

- No (disabled) if BT_CTRL_HCI_MODE_UART_H4 && [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Bluetooth Modem sleep Mode 1

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#) > [CONFIG_BT_CTRL_MODEM_SLEEP](#)

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

Default value:

- Yes (enabled) if [CONFIG_BT_CTRL_MODEM_SLEEP](#) && [CONFIG_BT_ENABLED](#)

CONFIG_BT_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#) > [CONFIG_BT_CTRL_MODEM_SLEEP](#) > [CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1](#)

Select the low power clock source for bluetooth controller

Available options:

- Main crystal (BT_CTRL_LPCLK_SEL_MAIN_XTAL)
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.

- External 32kHz crystal (BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)
External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT_CTRL_LPCLK_SEL_RTC_SLOW)
Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP

power up main XTAL during light sleep

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

Default value:

- No (disabled) if (BT_CTRL_LPCLK_SEL_MAIN_XTAL || BT_CTRL_LPCLK_SEL_EXT_32K_XTAL) && CONFIG_BT_ENABLED && CONFIG_FREERTOS_USE_TICKLESS_IDLE && CONFIG_BT_ENABLED

CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable HW AGC recorrect

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Enable uncoded phy AGC recorrect

Default value:

- No (disabled) if CONFIG_BT_ENABLED

CONFIG_BT_CTRL_CODED_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Default value:

- No (disabled) if CONFIG_BT_CTRL_AGC_RECORRECT_EN && CONFIG_BT_ENABLED

CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX

Disable active scan backoff

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

Default value:

- No (disabled) if CONFIG_BT_ENABLED

CONFIG_BT_HOST

Bluetooth Host

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)**
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (BT_NIMBLE_ENABLED)**
This option is recommended for BLE only usecases to save on memory
- **Controller Only (BT_CONTROLLER_ONLY)**
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

Bluedroid Options

 Contains:

- [CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK](#)
- [CONFIG_BT_BLUEDROID_MEM_DEBUG](#)
- [CONFIG_BT_BTU_TASK_STACK_SIZE](#)
- [CONFIG_BT_BTC_TASK_STACK_SIZE](#)
- [CONFIG_BT_BLE_ENABLED](#)
- [BT_DEBUG_LOG_LEVEL](#)
- [CONFIG_BT_ACL_CONNECTIONS](#)
- [CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST](#)
- [CONFIG_BT_STACK_NO_LOG](#)
- [CONFIG_BT_BLE_42_FEATURES_SUPPORTED](#)
- [CONFIG_BT_BLE_50_FEATURES_SUPPORTED](#)
- [CONFIG_BT_MULTI_CONNECTION_ENBALE](#)
- [CONFIG_BT_MAX_DEVICE_NAME_LEN](#)
- [CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN](#)
- [CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE](#)
- [CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT](#)
- [CONFIG_BT_BLE_RPA_SUPPORTED](#)
- [CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY](#)

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

Found in: Component config > Bluetooth > Bluedroid Options

This select btc task stack size

Default value:

- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

Found in: Component config > Bluetooth > Bluedroid Options

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth BlueDroid Host Stack task stack size

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#)

This select btu task stack size

Default value:

- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_MEM_DEBUG

BlueDroid memory debug

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#)

BlueDroid memory debug

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#)

This enables Bluetooth Low Energy

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if [CONFIG_BT_BLE_ENABLED](#) && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if [CONFIG_BT_GATTS_ENABLE](#) && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: [Component config](#) > [Bluetooth](#) > [BlueDroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

Default value:

- 8 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATT_MAX_SR_ATTRIBUTES

Max GATT Service Attributes

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Service Attributes Count

Range:

- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

Default value:

- 100 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATTS Service Change Mode

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)
Let Bluedroid handle the service change indication internally

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTC_ENABLE](#)

Maximum GATTC cache characteristic count

Range:

- from 1 to 500 if [CONFIG_BT_GATTC_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

Default value:

- 40 if [CONFIG_BT_GATTC_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTC_ENABLE](#)

This select can save gattc cache data to nvs flash

Default value:

- No (disabled) if [CONFIG_BT_GATTC_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTC_ENABLE](#)

The number of attempts to reconnect if the connection establishment failed

Range:

- from 0 to 7 if [CONFIG_BT_GATTC_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

Default value:

- 3 if [CONFIG_BT_GATTC_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#)

This option can be close when the app not used the ble security connect.

Default value:

- Yes (enabled) if [CONFIG_BT_BLE_ENABLED](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_BLE_SMP_ENABLE](#)

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

Default value:

- No (disabled) if [CONFIG_BT_BLE_SMP_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

BT DEBUG LOG LEVEL

 Contains:

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)

- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for L2CAP layer

Available options:

- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for RFCOMM layer

Available options:

- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SDP layer

Available options:

- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GAP layer

Available options:

- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BNEP layer

Available options:

- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
- EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for PAN layer

Available options:

- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for A2D layer

Available options:

- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)

- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVDT layer

Available options:

- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVCT layer

Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVRC layer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for MCA layer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for APPL layer

Available options:

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GATT layer

Available options:

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SMP layer

Available options:

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTIF layer

Available options:

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTC layer

Available options:

- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for OSI layer

Available options:

- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)

- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BLUFI layer

Available options:

- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:

- from 1 to 9 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-connections

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Enable this option if there are multiple connections

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select can save the internal RAM if there have the PSRAM

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select can make the allocation of memory will become more flexible

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

Memory reserved at start of DRAM for Bluetooth stack

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && [CONFIG_BT_BLE_ENABLED](#) && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

Range:

- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

Range:

- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: Component config > Bluetooth > Blueroid Options

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

Found in: Component config > Bluetooth > Blueroid Options

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

Found in: Component config > Bluetooth > Blueroid Options

This enables BLE 4.2 features.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

NimBLE Options Contains:

- *CONFIG_BT_NIMBLE_ACL_BUF_COUNT*
- *CONFIG_BT_NIMBLE_ACL_BUF_SIZE*

- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS`

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (`BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)

Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity” .

Available options:

- No logs (`BT_NIMBLE_LOG_LEVEL_NONE`)
- Error logs (`BT_NIMBLE_LOG_LEVEL_ERROR`)
- Warning logs (`BT_NIMBLE_LOG_LEVEL_WARNING`)
- Info logs (`BT_NIMBLE_LOG_LEVEL_INFO`)
- Debug logs (`BT_NIMBLE_LOG_LEVEL_DEBUG`)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

Range:

- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of bonds to save for peer security and our security

Default value:

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of CCC descriptors to save

Default value:

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM

Maximum number of connection oriented channels

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

Range:

- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE

The CPU core on which NimBLE host will run

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_TASK_STACK_SIZE

NimBLE Host task stack size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This configures stack size of NimBLE host task

Default value:

- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_CENTRAL

Enable BLE Central role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL

Enable BLE Peripheral role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_BROADCASTER

Enable BLE Broadcaster role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_NVS_PERSIST

Persist the BLE Bonding keys in NVS

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this flag to make bonding persistent across device reboots

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable security manager legacy pairing

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable security manager secure connections

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables extra runtime asserts and host debugging

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_SM_SC](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

Default value:

- “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Device Name characteristic value shall be 0 to 248 octets in length

Default value:

- 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

Default value:

- 256 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

Default value:

- 0 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

The number of ACL data buffers.

Default value:

- 20 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

Default value:

- 255 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

Default value:

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 70 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

Default value:

- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT

Low Priority HCI Event Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

Default value:

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT

MSYS_1 Block Count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

Default value:

- 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable Host Flow control

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_HS_FLOW_CTRL](#)

Host flow control interval in msec

Default value:

- 1000 if [CONFIG_BT_NIMBLE_HS_FLOW_CTRL](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

Default value:

- 2 if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable this option to send number-of-completed-packets event to controller after disconnection

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

Found in: Component config > Bluetooth > NimBLE Options

Time interval between RPA address change. This is applicable in case of Host based RPA

Range:

- from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE Mesh functionality

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

- *CONFIG_BT_NIMBLE_MESH_PROVISIONER*
- *CONFIG_BT_NIMBLE_MESH_PROV*
- *CONFIG_BT_NIMBLE_MESH_GATT_PROXY*
- *CONFIG_BT_NIMBLE_MESH_FRIEND*
- *CONFIG_BT_NIMBLE_MESH_LOW_POWER*
- *CONFIG_BT_NIMBLE_MESH_PROXY*
- *CONFIG_BT_NIMBLE_MESH_RELAY*
- *CONFIG_BT_NIMBLE_MESH_DEVICE_NAME*
- *CONFIG_BT_NIMBLE_MESH_NODE_COUNT*

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioning

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the advertising bearer

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_LOW_POWER

Enable mesh low power mode

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable this option to be able to act as a Low Power Node

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND

Enable mesh friend functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable this option to be able to act as a Friend Node

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME

Set mesh device name

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

This value defines Bluetooth Mesh device/node name

Default value:

- “nimble-mesh-node” if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT

Set mesh node count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Defines mesh node count.

Default value:

- 1 if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER

Enable BLE mesh provisioner

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable mesh provisioner.

Default value:

- 0 if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CRYPTOSTACK_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS

BLE host stop timeout in msec

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE Host stop procedure timeout in milliseconds.

Default value:

- 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY

Enable host based privacy for random address.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Enable connection reattempts on connection establishment error

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT

Maximum number connection reattempts

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#)

Defines maximum number of connection reattempts.

Range:

- from 1 to 7 if BT_NIMBLE_ENABLED && [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#) && BT_NIMBLE_ENABLED

Default value:

- 3 if BT_NIMBLE_ENABLED && [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

Range:

- from 0 to 4 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)

Default value:

- 1 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_EXT_ADV_DATA_LEN

Maximum length of the advertising data.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Defines size of extended advertising data. Size should not increase 1650.

Range:

- from 0 to 1650 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)

Default value:

- 1650 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

Enable periodic advertisement.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Enable this option to start periodic advertisement.

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#) > [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:

- from 1 to 8 if [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [BT_NIMBLE_ENABLED](#)

Default value:

- 1 if [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

Found in: Component config > Bluetooth > NimBLE Options

Set this option to enable blufi functionality.

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BLE_MESH

ESP BLE Mesh Support

Found in: Component config

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG_BLE_MESH_GATT_PROXY_CLIENT*
- *CONFIG_BLE_MESH_GATT_PROXY_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*
- *CONFIG_BLE_MESH_PROV*
- *CONFIG_BLE_MESH_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG_BLE_MESH_NO_LOG*
- *CONFIG_BLE_MESH_IVU_DIVIDER*
- *CONFIG_BLE_MESH_FAST_PROV*
- *CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*
- *CONFIG_BLE_MESH_CRPL*
- *CONFIG_BLE_MESH_RX_SDU_MAX*
- *CONFIG_BLE_MESH_MODEL_KEY_COUNT*
- *CONFIG_BLE_MESH_APP_KEY_COUNT*
- *CONFIG_BLE_MESH_MODEL_GROUP_COUNT*
- *CONFIG_BLE_MESH_LABEL_COUNT*
- *CONFIG_BLE_MESH_SUBNET_COUNT*
- *CONFIG_BLE_MESH_TX_SEG_MAX*
- *CONFIG_BLE_MESH_RX_SEG_MSG_COUNT*
- *CONFIG_BLE_MESH_TX_SEG_MSG_COUNT*
- *CONFIG_BLE_MESH_MEM_ALLOC_MODE*
- *CONFIG_BLE_MESH_MSG_CACHE_SIZE*
- *CONFIG_BLE_MESH_ADV_BUF_COUNT*
- *CONFIG_BLE_MESH_PB_GATT*
- *CONFIG_BLE_MESH_PB_ADV*
- *CONFIG_BLE_MESH_IVU_RECOVERY_IVI*
- *CONFIG_BLE_MESH_RELAY*

- [CONFIG_BLE_MESH_SETTINGS](#)
- [CONFIG_BLE_MESH_DEINIT](#)
- [CONFIG_BLE_MESH_USE_DUPLICATE_SCAN](#)
- [Support for BLE Mesh Client/Server models](#)
- [Support for BLE Mesh Foundation models](#)
- [CONFIG_BLE_MESH_NODE](#)
- [CONFIG_BLE_MESH_PROVISIONER](#)
- [CONFIG_BLE_MESH_FRIEND](#)
- [CONFIG_BLE_MESH_LOW_POWER](#)
- [CONFIG_BLE_MESH_HCI_5_0](#)
- [CONFIG_BLE_MESH_IV_UPDATE_TEST](#)
- [CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT](#)

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

It is a temporary solution and needs further modifications.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data” .

Default value:

- Yes (enabled) if `BT_BLUEDROID_ENABLED` && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (`BLE_MESH_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BLE_MESH_MEM_ALLOC_MODE_EXTERNAL`)

- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if (ESP32_SPIRAM_SUPPORT||ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG_BLE_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

BLE Mesh and BLE coexistence support Contains:

- *CONFIG_BLE_MESH_SUPPORT_BLE_SCAN*
- *CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_SUPPORT_BLE_ADV* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_SUPPORT_BLE_ADV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

Found in: Component config > CONFIG_BLE_MESH

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_PROVISIONER](#)

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

Range:

- from 1 to 100 if [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

Default value:

- 10 if [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_PROVISIONER](#)

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

Range:

- from 1 to 1000 if [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

Default value:

- 10 if [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_PROVISIONER](#)

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

Range:

- from 1 to 10 if [CONFIG_BLE_MESH_PB_ADV](#) && [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

Default value:

- 2 if [CONFIG_BLE_MESH_PB_ADV](#) && [CONFIG_BLE_MESH_PROVISIONER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:

- from 1 to 5 if *CONFIG_BLE_MESH_PB_GATT* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH_PB_GATT* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT

Maximum number of application keys that can be owned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_RECV_HB

Support receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: `Component config > CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

Found in: `Component config > CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV`

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.

Range:

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

Default value:

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

Found in: `Component config > CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

Range:

- from 1 to 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

Range:

- from 1 to 32767 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 4 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

Found in: *Component config* > *CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

Found in: *Component config* > *CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_SETTINGS](#)

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:

- from 0 to 1000000 if [CONFIG_BLE_MESH_SETTINGS](#) && [CONFIG_BLE_MESH](#)

Default value:

- 0 if [CONFIG_BLE_MESH_SETTINGS](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_SETTINGS](#)

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:

- No (disabled) if [CONFIG_BLE_MESH_NODE](#) && [CONFIG_BLE_MESH_SETTINGS](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_SETTINGS](#)

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

Default value:

- No (disabled) if [CONFIG_BLE_MESH_SETTINGS](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_SETTINGS](#) > [CONFIG_BLE_MESH_SPECIFIC_PARTITION](#)

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:

- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

Found in: `Component config` > `CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

Found in: `Component config` > `CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of application keys to which each model can be bound.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of addresses to which each model can be subscribed.

Range:

- from 1 to 4096 if *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

Found in: Component config > CONFIG_BLE_MESH

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

Range:

- from 0 to 4096 if *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

Found in: Component config > CONFIG_BLE_MESH

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

Range:

- from 2 to 65535 if *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:

- from 2 to 65535 if [CONFIG_BLE_MESH](#)

Default value:

- 10 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:

- from 6 to 256 if [CONFIG_BLE_MESH](#)

Default value:

- 60 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

Range:

- from 2 to 96 if [CONFIG_BLE_MESH](#)

Default value:

- 4 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_IVU_RECOVERY_IVI

Recovery the IV index when the latest whole IV update procedure is missed

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: `Component config` > `CONFIG_BLE_MESH`

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to if `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

Found in: `Component config` > `CONFIG_BLE_MESH`

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to 255 if `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

Found in: `Component config` > `CONFIG_BLE_MESH`

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

Range:

- from 36 to 384 if `CONFIG_BLE_MESH`

Default value:

- 384 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE_MESH_ADV_BUF_COUNT](#)) as there are outgoing segments.

Range:

- from 2 to 32 if [CONFIG_BLE_MESH](#)

Default value:

- 32 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_RELAY

Relay support

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH_NODE](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_RELAY](#)

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:

- No (disabled) if [CONFIG_BLE_MESH_RELAY](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_RELAY](#) > [CONFIG_BLE_MESH_RELAY_ADV_BUF](#)

Number of advertising buffers for relay packets available.

Range:

- from 6 to 256 if [CONFIG_BLE_MESH_RELAY_ADV_BUF](#) && [CONFIG_BLE_MESH_RELAY](#) && [CONFIG_BLE_MESH](#)

Default value:

- 60 if [CONFIG_BLE_MESH_RELAY_ADV_BUF](#) && [CONFIG_BLE_MESH_RELAY](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_LOW_POWER

Support for Low Power features

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

CONFIG_BLE_MESH_LPN_ESTABLISHMENT

Perform Friendship establishment using low power

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_LOW_POWER](#)

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

Default value:

- No (disabled) if [CONFIG_BLE_MESH_LOW_POWER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_LPN_AUTO

Automatically start looking for Friend nodes once provisioned

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_LOW_POWER](#)

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

Default value:

- No (disabled) if [CONFIG_BLE_MESH_LOW_POWER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT

Time from last received message before going to LPN mode

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_LOW_POWER](#) > [CONFIG_BLE_MESH_LPN_AUTO](#)

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

Range:

- from 0 to 3600 if [CONFIG_BLE_MESH_LPN_AUTO](#) && [CONFIG_BLE_MESH_LOW_POWER](#) && [CONFIG_BLE_MESH](#)

Default value:

- 15 if [CONFIG_BLE_MESH_LPN_AUTO](#) && [CONFIG_BLE_MESH_LOW_POWER](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [CONFIG_BLE_MESH_LOW_POWER](#)

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

Range:

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The MinQueueSizeLog field is defined as $\log_2(N)$, where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives $N = 2$, and value 7 gives $N = 128$.

Range:

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RECV_DELAY

Receive delay requested by the local node

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

Range:

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT

The value of the PollTimeout timer

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

Range:

- from 10 to 244735 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 300 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

Range:

- from 10 to if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

Range:

- from 0 to 50 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Maximum number of groups to which the LPN can subscribe.

Range:

- from 0 to 16384 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 8 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR

Automatically subscribe all nodes address

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Automatically subscribe all nodes address when friendship established.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FRIEND

Support for Friend feature

Found in: Component config > CONFIG_BLE_MESH

Enable this option to be able to act as a Friend Node.

CONFIG_BLE_MESH_FRIEND_RECV_WIN

Friend Receive Window

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Receive Window in milliseconds supported by the Friend node.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

Default value:

- 255 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE

Minimum number of buffers supported per Friend Queue

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

Range:

- from 2 to 65536 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

Default value:

- 16 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

Range:

- from 0 to 1023 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH_FRIEND* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

Found in: Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:

- No (disabled) if *CONFIG_BLE_MESH* && *CONFIG_BLE_MESH*

BLE Mesh STACK DEBUG LOG LEVEL

 Contains:

- *CONFIG_BLE_MESH_STACK_TRACE_LEVEL*

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

 Contains:

- *CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL*

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout(ms) for client message response

Found in: *Component config* > *CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

Range:

- from 100 to 1200000 if *CONFIG_BLE_MESH*

Default value:

- 4000 if *CONFIG_BLE_MESH*

Support for BLE Mesh Foundation models Contains:

- *CONFIG_BLE_MESH_CFG_CLI*
- *CONFIG_BLE_MESH_HEALTH_CLI*
- *CONFIG_BLE_MESH_HEALTH_SRV*

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

Found in: *Component config* > *CONFIG_BLE_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

Found in: *Component config* > *CONFIG_BLE_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

Found in: *Component config* > *CONFIG_BLE_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Server model.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

Support for BLE Mesh Client/Server models Contains:

- *CONFIG_BLE_MESH_GENERIC_BATTERY_CLI*
- *CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI*
- *CONFIG_BLE_MESH_GENERIC_LEVEL_CLI*
- *CONFIG_BLE_MESH_GENERIC_LOCATION_CLI*
- *CONFIG_BLE_MESH_GENERIC_ONOFF_CLI*
- *CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI*
- *CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI*
- *CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI*
- *CONFIG_BLE_MESH_GENERIC_SERVER*
- *CONFIG_BLE_MESH_LIGHT_CTL_CLI*
- *CONFIG_BLE_MESH_LIGHT_HSL_CLI*
- *CONFIG_BLE_MESH_LIGHT_LC_CLI*
- *CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI*
- *CONFIG_BLE_MESH_LIGHT_XYL_CLI*
- *CONFIG_BLE_MESH_LIGHTING_SERVER*
- *CONFIG_BLE_MESH_SCENE_CLI*
- *CONFIG_BLE_MESH_SCHEDULER_CLI*
- *CONFIG_BLE_MESH_SENSOR_CLI*
- *CONFIG_BLE_MESH_SENSOR_SERVER*
- *CONFIG_BLE_MESH_TIME_SCENE_SERVER*
- *CONFIG_BLE_MESH_TIME_CLI*

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic OnOff Client model.

CONFIG_BLE_MESH_GENERIC_LEVEL_CLI

Generic Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI

Generic Default Transition Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI

Generic Power OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI

Generic Power Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI

Generic Battery Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI

Generic Location Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI

Generic Property Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI

Sensor Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI

Time Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI

Scene Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI

Light Lightness Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Generic server models.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Sensor server models.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Client/Server models](#)

Enable support for Time and Scenes server models.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Lighting server models.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

Found in: Component config > CONFIG_BLE_MESH

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

BLE Mesh specific test option Contains:

- *CONFIG_BLE_MESH_DEBUG*
- *CONFIG_BLE_MESH_SHELL*
- *CONFIG_BLE_MESH_SELF_TEST*

CONFIG_BLE_MESH_SELF_TEST

Perform BLE Mesh self-tests

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK

Unprovisioned device enters mesh network automatically

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_SELF_TEST* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_SELF_TEST* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Activate shell module that provides BLE Mesh commands to the console.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Enable debug logs for the BLE Mesh functionality.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG_BLE_MESH_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

CoAP Configuration Contains:

- [CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE](#)
- [CONFIG_COAP_MBEDTLS_DEBUG](#)

CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE

CoAP Encryption method

Found in: [Component config](#) > [CoAP Configuration](#)

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)

- Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
- Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

Available options:

- Pre-Shared Keys (COAP_MBEDTLS_PSK)
- PKI Certificates (COAP_MBEDTLS_PKI)

CONFIG_COAP_MBEDTLS_DEBUG

Enable CoAP debugging

Found in: [Component config](#) > [CoAP Configuration](#)

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call `coap_set_log_level()` at runtime in order to enable CoAP debug output via the ESP log mechanism.

Default value:

- No (disabled)

CONFIG_COAP_MBEDTLS_DEBUG_LEVEL

Set CoAP debugging level

Found in: [Component config](#) > [CoAP Configuration](#) > [CONFIG_COAP_MBEDTLS_DEBUG](#)

Set CoAP debugging level

Available options:

- Emergency (COAP_LOG_EMERG)
- Alert (COAP_LOG_ALERT)
- Critical (COAP_LOG_CRIT)
- Error (COAP_LOG_ERROR)
- Warning (COAP_LOG_WARNING)
- Notice (COAP_LOG_NOTICE)
- Info (COAP_LOG_INFO)
- Debug (COAP_LOG_DEBUG)
- mbedTLS (COAP_LOG_MBEDTLS)

Driver configurations Contains:

- [ADC configuration](#)
- [GDMA Configuration](#)
- [MCPWM configuration](#)
- [SPI configuration](#)
- [TWAI configuration](#)
- [UART configuration](#)

ADC configuration Contains:

- [CONFIG_ADC_DISABLE_DAC](#)
- [CONFIG_ADC_FORCE_XPD_FSM](#)

CONFIG_ADC_FORCE_XPD_FSM

Use the FSM to control ADC power

Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

Default value:

- No (disabled)

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

Found in: [Component config](#) > [Driver configurations](#) > [ADC configuration](#)

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

Default value:

- Yes (enabled)

MCPWM configuration Contains:

- [CONFIG_MCPWM_ISR_IN_IRAM](#)

CONFIG_MCPWM_ISR_IN_IRAM

Place MCPWM ISR function into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [MCPWM configuration](#)

If this option is not selected, the MCPWM interrupt will be deferred when the Cache is in a disabled state (e.g. Flash write/erase operation).

Note that if this option is selected, all user registered ISR callbacks should never try to use cache as well. (with IRAM_ATTR)

Default value:

- No (disabled)

SPI configuration Contains:

- [CONFIG_SPI_MASTER_ISR_IN_IRAM](#)
- [CONFIG_SPI_SLAVE_ISR_IN_IRAM](#)
- [CONFIG_SPI_MASTER_IN_IRAM](#)
- [CONFIG_SPI_SLAVE_IN_IRAM](#)

CONFIG_SPI_MASTER_IN_IRAM

Place transmitting functions of SPI master into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

Default value:

- No (disabled)

CONFIG_SPI_MASTER_ISR_IN_IRAM

Place SPI master ISR function into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

Default value:

- Yes (enabled)

CONFIG_SPI_SLAVE_IN_IRAM

Place transmitting functions of SPI slave into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

Default value:

- No (disabled)

CONFIG_SPI_SLAVE_ISR_IN_IRAM

Place SPI slave ISR function into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

Default value:

- Yes (enabled)

TWAI configuration Contains:

- [CONFIG_TWAI_ISR_IN_IRAM](#)

CONFIG_TWAI_ISR_IN_IRAM

Place TWAI ISR function into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [TWAI configuration](#)

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

Default value:

- No (disabled)

UART configuration Contains:

- [CONFIG_UART_ISR_IN_IRAM](#)

CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [UART configuration](#)

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

Default value:

- No (disabled) if [CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH](#)

GDMA Configuration Contains:

- [CONFIG_GDMA_ISR_IRAM_SAFE](#)
- [CONFIG_GDMA_CTRL_FUNC_IN_IRAM](#)

CONFIG_GDMA_CTRL_FUNC_IN_IRAM

Place GDMA control functions into IRAM

Found in: [Component config](#) > [Driver configurations](#) > [GDMA Configuration](#)

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_GDMA_ISR_IRAM_SAFE

GDMA ISR IRAM-Safe

Found in: [Component config](#) > [Driver configurations](#) > [GDMA Configuration](#)

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:

- No (disabled)

eFuse Bit Manager Contains:

- [CONFIG_EFUSE_VIRTUAL](#)
- [CONFIG_EFUSE_CUSTOM_TABLE](#)

CONFIG_EFUSE_CUSTOM_TABLE

Use custom eFuse table

Found in: [Component config](#) > [eFuse Bit Manager](#)

Allows to generate a structure for eFuse from the CSV file.

Default value:

- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG_EFUSE_CUSTOM_TABLE](#)

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

Default value:

- “main/esp_efuse_custom_table.csv” if [CONFIG_EFUSE_CUSTOM_TABLE](#)

CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

Found in: [Component config](#) > [eFuse Bit Manager](#)

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

Default value:

- No (disabled)

CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH

Keep eFuses in flash

Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG_EFUSE_VIRTUAL](#)

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the *efuse* partition. partition.csv: “efuse_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

ESP-TLS Contains:

- [CONFIG_ESP_TLS_INSECURE](#)
- [CONFIG_ESP_TLS_LIBRARY_CHOOSE](#)
- [CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS](#)
- [CONFIG_ESP_DEBUG_WOLFSSL](#)
- [CONFIG_ESP_TLS_SERVER](#)

- [CONFIG_ESP_TLS_PSK_VERIFICATION](#)
- [CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY](#)
- [CONFIG_ESP_TLS_USE_DS_PERIPHERAL](#)

CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

Found in: [Component config](#) > [ESP-TLS](#)

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS ([ESP_TLS_USING_MBEDTLS](#))
- wolfSSL (License info in wolfSSL directory README) ([ESP_TLS_USING_WOLFSSL](#))

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

Found in: [Component config](#) > [ESP-TLS](#)

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

Default value:

- Yes (enabled)

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

Found in: [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

Found in: [Component config](#) > [ESP-TLS](#)

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_SERVER](#)

Enable session ticket support as specified in RFC5077

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_SERVER](#) > [CONFIG_ESP_TLS_SERVER_SESSION_TICKETS](#)

Sets the session ticket timeout used in the tls server.

Default value:

- 86400 if `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`

CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_SERVER](#)

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

CONFIG_ESP_TLS_PSK_VERIFICATION

Enable PSK verification

Found in: [Component config](#) > [ESP-TLS](#)

Enable support for pre shared key ciphers, supported for both mbedtls as well as wolfSSL TLS library.

CONFIG_ESP_TLS_INSECURE

Allow potentially insecure options

Found in: [Component config](#) > [ESP-TLS](#)

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_INSECURE](#)

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `cert_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY

Enable SMALL_CERT_VERIFY

Found in: [Component config](#) > [ESP-TLS](#)

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

Default value:

- Yes (enabled) if `ESP_TLS_USING_WOLFSSL`

CONFIG_ESP_DEBUG_WOLFSSL

Enable debug logs for wolfSSL

Found in: Component config > ESP-TLS

Enable detailed debug prints for wolfSSL SSL library.

ESP32S3-Specific Contains:

- *Cache config*
- *CONFIG_ESP32S3_DEFAULT_CPU_FREQ_MHZ*
- *CONFIG_ESP32S3_ULP_COPROC_ENABLED*
- *CONFIG_ESP32S3_DEEP_SLEEP_WAKEUP_DELAY*
- *CONFIG_ESP32S3_BROWNOUT_DET*
- *CONFIG_ESP32S3_DEBUG_OCDAWARE*
- *CONFIG_ESP32S3_NO_BLOBS*
- *CONFIG_ESP32S3_RTC_CLK_CAL_CYCLES*
- *CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM*
- *CONFIG_ESP32S3_RTC_CLK_SRC*

- *CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE*
- *CONFIG_ESP32S3_TRAX*

CONFIG_ESP32S3_DEFAULT_CPU_FREQ_MHZ

CPU frequency

Found in: Component config > ESP32S3-Specific

CPU frequency to be set on application startup.

Available options:

- 40 MHz (ESP32S3_DEFAULT_CPU_FREQ_40)
- 80 MHz (ESP32S3_DEFAULT_CPU_FREQ_80)
- 160 MHz (ESP32S3_DEFAULT_CPU_FREQ_160)
- 240 MHz (ESP32S3_DEFAULT_CPU_FREQ_240)

Cache config Contains:

- *CONFIG_ESP32S3_DCACHE_ASSOCIATED_WAYS*
- *CONFIG_ESP32S3_DATA_CACHE_LINE_SIZE*
- *CONFIG_ESP32S3_DATA_CACHE_SIZE*
- *CONFIG_ESP32S3_DATA_CACHE_WRAP*
- *CONFIG_ESP32S3_INSTRUCTION_CACHE_WRAP*
- *CONFIG_ESP32S3_ICACHE_ASSOCIATED_WAYS*
- *CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_SIZE*
- *CONFIG_ESP32S3_INSTRUCTION_CACHE_SIZE*

CONFIG_ESP32S3_INSTRUCTION_CACHE_SIZE

Instruction cache size

Found in: Component config > ESP32S3-Specific > Cache config

Instruction cache size to be set on application startup. If you use 16KB instruction cache rather than 32KB instruction cache, then the other 16KB will be managed by heap allocator.

Available options:

- 16KB (ESP32S3_INSTRUCTION_CACHE_16KB)
- 32KB (ESP32S3_INSTRUCTION_CACHE_32KB)

CONFIG_ESP32S3_ICACHE_ASSOCIATED_WAYS

Instruction cache associated ways

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

Instruction cache associated ways to be set on application startup.

Available options:

- 4 ways (ESP32S3_INSTRUCTION_CACHE_4WAYS)
- 8 ways (ESP32S3_INSTRUCTION_CACHE_8WAYS)

CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_SIZE

Instruction cache line size

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

Instruction cache line size to be set on application startup.

Available options:

- 16 Bytes (ESP32S3_INSTRUCTION_CACHE_LINE_16B)
- 32 Bytes (ESP32S3_INSTRUCTION_CACHE_LINE_32B)

CONFIG_ESP32S3_INSTRUCTION_CACHE_WRAP

Enable instruction cache wrap mode

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

If enabled, instruction cache will use wrap mode to read spi flash or spi ram. The wrap length equals to ESP32S3_INSTRUCTION_CACHE_LINE_SIZE. However, it depends on complex conditions.

Default value:

- No (disabled)

CONFIG_ESP32S3_DATA_CACHE_SIZE

Data cache size

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

Data cache size to be set on application startup. If you use 32KB data cache rather than 64KB data cache, the other 32KB will be added to the heap.

Available options:

- 16KB (ESP32S3_DATA_CACHE_16KB)
- 32KB (ESP32S3_DATA_CACHE_32KB)
- 64KB (ESP32S3_DATA_CACHE_64KB)

CONFIG_ESP32S3_DCACHE_ASSOCIATED_WAYS

Data cache associated ways

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

Data cache associated ways to be set on application startup.

Available options:

- 4 ways (ESP32S3_DATA_CACHE_4WAYS)
- 8 ways (ESP32S3_DATA_CACHE_8WAYS)

CONFIG_ESP32S3_DATA_CACHE_LINE_SIZE

Data cache line size

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

Data cache line size to be set on application startup.

Available options:

- 16 Bytes (ESP32S3_DATA_CACHE_LINE_16B)
- 32 Bytes (ESP32S3_DATA_CACHE_LINE_32B)
- 64 Bytes (ESP32S3_DATA_CACHE_LINE_64B)

CONFIG_ESP32S3_DATA_CACHE_WRAP

Enable data cache wrap mode

Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)

If enabled, data cache will use wrap mode to read spi flash or spi ram. The wrap length equals to ESP32S3_DATA_CACHE_LINE_SIZE. However, it depends on complex conditions.

Default value:

- No (disabled)

CONFIG_ESP32S3_SPIRAM_SUPPORT

Support for external, SPI-connected RAM

Found in: [Component config](#) > [ESP32S3-Specific](#)

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

Default value:

- No (disabled)

SPI RAM config

 Contains:

- [CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY](#)
- [CONFIG_SPIRAM_FETCH_INSTRUCTIONS](#)
- [CONFIG_SPIRAM_RODATA](#)
- [CONFIG_SPIRAM_BOOT_INIT](#)
- [CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL](#)
- [CONFIG_SPIRAM_MODE](#)
- [CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL](#)
- [CONFIG_SPIRAM_MEMTEST](#)
- [CONFIG_SPIRAM_SPEED](#)
- [CONFIG_SPIRAM_USE](#)
- [CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP](#)
- [CONFIG_SPIRAM_TYPE](#)

CONFIG_SPIRAM_MODE

Mode (QUAD/OCT) of SPI RAM chip in use

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

Available options:

- Quad Mode PSRAM (SPIRAM_MODE_QUAD)
- Octal Mode PSRAM (SPIRAM_MODE_OCT)

CONFIG_SPIRAM_TYPE

Type of SPIRAM chip in use

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

Available options:

- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 , LY68L6400 or APS6408 (SPIRAM_TYPE_ESPPSRAM64)

CONFIG_SPIRAM_FETCH_INSTRUCTIONS

Cache fetch instructions from SPI RAM

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

If enabled, instruction in flash will be copied into SPIRAM. If SPIRAM_RODATA also enabled, you can run the instruction when erasing or programming the flash.

Default value:

- No (disabled) if [CONFIG_ESP32S3_SPIRAM_SUPPORT](#)

CONFIG_SPIRAM_RODATA

Cache load read only data from SPI RAM

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

If enabled, rodata in flash will be copied into SPIRAM. If SPIRAM_FETCH_INSTRUCTIONS is also enabled, you can run the instruction when erasing or programming the flash.

Default value:

- No (disabled) if [CONFIG_ESP32S3_SPIRAM_SUPPORT](#)

CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY

Allow external memory as an argument to xTaskCreateStatic

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

Accessing memory in SPIRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from SPIRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the cache is disabled. Cannot be used together with ESP_COREDUMP_ENABLE_TO_FLASH.

Default value:

- No (disabled) if [CONFIG_ESP32S3_SPIRAM_SUPPORT](#)

CONFIG_SPIRAM_SPEED

Set RAM clock speed

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_SPIRAM_SUPPORT](#) > [SPI RAM config](#)

Select the speed for the SPI RAM chip.

Available options:

- 120MHz clock speed (SPIRAM_SPEED_120M)
- 80MHz clock speed (SPIRAM_SPEED_80M)
- 40Mhz clock speed (SPIRAM_SPEED_40M)

CONFIG_SPIRAM_BOOT_INIT

Initialize SPI RAM during startup

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you'll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

Default value:

- Yes (enabled) if `CONFIG_ESP32S3_SPIRAM_SUPPORT`

CONFIG_SPIRAM_IGNORE_NOTFOUND

Ignore PSRAM when not found

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

Default value:

- No (disabled) if `CONFIG_SPIRAM_BOOT_INIT` && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

CONFIG_SPIRAM_USE

SPI RAM access method

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU's memory map, by integrating it in the heap as 'special' memory needing `heap_caps_malloc` to allocate, or by fully integrating it making `malloc()` also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)` (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using `malloc()` as well (SPIRAM_USE_MALLOC)

CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

Default value:

- Yes (enabled) if `CONFIG_SPIRAM_BOOT_INIT` && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

Range:

- from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_ESP32S3_SPIRAM_SUPPORT

Default value:

- 16384 if SPIRAM_USE_MALLOC && CONFIG_ESP32S3_SPIRAM_SUPPORT

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

Default value:

- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32S3_SPIRAM_SUPPORT

CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

Found in: Component config > ESP32S3-Specific > CONFIG_ESP32S3_SPIRAM_SUPPORT > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

Range:

- from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_ESP32S3_SPIRAM_SUPPORT

Default value:

- 32768 if SPIRAM_USE_MALLOC && CONFIG_ESP32S3_SPIRAM_SUPPORT

CONFIG_ESP32S3_TRAX

Use TRAX tracing feature

Found in: Component config > ESP32S3-Specific

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

Default value:

- No (disabled)

CONFIG_ESP32S3_TRAX_TWOBANKS

Reserve memory for tracing both pro as well as app cpu execution

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_TRAX](#)

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

Default value:

- No (disabled) if [CONFIG_ESP32S3_TRAX](#) && [CONFIG_FREERTOS_UNICORE](#)

CONFIG_ESP32S3_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Coprocessor

Found in: [Component config](#) > [ESP32S3-Specific](#)

Set to 'y' if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

Default value:

- No (disabled)

CONFIG_ESP32S3_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)

Bytes of memory to reserve for ULP coprocessor firmware & data.

Data is reserved at the beginning of RTC slow memory.

Range:

- from 32 to 8176 if [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)
- from 0 to 0 if [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)

Default value:

- 512 if [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)
- 0 if [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)

CONFIG_ESP32S3_ULP_COPROC_RISCV

Enable RISC-V as ULP coprocessor

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)

Set this to y to use the RISC-V coprocessor instead of the FSM-ULP.

Default value:

- No (disabled) if [CONFIG_ESP32S3_ULP_COPROC_ENABLED](#)

CONFIG_ESP32S3_DEBUG_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

Found in: [Component config](#) > [ESP32S3-Specific](#)

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

Default value:

- Yes (enabled)

CONFIG_ESP32S3_BROWNOUT_DET

Hardware brownout detect & reset

Found in: [Component config](#) > [ESP32S3-Specific](#)

The ESP32-S3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

Default value:

- Yes (enabled)

CONFIG_ESP32S3_BROWNOUT_DET_LVL_SEL

Brownout voltage level

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_BROWNOUT_DET](#)

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP3-S3 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

Available options:

- 2.44V (ESP32S3_BROWNOUT_DET_LVL_SEL_7)
- 2.56V (ESP32S3_BROWNOUT_DET_LVL_SEL_6)
- 2.67V (ESP32S3_BROWNOUT_DET_LVL_SEL_5)
- 2.84V (ESP32S3_BROWNOUT_DET_LVL_SEL_4)
- 2.98V (ESP32S3_BROWNOUT_DET_LVL_SEL_3)
- 3.19V (ESP32S3_BROWNOUT_DET_LVL_SEL_2)
- 3.30V (ESP32S3_BROWNOUT_DET_LVL_SEL_1)

CONFIG_ESP32S3_TIME_SYSCALL

Timers used for gettimeofday function

Found in: [Component config](#) > [ESP32S3-Specific](#)

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (ESP32S3_TIME_SYSCALL_USE_RTC_FRC1)
- RTC (ESP32S3_TIME_SYSCALL_USE_RTC)
- High-resolution timer (ESP32S3_TIME_SYSCALL_USE_FRC1)
- None (ESP32S3_TIME_SYSCALL_USE_NONE)

CONFIG_ESP32S3_RTC_CLK_SRC

RTC clock source

Found in: [Component config](#) > [ESP32S3-Specific](#)

Choose which clock is used as RTC clock source.

Available options:

- Internal 150kHz RC oscillator (ESP32S3_RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (ESP32S3_RTC_CLK_SRC_EXT_CRYST)
- External 32kHz oscillator at 32K_XP pin (ESP32S3_RTC_CLK_SRC_EXT_OSC)
- Internal 8MHz oscillator, divided by 256 (~32kHz) (ESP32S3_RTC_CLK_SRC_INT_8MD256)

CONFIG_ESP32S3_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

Found in: [Component config](#) > [ESP32S3-Specific](#)

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:

- from 0 to 27000 if ESP32S3_RTC_CLK_SRC_EXT_CRYST || ESP32S3_RTC_CLK_SRC_EXT_OSC || ESP32S3_RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

Default value:

- 3000 if ESP32S3_RTC_CLK_SRC_EXT_CRYST || ESP32S3_RTC_CLK_SRC_EXT_OSC || ESP32S3_RTC_CLK_SRC_INT_8MD256
- 1024

CONFIG_ESP32S3_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

Found in: [Component config](#) > [ESP32S3-Specific](#)

When ESP32S3 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

Range:

- from 0 to 5000

Default value:

- 2000

CONFIG_ESP32S3_NO_BLOBS

No Binary Blobs

Found in: [Component config](#) > [ESP32S3-Specific](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:

- No (disabled) if [CONFIG_BT_ENABLED](#)

CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

Found in: [Component config](#) > [ESP32S3-Specific](#)

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs.

Default value:

- No (disabled)

CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE

Use fixed static RAM size

Found in: [Component config](#) > [ESP32S3-Specific](#)

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with [ESP32S3_FIXED_STATIC_RAM_SIZE](#)

Default value:

- No (disabled)

CONFIG_ESP32S3_FIXED_STATIC_RAM_SIZE

Fixed Static RAM size

Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE](#)

RAM size dedicated for static variables (.data & .bss sections).

Range:

- from 0 to 0x34000 if [CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE](#)

Default value:

- “0x10000” if [CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE](#)

ADC-Calibration

Common ESP-related Contains:

- [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#)

CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

Found in: [Component config](#) > [Common ESP-related](#)

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

Default value:

- Yes (enabled)

Ethernet Contains:

- [CONFIG_ETH_USE_OPENETH](#)
- [CONFIG_ETH_USE_SPI_ETHERNET](#)

CONFIG_ETH_USE_SPI_ETHERNET

Support SPI to Ethernet Module

Found in: [Component config](#) > [Ethernet](#)

ESP-IDF can also support some SPI-Ethernet modules.

Default value:

- Yes (enabled)

Contains:

- [CONFIG_ETH_SPI_ETHERNET_DM9051](#)
- [CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL](#)
- [CONFIG_ETH_SPI_ETHERNET_W5500](#)

CONFIG_ETH_SPI_ETHERNET_DM9051

Use DM9051

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_SPI_ETHERNET](#)

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500

Use W5500 (MAC RAW)

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_SPI_ETHERNET](#)

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL

Use KSZ8851SNL

Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

Found in: Component config > Ethernet

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

Default value:

- No (disabled)

Contains:

- [CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM](#)
- [CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM](#)

CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM

Number of Ethernet DMA Rx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH

Number of DMA receive buffers, each buffer is 1600 bytes.

Range:

- from 1 to 64 if [CONFIG_ETH_USE_OPENETH](#)

Default value:

- 4 if [CONFIG_ETH_USE_OPENETH](#)

CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

Number of Ethernet DMA Tx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH

Number of DMA transmit buffers, each buffer is 1600 bytes.

Range:

- from 1 to 64 if [CONFIG_ETH_USE_OPENETH](#)

Default value:

- 1 if [CONFIG_ETH_USE_OPENETH](#)

Event Loop Library Contains:

- [CONFIG_ESP_EVENT_LOOP_PROFILING](#)
- [CONFIG_ESP_EVENT_POST_FROM_ISR](#)

CONFIG_ESP_EVENT_LOOP_PROFILING

Enable event loop profiling

Found in: Component config > Event Loop Library

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

Default value:

- No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR

Support posting events from ISRs

Found in: [Component config](#) > [Event Loop Library](#)

Enable posting events from interrupt handlers.

Default value:

- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Support posting events from ISRs placed in IRAM

Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG_ESP_EVENT_POST_FROM_ISR](#)

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

Default value:

- Yes (enabled)

GDB Stub Contains:

- [CONFIG_ESP_GDBSTUB_SUPPORT_TASKS](#)

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Enable listing FreeRTOS tasks through GDB Stub

Found in: [Component config](#) > [GDB Stub](#)

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS

Maximum number of tasks supported by GDB Stub

Found in: [Component config](#) > [GDB Stub](#) > [CONFIG_ESP_GDBSTUB_SUPPORT_TASKS](#)

Set the number of tasks which GDB Stub will support.

Default value:

- 32 if [CONFIG_ESP_GDBSTUB_SUPPORT_TASKS](#)

ESP HTTP client Contains:

- [CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH](#)
- [CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH](#)
- [CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS](#)

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

Enable https

Found in: Component config > ESP HTTP client

This option will enable https protocol by linking esp-tls library and initializing SSL transport

Default value:

- Yes (enabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

Enable HTTP Basic Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

Default value:

- No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH

Enable HTTP Digest Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

Default value:

- Yes (enabled)

HTTP Server Contains:

- *CONFIG_HTTPD_PURGE_BUF_LEN*
- *CONFIG_HTTPD_LOG_PURGE_DATA*
- *CONFIG_HTTPD_MAX_REQ_HDR_LEN*
- *CONFIG_HTTPD_MAX_URI_LEN*
- *CONFIG_HTTPD_ERR_RESP_NO_DELAY*
- *CONFIG_HTTPD_WS_SUPPORT*

CONFIG_HTTPD_MAX_REQ_HDR_LEN

Max HTTP Request Header Length

Found in: Component config > HTTP Server

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

Default value:

- 512

CONFIG_HTTPD_MAX_URI_LEN

Max HTTP URI Length

Found in: Component config > HTTP Server

This sets the maximum supported size of HTTP request URI to be processed by the server

Default value:

- 512

CONFIG_HTTPD_ERR_RESP_NO_DELAY

Use TCP_NODELAY socket option when sending HTTP error responses

Found in: [Component config](#) > [HTTP Server](#)

Using TCP_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

Default value:

- Yes (enabled)

CONFIG_HTTPD_PURGE_BUF_LEN

Length of temporary buffer for purging data

Found in: [Component config](#) > [HTTP Server](#)

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

Default value:

- 32

CONFIG_HTTPD_LOG_PURGE_DATA

Log purged content data at Debug level

Found in: [Component config](#) > [HTTP Server](#)

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

Default value:

- No (disabled)

CONFIG_HTTPD_WS_SUPPORT

WebSocket server support

Found in: [Component config](#) > [HTTP Server](#)

This sets the WebSocket server support.

Default value:

- No (disabled)

ESP HTTPS OTA Contains:

- [CONFIG_OTA_ALLOW_HTTP](#)

CONFIG_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

Default value:

- No (disabled)

ESP HTTPS server

 Contains:

- *CONFIG_ESP_HTTPS_SERVER_ENABLE*

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings

 Contains:

- *MAC Config*
- *RTC Clock Config*
- *Sleep Config*

MAC Config

 Contains:

- *CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES*

CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

Found in: *Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Available options:

- Two (ESP32S3_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32S3_UNIVERSAL_MAC_ADDRESSES_FOUR)

Sleep Config Contains:

- [CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU](#)
- [CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND](#)
- [CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND](#)
- [CONFIG_ESP_SLEEP_POWER_DOWN_FLASH](#)
- [CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND](#)

CONFIG_ESP_SLEEP_POWER_DOWN_FLASH

Power down flash in light sleep when there is no SPIRAM

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

Default value:

- No (disabled)

CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND

light sleep GPIO reset workaround

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

esp32c3, esp32s3 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

Default value:

- Yes (enabled)

CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

PSRAM leakage current workaround in light sleep

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND

Flash leakage current workaround in light sleep

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

Default value:

- Yes (enabled)

CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU

All pins of mspi need pull up

Found in: Component config > Hardware Settings > Sleep Config

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

Default value:

- Yes (enabled)

RTC Clock Config Contains:

- [CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB](#)

CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB

Keep BBPLL clock always work

Found in: Component config > Hardware Settings > RTC Clock Config

When software switches the CPU clock source from BBPLL clock to XTAL, usually the BBPLL will be switched off. This helps to save some power consumption in sleep modes. However this may also happen during the software reset, resulting in the inactive (disconnected from host) of the USB_SERIAL_JTAG device during software reset.

When USB_SERIAL_JTAG is being used, whether to turn off the clock source during software reset and in sleep modes is determined by RTC_CLOCK_BBPLL_POWER_ON_WITH_USB.

- When RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is enabled, the clock will be kept, so that the USB_SERIAL_JTAG will keep alive during software reset. The side-effect is the increasing of power consumption during sleep modes, even though USB_SERIAL_JTAG will not work in sleep modes.
- When RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is disabled, the clock will be turned off. USB_SERIAL_JTAG will be inactive during software reset and in sleep modes. This saves some power consumption in sleep modes.

When USB_SERIAL_JTAG is not being used, software will always turn off BBPLL regardless of RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is set or not.

Default value:

- Yes (enabled)

IPC (Inter-Processor Call) Contains:

- [CONFIG_ESP_IPC_TASK_STACK_SIZE](#)
- [CONFIG_ESP_IPC_USES_CALLERS_PRIORITY](#)

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

Found in: [Component config](#) > [IPC \(Inter-Processor Call\)](#)

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

Range:

- from 512 to 65536

Default value:

- 1536

CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

IPC runs at caller's priority

Found in: [Component config](#) > [IPC \(Inter-Processor Call\)](#)

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

Default value:

- Yes (enabled) if [CONFIG_FREERTOS_UNICORE](#)

LCD and Touch Panel Contains:

- [LCD Peripheral Configuration](#)

LCD Peripheral Configuration Contains:

- [CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE](#)
- [CONFIG_LCD_RGB_ISR_IRAM_SAFE](#)

CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE

LCD panel io format buffer size

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

Default value:

- 32

CONFIG_LCD_RGB_ISR_IRAM_SAFE

RGB LCD ISR IRAM-Safe

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

Default value:

- No (disabled)

ESP NETIF Adapter Contains:

- [CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER](#)
- [CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL](#)
- [CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB](#)

CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

Found in: [Component config](#) > [ESP NETIF Adapter](#)

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

Range:

- from 0 to 65535

Default value:

- 120

CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

TCP/IP Stack Library

Found in: [Component config](#) > [ESP NETIF Adapter](#)

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (ESP_NETIF_TCPIP_LWIP)
lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER

Enable backward compatible tcpip_adapter interface

Found in: [Component config](#) > [ESP NETIF Adapter](#)

Backward compatible interface to tcpip_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

Default value:

- Yes (enabled)

PHY Contains:

- [CONFIG_ESP_PHY_ENABLE_USB](#)
- [CONFIG_ESP_PHY_MAX_WIFI_TX_POWER](#)
- [CONFIG_ESP_PHY_MAC_BB_PD](#)
- [CONFIG_ESP_PHY_REDUCE_TX_POWER](#)
- [CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE](#)
- [CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION](#)

CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

Found in: [Component config](#) > [PHY](#)

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

Default value:

- Yes (enabled)

CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

Found in: [Component config](#) > [PHY](#)

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

Default value:

- No (disabled)

Contains:

- [CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID](#)
- [CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN](#)

CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID

Reset default PHY init data if invalid

Found in: [Component config](#) > [PHY](#) > [CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION](#)

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

Default value:

- No (disabled) if [CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION](#)

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

Support multiple PHY init data bin

Found in: [Component config](#) > [PHY](#) > [CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION](#)

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

Default value:

- No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED

Support embedded multiple phy init data bin to app bin

Found in: `Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

Default value:

- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

CONFIG_ESP_PHY_INIT_DATA_ERROR

Terminate operation when PHY init data error

Found in: `Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

Default value:

- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

CONFIG_ESP_PHY_MAX_WIFI_TX_POWER

Max WiFi TX power (dBm)

Found in: `Component config > PHY`

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

Range:

- from 10 to 20

Default value:

- 20

CONFIG_ESP_PHY_MAC_BB_PD

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

Found in: `Component config > PHY`

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

Default value:

- No (disabled) if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

CONFIG_ESP_PHY_REDUCE_TX_POWER

Reduce PHY TX power when brownout reset

Found in: *Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

Default value:

- Yes (enabled) if ESP32_BROWNOUT_DET

CONFIG_ESP_PHY_ENABLE_USB

Enable USB when phy init

Found in: *Component config > PHY*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

Default value:

- Yes (enabled)
- No (disabled)

Power Management Contains:

- *CONFIG_PM_SLP_DISABLE_GPIO*
- *CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP*
- *CONFIG_PM_SLP_IRAM_OPT*
- *CONFIG_PM_RTOS_IDLE_OPT*
- *CONFIG_PM_ENABLE*

CONFIG_PM_ENABLE

Support for power management

Found in: *Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

Default value:

- No (disabled)

CONFIG_PM_DFS_INIT_AUTO

Enable dynamic frequency scaling (DFS) at startup

Found in: *Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

Default value:

- No (disabled) if *CONFIG_PM_ENABLE*

CONFIG_PM_PROFILING

Enable profiling counters for PM locks

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_ENABLE](#)

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_ENABLE](#)

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

Found in: [Component config](#) > [Power Management](#)

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

Found in: [Component config](#) > [Power Management](#)

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

Found in: [Component config](#) > [Power Management](#)

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio_sleep_sel_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio_sleep_set_direction' and 'gpio_sleep_set_pull_mode' to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable [GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL](#) at first, otherwise you will not be able to switch pullup/pulldown mode.

CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP

Power down CPU in light sleep

Found in: [Component config](#) > [Power Management](#)

If enabled, the CPU will be powered down in light sleep. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

Default value:

- Yes (enabled)

CONFIG_PM_POWER_DOWN_TAGMEM_IN_LIGHT_SLEEP

Power down I/D-cache tag memory in light sleep

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP](#)

If enabled, the I/D-cache tag memory will be retained in light sleep. Depending on the the cache configuration, if this option is enabled, it will consume up to 9 KB of internal RAM.

Default value:

- Yes (enabled)

ESP Ringbuf Contains:

- [CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH](#)
- [CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH](#)

CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH

Place non-ISR ringbuf functions into flash

Found in: [Component config](#) > [ESP Ringbuf](#)

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

Default value:

- No (disabled)

CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH

Place ISR ringbuf functions into flash

Found in: [Component config](#) > [ESP Ringbuf](#)

Place non-ISR ringbuf functions (like xRingbufferSendFromISR/xRingbufferReceiveFromISR) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which is configured to run the ISR from an IRAM context, e.g. CONFIG_UART_ISR_IN_IRAM.

Default value:

- No (disabled)

ESP System Settings Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`
- `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_TASK_WDT`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- *Memory protection*
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

Found in: Component config > ESP System Settings

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (`ESP_SYSTEM_PANIC_PRINT_HALT`)
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (`ESP_SYSTEM_PANIC_PRINT_REBOOT`)
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (`ESP_SYSTEM_PANIC_SILENT_REBOOT`)
Just resets the processor without outputting anything
- GDBStub on panic (`ESP_SYSTEM_PANIC_GDBSTUB`)
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (`ESP_SYSTEM_GDBSTUB_RUNTIME`)
Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime. This feature will switch system to single core mode.

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

Found in: Component config > ESP System Settings

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP

Enable RTC fast memory for dynamic allocations

Found in: Component config > ESP System Settings

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

Default value:

- Yes (enabled)

Memory protection Contains:

- [CONFIG_ESP_SYSTEM_MEMPROT_FEATURE](#)

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

Enable memory protection

Found in: Component config > ESP System Settings > Memory protection

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK

Lock memory protection settings

Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

Default value:

- Yes (enabled) if [CONFIG_ESP_SYSTEM_MEMPROT_FEATURE](#)

CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE

System event queue size

Found in: Component config > ESP System Settings

Config system event queue size in different application.

Default value:

- 32

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE

Event loop task stack size

Found in: [Component config](#) > [ESP System Settings](#)

Config system event task stack size in different application.

Default value:

- 2304

CONFIG_ESP_MAIN_TASK_STACK_SIZE

Main task stack size

Found in: [Component config](#) > [ESP System Settings](#)

Configure the “main task” stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

Default value:

- 3584

CONFIG_ESP_MAIN_TASK_AFFINITY

Main task core affinity

Found in: [Component config](#) > [ESP System Settings](#)

Configure the “main task” core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (`ESP_MAIN_TASK_AFFINITY_CPU0`)
- CPU1 (`ESP_MAIN_TASK_AFFINITY_CPU1`)
- No affinity (`ESP_MAIN_TASK_AFFINITY_NO_AFFINITY`)

CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

Found in: [Component config](#) > [ESP System Settings](#)

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

Default value:

- 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

Found in: [Component config](#) > [ESP System Settings](#)

Select where to send console output (through `stdout` and `stderr`).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- USB CDC (ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_SECONDARY

Channel for console secondary output

Found in: [Component config](#) > [ESP System Settings](#)

This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.

CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

Found in: [Component config](#) > [ESP System Settings](#)

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

Available options:

- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

Found in: [Component config](#) > [ESP System Settings](#)

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

Default value:

- 43 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_RX_GPIO

UART RX on GPIO#

Found in: [Component config](#) > [ESP System Settings](#)

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

Default value:

- 44 if ESP_CONSOLE_UART_CUSTOM

CONFIG_ESP_CONSOLE_UART_BAUDRATE

UART console baud rate

Found in: [Component config](#) > [ESP System Settings](#)

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 1200 to 4000000 if [CONFIG_PM_ENABLE](#)
- from 1200 to 1000000 if [CONFIG_PM_ENABLE](#)

Default value:

- 115200

CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE

Size of USB CDC RX buffer

Found in: [Component config](#) > [ESP System Settings](#)

Set the size of USB CDC RX buffer. Increase the buffer size if your application is often receiving data over USB CDC.

Range:

- from 4 to 16384 if ESP_CONSOLE_USB_CDC

Default value:

- 64 if ESP_CONSOLE_USB_CDC

CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF

Enable esp_rom_printf / ESP_EARLY_LOG via USB CDC

Found in: [Component config](#) > [ESP System Settings](#)

If enabled, esp_rom_printf and ESP_EARLY_LOG output will also be sent over USB CDC. Disabling this option saves about 1kB of RAM.

Default value:

- No (disabled) if `ESP_CONSOLE_USB_CDC`

CONFIG_ESP_INT_WDT

Interrupt watchdog

Found in: [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

Default value:

- Yes (enabled)

CONFIG_ESP_INT_WDT_TIMEOUT_MS

Interrupt watchdog timeout (ms)

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_INT_WDT](#)

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

Range:

- from 10 to 10000

Default value:

- 300 if `ESP32_SPIRAM_SUPPORT` && [CONFIG_ESP_INT_WDT](#)
- 800 if `ESP32_SPIRAM_SUPPORT` && [CONFIG_ESP_INT_WDT](#)

CONFIG_ESP_INT_WDT_CHECK_CPU1

Also watch CPU1 tick interrupt

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_INT_WDT](#)

Also detect if interrupts on CPU 1 are disabled for too long.

Default value:

- Yes (enabled) if [CONFIG_ESP_INT_WDT](#) && [CONFIG_FREERTOS_UNICORE](#)

CONFIG_ESP_TASK_WDT

Initialize Task Watchdog Timer on startup

Found in: [Component config](#) > [ESP System Settings](#)

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

Default value:

- Yes (enabled)

CONFIG_ESP_TASK_WDT_PANIC

Invoke panic handler on Task Watchdog timeout

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT](#)

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

Default value:

- No (disabled)

CONFIG_ESP_TASK_WDT_TIMEOUT_S

Task Watchdog timeout period (seconds)

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

Range:

- from 1 to 60

Default value:

- 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0

Watch CPU0 Idle Task

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

Default value:

- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1

Watch CPU1 Idle Task

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

Default value:

- Yes (enabled) if [CONFIG_ESP_TASK_WDT](#) && [CONFIG_FREERTOS_UNICORE](#)

CONFIG_ESP_XT_WDT

Initialize XTAL32K watchdog timer on startup

Found in: [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K_CLK and generate an interrupt.

CONFIG_ESP_XT_WDT_TIMEOUT

XTAL32K watchdog timeout period

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_XT_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC_CLK.

Range:

- from 1 to 255 if [CONFIG_ESP_XT_WDT](#)

Default value:

- 200 if [CONFIG_ESP_XT_WDT](#)

CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE

Automatically switch to BACKUP32K_CLK when timer expires

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_XT_WDT](#)

Enable this to automatically switch to BACKUP32K_CLK as the source of RTC_SLOW_CLK when the watchdog timer expires.

Default value:

- Yes (enabled) if [CONFIG_ESP_XT_WDT](#)

CONFIG_ESP_PANIC_HANDLER_IRAM

Place panic handler code in IRAM

Found in: [Component config](#) > [ESP System Settings](#)

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

Default value:

- No (disabled)

CONFIG_ESP_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

Found in: [Component config](#) > [ESP System Settings](#)

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

Default value:

- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if `ESP32_TRAX` &&
`ESP32S2_TRAX` && [CONFIG_ESP32S3_TRAX](#)

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

Found in: [Component config](#) > [ESP System Settings](#)

Interrupt level to use for Interrupt Watchdog and other system checks.

Available options:

- Level 5 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_5`)
Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_4`)
Using level 4 interrupt for Interrupt Watchdog and other system checks.

High resolution timer (`esp_timer`) Contains:

- [CONFIG_ESP_TIMER_PROFILING](#)
- [CONFIG_ESP_TIMER_IMPL](#)
- [CONFIG_ESP_TIMER_TASK_STACK_SIZE](#)
- [CONFIG_ESP_TIMER_INTERRUPT_LEVEL](#)
- [CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD](#)

CONFIG_ESP_TIMER_PROFILING

Enable esp_timer profiling features

Found in: [Component config](#) > [High resolution timer \(esp_timer\)](#)

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

Default value:

- No (disabled)

CONFIG_ESP_TIMER_TASK_STACK_SIZE

High-resolution timer task stack size

Found in: [Component config](#) > [High resolution timer \(esp_timer\)](#)

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

Range:

- from 2048 to 65536

Default value:

- 3584

CONFIG_ESP_TIMER_INTERRUPT_LEVEL

Interrupt level

Found in: [Component config](#) > [High resolution timer \(esp_timer\)](#)

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

Range:

- from 1 to 1

Default value:

- 1

CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

Support ISR dispatch method

Found in: [Component config](#) > [High resolution timer \(esp_timer\)](#)

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

Default value:

- No (disabled)

CONFIG_ESP_TIMER_IMPL

Hardware timer to use for esp_timer

Found in: *Component config > High resolution timer (esp_timer)*

esp_timer APIs can be implemented using different hardware timers.

- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for non ESP32 chips.

Available options:

- FRC2 (legacy) timer (ESP_TIMER_IMPL_FRC2)
- LAC timer of Timer Group 0 (ESP_TIMER_IMPL_TG0_LAC)
- SYSTIMER (ESP_TIMER_IMPL_SYSTIMER)

Wi-Fi Contains:

- [CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE](#)
- [CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN](#)
- [CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM](#)
- [CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM](#)
- [CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM](#)
- [CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM](#)
- [CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM](#)
- [CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM](#)
- [CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE](#)
- [CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE](#)
- [CONFIG_ESP32_WIFI_TX_BUFFER](#)
- [CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED](#)
- [CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED](#)
- [CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED](#)
- [CONFIG_ESP32_WIFI_CSI_ENABLED](#)
- [CONFIG_ESP_WIFI_FTM_ENABLE](#)
- [CONFIG_ESP_WIFI_GCMP_SUPPORT](#)
- [CONFIG_ESP_WIFI_GMAC_SUPPORT](#)
- [CONFIG_ESP32_WIFI_IRAM_OPT](#)
- [CONFIG_ESP32_WIFI_MGMT_SBUF_NUM](#)
- [CONFIG_ESP32_WIFI_NVS_ENABLED](#)
- [CONFIG_ESP32_WIFI_RX_IRAM_OPT](#)
- [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)
- [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)
- [CONFIG_ESP_WIFI_SOFTAP_SUPPORT](#)
- [CONFIG_ESP32_WIFI_TASK_CORE_ID](#)

CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE

Software controls WiFi/Bluetooth coexistence

Found in: *Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

Default value:

- Yes (enabled) if [CONFIG_BT_ENABLED](#)

CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM

Max number of WiFi static RX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

Range:

- from 2 to 25

Default value:

- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM

Max number of WiFi dynamic RX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

Range:

- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

Default value:

- 32

CONFIG_ESP32_WIFI_TX_BUFFER

Type of WiFi TX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:

- Static (`ESP32_WIFI_STATIC_TX_BUFFER`)

- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM

Max number of WiFi static TX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:

- from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

Default value:

- 16 if ESP32_WIFI_STATIC_TX_BUFFER

CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM

Max number of WiFi cache TX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

Range:

- from 16 to 128 if ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || [CONFIG_ESP32S3_SPIRAM_SUPPORT](#)

Default value:

- 32 if ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || [CONFIG_ESP32S3_SPIRAM_SUPPORT](#)

CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM

Max number of WiFi dynamic TX buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:

- from 1 to 128

Default value:

- 32

CONFIG_ESP32_WIFI_CSI_ENABLED

WiFi CSI(Channel State Information)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

Default value:

- No (disabled)

CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED

WiFi AMPDU TX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMPDU TX feature

Default value:

- Yes (enabled)

CONFIG_ESP32_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED](#)

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

Range:

- from 2 to 32

Default value:

- 6

CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMPDU RX feature

Default value:

- Yes (enabled)

CONFIG_ESP32_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED](#)

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

Range:

- from 2 to 32

Default value:

- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`

CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMSDU TX feature

Default value:

- No (disabled) if `ESP32_SPIRAM_SUPPORT` || `ESP32S2_SPIRAM_SUPPORT` || `CONFIG_ESP32S3_SPIRAM_SUPPORT`

CONFIG_ESP32_WIFI_NVS_ENABLED

WiFi NVS flash

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable WiFi NVS flash

Default value:

- Yes (enabled)

CONFIG_ESP32_WIFI_TASK_CORE_ID

WiFi Task Core ID

Found in: [Component config](#) > [Wi-Fi](#)

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (`ESP32_WIFI_TASK_PINNED_TO_CORE_0`)
- Core 1 (`ESP32_WIFI_TASK_PINNED_TO_CORE_1`)

CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN

Max length of WiFi SoftAP Beacon

Found in: [Component config](#) > [Wi-Fi](#)

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 ($752+36*5$).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

Range:

- from 752 to 1256

Default value:

- 752

CONFIG_ESP32_WIFI_MGMT_SBUF_NUM

WiFi mgmt short buffer number

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi management short buffer.

Range:

- from 6 to 32

Default value:

- 32

CONFIG_ESP32_WIFI_IRAM_OPT

WiFi IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:

- No (disabled) if [CONFIG_BT_ENABLED](#) && ESP32_SPIRAM_SUPPORT
- Yes (enabled)

CONFIG_ESP32_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

Default value:

- No (disabled) if [CONFIG_BT_ENABLED](#) && ESP32_SPIRAM_SUPPORT
- Yes (enabled)

CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

Default value:

- Yes (enabled)

CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT,

the other 7.3KB IRAM memory would be taken by this option. If already enabled `ESP32_WIFI_RX_IRAM_OPT`, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME

Minimum active time

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

The minimum timeout for waiting to receive data, unit: milliseconds.

Range:

- from 8 to 60 if [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

Default value:

- 50 if [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME

Maximum keep alive time

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

The maximum time that wifi keep alive, unit: seconds.

Range:

- from 10 to 60 if [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

Default value:

- 10 if [CONFIG_ESP_WIFI_SLP_IRAM_OPT](#)

CONFIG_ESP_WIFI_FTM_ENABLE

WiFi FTM

Found in: [Component config](#) > [Wi-Fi](#)

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

Default value:

- No (disabled)

CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT

FTM Initiator support

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_FTM_ENABLE](#)

Default value:

- Yes (enabled) if [CONFIG_ESP_WIFI_FTM_ENABLE](#)

CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT

FTM Responder support

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_FTM_ENABLE](#)

Default value:

- Yes (enabled) if [CONFIG_ESP_WIFI_FTM_ENABLE](#)

CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE

Power Management for station at disconnected

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

CONFIG_ESP_WIFI_GCMP_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

Default value:

- No (disabled)

CONFIG_ESP_WIFI_GMAC_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

Default value:

- No (disabled)

CONFIG_ESP_WIFI_SOFTAP_SUPPORT

WiFi SoftAP Support

Found in: [Component config](#) > [Wi-Fi](#)

WiFi module can be compiled without SoftAP to save code size.

Default value:

- Yes (enabled)

CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Wifi sleep optimize when beacon lost

Found in: [Component config](#) > [Wi-Fi](#)

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT

Beacon loss timeout

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

Range:

- from 5 to 100 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Default value:

- 10 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD

Maximum number of consecutive lost beacons allowed

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

Range:

- from 0 to 8 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Default value:

- 3 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME

Delta early time for RF PHY on

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

Range:

- from 0 to 100 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Default value:

- 2 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME

Delta timeout time for RF PHY off

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

Range:

- from 0 to 8 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

Default value:

- 2 if [CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT](#)

CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM

Maximum espnow encrypt peers number

Found in: [Component config](#) > [Wi-Fi](#)

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number.

When using ESP mesh, this value should be set to a maximum of 6.

Range:

- from 0 to 17

Default value:

- 7

Core dump Contains:

- [CONFIG_ESP_COREDUMP_CHECK_BOOT](#)
- [CONFIG_ESP_COREDUMP_DATA_FORMAT](#)
- [CONFIG_ESP_COREDUMP_CHECKSUM](#)
- [CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART](#)
- [CONFIG_ESP_COREDUMP_UART_DELAY](#)
- [CONFIG_ESP_COREDUMP_DECODE](#)
- [CONFIG_ESP_COREDUMP_MAX_TASKS_NUM](#)

CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART

Data destination

Found in: [Component config](#) > [Core dump](#)

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the `components/partition_table` directory.

Available options:

- Flash (`ESP_COREDUMP_ENABLE_TO_FLASH`)
- UART (`ESP_COREDUMP_ENABLE_TO_UART`)
- None (`ESP_COREDUMP_ENABLE_TO_NONE`)

CONFIG_ESP_COREDUMP_DATA_FORMAT

Core dump data format

Found in: [Component config](#) > [Core dump](#)

Select the data format for core dump.

Available options:

- Binary format (`ESP_COREDUMP_DATA_FORMAT_BIN`)
- ELF format (`ESP_COREDUMP_DATA_FORMAT_ELF`)

CONFIG_ESP_COREDUMP_CHECKSUM

Core dump data integrity check

Found in: [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (`ESP_COREDUMP_CHECKSUM_CRC32`)
- Use SHA256 for integrity verification (`ESP_COREDUMP_CHECKSUM_SHA256`)

CONFIG_ESP_COREDUMP_CHECK_BOOT

Check core dump data integrity on boot

Found in: [Component config](#) > [Core dump](#)

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

Default value:

- Yes (enabled) if `ESP_COREDUMP_ENABLE_TO_FLASH`

CONFIG_ESP_COREDUMP_MAX_TASKS_NUM

Maximum number of tasks

Found in: [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

CONFIG_ESP_COREDUMP_UART_DELAY

Delay before print to UART

Found in: [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

Default value:

- 0 if ESP_COREDUMP_ENABLE_TO_UART

CONFIG_ESP_COREDUMP_DECODE

Handling of UART core dumps in IDF Monitor

Found in: [Component config](#) > [Core dump](#)

Available options:

- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don't decode (ESP_COREDUMP_DECODE_DISABLE)

FAT Filesystem support

 Contains:

- [CONFIG_FATFS_API_ENCODING](#)
- [CONFIG_FATFS_USE_FASTSEEK](#)
- [CONFIG_FATFS_LONG_FILENAMES](#)
- [CONFIG_FATFS_MAX_LFN](#)
- [CONFIG_FATFS_FS_LOCK](#)
- [CONFIG_FATFS_CHOOSE_CODEPAGE](#)
- [CONFIG_FATFS_ALLOC_PREFER_EXTRAM](#)
- [CONFIG_FATFS_TIMEOUT_MS](#)
- [CONFIG_FATFS_PER_FILE_CACHE](#)

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

Found in: [Component config](#) > [FAT Filesystem support](#)

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)

- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portugese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_LONG_FILENAMES

Long filename support

Found in: [Component config](#) > [FAT Filesystem support](#)

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

CONFIG_FATFS_MAX_LFN

Max long filename length

Found in: [Component config](#) > [FAT Filesystem support](#)

Maximum long filename length. Can be reduced to save RAM.

Range:

- from 12 to 255

Default value:

- 255

CONFIG_FATFS_API_ENCODING

API character encoding

Found in: [Component config](#) > [FAT Filesystem support](#)

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

Found in: [Component config](#) > [FAT Filesystem support](#)

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

Range:

- from 0 to 65535

Default value:

- 0

CONFIG_FATFS_TIMEOUT_MS

Timeout for acquiring a file lock, ms

Found in: [Component config](#) > [FAT Filesystem support](#)

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

Default value:

- 10000

CONFIG_FATFS_PER_FILE_CACHE

Use separate cache for each file

Found in: [Component config](#) > [FAT Filesystem support](#)

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

Default value:

- Yes (enabled)

CONFIG_FATFS_ALLOC_PREFER_EXTRAM

Prefer external RAM when allocating FATFS buffers

Found in: [Component config](#) > [FAT Filesystem support](#)

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

Default value:

- Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC` || `SPIRAM_USE_MALLOC`

CONFIG_FATFS_USE_FASTSEEK

Enable fast seek algorithm when using `lseek` function through VFS FAT

Found in: [Component config](#) > [FAT Filesystem support](#)

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

Default value:

- No (disabled)

CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE

Fast seek CLMT buffer size

Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

Default value:

- 64 if *CONFIG_FATFS_USE_FASTSEEK*

Modbus configuration Contains:

- *CONFIG_FMB_COMM_MODE_ASCII_EN*
- *CONFIG_FMB_COMM_MODE_RTU_EN*
- *CONFIG_FMB_COMM_MODE_TCP_EN*
- *CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE*
- *CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT*
- *CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT*
- *CONFIG_FMB_CONTROLLER_STACK_SIZE*
- *CONFIG_FMB_PORT_TASK_PRIO*
- *CONFIG_FMB_PORT_TASK_STACK_SIZE*
- *CONFIG_FMB_QUEUE_LENGTH*
- *CONFIG_FMB_SERIAL_BUF_SIZE*
- *CONFIG_FMB_EVENT_QUEUE_TIMEOUT*
- *CONFIG_FMB_TIMER_PORT_ENABLED*
- *CONFIG_FMB_PORT_TASK_AFFINITY*
- *CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD*
- *CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB*
- *CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS*
- *CONFIG_FMB_MASTER_DELAY_MS_CONVERT*
- *CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND*

CONFIG_FMB_COMM_MODE_TCP_EN

Enable Modbus stack support for TCP communication mode

Found in: Component config > Modbus configuration

Enable Modbus TCP option for stack.

Default value:

- Yes (enabled)

CONFIG_FMB_TCP_PORT_DEFAULT

Modbus TCP port number

Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN

Modbus default port number used by Modbus TCP stack

Range:

- from 0 to 65535

Default value:

- 502

CONFIG_FMB_TCP_PORT_MAX_CONN

Maximum allowed connections for TCP stack

Found in: [Component config](#) > [Modbus configuration](#) > [CONFIG_FMB_COMM_MODE_TCP_EN](#)

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

Range:

- from 1 to 6

Default value:

- 5

CONFIG_FMB_TCP_CONNECTION_TOUT_SEC

Modbus TCP connection timeout

Found in: [Component config](#) > [Modbus configuration](#) > [CONFIG_FMB_COMM_MODE_TCP_EN](#)

Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

Range:

- from 1 to 3600

Default value:

- 20

CONFIG_FMB_COMM_MODE_RTU_EN

Enable Modbus stack support for RTU mode

Found in: [Component config](#) > [Modbus configuration](#)

Enable RTU Modbus communication mode option for Modbus serial stack.

Default value:

- Yes (enabled)

CONFIG_FMB_COMM_MODE_ASCII_EN

Enable Modbus stack support for ASCII mode

Found in: [Component config](#) > [Modbus configuration](#)

Enable ASCII Modbus communication mode option for Modbus serial stack.

Default value:

- Yes (enabled)

CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND

Slave respond timeout (Milliseconds)

Found in: [Component config](#) > [Modbus configuration](#)

If master sends a frame which is not broadcast, it has to wait sometime for slave response. If slave is not respond in this time, the master will process timeout error.

Range:

- from 50 to 3000

Default value:

- 150

CONFIG_FMB_MASTER_DELAY_MS_CONVERT

Slave conversion delay (Milliseconds)

Found in: [Component config](#) > [Modbus configuration](#)

If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

Range:

- from 50 to 400

Default value:

- 200

CONFIG_FMB_QUEUE_LENGTH

Modbus serial task queue length

Found in: [Component config](#) > [Modbus configuration](#)

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

Range:

- from 0 to 200

Default value:

- 20

CONFIG_FMB_PORT_TASK_STACK_SIZE

Modbus port task stack size

Found in: [Component config](#) > [Modbus configuration](#)

Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).

Range:

- from 2048 to 8192

Default value:

- 4096

CONFIG_FMB_SERIAL_BUF_SIZE

Modbus serial task RX/TX buffer size

Found in: [Component config](#) > [Modbus configuration](#)

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

Range:

- from 0 to 2048

Default value:

- 256

CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB

Number of data bits per ASCII character

Found in: [Component config](#) > [Modbus configuration](#)

This option defines the number of data bits per ASCII character.

Range:

- from 7 to 8

Default value:

- 8

CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS

Response timeout for ASCII communication mode (ms)

Found in: [Component config](#) > [Modbus configuration](#)

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

Range:

- from 300 to 2000

Default value:

- 1000

CONFIG_FMB_PORT_TASK_PRIO

Modbus port task priority

Found in: [Component config](#) > [Modbus configuration](#)

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_PORT_TASK_PRIO - 1).

Range:

- from 3 to 23

Default value:

- 10

CONFIG_FMB_PORT_TASK_AFFINITY

Modbus task affinity

Found in: [Component config](#) > [Modbus configuration](#)

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

Available options:

- No affinity (FMB_PORT_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (FMB_PORT_TASK_AFFINITY_CPU0)
- CPU1 (FMB_PORT_TASK_AFFINITY_CPU1)

CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT

Modbus controller slave ID support

Found in: [Component config](#) > [Modbus configuration](#)

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

Default value:

- Yes (enabled)

CONFIG_FMB_CONTROLLER_SLAVE_ID

Modbus controller slave ID

Found in: Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

Range:

- from 0 to 4294967295

Default value:

- “0x00112233”

CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT

Modbus controller notification timeout (ms)

Found in: Component config > Modbus configuration

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

Range:

- from 0 to 200

Default value:

- 20

CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE

Modbus controller notification queue size

Found in: Component config > Modbus configuration

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

Range:

- from 0 to 200

Default value:

- 20

CONFIG_FMB_CONTROLLER_STACK_SIZE

Modbus controller stack size

Found in: Component config > Modbus configuration

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

Range:

- from 0 to 8192

Default value:

- 4096

CONFIG_FMB_EVENT_QUEUE_TIMEOUT

Modbus stack event queue timeout (ms)

Found in: [Component config](#) > [Modbus configuration](#)

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

Range:

- from 0 to 500

Default value:

- 20

CONFIG_FMB_TIMER_PORT_ENABLED

Modbus stack use timer for 3.5T symbol time measurement

Found in: [Component config](#) > [Modbus configuration](#)

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

Default value:

- No (disabled)

CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD

Modbus timer uses ISR dispatch method

Found in: [Component config](#) > [Modbus configuration](#)

If this option is set the Modbus stack uses ISR dispatch method to send timeout events from the callback function called from ISR. This option has dependency with the UART_ISR_IN_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

Default value:

- No (disabled)

FreeRTOS Contains:

- [CONFIG_FREERTOS_CHECK_STACKOVERFLOW](#)
- [CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER](#)
- [CONFIG_FREERTOS_INTERRUPT_BACKTRACE](#)
- [CONFIG_FREERTOS_OPTIMIZED_SCHEDULER](#)

- [CONFIG_FREERTOS_HZ](#)
- [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)
- [CONFIG_FREERTOS_LEGACY_HOOKS](#)
- [CONFIG_FREERTOS_CORETIMER](#)

CONFIG_FREERTOS_UNICORE

Run FreeRTOS only on first core

Found in: [Component config](#) > [FreeRTOS](#)

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

This invisible config value sets the value of `tskNO_AFFINITY` in `task.h`. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) `INT_MAX`.

CONFIG_FREERTOS_CORETIMER

Xtensa timer to use as the FreeRTOS tick source

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

Available options:

- Timer 0 (int 6, level 1) (`FREERTOS_CORETIMER_0`)
Select this to use timer 0
- Timer 1 (int 15, level 3) (`FREERTOS_CORETIMER_1`)
Select this to use timer 1
- SYSTIMER 0 (level 1) (`FREERTOS_CORETIMER_SYSTIMER_LVL1`)
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (`FREERTOS_CORETIMER_SYSTIMER_LVL3`)
Select this to use systimer with the 3 interrupt priority.

CONFIG_FREERTOS_OPTIMIZED_SCHEDULER

Enable FreeRTOS platform optimized scheduler

Found in: [Component config](#) > [FreeRTOS](#)

On most platforms there are instructions can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

Default value:

- Yes (enabled) if [CONFIG_FREERTOS_UNICORE](#)

CONFIG_FREERTOS_HZ

Tick rate (Hz)

Found in: [Component config](#) > [FreeRTOS](#)

Select the tick rate at which FreeRTOS does pre-emptive context switching.

Range:

- from 1 to 1000

Default value:

- 100

CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION

Halt when an SMP-untested function is called

Found in: [Component config](#) > [FreeRTOS](#)

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

Default value:

- Yes (enabled)

CONFIG_FREERTOS_CHECK_STACKOVERFLOW

Check for stack overflow

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS can check for stack overflows in threads and trigger an user function called `vApplicationStackOverflowHook` when this happens.

Available options:

- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
Do not check for stack overflows (`configCHECK_FOR_STACK_OVERFLOW=0`)
- Check by stack pointer value (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (`configCHECK_FOR_STACK_OVERFLOW=1`)
- Check using canary bytes (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (`configCHECK_FOR_STACK_OVERFLOW=2`)

CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK

Set a debug watchpoint as a stack overflow check

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using `gdb`, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, `gdb` will stop with a `SIGTRAP` message. When no JTAG OCD is attached, `esp-idf` will panic on an unhandled debug exception.

Default value:

- No (disabled)

CONFIG_FREERTOS_INTERRUPT_BACKTRACE

Enable backtrace from interrupt to task context

Found in: [Component config](#) > [FreeRTOS](#)

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

Number of thread local storage pointers

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

Range:

- from 1 to 256

Default value:

- 1

CONFIG_FREERTOS_ASSERT

FreeRTOS assertions

Found in: [Component config](#) > [FreeRTOS](#)

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

By default these behave the same as the global project assert settings.

Available options:

- abort() on failed assertions (FREERTOS_ASSERT_FAIL_ABORT)
If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic handler can be configured to handle the outcome of an abort() in different ways.
If assertions are disabled for the entire project, they are also disabled in FreeRTOS and this option is unavailable.
- Print and continue failed assertions (FREERTOS_ASSERT_FAIL_PRINT_CONTINUE)
If a FreeRTOS assertion fails, print it out and continue.
- Disable FreeRTOS assertions (FREERTOS_ASSERT_DISABLE)
FreeRTOS configASSERT() will not be compiled into the binary.

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

Idle Task stack size

Found in: [Component config](#) > [FreeRTOS](#)

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

Range:

- from 768 to 32768

Default value:

- 1536

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

Found in: [Component config](#) > [FreeRTOS](#)

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

Range:

- from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
- from 1536 to 32768

Default value:

- 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
- 1536

CONFIG_FREERTOS_LEGACY_HOOKS

Use FreeRTOS legacy hooks

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp_register_freertos_XXX_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can't be migrated to the esp_register_freertos_XXX_hook system.

Default value:

- No (disabled)

CONFIG_FREERTOS_MAX_TASK_NAME_LEN

Maximum task name length

Found in: [Component config](#) > [FreeRTOS](#)

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

Range:

- from 1 to 256

Default value:

- 16

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook

Found in: [Component config](#) > [FreeRTOS](#)

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```
void vPortCleanUpTCB ( void \*pxTCB ) {  
    // place clean up code here  
}
```

Default value:

- No (disabled)

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

FreeRTOS timer task priority

Found in: [Component config](#) > [FreeRTOS](#)

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the priority that the timer task will run at.

Range:

- from 1 to 25

Default value:

- 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

FreeRTOS timer task stack size

Found in: [Component config](#) > [FreeRTOS](#)

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

Range:

- from 1536 to 32768

Default value:

- 2048

CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

FreeRTOS timer queue length

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the 'timer command queue'. The 'timer command queue' is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

Range:

- from 5 to 20

Default value:

- 10

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

FreeRTOS queue registry size

Found in: [Component config](#) > [FreeRTOS](#)

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

Range:

- from 0 to 20

Default value:

- 0

CONFIG_FREERTOS_USE_TRACE_FACILITY

Enable FreeRTOS trace facility

Found in: [Component config](#) > [FreeRTOS](#)

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

Default value:

- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

Enable FreeRTOS stats formatting functions

Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG_FREERTOS_USE_TRACE_FACILITY](#)

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

Default value:

- No (disabled) if [CONFIG_FREERTOS_USE_TRACE_FACILITY](#)

CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID

Enable display of xCoreID in vTaskList

Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG_FREERTOS_USE_TRACE_FACILITY](#) > [CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS](#)

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

Default value:

- No (disabled) if [CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS](#)

CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS

Enable FreeRTOS to collect run time stats

Found in: [Component config](#) > [FreeRTOS](#)

If enabled, configGENERATE_RUN_TIME_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS_USE_STATS_FORMATTING_FUNCTIONS and FREERTOS_USE_TRACE_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

Default value:

- No (disabled)

CONFIG_FREERTOS_RUN_TIME_STATS_CLK

Choose the clock source for run time stats

Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS](#)

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

CONFIG_FREERTOS_USE_TICKLESS_IDLE

Tickless idle support

Found in: [Component config](#) > [FreeRTOS](#)

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as "automatic light sleep".

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip_unhandled_events" option as true.

If disabled, automatic light sleep support will be disabled.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP

Minimum number of ticks to enter sleep mode for

Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

Range:

- from 2 to 4294967295 if [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

Default value:

- 3 if [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER

Enclose all task functions in a wrapper function

Found in: [Component config](#) > [FreeRTOS](#)

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

Found in: [Component config](#) > [FreeRTOS](#)

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

Found in: [Component config](#) > [FreeRTOS](#)

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure

Default value:

- No (disabled)

CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH

Place FreeRTOS functions into Flash

Found in: [Component config](#) > [FreeRTOS](#)

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

Default value:

- No (disabled)

CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT

Enable task snapshot functions

Found in: [Component config](#) > [FreeRTOS](#)

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH

Place task snapshot functions into flash

Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT](#)

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

Default value:

- No (disabled) if `CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT` && `CONFIG_ESP_PANIC_HANDLER_IRAM`

Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`

CONFIG_HAL_DEFAULT_ASSERTION_LEVEL

Default HAL assertion level

Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (`HAL_ASSERTION_EQUALS_SYSTEM`)
- Disabled (`HAL_ASSERTION_DISABLE`)
- Silent (`HAL_ASSERTION_SILIENT`)
- Enabled (`HAL_ASSERTION_ENABLE`)

Heap memory debugging Contains:

- `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`
- `CONFIG_HEAP_TASK_TRACKING`
- `CONFIG_HEAP_CORRUPTION_DETECTION`
- `CONFIG_HEAP_TRACING_DEST`
- `CONFIG_HEAP_TRACING_STACK_DEPTH`

CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

Found in: [Component config](#) > [Heap memory debugging](#)

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (`HEAP_POISONING_DISABLED`)
- Light impact (`HEAP_POISONING_LIGHT`)
- Comprehensive (`HEAP_POISONING_COMPREHENSIVE`)

CONFIG_HEAP_TRACING_DEST

Heap tracing

Found in: [Component config](#) > [Heap memory debugging](#)

Enables the heap tracing API defined in `esp_heap_trace.h`.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

Available options:

- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

Found in: [Component config](#) > [Heap memory debugging](#)

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

CONFIG_HEAP_TASK_TRACKING

Enable heap task tracking

Found in: [Component config](#) > [Heap memory debugging](#)

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS

Abort if memory allocation fails

Found in: [Component config](#) > [Heap memory debugging](#)

When enabled, if a memory allocation operation fails it will cause a system abort.

Default value:

- No (disabled)

jsmn Contains:

- [CONFIG_JSMN_PARENT_LINKS](#)
- [CONFIG_JSMN_STRICT](#)

CONFIG_JSMN_PARENT_LINKS

Enable parent links

Found in: [Component config](#) > [jsmn](#)

You can access to parent node of parsed json

Default value:

- No (disabled)

CONFIG_JSMN_STRICT

Enable strict mode

Found in: [Component config](#) > [jsmn](#)

In strict mode primitives are: numbers and booleans

Default value:

- No (disabled)

libsodium Contains:

- [CONFIG_LIBSODIUM_USE_MBEDTLS_SHA](#)

CONFIG_LIBSODIUM_USE_MBEDTLS_SHA

Use mbedTLS SHA256 & SHA512 implementations

Found in: [Component config](#) > [libsodium](#)

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium's API manages SHA state).

Default value:

- Yes (enabled)

Log output Contains:

- [CONFIG_LOG_DEFAULT_LEVEL](#)
- [CONFIG_LOG_TIMESTAMP_SOURCE](#)
- [CONFIG_LOG_MAXIMUM_LEVEL](#)
- [CONFIG_LOG_COLORS](#)

CONFIG_LOG_DEFAULT_LEVEL

Default log verbosity

Found in: [Component config](#) > [Log output](#)

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output (`LOG_DEFAULT_LEVEL_NONE`)
- Error (`LOG_DEFAULT_LEVEL_ERROR`)
- Warning (`LOG_DEFAULT_LEVEL_WARN`)
- Info (`LOG_DEFAULT_LEVEL_INFO`)
- Debug (`LOG_DEFAULT_LEVEL_DEBUG`)
- Verbose (`LOG_DEFAULT_LEVEL_VERBOSE`)

CONFIG_LOG_MAXIMUM_LEVEL

Maximum log verbosity

Found in: [Component config](#) > [Log output](#)

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

Available options:

- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

CONFIG_LOG_COLORS

Use ANSI terminal colors in log output

Found in: [Component config](#) > [Log output](#)

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

Default value:

- Yes (enabled)

CONFIG_LOG_TIMESTAMP_SOURCE

Log Timestamps

Found in: [Component config](#) > [Log output](#)

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the ESP32's RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:

- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

LWIP Contains:

- `CONFIG_LWIP_NETIF_LOOPBACK`
- *TCP*
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- *UDP*
- `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`

CONFIG_LWIP_LOCAL_HOSTNAME

Local netif hostname

Found in: Component config > LWIP

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

Default value:

- “espressif”

CONFIG_LWIP_NETIF_API

Enable usage of standard POSIX APIs in LWIP

Found in: Component config > LWIP

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as

esp_netif_get_netif_impl_name()

Default value:

- No (disabled)

CONFIG_LWIP_TCPIP_CORE_LOCKING

Enable tcpip core locking

Found in: [Component config](#) > [LWIP](#)

If Enable tcpip core locking, Creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.

Default value:

- No (disabled)

CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES

Enable mDNS queries in resolving host name

Found in: [Component config](#) > [LWIP](#)

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

Default value:

- Yes (enabled)

CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

Found in: [Component config](#) > [LWIP](#)

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

Default value:

- No (disabled)

CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

Found in: [Component config](#) > [LWIP](#)

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

Default value:

- No (disabled)

CONFIG_LWIP_TIMERS_ONDEMAND

Enable LWIP Timers on demand

Found in: [Component config](#) > [LWIP](#)

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

Default value:

- Yes (enabled)

CONFIG_LWIP_MAX_SOCKETS

Max number of open sockets

Found in: [Component config](#) > [LWIP](#)

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

Range:

- from 1 to 16

Default value:

- 10

CONFIG_LWIP_USE_ONLY_LWIP_SELECT

Support LWIP socket select() only (DEPRECATED)

Found in: [Component config](#) > [LWIP](#)

This option is deprecated. Use VFS_SUPPORT_SELECT instead, which is the inverse of this option.

The virtual filesystem layer of select() redirects sockets to lwip_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip_select(), therefore, select can be used for sockets only.

Default value:

- No (disabled)

CONFIG_LWIP_SO_LINGER

Enable SO_LINGER processing

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows SO_LINGER processing. l_onoff = 1,l_linger can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

Default value:

- No (disabled)

CONFIG_LWIP_SO_REUSE

Enable SO_REUSEADDR option

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows binding to a port which remains in TIME_WAIT.

Default value:

- Yes (enabled)

CONFIG_LWIP_SO_REUSE_RXTOALL

SO_REUSEADDR copies broadcast/multicast to all matches

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_SO_REUSE](#)

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

Default value:

- Yes (enabled)

CONFIG_LWIP_SO_RCVBUF

Enable SO_RCVBUF option

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows checking for available data on a netconn.

Default value:

- No (disabled)

CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows checking for the destination address of a received IPv4 Packet.

Default value:

- No (disabled)

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

Default value:

- Yes (enabled)

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

Default value:

- Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows reassembling incoming fragmented IP4 packets.

Default value:

- No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows reassembling incoming fragmented IP6 packets.

Default value:

- No (disabled)

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows packets forwarding across multiple interfaces.

Default value:

- No (disabled)

CONFIG_LWIP_IPV4_NAPT

Enable NAT (new/experimental)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_IP_FORWARD](#)

Enabling this option allows Network Address and Port Translation.

Default value:

- No (disabled) if [CONFIG_LWIP_IP_FORWARD](#)

CONFIG_LWIP_STATS

Enable LWIP statistics

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows LWIP statistics

Default value:

- No (disabled)

CONFIG_LWIP_ETHARP_TRUST_IP_MAC

Enable LWIP ARP trust

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little

latency. The peer *is* in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer. - The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

Default value:

- No (disabled)

CONFIG_LWIP_ESP_GRATUITOUS_ARP

Send gratuitous ARP periodically

Found in: [Component config](#) > [LWIP](#)

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

Default value:

- Yes (enabled)

CONFIG_LWIP_GARP_TMR_INTERVAL

GARP timer interval(seconds)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_ESP_GRATUITOUS_ARP](#)

Set the timer interval for gratuitous ARP. The default value is 60s

Default value:

- 60

CONFIG_LWIP_TCPIP_RECVMBOX_SIZE

TCPIP task receive mail box size

Found in: [Component config](#) > [LWIP](#)

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

Range:

- from 6 to 64 if [CONFIG_LWIP_WND_SCALE](#)
- from 6 to 1024 if [CONFIG_LWIP_WND_SCALE](#)

Default value:

- 32

CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

Found in: [Component config](#) > [LWIP](#)

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

Default value:

- Yes (enabled)

CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID

DHCP: Disable Use of HW address as client identification

Found in: [Component config](#) > [LWIP](#)

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

Default value:

- No (disabled)

CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID

DHCP: Disable Use of vendor class identification

Found in: [Component config](#) > [LWIP](#)

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

Default value:

- Yes (enabled)

CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

Found in: [Component config](#) > [LWIP](#)

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

Default value:

- No (disabled)

CONFIG_LWIP_DHCP_OPTIONS_LEN

DHCP total option length

Found in: [Component config](#) > [LWIP](#)

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

Range:

- from 68 to 255

Default value:

- 68
- 108

DHCP server Contains:

- [CONFIG_LWIP_DHCPS](#)

CONFIG_LWIP_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

Default value:

- Yes (enabled)

CONFIG_LWIP_DHCPS_LEASE_UNIT

Multiplier for lease time, in seconds

Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG_LWIP_DHCPS](#)

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

Range:

- from 1 to 3600

Default value:

- 60

CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG_LWIP_DHCPS](#)

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

Range:

- from 1 to 64

Default value:

- 8

CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

Default value:

- No (disabled)

Contains:

- [CONFIG_LWIP_AUTOIP_TRIES](#)
- [CONFIG_LWIP_AUTOIP_MAX_CONFLICTS](#)
- [CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL](#)

CONFIG_LWIP_AUTOIP_TRIES

DHCP Probes before self-assigning IPv4 LL address

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_AUTOIP](#)

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

Range:

- from 1 to 100 if [CONFIG_LWIP_AUTOIP](#)

Default value:

- 2 if [CONFIG_LWIP_AUTOIP](#)

CONFIG_LWIP_AUTOIP_MAX_CONFLICTS

Max IP conflicts before rate limiting

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_AUTOIP](#)

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

Range:

- from 1 to 100 if [CONFIG_LWIP_AUTOIP](#)

Default value:

- 9 if [CONFIG_LWIP_AUTOIP](#)

CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

Rate limited interval (seconds)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_AUTOIP](#)

If rate limiting self-assignment requests, wait this long between each request.

Range:

- from 5 to 120 if [CONFIG_LWIP_AUTOIP](#)

Default value:

- 20 if [CONFIG_LWIP_AUTOIP](#)

CONFIG_LWIP_IPV6

Enable IPv6

Found in: [Component config](#) > [LWIP](#)

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

Default value:

- Yes (enabled)

CONFIG_LWIP_IPV6_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_IPV6](#)

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

Default value:

- No (disabled)

CONFIG_LWIP_IPV6_NUM_ADDRESSES

Number of IPv6 addresses on each network interface

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_IPV6](#)

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

Default value:

- 3

CONFIG_LWIP_IPV6_FORWARD

Enable IPv6 forwarding between interfaces

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_IPV6](#)

Forwarding IPv6 packets between interfaces is only required when acting as a router.

Default value:

- No (disabled)

CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

Found in: [Component config](#) > [LWIP](#)

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

Default value:

- 0 if [CONFIG_LWIP_IPV6_AUTOCONFIG](#)

CONFIG_LWIP_IPV6_DHCP6

Enable DHCPv6 stateless address autoconfiguration

Found in: [Component config](#) > [LWIP](#)

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

Default value:

- No (disabled) if [CONFIG_LWIP_IPV6_AUTOCONFIG](#)

CONFIG_LWIP_NETIF_STATUS_CALLBACK

Enable status callback for network interfaces

Found in: [Component config](#) > [LWIP](#)

Enable callbacks when the network interface is up/down and addresses are changed.

Default value:

- No (disabled)

CONFIG_LWIP_NETIF_LOOPBACK

Support per-interface loopback

Found in: Component config > LWIP

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will “loop back” and be received by this interface.

Default value:

- Yes (enabled)

Contains:

- *CONFIG_LWIP_LOOPBACK_MAX_PBUFS*

CONFIG_LWIP_LOOPBACK_MAX_PBUFS

Max queued loopback packets per interface

Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

Range:

- from 0 to 16

Default value:

- 8

TCP Contains:

- *CONFIG_LWIP_TCP_WND_DEFAULT*
- *CONFIG_LWIP_TCP_SND_BUF_DEFAULT*
- *CONFIG_LWIP_TCP_RECVMBOX_SIZE*
- *CONFIG_LWIP_TCP_RTO_TIME*
- *CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES*
- *CONFIG_LWIP_MAX_ACTIVE_TCP*
- *CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT*
- *CONFIG_LWIP_MAX_LISTENING_TCP*
- *CONFIG_LWIP_TCP_MAXRTX*
- *CONFIG_LWIP_TCP_SYNMAXRTX*
- *CONFIG_LWIP_TCP_MSL*
- *CONFIG_LWIP_TCP_MSS*
- *CONFIG_LWIP_TCP_OVERSIZE*
- *CONFIG_LWIP_TCP_QUEUE_OOSEQ*
- *CONFIG_LWIP_TCP_SACK_OUT*
- *CONFIG_LWIP_WND_SCALE*
- *CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION*
- *CONFIG_LWIP_TCP_TMR_INTERVAL*

CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

Found in: Component config > LWIP > TCP

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

Range:

- from 1 to 1024

Default value:

- 16

CONFIG_LWIP_MAX_LISTENING_TCP

Maximum listening TCP Connections

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

Range:

- from 1 to 1024

Default value:

- 16

CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION

TCP high speed retransmissions

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

Default value:

- Yes (enabled)

CONFIG_LWIP_TCP_MAXRTX

Maximum number of retransmissions of data segments

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum number of retransmissions of data segments.

Range:

- from 3 to 12

Default value:

- 12

CONFIG_LWIP_TCP_SYNMAXRTX

Maximum number of retransmissions of SYN segments

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum number of retransmissions of SYN segments.

Range:

- from 3 to 12

Default value:

- 6
- 12

CONFIG_LWIP_TCP_MSS

Maximum Segment Size (MSS)

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220<= TCP_mSS <= 1440

Range:

- from 536 to 1460

Default value:

- 1440

CONFIG_LWIP_TCP_TMR_INTERVAL

TCP timer interval(ms)

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

Default value:

- 250

CONFIG_LWIP_TCP_MSL

Maximum segment lifetime (MSL)

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum segment lifetime in milliseconds.

Default value:

- 60000

CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT

Maximum FIN segment lifetime

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum segment lifetime in milliseconds.

Default value:

- 20000

CONFIG_LWIP_TCP_SND_BUF_DEFAULT

Default send buffer size

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

Range:

- from 2440 to 65535 if [CONFIG_LWIP_WND_SCALE](#)
- from 2440 to 1024000 if [CONFIG_LWIP_WND_SCALE](#)

Default value:

- 5744

CONFIG_LWIP_TCP_WND_DEFAULT

Default receive window size

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

Range:

- from 2440 to 65535 if [CONFIG_LWIP_WND_SCALE](#)
- from 2440 to 1024000 if [CONFIG_LWIP_WND_SCALE](#)

Default value:

- 5744

CONFIG_LWIP_TCP_RECVMBOX_SIZE

Default TCP receive mail box size

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: $LWIP_TCP_WND_DEFAULT/TCP_MSS + 2$, e.g. if $LWIP_TCP_WND_DEFAULT=14360$, $TCP_MSS=1436$, then the recommended receive mail box size is $(14360/1436 + 2) = 12$.

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCP_RECVMBOX_SIZE` multiples the maximum TCP socket number. In other words, the bigger `LWIP_TCP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

Range:

- from 6 to 64 if [CONFIG_LWIP_WND_SCALE](#)
- from 6 to 1024 if [CONFIG_LWIP_WND_SCALE](#)

Default value:

- 6

CONFIG_LWIP_TCP_QUEUE_OOSEQ

Queue incoming out-of-order segments

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

Default value:

- Yes (enabled)

CONFIG_LWIP_TCP_SACK_OUT

Support sending selective acknowledgements

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

TCP will support sending selective acknowledgements (SACKs).

Default value:

- No (disabled)

CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES

Keep TCP connections when IP changed

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2

Disable this option to keep consistent with the original LWIP code behavior.

Default value:

- No (disabled)

CONFIG_LWIP_TCP_OVERSIZE

Pre-allocate transmit PBUF size

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

CONFIG_LWIP_WND_SCALE

Support TCP window scale

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Enable this feature to support TCP window scaling.

Default value:

- No (disabled) if [CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP](#)

CONFIG_LWIP_TCP_RCV_SCALE

Set TCP receiving window scaling factor

Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG_LWIP_WND_SCALE](#)

Enable this feature to support TCP window scaling.

Range:

- from 0 to 14 if [CONFIG_LWIP_WND_SCALE](#)

Default value:

- 0 if `CONFIG_LWIP_WND_SCALE`

CONFIG_LWIP_TCP_RTO_TIME

Default TCP rto time

Found in: [Component config](#) > [LWIP](#) > [TCP](#)

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

Default value:

- 3000
- 1500

UDP Contains:

- [CONFIG_LWIP_UDP_RECVMBOX_SIZE](#)
- [CONFIG_LWIP_MAX_UDP_PCBS](#)

CONFIG_LWIP_MAX_UDP_PCBS

Maximum active UDP control blocks

Found in: [Component config](#) > [LWIP](#) > [UDP](#)

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

Range:

- from 1 to 1024

Default value:

- 16

CONFIG_LWIP_UDP_RECVMBOX_SIZE

Default UDP receive mail box size

Found in: [Component config](#) > [LWIP](#) > [UDP](#)

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum `UDP_RECVMBOX_SIZE` packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is `UDP_RECVMBOX_SIZE` multiples the maximum UDP socket number. In other words, the bigger `UDP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

Range:

- from 6 to 64

Default value:

- 6

Checksums Contains:

- [CONFIG_LWIP_CHECKSUM_CHECK_ICMP](#)
- [CONFIG_LWIP_CHECKSUM_CHECK_IP](#)
- [CONFIG_LWIP_CHECKSUM_CHECK_UDP](#)

CONFIG_LWIP_CHECKSUM_CHECK_IP

Enable LWIP IP checksums

Found in: [Component config](#) > [LWIP](#) > [Checksums](#)

Enable checksum checking for received IP messages

Default value:

- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_UDP

Enable LWIP UDP checksums

Found in: [Component config](#) > [LWIP](#) > [Checksums](#)

Enable checksum checking for received UDP messages

Default value:

- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP

Enable LWIP ICMP checksums

Found in: [Component config](#) > [LWIP](#) > [Checksums](#)

Enable checksum checking for received ICMP messages

Default value:

- Yes (enabled)

CONFIG_LWIP_TCPIP_TASK_STACK_SIZE

TCP/IP Task Stack Size

Found in: [Component config](#) > [LWIP](#)

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

Range:

- from 2048 to 65536

Default value:

- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY

TCP/IP task affinity

Found in: [Component config](#) > [LWIP](#)

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

Available options:

- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)

CONFIG_LWIP_PPP_SUPPORT

Enable PPP support (new/experimental)

Found in: [Component config](#) > [LWIP](#)

Enable PPP stack. Now only PPP over serial is possible.

PPP over serial support is experimental and unsupported.

Default value:

- No (disabled)

Contains:

- [CONFIG_LWIP_PPP_ENABLE_IPV6](#)

CONFIG_LWIP_PPP_ENABLE_IPV6

Enable IPV6 support for PPP connections (IPV6CP)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_PPP_SUPPORT](#)

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

Default value:

- Yes (enabled) if [CONFIG_LWIP_PPP_SUPPORT](#) && [CONFIG_LWIP_IPV6](#)

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE

Max number of IPv6 packets to queue during MAC resolution

Found in: [Component config](#) > [LWIP](#)

Config max number of IPv6 packets to queue during MAC resolution.

Range:

- from 3 to 20

Default value:

- 3

CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS

Max number of entries in IPv6 neighbor cache

Found in: [Component config](#) > [LWIP](#)

Config max number of entries in IPv6 neighbor cache

Range:

- from 3 to 10

Default value:

- 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT

Enable Notify Phase Callback

Found in: [Component config](#) > [LWIP](#)

Enable to set a callback which is called on change of the internal PPP state machine.

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_PPP_PAP_SUPPORT

Enable PAP support

Found in: [Component config](#) > [LWIP](#)

Enable Password Authentication Protocol (PAP) support

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_PPP_CHAP_SUPPORT

Enable CHAP support

Found in: [Component config](#) > [LWIP](#)

Enable Challenge Handshake Authentication Protocol (CHAP) support

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_PPP_MSCHAP_SUPPORT

Enable MSCHAP support

Found in: [Component config](#) > [LWIP](#)

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_PPP_MPPE_SUPPORT

Enable MPPE support

Found in: [Component config](#) > [LWIP](#)

Enable Microsoft Point-to-Point Encryption (MPPE) support

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_ENABLE_LCP_ECHO

Enable LCP ECHO

Found in: [Component config](#) > [LWIP](#)

Enable LCP echo keepalive requests

Default value:

- No (disabled) if [CONFIG_LWIP_PPP_SUPPORT](#)

CONFIG_LWIP_LCP_ECHOINTERVAL

Echo interval (s)

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_ENABLE_LCP_ECHO](#)

Interval in seconds between keepalive LCP echo requests, 0 to disable.

Range:

- from 0 to 1000000 if [CONFIG_LWIP_ENABLE_LCP_ECHO](#)

Default value:

- 3 if [CONFIG_LWIP_ENABLE_LCP_ECHO](#)

CONFIG_LWIP_LCP_MAXECHOFAILS

Maximum echo failures

Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO

Number of consecutive unanswered echo requests before failure is indicated.

Range:

- from 0 to 100000 if *CONFIG_LWIP_ENABLE_LCP_ECHO*

Default value:

- 3 if *CONFIG_LWIP_ENABLE_LCP_ECHO*

CONFIG_LWIP_PPP_DEBUG_ON

Enable PPP debug log output

Found in: Component config > LWIP

Enable PPP debug log output

Default value:

- No (disabled) if *CONFIG_LWIP_PPP_SUPPORT*

CONFIG_LWIP_SLIP_SUPPORT

Enable SLIP support (new/experimental)

Found in: Component config > LWIP

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

Default value:

- No (disabled)

Contains:

- *CONFIG_LWIP_SLIP_DEBUG_ON*

CONFIG_LWIP_SLIP_DEBUG_ON

Enable SLIP debug log output

Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT

Enable SLIP debug log output

Default value:

- No (disabled) if *CONFIG_LWIP_SLIP_SUPPORT*

ICMP Contains:

- *CONFIG_LWIP_ICMP*
- *CONFIG_LWIP_BROADCAST_PING*
- *CONFIG_LWIP_MULTICAST_PING*

CONFIG_LWIP_ICMP

ICMP: Enable ICMP

Found in: Component config > LWIP > ICMP

Enable ICMP module for check network stability

Default value:

- Yes (enabled)

CONFIG_LWIP_MULTICAST_PING

Respond to multicast pings

Found in: Component config > LWIP > ICMP

Default value:

- No (disabled)

CONFIG_LWIP_BROADCAST_PING

Respond to broadcast pings

Found in: Component config > LWIP > ICMP

Default value:

- No (disabled)

LWIP RAW API Contains:

- *CONFIG_LWIP_MAX_RAW_PCBS*

CONFIG_LWIP_MAX_RAW_PCBS

Maximum LWIP RAW PCBs

Found in: Component config > LWIP > LWIP RAW API

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

Range:

- from 1 to 1024

Default value:

- 16

SNTP Contains:

- *CONFIG_LWIP_SNTP_MAX_SERVERS*
- *CONFIG_LWIP_SNTP_UPDATE_DELAY*
- *CONFIG_LWIP_DHCP_GET_NTP_SRV*

CONFIG_LWIP_SNTP_MAX_SERVERS

Maximum number of NTP servers

Found in: Component config > LWIP > SNTP

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

Range:

- from 1 to 16

Default value:

- 1

CONFIG_LWIP_DHCP_GET_NTP_SRV

Request NTP servers from DHCP

Found in: *Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

Default value:

- No (disabled)

CONFIG_LWIP_DHCP_MAX_NTP_SERVERS

Maximum number of NTP servers aquired via DHCP

Found in: *Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers aquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers” , any extra servers would be just ignored.

Range:

- from 1 to 16 if *CONFIG_LWIP_DHCP_GET_NTP_SRV*

Default value:

- 1 if *CONFIG_LWIP_DHCP_GET_NTP_SRV*

CONFIG_LWIP_SNTP_UPDATE_DELAY

Request interval to update time (ms)

Found in: *Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

Range:

- from 15000 to 4294967295

Default value:

- 3600000

CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

Found in: *Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

Default value:

- Yes (enabled) if `COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`

Hooks Contains:

- *CONFIG_LWIP_HOOK_ND6_GET_GW*
- *CONFIG_LWIP_HOOK_IP6_ROUTE*
- *CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE*
- *CONFIG_LWIP_HOOK_TCP_ISN*

CONFIG_LWIP_HOOK_TCP_ISN

TCP ISN Hook

Found in: [Component config](#) > [LWIP](#) > [Hooks](#)

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp_next_iss*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

CONFIG_LWIP_HOOK_IP6_ROUTE

IPv6 route Hook

Found in: [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

CONFIG_LWIP_HOOK_ND6_GET_GW

IPv6 get gateway Hook

Found in: [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)

CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE

Netconn external resolve Hook

Found in: [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM`)

CONFIG_LWIP_DEBUG

Enable LWIP Debug

Found in: [Component config](#) > [LWIP](#)

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

Default value:

- No (disabled)

Contains:

- [CONFIG_LWIP_API_LIB_DEBUG](#)
- [CONFIG_LWIP_DHCP_DEBUG](#)
- [CONFIG_LWIP_DHCP_STATE_DEBUG](#)
- [CONFIG_LWIP_ETHARP_DEBUG](#)
- [CONFIG_LWIP_ICMP_DEBUG](#)
- [CONFIG_LWIP_ICMP6_DEBUG](#)
- [CONFIG_LWIP_IP_DEBUG](#)
- [CONFIG_LWIP_IP6_DEBUG](#)
- [CONFIG_LWIP_NETIF_DEBUG](#)
- [CONFIG_LWIP_PBUF_DEBUG](#)
- [CONFIG_LWIP_SNTP_DEBUG](#)
- [CONFIG_LWIP_SOCKETS_DEBUG](#)
- [CONFIG_LWIP_TCP_DEBUG](#)
- [CONFIG_LWIP_DEBUG_ESP_LOG](#)

CONFIG_LWIP_DEBUG_ESP_LOG

Route LWIP debugs through ESP_LOG interface

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_DEBUG](#)

Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

Default value:

- No (disabled) if [CONFIG_LWIP_DEBUG](#)

CONFIG_LWIP_NETIF_DEBUG

Enable netif debug messages

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_DEBUG](#)

Default value:

- No (disabled) if [CONFIG_LWIP_DEBUG](#)

CONFIG_LWIP_PBUF_DEBUG

Enable pbuf debug messages

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_DEBUG](#)

Default value:

- No (disabled) if [CONFIG_LWIP_DEBUG](#)

CONFIG_LWIP_ETHARP_DEBUG

Enable etharp debug messages

Found in: [Component config](#) > [LWIP](#) > [CONFIG_LWIP_DEBUG](#)

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_API_LIB_DEBUG

Enable api lib debug messages

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_SOCKETS_DEBUG

Enable socket debug messages

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_IP_DEBUG

Enable IP debug messages

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG` && `CONFIG_LWIP_ICMP`

CONFIG_LWIP_DHCP_STATE_DEBUG

Enable DHCP state tracking

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_DHCP_DEBUG

Enable DHCP debug messages

Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`

Default value:

- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_IP6_DEBUG

Enable IP6 debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_ICMP6_DEBUG

Enable ICMP6 debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_TCP_DEBUG

Enable TCP debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

CONFIG_LWIP_SNTP_DEBUG

Enable SNTP debug messages

Found in: Component config > LWIP > CONFIG_LWIP_DEBUG

Default value:

- No (disabled) if *CONFIG_LWIP_DEBUG*

mbedTLS Contains:

- *CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG_MBEDTLS_CHACHA20_C*
- *CONFIG_MBEDTLS_ECP_C*
- *CONFIG_MBEDTLS_CMAC_C*

- `CONFIG_MBEDTLS_TLS_MODE`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

CONFIG_MBEDTLS_MEM_ALLOC_MODE

Memory allocation strategy

Found in: `Component config > mbedTLS`

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default `malloc()` behavior in ESP-IDF
- Custom allocation mode, by overwriting `calloc()/free()` using `mbedtls_platform_set_calloc_free()` function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (`MBEDTLS_INTERNAL_MEM_ALLOC`)
- External SPIRAM (`MBEDTLS_EXTERNAL_MEM_ALLOC`)
- Default alloc mode (`MBEDTLS_DEFAULT_MEM_ALLOC`)
- Custom alloc mode (`MBEDTLS_CUSTOM_MEM_ALLOC`)
- Internal IRAM (`MBEDTLS_IRAM_8BIT_MEM_ALLOC`)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

Found in: `Component config > mbedTLS`

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (`max_fragment_length`, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of `MBEDTLS_ERR_SSL_INVALID_RECORD` (-0x7200).

Range:

- from 512 to 16384

Default value:

- 16384

CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

Asymmetric in/out fragment length

Found in: [Component config](#) > [mbedtls](#)

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN

TLS maximum incoming fragment length

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN](#)

This defines maximum incoming fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

Range:

- from 512 to 16384

Default value:

- 16384

CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN

TLS maximum outgoing fragment length

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN](#)

This defines maximum outgoing fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

Range:

- from 512 to 16384

Default value:

- 4096

CONFIG_MBEDTLS_DYNAMIC_BUFFER

Using dynamic TX/RX buffer

Found in: [Component config](#) > [mbedtls](#)

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN” , so to save more heap, users can set the options to be an appropriate value.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS` && `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

CONFIG_MBEDTLS_DYNAMIC_FREE_PEER_CERT

Free SSL peer certificate after its usage

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER`

Free peer certificate after its usage in handshake process.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free private key and DHM data after its usage

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER`

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

Found in: `Component config > mbedTLS`

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

Default value:

- No (disabled)

CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG

Set mbedTLS debugging level

Available options:

- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedTLS v2.28.x related Contains:

- *DTLS-based configurations*
- *CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION*
- *CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK*
- *CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE*
- *CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT*
- *CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH*

CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

Variable SSL buffer length

Found in: Component config > mbedTLS > mbedTLS v2.28.x related

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT

Use a backward compatible ECDH context (Experimental)

Found in: Component config > mbedTLS > mbedTLS v2.28.x related

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS_ECP_RESTARTABLE or if you want to access ECDH context fields directly.

Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK

Enable trusted certificate callbacks

Found in: Component config > mbedTLS > mbedTLS v2.28.x related

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION

Enable serialization of the TLS context structures

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE

Keep peer certificate after handshake completion

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_DYNAMIC_FREE_PEER_CERT](#)

DTLS-based configurations Contains:

- [CONFIG_MBEDTLS_SSL_DTLS_SRTP](#)
- [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Support for the DTLS Connection ID extension

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

Default value:

- No (disabled) if [CONFIG_MBEDTLS_SSL_PROTO_DTLS](#)

CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX

Maximum length of CIDs used for incoming DTLS messages

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Maximum length of CIDs used for incoming DTLS messages

Range:

- from 0 to 32 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Default value:

- 32 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Maximum length of CIDs used for outgoing DTLS messages

Range:

- from 0 to 32 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Default value:

- 32 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY

Record plaintext padding (for DTLS 1.2)

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

Notes: A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

Range:

- from 0 to 32 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

Default value:

- 16 if [CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID](#)

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

Default value:

- No (disabled) if [CONFIG_MBEDTLS_SSL_PROTO_DTLS](#)

Certificate Bundle Contains:

- [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#)

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Available options:

- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Default value:

- No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#) > [CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS

Maximum no of certificates allowed in certificate bundle

Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG_MBEDTLS_CERTIFICATE_BUNDLE](#)

Default value:

- 200

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedtls ecp restartable

Found in: [Component config](#) > [mbedtls](#)

Enable “non-blocking” ECC operations that can return early and be resumed.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CMAC_C

Enable CMAC mode for block ciphers

Found in: [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

Default value:

- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES

Enable hardware AES acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_AES_USE_INTERRUPT

Use interrupt for long AES operations

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HARDWARE_AES](#)

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HARDWARE_MPI

Enable hardware MPI (bignum) acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_SHA

Enable hardware SHA acceleration

Found in: [Component config](#) > [mbedtls](#)

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

Default value:

- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_ROM_MD5

Use MD5 implementation in ROM

Found in: [Component config](#) > [mbedtls](#)

Use ROM MD5 in mbedtls.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

Found in: [Component config](#) > [mbedtls](#)

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:

- No (disabled)

CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

Found in: [Component config](#) > [mbedtls](#)

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:

- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME

Enable mbedtls time support

Found in: [Component config](#) > [mbedtls](#)

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE

Enable mbedtls certificate expiry check

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_HAVE_TIME](#)

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECDSA_DETERMINISTIC

Enable deterministic ECDSA

Found in: [Component config](#) > [mbedtls](#)

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SHA512_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

Found in: [Component config](#) > [mbedtls](#)

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

Found in: [Component config](#) > [mbedtls](#)

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

TLS Key Exchange Methods

 Contains:

- [CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE](#)
- [CONFIG_MBEDTLS_PSK_MODES](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_RSA](#)
- [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

CONFIG_MBEDTLS_PSK_MODES

Enable pre-shared-key ciphersuites

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

Default value:

- No (disabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

Default value:

- No (disabled) if [CONFIG_MBEDTLS_PSK_MODES](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK

Enable ECDHE-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#) && [CONFIG_MBEDTLS_ECDH_C](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_PSK_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

Default value:

- Yes (enabled) if [CONFIG_MBEDTLS_PSK_MODES](#)

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

Found in: [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA

Enable ECDH-RSA based ciphersuite modes

Found in: [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE

Enable ECJPAKE based ciphersuite modes

Found in: [Component config > mbedTLS > TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

Default value:

- No (disabled) if [CONFIG_MBEDTLS_ECJPAKE_C](#) && [CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED](#)

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

Found in: [Component config > mbedTLS](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_SSL3

Legacy SSL 3.0 support

Found in: [Component config > mbedTLS](#)

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1

Support TLS 1.0 protocol

Found in: [Component config](#) > [mbedtls](#)

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_1

Support TLS 1.1 protocol

Found in: [Component config](#) > [mbedtls](#)

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

Found in: [Component config](#) > [mbedtls](#)

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1

Support GM/T SSL 1.1 protocol

Found in: [Component config](#) > [mbedtls](#)

Provisions for GM/T SSL 1.1 support

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS

Support DTLS protocol (all versions)

Found in: [Component config](#) > [mbedtls](#)

Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

Default value:

- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN

Support ALPN (Application Layer Protocol Negotiation)

Found in: [Component config](#) > [mbedtls](#)

Disabling this option will save some code size if it is not needed.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

Found in: [Component config > mbedTLS](#)

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_KEY_USAGE

Enable verification of the keyUsage extension

Found in: [Component config > mbedTLS](#)

Disabling this avoids problems with mis-issued and/or misused (intermediate) CA and leaf certificates. Depending on your PKI use, disabling this can be a security risk.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_EXTENDED_KEY_USAGE

Enable verification of the extendedKeyUsage extension

Found in: [Component config > mbedTLS](#)

Disabling this avoids problems with mis-issued and/or misused certificates. Depending on your PKI use, disabling this can be a security risk.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

Found in: [Component config > mbedTLS](#)

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:

- Yes (enabled)

Symmetric Ciphers Contains:

- [CONFIG_MBEDTLS_AES_C](#)
- [CONFIG_MBEDTLS_BLOWFISH_C](#)
- [CONFIG_MBEDTLS_CAMELLIA_C](#)
- [CONFIG_MBEDTLS_CCM_C](#)
- [CONFIG_MBEDTLS_DES_C](#)
- [CONFIG_MBEDTLS_GCM_C](#)
- [CONFIG_MBEDTLS_NIST_KW_C](#)
- [CONFIG_MBEDTLS_RC4_MODE](#)
- [CONFIG_MBEDTLS_XTEA_C](#)

CONFIG_MBEDTLS_AES_C

AES block cipher

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_CAMELLIA_C

Camellia block cipher

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Default value:

- No (disabled)

CONFIG_MBEDTLS_DES_C

DES block cipher (legacy, insecure)

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

Default value:

- No (disabled)

CONFIG_MBEDTLS_RC4_MODE

RC4 Stream Cipher (legacy, insecure)

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

Available options:

- Disabled (MBEDTLS_RC4_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS_RC4_ENABLED_NO_DEFAULT)
- Enabled (MBEDTLS_RC4_ENABLED)

CONFIG_MBEDTLS_BLOWFISH_C

Blowfish block cipher (read help)

Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

Default value:

- No (disabled)

CONFIG_MBEDTLS_XTEA_C

XTEA block cipher

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the XTEA block cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CCM_C

CCM (Counter with CBC-MAC) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_GCM_C

GCM (Galois/Counter) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C

NIST key wrapping (KW) and KW padding (KWP)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable NIST key wrapping and key wrapping padding.

Default value:

- No (disabled)

CONFIG_MBEDTLS_RIPEMD160_C

Enable RIPEMD-160 hash algorithm

Found in: Component config > mbedTLS

Enable the RIPEMD-160 hash algorithm.

Default value:

- No (disabled)

Certificates Contains:

- [CONFIG_MBEDTLS_PEM_PARSE_C](#)
- [CONFIG_MBEDTLS_PEM_WRITE_C](#)
- [CONFIG_MBEDTLS_X509_CRL_PARSE_C](#)
- [CONFIG_MBEDTLS_X509_CSR_PARSE_C](#)

CONFIG_MBEDTLS_PEM_PARSE_C

Read & Parse PEM formatted certificates

Found in: Component config > mbedTLS > Certificates

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C

Write PEM formatted certificates

Found in: Component config > mbedTLS > Certificates

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C

X.509 CRL parsing

Found in: Component config > mbedTLS > Certificates

Support for parsing X.509 Certificate Revocation Lists.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C

X.509 CSR parsing

Found in: Component config > mbedTLS > Certificates

Support for parsing X.509 Certificate Signing Requests

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_C

Elliptic Curve Ciphers

Found in: Component config > mbedTLS

Default value:

- Yes (enabled)

Contains:

- *CONFIG_MBEDTLS_ECDH_C*
- *CONFIG_MBEDTLS_ECJPAKE_C*
- *CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED*
- *CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED*

- `CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`

CONFIG_MBEDTLS_ECDH_C

Elliptic Curve Diffie-Hellman (ECDH)

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C > CONFIG_MBEDTLS_ECDH_C`

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

Default value:

- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for SECP192R1 Elliptic Curve.

Default value:

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for SECP224R1 Elliptic Curve.

Default value:

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

Enable SECP256R1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP256R1 Elliptic Curve.

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED

Enable SECP384R1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP384R1 Elliptic Curve.

Default value:

- Yes (enabled) if ([CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN](#) || [CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY](#)) && [CONFIG_MBEDTLS_ECP_C](#)

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED

Enable SECP521R1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP521R1 Elliptic Curve.

Default value:

- Yes (enabled) if ([CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN](#) || [CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY](#)) && [CONFIG_MBEDTLS_ECP_C](#)

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED

Enable SECP192K1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP192K1 Elliptic Curve.

Default value:

- Yes (enabled) if ([CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN](#) || [CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY](#)) && [CONFIG_MBEDTLS_ECP_C](#)

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED

Enable SECP224K1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP224K1 Elliptic Curve.

Default value:

- Yes (enabled) if ([CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN](#) || [CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY](#)) && [CONFIG_MBEDTLS_ECP_C](#)

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED

Enable SECP256K1 curve

Found in: [Component config](#) > [mbedtls](#) > [CONFIG_MBEDTLS_ECP_C](#)

Enable support for SECP256K1 Elliptic Curve.

Default value:

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED

Enable BP256R1 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED

Enable BP384R1 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED

Enable BP512R1 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED

Enable CURVE25519 curve

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for CURVE25519 Elliptic Curve.

Default value:

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST ‘modulo p’ optimisations

Found in: `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

end of Elliptic Curve options

Default value:

- Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

Found in: [Component config > mbedTLS](#)

Enable support for Poly1305 MAC algorithm.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

Found in: [Component config > mbedTLS](#)

Enable support for Chacha20 stream cipher.

Default value:

- No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C

ChaCha20-Poly1305 AEAD algorithm

Found in: [Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:

- No (disabled) if `CONFIG_MBEDTLS_CHACHA20_C` && `CONFIG_MBEDTLS_POLY1305_C`

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

Found in: [Component config > mbedTLS](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

Found in: [Component config > mbedTLS](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

Default value:

- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

Found in: [Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C](#)

Enable threading alt to allow your own alternate threading implementation.

Default value:

- Yes (enabled) if *CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C

Enable the pthread wrapper layer for the threading layer.

Default value:

- No (disabled) if *CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

Found in: Component config > mbedTLS

Fallback to software implementation for RSA key lengths larger than *SOC_RSA_MAX_BIT_LEN*. If this is not active then the ESP will be unable to process keys greater than *SOC_RSA_MAX_BIT_LEN*.

Default value:

- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS

Show configurations with potential security risks

Found in: Component config > mbedTLS

Default value:

- No (disabled)

Contains:

- *CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT*

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

X.509 CRT parsing with unsupported critical extensions

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

Default value:

- No (disabled) if *CONFIG_MBEDTLS_SECURITY_RISKS*

mDNS Contains:

- *CONFIG_MDNS_MAX_SERVICES*
- *CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS*
- *CONFIG_MDNS_STRICT_MODE*
- *CONFIG_MDNS_TASK_AFFINITY*
- *CONFIG_MDNS_TASK_PRIORITY*
- *CONFIG_MDNS_TASK_STACK_SIZE*
- *CONFIG_MDNS_TIMER_PERIOD_MS*
- *CONFIG_MDNS_MULTIPLE_INSTANCE*
- *CONFIG_MDNS_NETWORKING_SOCKET*

CONFIG_MDNS_MAX_SERVICES

Max number of services

Found in: [Component config](#) > [mDNS](#)

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

Range:

- from 1 to 64

Default value:

- 10

CONFIG_MDNS_TASK_PRIORITY

mDNS task priority

Found in: [Component config](#) > [mDNS](#)

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

Range:

- from 1 to 255

Default value:

- 1

CONFIG_MDNS_TASK_STACK_SIZE

mDNS task stack size

Found in: [Component config](#) > [mDNS](#)

Allows setting mDNS task stacksize.

Default value:

- 4096

CONFIG_MDNS_TASK_AFFINITY

mDNS task affinity

Found in: [Component config](#) > [mDNS](#)

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

Available options:

- No affinity (MDNS_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (MDNS_TASK_AFFINITY_CPU0)
- CPU1 (MDNS_TASK_AFFINITY_CPU1)

CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS

mDNS adding service timeout (ms)

Found in: [Component config](#) > [mDNS](#)

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

Range:

- from 10 to 30000

Default value:

- 2000

CONFIG_MDNS_STRICT_MODE

mDNS strict mode

Found in: [Component config](#) > [mDNS](#)

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mdns resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

Default value:

- No (disabled)

CONFIG_MDNS_TIMER_PERIOD_MS

mDNS timer period (ms)

Found in: [Component config](#) > [mDNS](#)

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

Range:

- from 10 to 10000

Default value:

- 100

CONFIG_MDNS_NETWORKING_SOCKET

Use BSD sockets for mdns networking

Found in: [Component config](#) > [mDNS](#)

Enables optional mdns networking implementation using BSD sockets in UDP multicast mode. This option creates a new thread to serve receiving packets (TODO). This option uses additional N sockets, where N is number of interfaces.

Default value:

- No (disabled)

CONFIG_MDNS_MULTIPLE_INSTANCE

Multiple instances under the same service type

Found in: [Component config](#) > [mDNS](#)

Enables adding multiple service instances under the same service type.

Default value:

- Yes (enabled)

ESP-MQTT Configurations Contains:

- [CONFIG_MQTT_CUSTOM_OUTBOX](#)
- [CONFIG_MQTT_TRANSPORT_SSL](#)
- [CONFIG_MQTT_TRANSPORT_WEBSOCKET](#)
- [CONFIG_MQTT_PROTOCOL_311](#)
- [CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED](#)
- [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)
- [CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS](#)

- [CONFIG_MQTT_REPORT_DELETED_MESSAGES](#)
- [CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED](#)
- [CONFIG_MQTT_MSG_ID_INCREMENTAL](#)

CONFIG_MQTT_PROTOCOL_311

Enable MQTT protocol 3.1.1

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

If not, this library will use MQTT protocol 3.1

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_SSL

Enable MQTT over SSL

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Enable MQTT transport over SSL with mbedtls

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT over Websocket

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Enable MQTT transport over Websocket.

Default value:

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_TRANSPORT_WEBSOCKET](#)

Enable MQTT transport over Websocket Secure.

Default value:

- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

Default value:

- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

Default value:

- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

Default value:

- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

Found in: [Component config](#) > [ESP-MQTT Configurations](#)

Custom MQTT configurations.

Default value:

- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

Default MQTT over TCP port

Default value:

- 1883 if [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

CONFIG_MQTT_SSL_DEFAULT_PORT

Default MQTT over SSL port

Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG_MQTT_USE_CUSTOM_CONFIG](#)

Default MQTT over SSL port

Default value:

- 8883 if [CONFIG_MQTT_USE_CUSTOM_CONFIG](#) && [CONFIG_MQTT_TRANSPORT_SSL](#)

CONFIG_MQTT_WS_DEFAULT_PORT

Default MQTT over Websocket port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket port

Default value:

- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

CONFIG_MQTT_WSS_DEFAULT_PORT

Default MQTT over Websocket Secure port

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket Secure port

Default value:

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

CONFIG_MQTT_BUFFER_SIZE

Default MQTT Buffer Size

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

This buffer size using for both transmit and receive

Default value:

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_TASK_STACK_SIZE

MQTT task stack size

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task stack size

Default value:

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_DISABLE_API_LOCKS

Disable API locks

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

Default value:

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task priority. Higher number denotes higher priority.

Default value:

- 5 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

Found in: Component config > ESP-MQTT Configurations

This will enable core selection

Default value:

- “false”

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use ?

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Available options:

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

Found in: Component config > ESP-MQTT Configurations

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar).

Default value:

- No (disabled)

CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS

Outbox message expired timeout[ms]

Found in: Component config > ESP-MQTT Configurations

Messages which stays in the outbox longer than this value before being published will be discarded.

Default value:

- 30000 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*

Newlib Contains:

- *CONFIG_NEWLIB_NANO_FORMAT*
- *CONFIG_NEWLIB_STDIN_LINE_ENDING*
- *CONFIG_NEWLIB_STDOUT_LINE_ENDING*

CONFIG_NEWLIB_STDOUT_LINE_ENDING

Line ending for UART output

Found in: Component config > Newlib

This option allows configuring the desired line endings sent to UART when a newline (‘n’ , LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

CONFIG_NEWLIB_STDIN_LINE_ENDING

Line ending for UART input

Found in: [Component config](#) > [Newlib](#)

This option allows configuring which input sequence on UART produces a newline ('n' , LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

CONFIG_NEWLIB_NANO_FORMAT

Enable 'nano' formatting options for printf/scanf family

Found in: [Component config](#) > [Newlib](#)

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for 'enable-newlib-nano-formatted-io' : <https://sourceware.org/newlib/README>

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

Default value:

- No (disabled)

NVS Contains:

- [CONFIG_NVS_ENCRYPTION](#)
- [CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG](#)
- [CONFIG_NVS_ASSERT_ERROR_CHECK](#)

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

Found in: *Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

Default value:

- Yes (enabled) if *CONFIG_SECURE_FLASH_ENC_ENABLED*

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

Found in: *Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK

Use assertions for error checking

Found in: *Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

Default value:

- No (disabled)

OpenSSL Contains:

- *CONFIG_OPENSSL_DEBUG*
- *CONFIG_OPENSSL_ERROR_STACK*
- *CONFIG_OPENSSL_LOWLEVEL_DEBUG*
- *CONFIG_OPENSSL_DEBUG_LEVEL*
- *CONFIG_OPENSSL_ASSERT*

CONFIG_OPENSSL_DEBUG

Enable OpenSSL debugging

Found in: *Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL_DEBUG” works.

Default value:

- No (disabled)

CONFIG_OPENSSL_ERROR_STACK

Enable OpenSSL error structure

Found in: *Component config > OpenSSL*

Enable OpenSSL Error reporting

Default value:

- Yes (enabled)

CONFIG_OPENSSL_DEBUG_LEVEL

OpenSSL debugging level

Found in: [Component config](#) > [OpenSSL](#)

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL_DEBUG_LEVEL” works.

For example: If OPENSSL_DEBUG_LEVEL = 2, you use function “SSL_DEBUG(1, “malloc failed”)” . Because 1 < 2, it will not print.

Range:

- from 0 to 255 if [CONFIG_OPENSSL_DEBUG](#)

Default value:

- 0 if [CONFIG_OPENSSL_DEBUG](#)

CONFIG_OPENSSL_LOWLEVEL_DEBUG

Enable OpenSSL low-level module debugging

Found in: [Component config](#) > [OpenSSL](#)

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.

Default value:

- No (disabled) if [CONFIG_OPENSSL_DEBUG](#)

CONFIG_OPENSSL_ASSERT

Select OpenSSL assert function

Found in: [Component config](#) > [OpenSSL](#)

OpenSSL function needs “assert” function to check if input parameters are valid.

If you want to use assert debugging function, “OPENSSL_DEBUG” should be enabled.

Available options:

- Do nothing (OPENSSL_ASSERT_DO_NOTHING)
Do nothing and “SSL_ASSERT” does not work.
- Check and exit (OPENSSL_ASSERT_EXIT)
Enable assert exiting, it will check and return error code.
- Show debugging message (OPENSSL_ASSERT_DEBUG)
Enable assert debugging, it will check and show debugging message.
- Show debugging message and exit (OPENSSL_ASSERT_DEBUG_EXIT)
Enable assert debugging and exiting, it will check, show debugging message and return error code.
- Show debugging message and block (OPENSSL_ASSERT_DEBUG_BLOCK)
Enable assert debugging and blocking, it will check, show debugging message and block by “while (1);” .

OpenThread Contains:

- [CONFIG_OPENTHREAD_ENABLED](#)

CONFIG_OPENTHREAD_ENABLED

OpenThread

Found in: [Component config](#) > [OpenThread](#)

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

Default value:

- No (disabled)

CONFIG_OPENTHREAD_RADIO_TYPE

Config the Thread radio type

Found in: [Component config](#) > [OpenThread](#) > [CONFIG_OPENTHREAD_ENABLED](#)

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
Select this to connect to a Radio Co-Processor via UART.

CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

Found in: [Component config](#) > [OpenThread](#) > [CONFIG_OPENTHREAD_ENABLED](#)

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (OPENTHREAD_FTD)
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD_MTD)
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD_RADIO)
Select this to enable Radio Only Device which cannot can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_DIAG

Enable diag

Found in: [Component config](#) > [OpenThread](#) > [CONFIG_OPENTHREAD_ENABLED](#)

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

Default value:

- Yes (enabled) if [CONFIG_OPENTHREAD_ENABLED](#)

CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

Found in: [Component config](#) > [OpenThread](#) > [CONFIG_OPENTHREAD_ENABLED](#)

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_JOINER

Enable Joiner

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_SRP_CLIENT

Enable SRP Client

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_BORDER_ROUTER

Enable Border Router

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable border router features in OpenThread.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_ESP_LIB_FROM_INTERNAL_SRC

Build esp_openthread libraries from source

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Override the shipped libopenthread_br.a and libopenthread_port.a, for internal builds.

Default value:

- No (disabled) if *CONFIG_OPENTHREAD_ENABLED*

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Range:

- from 50 to 100 if *CONFIG_OPENTHREAD_ENABLED*

Default value:

- 65 if *CONFIG_OPENTHREAD_ENABLED*

PThreads Contains:

- [CONFIG_PTHREAD_TASK_NAME_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_CORE_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_PRIO_DEFAULT](#)
- [CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT](#)
- [CONFIG_PTHREAD_STACK_MIN](#)

CONFIG_PTHREAD_TASK_PRIO_DEFAULT

Default task priority

Found in: [Component config](#) > [PThreads](#)

Priority used to create new tasks with default pthread parameters.

Range:

- from 0 to 255

Default value:

- 5

CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT

Default task stack size

Found in: [Component config](#) > [PThreads](#)

Stack size used to create new tasks with default pthread parameters.

Default value:

- 3072

CONFIG_PTHREAD_STACK_MIN

Minimum allowed pthread stack size

Found in: [Component config](#) > [PThreads](#)

Minimum allowed pthread stack size set in attributes passed to pthread_create

Default value:

- 768

CONFIG_PTHREAD_TASK_CORE_DEFAULT

Default pthread core affinity

Found in: [Component config](#) > [PThreads](#)

The default core to which pthreads are pinned.

Available options:

- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

Found in: [Component config](#) > [PThreads](#)

The default name of pthreads.

Default value:

- “pthread”

SPI Flash driver Contains:

- *Auto-detect flash chips*
- *CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE*
- *CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE*
- *CONFIG_SPI_FLASH_ENABLE_COUNTERS*
- *CONFIG_SPI_FLASH_ROM_DRIVER_PATCH*
- *CONFIG_SPI_FLASH_YIELD_DURING_ERASE*
- *CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED*
- *CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE*
- *CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST*
- *CONFIG_SPI_FLASH_SIZE_OVERRIDE*
- *CONFIG_SPI_FLASH_SHARE_SPII_BUS*
- *CONFIG_SPI_FLASH_ROM_IMPL*
- *CONFIG_SPI_FLASH_USE_LEGACY_IMPL*
- *CONFIG_SPI_FLASH_VERIFY_WRITE*
- *CONFIG_SPI_FLASH_DANGEROUS_WRITE*

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

Found in: Component config > SPI Flash driver

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

Default value:

- No (disabled) if *CONFIG_SPI_FLASH_VERIFY_WRITE*

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

Default value:

- No (disabled) if *CONFIG_SPI_FLASH_VERIFY_WRITE*

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

Found in: [Component config](#) > [SPI Flash driver](#)

This option enables the following APIs:

- spi_flash_reset_counters
- spi_flash_dump_counters
- spi_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

Default value:

- 0

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

Found in: [Component config](#) > [SPI Flash driver](#)

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ROM_IMPL

Use esp_flash implementation in ROM

Found in: [Component config](#) > [SPI Flash driver](#)

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI_FLASH_AUTO_SUSPEND (C3, S3)

Default value:

- No (disabled)

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

Found in: [Component config](#) > [SPI Flash driver](#)

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature **does not** check calls to the esp_rom_XXX SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_USE_LEGACY_IMPL

Use the legacy implementation before IDF v4.0

Found in: [Component config](#) > [SPI Flash driver](#)

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_SHARE_SPI1_BUS

Support other devices attached to SPI1 bus

Found in: [Component config](#) > [SPI Flash driver](#)

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

Default value:

- No (disabled) if [CONFIG_SPI_FLASH_USE_LEGACY_IMPL](#)

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

Found in: [Component config](#) > [SPI Flash driver](#)

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

Found in: [Component config](#) > [SPI Flash driver](#)

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG_SPI_FLASH_YIELD_DURING_ERASE](#)

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

Default value:

- 20

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG_SPI_FLASH_YIELD_DURING_ERASE](#)

Defines how many ticks will be before returning to continue a erasing.

Default value:

- 1

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

Found in: [Component config](#) > [SPI Flash driver](#)

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

Range:

- from 256 to 8192

Default value:

- 8192

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

Found in: [Component config](#) > [SPI Flash driver](#)

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

Default value:

- No (disabled)

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

Found in: [Component config](#) > [SPI Flash driver](#)

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

Default value:

- No (disabled) if [CONFIG_SPI_FLASH_USE_LEGACY_IMPL](#)

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

Found in: [Component config](#) > [SPI Flash driver](#)

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default_registered_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

Default value:

- No (disabled) if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`

Auto-detect flash chips Contains:

- `CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_OPI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_TH_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_OPI_CHIP

mxic (opi)

Found in: Component config > SPI Flash driver > Auto-detect flash chips

Enable this to support auto detection of Octal MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

Default value:

- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

Found in: Component config > SPI Flash driver

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

Default value:

- Yes (enabled)

SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG_SPIFFS_USE_MAGIC*
- *CONFIG_SPIFFS_GC_STATS*
- *CONFIG_SPIFFS_PAGE_CHECK*
- *CONFIG_SPIFFS_FOLLOW_SYMLINKS*
- *CONFIG_SPIFFS_MAX_PARTITIONS*
- *CONFIG_SPIFFS_USE_MTIME*

- [CONFIG_SPIFFS_GC_MAX_RUNS](#)
- [CONFIG_SPIFFS_OBJ_NAME_LEN](#)
- [CONFIG_SPIFFS_META_LENGTH](#)
- [SPIFFS Cache Configuration](#)
- [CONFIG_SPIFFS_PAGE_SIZE](#)
- [CONFIG_SPIFFS_MTIME_WIDE_64_BITS](#)

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

Found in: [Component config](#) > [SPIFFS Configuration](#)

Define maximum number of partitions that can be mounted.

Range:

- from 1 to 10

Default value:

- 3

SPIFFS Cache Configuration Contains:

- [CONFIG_SPIFFS_CACHE](#)

CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#)

Enables/disable memory read caching of nucleus file system operations.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_WR

Enable SPIFFS Write Caching

Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG_SPIFFS_CACHE](#)

Enables memory write caching for file descriptors in hydrogen.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS

Enable SPIFFS Cache Statistics

Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG_SPIFFS_CACHE](#)

Enable/disable statistics on caching. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_CHECK

Enable SPIFFS Page Check

Found in: [Component config](#) > [SPIFFS Configuration](#)

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS

Set Maximum GC Runs

Found in: [Component config](#) > [SPIFFS Configuration](#)

Define maximum number of GC runs to perform to reach desired free pages.

Range:

- from 1 to 255

Default value:

- 10

CONFIG_SPIFFS_GC_STATS

Enable SPIFFS GC Statistics

Found in: [Component config](#) > [SPIFFS Configuration](#)

Enable/disable statistics on gc. Debug/test purpose only.

Default value:

- No (disabled)

CONFIG_SPIFFS_PAGE_SIZE

SPIFFS logical page size

Found in: [Component config](#) > [SPIFFS Configuration](#)

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

Range:

- from 256 to 1024

Default value:

- 256

CONFIG_SPIFFS_OBJ_NAME_LEN

Set SPIFFS Maximum Name Length

Found in: [Component config](#) > [SPIFFS Configuration](#)

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Range:

- from 1 to 256

Default value:

- 32

CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

Found in: [Component config](#) > [SPIFFS Configuration](#)

If this option is enabled, symbolic links are taken into account during partition image creation.

Default value:

- No (disabled)

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

Found in: [Component config](#) > [SPIFFS Configuration](#)

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG_SPIFFS_USE_MAGIC](#)

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

Found in: [Component config](#) > [SPIFFS Configuration](#)

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

$SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH$ should not exceed $SPIFFS_PAGE_SIZE - 64$.

Default value:

- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

Found in: [Component config](#) > [SPIFFS Configuration](#)

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

Default value:

- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

Found in: [Component config](#) > [SPIFFS Configuration](#)

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support time_t 64 bits (see SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS).

Default value:

- No (disabled) if *CONFIG_SPIFFS_META_LENGTH* >= 8

Debug Configuration Contains:

- [CONFIG_SPIFFS_DBG](#)
- [CONFIG_SPIFFS_API_DBG](#)
- [CONFIG_SPIFFS_CACHE_DBG](#)
- [CONFIG_SPIFFS_CHECK_DBG](#)
- [CONFIG_SPIFFS_TEST_VISUALISATION](#)
- [CONFIG_SPIFFS_GC_DBG](#)

CONFIG_SPIFFS_DBG

Enable general SPIFFS debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print general debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_API_DBG

Enable SPIFFS API debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print API debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_GC_DBG

Enable SPIFFS Garbage Cleaner debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print GC debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CACHE_DBG

Enable SPIFFS Cache debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print cache debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_CHECK_DBG

Enable SPIFFS Filesystem Check debug

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enabling this option will print Filesystem Check debug messages to the console.

Default value:

- No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION

Enable SPIFFS Filesystem Visualization

Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)

Enable this option to enable SPIFFS_vis function in the API.

Default value:

- No (disabled)

TCP Transport Contains:

- [Websocket](#)

Websocket Contains:

- [CONFIG_WS_TRANSPORT](#)

CONFIG_WS_TRANSPORT

Enable Websocket Transport

Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)

Enable support for creating websocket transport.

Default value:

- Yes (enabled)

CONFIG_WS_BUFFER_SIZE

Websocket transport buffer size

Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG_WS_TRANSPORT](#)

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:

- 1024

TinyUSB Stack Contains:

- [CONFIG_TINYUSB](#)

CONFIG_TINYUSB

Use TinyUSB Stack

Found in: [Component config](#) > [TinyUSB Stack](#)

Enable TinyUSB stack support. Note that, esp-idf only uses the device stack provided by TinyUSB.

Default value:

- No (disabled)

CONFIG_TINYUSB_DEBUG_LEVEL

TinyUSB log level (0-3)

Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG_TINYUSB](#)

Specify verbosity of TinyUSB log output.

Range:

- from 0 to 3 if [CONFIG_TINYUSB](#)

Default value:

- 0 if [CONFIG_TINYUSB](#)

TinyUSB task configuration

 Contains:

- [CONFIG_TINYUSB_NO_DEFAULT_TASK](#)
- [CONFIG_TINYUSB_TASK_PRIORITY](#)
- [CONFIG_TINYUSB_TASK_STACK_SIZE](#)

CONFIG_TINYUSB_NO_DEFAULT_TASK

Do not create a TinyUSB task

Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG_TINYUSB](#) > [TinyUSB task configuration](#)

This option allows to not create the FreeRTOS task during the driver initialization. User will have to handle TinyUSB events manually.

Default value:

- No (disabled) if [CONFIG_TINYUSB](#)

CONFIG_TINYUSB_TASK_PRIORITY

TinyUSB task priority

Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG_TINYUSB](#) > [TinyUSB task configuration](#)

Set the priority of the default TinyUSB main task.

Default value:

- 5 if [CONFIG_TINYUSB_NO_DEFAULT_TASK](#) && [CONFIG_TINYUSB](#)

CONFIG_TINYUSB_TASK_STACK_SIZE

TinyUSB task stack size (bytes)

Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG_TINYUSB](#) > [TinyUSB task configuration](#)

Set the stack size of the default TinyUSB main task.

Default value:

- 4096 if [CONFIG_TINYUSB_NO_DEFAULT_TASK](#) && [CONFIG_TINYUSB](#)

Descriptor configuration Contains:

- `CONFIG_TINYUSB_DESC_BCD_DEVICE`
- `CONFIG_TINYUSB_DESC_CDC_STRING`
- `CONFIG_TINYUSB_DESC_HID_STRING`
- `CONFIG_TINYUSB_DESC_MANUFACTURER_STRING`
- `CONFIG_TINYUSB_DESC_MSC_STRING`
- `CONFIG_TINYUSB_DESC_CUSTOM_PID`
- `CONFIG_TINYUSB_DESC_USE_DEFAULT_PID`
- `CONFIG_TINYUSB_DESC_PRODUCT_STRING`
- `CONFIG_TINYUSB_DESC_SERIAL_STRING`
- `CONFIG_TINYUSB_DESC_CUSTOM_VID`
- `CONFIG_TINYUSB_DESC_USE_ESPRESSIF_VID`

CONFIG_TINYUSB_DESC_USE_ESPRESSIF_VID

VID: Use Espressif's vendor ID

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Enable this option, USB device will use Espressif's vendor ID as its VID. This is helpful at product develop stage.

Default value:

- Yes (enabled) if `CONFIG_TINYUSB`

CONFIG_TINYUSB_DESC_CUSTOM_VID

VID: Custom vendor ID

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Custom Vendor ID.

Default value:

- "0x1234" if `CONFIG_TINYUSB_DESC_USE_ESPRESSIF_VID` && `CONFIG_TINYUSB`

CONFIG_TINYUSB_DESC_USE_DEFAULT_PID

PID: Use a default PID assigned to TinyUSB

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Default TinyUSB PID assigning uses values 0x4000...0x4007.

Default value:

- Yes (enabled) if `CONFIG_TINYUSB`

CONFIG_TINYUSB_DESC_CUSTOM_PID

PID: Custom product ID

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Custom Product ID.

Default value:

- "0x5678" if `CONFIG_TINYUSB_DESC_USE_DEFAULT_PID` && `CONFIG_TINYUSB`

CONFIG_TINYUSB_DESC_BCD_DEVICE

bcdDevice

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Version of the firmware of the USB device.

Default value:

- “0x0100” if *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_MANUFACTURER_STRING

Manufacturer name

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Name of the manufacturer of the USB device.

Default value:

- “Espressif Systems” if *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_PRODUCT_STRING

Product name

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Name of the USB device.

Default value:

- “Espressif Device” if *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_SERIAL_STRING

Serial string

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Serial number of the USB device.

Default value:

- 123456 if *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_CDC_STRING

CDC Device String

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Name of the CDC device.

Default value:

- “Espressif CDC Device” if *CONFIG_TINYUSB_CDC_ENABLED* && *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_MSC_STRING

MSC Device String

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Name of the MSC device.

Default value:

- “Espressif MSC Device” if *CONFIG_TINYUSB_MSC_ENABLED* && *CONFIG_TINYUSB*

CONFIG_TINYUSB_DESC_HID_STRING

HID Device String

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Descriptor configuration

Name of the HID device

Default value:

- “Espressif HID Device” if TINYUSB_HID_ENABLED && *CONFIG_TINYUSB*

Massive Storage Class (MSC) Contains:

- *CONFIG_TINYUSB_MSC_ENABLED*

CONFIG_TINYUSB_MSC_ENABLED

Enable TinyUSB MSC feature

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Massive Storage Class (MSC)

Enable TinyUSB MSC feature.

Default value:

- No (disabled) if *CONFIG_TINYUSB*

CONFIG_TINYUSB_MSC_BUFSIZE

MSC FIFO size

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Massive Storage Class (MSC) > CONFIG_TINYUSB_MSC_ENABLED

MSC FIFO size, in bytes.

Range:

- from 64 to 10000 if *CONFIG_TINYUSB_MSC_ENABLED* && *CONFIG_TINYUSB*

Default value:

- 512 if *CONFIG_TINYUSB_MSC_ENABLED* && *CONFIG_TINYUSB*

Communication Device Class (CDC) Contains:

- *CONFIG_TINYUSB_CDC_ENABLED*

CONFIG_TINYUSB_CDC_ENABLED

Enable TinyUSB CDC feature

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Communication Device Class (CDC)

Enable TinyUSB CDC feature.

Default value:

- No (disabled) if *CONFIG_TINYUSB*

CONFIG_TINYUSB_CDC_RX_BUFSIZE

CDC FIFO size of RX channel

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Communication Device Class (CDC) > CONFIG_TINYUSB_CDC_ENABLED

CDC FIFO size of RX channel.

Range:

- from 64 to 10000 if `CONFIG_TINYUSB_CDC_ENABLED` && `CONFIG_TINYUSB`

Default value:

- 64 if `CONFIG_TINYUSB_CDC_ENABLED` && `CONFIG_TINYUSB`

CONFIG_TINYUSB_CDC_TX_BUFSIZE

CDC FIFO size of TX channel

Found in: Component config > TinyUSB Stack > CONFIG_TINYUSB > Communication Device Class (CDC) > CONFIG_TINYUSB_CDC_ENABLED

CDC FIFO size of TX channel.

Default value:

- 64 if `CONFIG_TINYUSB_CDC_ENABLED` && `CONFIG_TINYUSB`

Unity unit testing library Contains:

- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

CONFIG_UNITY_ENABLE_FLOAT

Support for float type

Found in: Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_DOUBLE

Support for double type

Found in: Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT

Support for 64-bit integer types

Found in: Component config > Unity unit testing library

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to `UNITY_ASSERT_EQUAL`, as that will cause pointer-to-int-cast warnings.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

Found in: [Component config](#) > [Unity unit testing library](#)

If set, Unity will colorize test results using console escape sequences.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

Found in: [Component config](#) > [Unity unit testing library](#)

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

Default value:

- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

Found in: [Component config](#) > [Unity unit testing library](#)

If set, `unity_fixture.h` header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

Default value:

- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

Found in: [Component config](#) > [Unity unit testing library](#)

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as `TEST_ASSERT`, `TEST_FAIL` etc.

Default value:

- No (disabled)

USB-OTG Contains:

- [CONFIG_USB_HOST_HW_BUFFER_BIAS](#)
- [CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE](#)

CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE

Largest size (in bytes) of transfers to/from default endpoints

Found in: [Component config](#) > [USB-OTG](#)

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

Default value:

- 256

CONFIG_USB_HOST_HW_BUFFER_BIAS

Hardware FIFO size biasing

Found in: [Component config](#) > [USB-OTG](#)

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (USB_HOST_HW_BUFFER_BIAS_BALANCED)
- Bias IN (USB_HOST_HW_BUFFER_BIAS_IN)
- Periodic OUT (USB_HOST_HW_BUFFER_BIAS_PERIODIC_OUT)

Virtual file system Contains:

- [CONFIG_VFS_SUPPORT_IO](#)

CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

Found in: [Component config](#) > [Virtual file system](#)

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#)

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT

Provide select function

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#)

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

Default value:

- Yes (enabled) if [CONFIG_VFS_SUPPORT_IO](#) && [CONFIG_LWIP_USE_ONLY_LWIP_SELECT](#)

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#) > [CONFIG_VFS_SUPPORT_SELECT](#)

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

Default value:

- Yes (enabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

Found in: [Component config](#) > [Virtual file system](#) > [CONFIG_VFS_SUPPORT_IO](#)

Disabling this option can save memory when the support for termios.h is not required.

Default value:

- Yes (enabled)

Host File System I/O (Semihosting) Contains:

- [CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS](#)

CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

Host FS: Maximum number of the host filesystem mount points

Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)

Define maximum number of host filesystem mount points.

Default value:

- 1

Wear Levelling Contains:

- [CONFIG_WL_SECTOR_MODE](#)
- [CONFIG_WL_SECTOR_SIZE](#)

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

Found in: Component config > Wear Levelling

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

Found in: Component config > Wear Levelling

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

Wi-Fi Provisioning Manager Contains:

- [CONFIG_WIFI_PROV_BLE_BONDING](#)
- [CONFIG_WIFI_PROV_BLE_SEC_CONN](#)
- [CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION](#)
- [CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV](#)
- [CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES](#)

- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES

Max Wi-Fi Scan Result Entries

Found in: Component config > Wi-Fi Provisioning Manager

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

Range:

- from 1 to 255

Default value:

- 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT

Provisioning auto-stop timeout

Found in: Component config > Wi-Fi Provisioning Manager

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Range:

- from 5 to 600

Default value:

- 30

CONFIG_WIFI_PROV_BLE_BONDING

Enable BLE bonding

Found in: Component config > Wi-Fi Provisioning Manager

This option is applicable only when provisioning transport is BLE.

CONFIG_WIFI_PROV_BLE_SEC_CONN

Enable BLE Secure connection flag

Found in: Component config > Wi-Fi Provisioning Manager

Used to enable Secure connection support when provisioning transport is BLE.

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED`

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION

Force Link Encryption during characteristic Read / Write

Found in: Component config > Wi-Fi Provisioning Manager

Used to enforce link encryption when attempting to read / write characteristic

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#) > [CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV](#)

Default value:

- Yes (enabled) if [CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV](#)

Supplicant Contains:

- [CONFIG_WPA_TESTING_OPTIONS](#)
- [CONFIG_WPA_11KV_SUPPORT](#)
- [CONFIG_WPA_DPP_SUPPORT](#)
- [CONFIG_WPA_MBO_SUPPORT](#)
- [CONFIG_WPA_SUITE_B_192](#)
- [CONFIG_WPA_WAPI_PSK](#)
- [CONFIG_WPA_DEBUG_PRINT](#)
- [CONFIG_WPA_WPS_STRICT](#)
- [CONFIG_WPA_MBEDTLS_CRYPTO](#)

CONFIG_WPA_MBEDTLS_CRYPTO

Use MbedTLS crypto APIs

Found in: [Component config](#) > [Supplicant](#)

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

Default value:

- Yes (enabled)

CONFIG_WPA_WAPI_PSK

Enable WAPI PSK support

Found in: [Component config](#) > [Supplicant](#)

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

Default value:

- No (disabled)

CONFIG_WPA_SUITE_B_192

Enable NSA suite B support with 192 bit key

Found in: [Component config](#) > [Supplicant](#)

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

Default value:

- No (disabled)

CONFIG_WPA_DEBUG_PRINT

Print debug messages from WPA Supplicant

Found in: [Component config](#) > [Supplicant](#)

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

Default value:

- No (disabled)

CONFIG_WPA_TESTING_OPTIONS

Add DPP testing code

Found in: [Component config](#) > [Supplicant](#)

Select this to enable unity test for DPP.

Default value:

- No (disabled)

CONFIG_WPA_WPS_STRICT

Strictly validate all WPS attributes

Found in: [Component config](#) > [Supplicant](#)

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

Default value:

- No (disabled)

CONFIG_WPA_11KV_SUPPORT

Enable 802.11k, 802.11v APIs handling

Found in: [Component config](#) > [Supplicant](#)

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

Default value:

- No (disabled)

CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

Found in: [Component config](#) > [Supplicant](#) > [CONFIG_WPA_11KV_SUPPORT](#)

Keep scan results in cache, if not enabled, those will be flushed immediately.

Default value:

- No (disabled) if [CONFIG_WPA_11KV_SUPPORT](#)

CONFIG_WPA_MBO_SUPPORT

Enable MBO support

Found in: [Component config](#) > [Supplicant](#)

Select this option to enable WiFi Multiband operation certification support.

Default value:

- No (disabled)

CONFIG_WPA_DPP_SUPPORT

Enable DPP support

Found in: *Component config > Supplicant*

Select this option to enable WiFi Easy Connect Support.

Default value:

- No (disabled)

Compatibility options

Contains:

- *CONFIG_LEGACY_INCLUDE_COMMON_HEADERS*

CONFIG_LEGACY_INCLUDE_COMMON_HEADERS

Include headers across components as before IDF v4.0

Found in: *Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It's not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it's changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

Default value:

- No (disabled)

2.9.7 Customisations

Because IDF builds by default with *Warning On Undefined Variables*, when the Kconfig tool generates Makefiles (the `auto.conf` file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that `ifdef` and `ifndef` can still be used in Makefiles, because they test if a variable is defined *and has a non-empty value.*)

When generating header files for C & C++, the behaviour is not customised - so `ifdef` can be used to test if a boolean config item is set or not.

2.10 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

ESP_FAIL (-1): Generic `esp_err_t` code indicating failure

ESP_OK (0): *esp_err_t* value indicating success (no error)

ESP_ERR_NO_MEM (0x101): Out of memory

ESP_ERR_INVALID_ARG (0x102): Invalid argument

ESP_ERR_INVALID_STATE (0x103): Invalid state

ESP_ERR_INVALID_SIZE (0x104): Invalid size

ESP_ERR_NOT_FOUND (0x105): Requested resource not found

ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported

ESP_ERR_TIMEOUT (0x107): Operation timed out

ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid

ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid

ESP_ERR_INVALID_VERSION (0x10a): Version was invalid

ESP_ERR_INVALID_MAC (0x10b): MAC address was invalid

ESP_ERR_NOT_FINISHED (0x10c): There are items remained to retrieve

ESP_ERR_NVS_BASE (0x1100): Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED (0x1101): The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND (0x1102): Id namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY (0x1104): Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105): There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME (0x1106): Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE (0x1107): Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG (0x1109): Key name is too long

ESP_ERR_NVS_PAGE_FULL (0x110a): Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE (0x110b): NVS is in an inconsistent state due to a previous error. Call *nvs_flash_init* and *nvs_open* again, then retry.

ESP_ERR_NVS_INVALID_LENGTH (0x110c): String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call *nvs_flash_init* again.

ESP_ERR_NVS_VALUE_TOO_LONG (0x110e): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111): XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED (0x1112): XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED (0x1113): XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114): XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn't fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

ESP_ERR_EFUSE (0x1600): Base error code for efuse api.

ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING (0x1604): Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

ESP_ERR_IMAGE_BASE (0x2000)

ESP_ERR_IMAGE_FLASH_FAIL (0x2001)

ESP_ERR_IMAGE_INVALID (0x2002)

ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes

ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF (**0x3004**): WiFi interface error

ESP_ERR_WIFI_MODE (**0x3005**): WiFi mode error

ESP_ERR_WIFI_STATE (**0x3006**): WiFi internal state error

ESP_ERR_WIFI_CONN (**0x3007**): WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS (**0x3008**): WiFi internal NVS module error

ESP_ERR_WIFI_MAC (**0x3009**): MAC address is invalid

ESP_ERR_WIFI_SSID (**0x300a**): SSID is invalid

ESP_ERR_WIFI_PASSWORD (**0x300b**): Password is invalid

ESP_ERR_WIFI_TIMEOUT (**0x300c**): Timeout error

ESP_ERR_WIFI_WAKE_FAIL (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK (**0x300e**): The caller would block

ESP_ERR_WIFI_NOT_CONNECT (**0x300f**): Station still in disconnect status

ESP_ERR_WIFI_POST (**0x3012**): Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE (**0x3013**): Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE (**0x3014**): Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC (**0x3015**): The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW (**0x3016**): The WiFi TX is disallowed

ESP_ERR_WIFI_REGISTRAR (**0x3033**): WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE (**0x3034**): WPS type error

ESP_ERR_WIFI_WPS_SM (**0x3035**): WPS state machine is not initialized

ESP_ERR_ESPNOW_BASE (**0x3064**): ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT (**0x3065**): ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG (**0x3066**): Invalid argument

ESP_ERR_ESPNOW_NO_MEM (**0x3067**): Out of memory

ESP_ERR_ESPNOW_FULL (**0x3068**): ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND (**0x3069**): ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL (**0x306a**): Internal error

ESP_ERR_ESPNOW_EXIST (**0x306b**): ESPNOW peer has existed

ESP_ERR_ESPNOW_IF (**0x306c**): Interface error

ESP_ERR_DPP_FAILURE (**0x3097**): Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE (**0x3098**): DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR (**0x3099**): Encountered invalid DPP Attribute

ESP_ERR_MESH_BASE (**0x4000**): Starting number of MESH error codes

ESP_ERR_MESH_WIFI_NOT_START (**0x4001**)

ESP_ERR_MESH_NOT_INIT (**0x4002**)

ESP_ERR_MESH_NOT_CONFIG (**0x4003**)

ESP_ERR_MESH_NOT_START (**0x4004**)

Chapter 4

API Guides

4.1 Application Level Tracing library

4.1.1 Overview

IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32-S3 via JTAG interface with small overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behavior analysis, see [System Behavior Analysis with SEGGER SystemView](#)
4. Source code coverage, see [Gcov \(Source Code Coverage\)](#)

Tracing components when working over JTAG interface are shown in the figure below.

4.1.2 Modes of Operation

The library supports two modes of operation:

Post-mortem mode. This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from *HW UP BUFFER* buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program's behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

Streaming mode. Tracing module enters this mode when host connects to ESP32-S3. In this mode before writing new data to *HW UP BUFFER* tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISRs, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option [CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX](#). This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed

Fig. 1: Tracing Components when Working Over JTAG

down, e.g due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.

4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see [JTAG Debugging](#) for details.
2. **Target side:** Application tracing functionality can be enabled in menuconfig. *Component config > Application Level Tracing* menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables `CONFIG_APPTRACE_ENABLE` option.

Note: In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see [Optimize JTAG speed](#).

There are two additional menuconfig options not mentioned above:

1. *Threshold for flushing last trace data to host on panic* (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less then 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic they will not be

flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. *Timeout for flushing last trace data to host on panic* (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.

4.1.4 How to use this library

This library provides API for transferring arbitrary data between host and ESP32-S3. When enabled in menuconfig target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

Application Specific Tracing

In general user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. On target side user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
↳ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` function uses `memcpy` to copy user data to the internal buffer. In some cases it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↳*tmo in us*);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo_
↳in us*);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report_
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

Also according to his needs user may want to receive data from the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[32];
```

(continues on next page)

(continued from previous page)

```

char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apprace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not
↳wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

```

esp_apprace_read() function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use esp_apprace_down_buffer_get() and esp_apprace_down_buffer_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```

#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apprace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apprace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}

```

2. The next step is to build the program image and download it to the target as described in the [Getting Started Guide](#).
3. Run OpenOCD (see [JTAG Debugging](#)).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal telnet <oozd_host> 4444. If telnet session is opened on the same machine which runs OpenOCD you can use localhost as <oozd_host> in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see [OpenOCD Application Level Tracing Commands](#).
6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in \$IDF_PATH/

tools/esp_app_trace: appttrace_proc.py (used for feature tests) and logtrace_proc.py (see more details in section [Logging to Host](#)).

OpenOCD Application Level Tracing Commands *HW UP BUFFER* is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So it is possible situation that user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions tracing module prepends all user data chunks with header which contains allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

Note: Currently OpenOCD does not provide commands to send arbitrary user data to the target.

Command usage:

```
esp appttrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

start Start tracing (continuous streaming).
stop Stop tracing.
status Get tracing status.
dump Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt  
[skip_size]]]]]
```

outfile Path to file to save data from both CPUs. This argument should have the following format: file://path/to/file.

poll_period Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.

trace_size Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).

stop_tmo Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.

wait4halt If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.

skip_size Number of bytes to skip at the start. By default 0.

Note: If `poll_period` is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect 2048 bytes of tracing data to a file “trace.log”. The file will be saved in “openocd-esp32” directory.

```
esp appttrace start file://trace.log 1 2048 5 0 0
```

The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

Note: Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of timeout. Either increase the timeout or use a function `esp_apptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

```
esp apptrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp apptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp apptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target's operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset use the `openocd reset halt` command.

Logging to Host

IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host.

By default IDF's logging library uses `vprintf`-like function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of `vprintf`-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_apptrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

Limitations Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for `printf` arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from `.rodata` section are supported as format strings and arguments.
4. Maximum number of `printf` arguments is 256.

How To Use It In order to use logging via trace module user needs to perform the following steps:

1. On target side special `vprintf`-like function needs to be installed. As it was mentioned earlier this function is `esp_apptrace_vprintf`. It sends log data to the host. Example code is provided in [system/app_trace_to_host](#).
2. Follow instructions in items 2-5 in [Application Specific Tracing](#).
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`.

Log Trace Processor Command Options

 Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

trace_file Path to log trace file

elf_file Path to program ELF file

Optional arguments:

-h, --help show this help message and exit

--no-errors, -n Do not print errors

System Behavior Analysis with SEGGER SystemView

Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see [SystemView](#)). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

Note: Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

How To Use It Support for this feature is enabled by *Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG_APPTRACE_SV_ENABLE)* menuconfig option. There are several other options enabled under the same menu:

1. ESP32-S3 timer to use as SystemView timestamp source: (*CONFIG_APPTRACE_SV_TS_SOURCE*) selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32-S3 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In dual-core mode external timer working at 40 Mhz is used, so timestamp granularity is 25 ns.
2. Individually enabled or disabled collection of SystemView events (*CONFIG_APPTRACE_SV_EVT_XXX*):
 - Trace Buffer Overflow Event
 - ISR Enter Event
 - ISR Exit Event
 - ISR Exit to Scheduler Event
 - Task Start Execution Event
 - Task Stop Execution Event
 - Task Start Ready State Event
 - Task Stop Ready State Event
 - Task Create Event
 - Task Terminate Event
 - System Idle Event
 - Timer Enter Event
 - Timer Exit Event

IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

OpenOCD SystemView Tracing Command Options Command usage:

```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:

start Start tracing (continuous streaming).**stop** Stop tracing.**status** Get tracing status.

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

outfile1 Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.**outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.**poll_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.**trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).**stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

Note: If `poll_period` is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVdat” and “app-cpu.SVdat” . The files will be saved in “openocd-esp32” directory.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat
```

The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat 0 -1 -1
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.

Data Visualization After trace data are collected user can use special tool to visualize the results and inspect behavior of the program.

Unfortunately SystemView does not support tracing from multiple cores. So when tracing from ESP32-S3 working in dual-core mode two files are generated: one for PRO CPU and another one for APP CPU. User can load every file into separate instance of the tool.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called *Impulse* which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

Note: IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping `$SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt` with

`$IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt`. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

Configure Impulse for Dual Core Traces After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs, users can add special Multi Adapter port and load both files into one view. To do this, users need to do the following in Eclipse:

1. Open 'Signal Ports' view. Go to Windows->Show View->Other menu. Find 'Signal Ports' view in Impulse folder and double-click on it.
2. In 'Signal Ports' view right-click on 'Ports' and select 'Add ...' ->New Multi Adapter Port
3. In open dialog Press 'Add' button and select 'New Pipe/File' .
4. In open dialog select 'SystemView Serializer' as Serializer and set path to PRO CPU trace file. Press OK.
5. Repeat steps 3-4 for APP CPU trace file.
6. Double-click on created port. View for this port should open.
7. Click Start/Stop Streaming button. Data should be loaded.
8. Use 'Zoom Out' , 'Zoom In' and 'Zoom Fit' button to inspect data.
9. For settings measurement cursors and other features please see [Impulse documentation](#)).

Note: If you have problems with visualization (no data are shown or strange behavior of zoom action is observed) you can try to delete current signal hierarchy and double click on the necessary file or port. Eclipse will ask you to create new signal hierarchy.

Gcov (Source Code Coverage)

Basics of Gcov and Gcovr Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program' s runtime. **Gcov** is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The **Gcovr** tool is utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the Host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a `.gcno` notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have their own `.gcno` file of the same name (e.g., a `main.c` will generate a `main.gcno` when compiled).
2. Execute the program. During execution, the program should generate `.gda` data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a `.gda` file for each source file compiled with the `--coverage` option (e.g., `main.c` will generate a `main.gda`).
3. Gcov or Gcovr can be used generate a code coverage based on the `.gcno`, `.gda`, and source files. Gcov will generate a text based coverage report for each source file in the form of a `.gcov` file, whilst Gcovr will generate a coverage report in HTML format.

Gcov and Gcovr in ESP-IDF Using Gcov in ESP-IDF is complicated by the fact that the program is running remotely from the Host (i.e., on the target). The code coverage data (i.e., the `.gda` files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. [Setting Up a Project for Gcov](#)
2. [Dumping Code Coverage Data](#)
3. [Generating Coverage Report](#)

Setting Up a Project for Gcov

Compiler Option In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

To cause all source files in a component to be compiled with the `--coverage` option.

- Add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

To cause a select number of source files (e.g. `source1.c` and `source2.c`) in the same component to be compiled with the

- Add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `source1.o: CFLAGS += --coverage` and `source2.o: CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

When a source file is compiled with the `--coverage` option (e.g. `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project's build directory.

Project Configuration Before building a project with source code coverage, ensure that the following project configuration options are enabled by running `idf.py menuconfig` (or `make menuconfig` if using the legacy Make build system).

- Enable the application tracing module by choosing *Trace Memory* for the [CONFIG_APPTRACE_DESTINATION](#) option.
- Enable Gcov to host via the [CONFIG_APPTRACE_GCOV_ENABLE](#)

Dumping Code Coverage Data Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the Host is known as dumping.

The dumping of coverage data is done via OpenOCD (see [JTAG Debugging](#) on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <occd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project's build directory. For example, if `gcov_example_main.c` of the main component was compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda` (or `build/main/gcov_example_main.gcda` if using the legacy Make build system). Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application's life time. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application's entire lifetime.

ESP-IDF supports two methods of dumping code coverage data from the target to the host:

- Instant Run-Time Dumpgit
- Hard-coded Dump

Instant Run-Time Dump An Instant Run-Time Dump is triggered by calling the ESP32-S3 `gcov` OpenOCD command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32-S3's current state and execute a builtin IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the Host. Upon completion, the ESP32-S3 will resume its current state.

Hard-coded Dump A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the Host must execute the `esp_gcov_dump`

OpenOCD command (via a telnet session). The `esp_gcov_dump` command will cause OpenOCD to connect to the ESP32-S3, retrieve the code coverage data, then disconnect from the ESP32-S3 thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application's lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application's lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application's main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp_gcov_dump` automatically via the use a `gdbinit` script (see Using GDB from [Command Line](#)).

The following GDB script is will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp_gcov_dump` OpenOCD command.

```
b esp_gcov_dump
commands
mon esp_gcov_dump
end
```

Note: Note that all OpenOCD commands should be invoked in GDB as: `mon <occd_command>`.

Generating Coverage Report Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both `Gcov` and `Gcovr` can be used to generate code coverage reports. `Gcov` is provided along with the Xtensa toolchain, whilst `Gcovr` may need to be installed separately. For details on how to use `Gcov` or `Gcovr`, refer to [Gcov documentation](#) and [Gcovr documentation](#).

Adding Gcovr Build Target to Project To make report generation more convenient, users can define additional build targets in their projects such report generation can be done with a single build command.

CMake Build System For the CMake build systems, add the following lines to the `CMakeLists.txt` file of your project.

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

Make Build System For the Make build systems, add the following lines to the `Makefile` of your project.

```
GCOV := $(call dequote,$(CONFIG_SDK_TOOLPREFIX))gcov
REPORT_DIR := $(BUILD_DIR_BASE)/coverage_report

gcovr-report:
    echo "Generating coverage report in: $(REPORT_DIR)"
    echo "Using gcov: $(GCOV)"
    mkdir -p $(REPORT_DIR)/html
    cd $(BUILD_DIR_BASE)
    gcovr -r $(PROJECT_PATH) --gcov-executable $(GCOV) -s --html-details $(REPORT_
↵DIR)/html/index.html
```

(continues on next page)

```
cov-data-clean:
    echo "Remove coverage data files..."
    find $(BUILD_DIR_BASE) -name "*.gcda" -exec rm {} +
    rm -rf $(REPORT_DIR)

.PHONY: gcovr-report cov-data-clean
```

The following commands can now be used:

- make `gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- make `cov-data-clean` will remove all coverage data files.

4.2 Application Startup Flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. *First stage bootloader* in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x0.
2. *Second stage bootloader* loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. *Application startup* executes. At this point the second CPU and RTOS scheduler are started.

This process is explained in detail in the following sections.

4.2.1 First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located in the mask ROM of the ESP32-S3 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see *deep sleep* documentation for this.
2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32-S3 datasheet for a description of SoC boot modes and how to execute them.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

Note: During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

Second stage bootloader binary image is loaded from the start of flash at offset 0x0.

4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x0 in flash is the second stage bootloader. Second stage bootloader source code is available in [components/bootloader](#) directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (*configurable value*). See [partition tables](#) documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the `otadata` partition to determine which one should be booted. See [Over The Air Updates \(OTA\)](#) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see [Bootloader](#).

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal *IRAM (Instruction RAM)* or *DRAM (Data RAM)*, the contents are copied from flash to the load address.
- For segments which have load addresses in *DROM (data stored in Flash)* or *IROM (code executed from Flash)* regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.

Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

4.2.3 Application startup

Application startup covers everything that happens after the app starts executing and before the `app_main` function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling `app_main`.

Note: Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer's perspective only, skip forward to [Running the main task](#).

Port Initialization

ESP-IDF application entry point is `call_start_cpu0` function found in [components/esp_system/port/cpu_start.c](#). This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment (“CRT”) and performs initial configuration of the SoC's internal hardware:

- Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing *Fatal Errors* to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
- If the option `CONFIG_BOOTLOADER_WDT_ENABLE` is not set then the RTC watchdog timer is disabled.
- Initialize internal memory (data & bss).

- Finish configuring the MMU cache.
- Enable PSRAM if configured.
- Set the CPU clocks to the frequencies configured for the project.
- If the app is configured to run on multiple cores, start the other core and wait for it to initialize as well (inside the similar “port layer” initialization function `call_start_cpu1`).

Once `call_start_cpu0` completes running, it calls the “system layer” initialization function `start_cpu0` found in `components/esp_system/startup.c`. Other cores will also complete port-layer initialization and call `start_other_cores` found in the same file.

System Initialization

The main system initialization function is `start_cpu0`. By default, this function is weak-linked to the function `start_cpu0_default`. This means that it’s possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

- Log information about this application (project name, *App version*, etc.) if default log level enables this.
- Initialize the heap allocator (before this point all allocations must be static or on the stack).
- Initialize newlib component syscalls and time functions.
- Configure the brownout detector.
- Setup libc stdin, stdout, and stderr according to the *serial console configuration*.
- Perform any security-related checks, including burning efuses that should be burned for this configuration (including *permanently limiting ROM download modes*).
- Initialize SPI flash API support.
- Call global C++ constructors and any C functions marked with `__attribute__((constructor))`.

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the `ESP_SYSTEM_INIT_FN` macro, it will be called as part of secondary initialization.

Running the main task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function `app_main` in the firmware.

The main task that runs `app_main` has a fixed RTOS priority (one higher than the minimum) and a *configurable stack size*.

The main task core affinity is also configurable: `CONFIG_ESP_MAIN_TASK_AFFINITY`.

Unlike normal FreeRTOS tasks (or embedded C main functions), the `app_main` task is allowed to return. If this happens, the task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement `app_main` as either a function that creates other application tasks and then returns, or as a main application task itself.

Second core startup

A similar but simpler startup process happens on the APP CPU:

When running system initialization, the code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, APP CPU jumps to `call_start_cpu1` function in `components/esp_system/port/cpu_start.c`.

While PRO CPU does initialization in `start_cpu0` function, APP CPU runs `start_cpu_other_cores` function. Similar to `start_cpu0`, this function is weak-linked and defaults to the

`start_cpu_other_cores_default` function but can be replaced with a different function by the application.

The `start_cpu_other_cores_default` function does some core-specific system initialization and then waits for the PRO CPU to start the FreeRTOS scheduler, at which point it executes `esp_startup_start_app_other_cores` which is another weak-linked function defaulting to `esp_startup_start_app_other_cores_default`.

By default `esp_startup_start_app_other_cores_default` does nothing but spin in a busy-waiting loop until the scheduler of the PRO CPU triggers an interrupt to start the RTOS scheduler on the APP CPU.

4.3 BluFi

4.3.1 Overview

The BluFi for ESP32-S3 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32-S3. Using this information ESP32-S3 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

4.3.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32-S3 into GATT Server mode and then it will send broadcasts with specific *advertising data*. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32-S3 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32-S3 (see the section *The Frame Formats Defined in BluFi* for details).
4. After ESP32-S3 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32-S3 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32-S3.
7. When receiving this control frame, ESP32-S3 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of *The Frame Formats Defined in BluFi*, with the Wi-Fi configuration information to ESP32-S3, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32-S3. When receiving this control frame, ESP32-S3 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32-S3 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

Note:

1. After ESP32-S3 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

4.3.3 The Flow Chart of BluFi

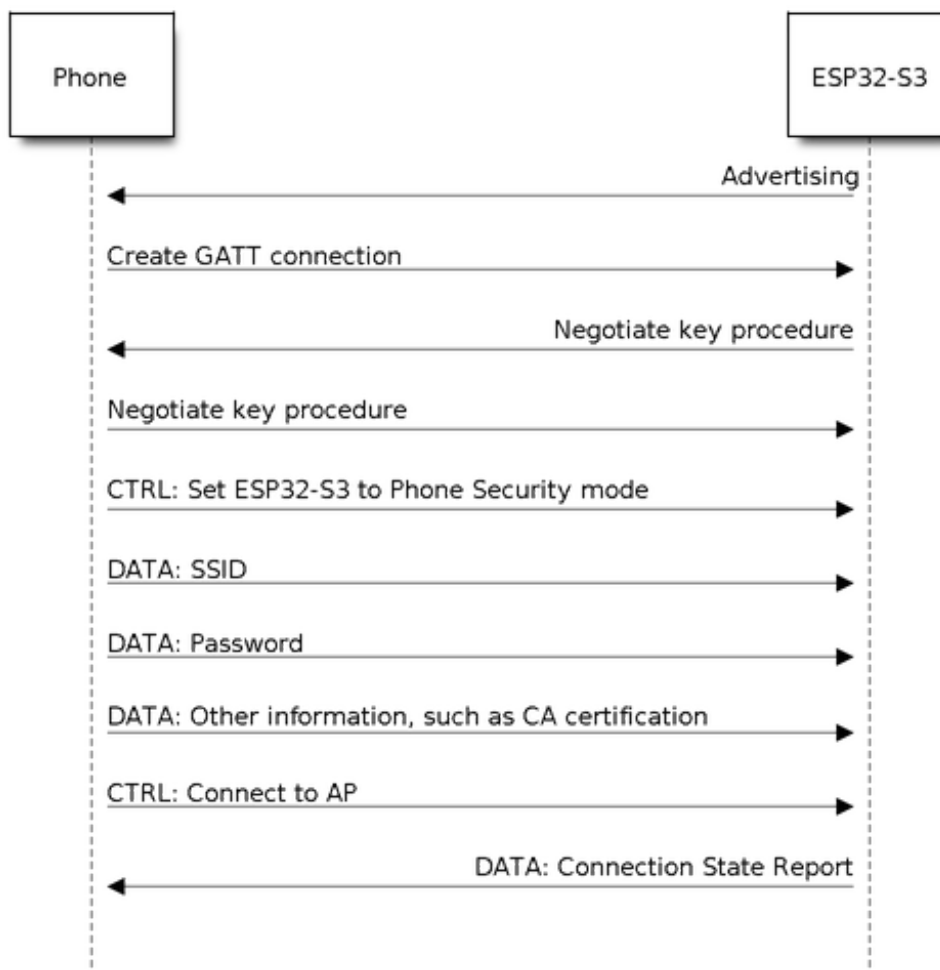

Fig. 2: BluFi Flow Chart

4.3.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32-S3 are defined as follows:

The frame format with no fragment (8 bit):

Description	Value
Type (Least Significant Bit)	1
Frame Control	1
Sequence Number	1
Data Length	1
Data	$\{\text{Data Length}\}$
Checksum (Most Significant Bit)	2

If the **Frame Ctrl** bit is enabled, the **Total length** bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit) :

Description	Value
Type (Least Significant Bit)	1
Frame Control (Frag)	1
Sequence Number	1
Data Length	1
Data	<ul style="list-style-type: none"> Total Content Length: 2 Content: $\{\text{Data Length}\} - 2$
Checksum (Most Significant Bit)	2

Normally, the control frame does not contain data bits, except for ACK Frame.

The format of ACK Frame (8 bit) :

Description	Value
Type - ACK (Least Significant Bit)	1
Frame Control	1
Sequence Number	1
Data Length	1
Data	Acked Sequence Number: 2
Checksum (Most Significant Bit)	2

1. Type

The **Type** field, taking 1 byte, is divided into **Type** and **Subtype**, that Type uses the lower 2 bits and **Subtype** uses the upper 6 bits.

- The control frame is not encrypted for the time being and supports to be verified;
- The data frame supports to be encrypted and verified.

1.1 Control Frame (Binary: 0x0 b' 00)

Control Frame	Implication	Explanation	Note
0x0 (b'000000)	ACK	The data field of the ACK frame uses the same sequence value of the frame to reply to.	The data field consumes a byte and its value is the same as the sequence field of the frame to reply to.
0x1 (b'000001)	Set ESP device to the security mode.	To inform ESP device of the security mode to use when sending data, which is allowed to be reset multiple times during the process. Each setting affects the subsequent security mode used. If it is not set, ESP device will send the control frame and data frame with no checksum and encryption by default. The data transmission from the mobile phone to ESP device is controlled by this control frame.	The data field consumes a byte. The higher 4 bits are for the security mode setting of the control frame, and the lower 4 bits are for the security mode setting of the data frame. <ul style="list-style-type: none"> b' 0000: no checksum and no encryption; b' 0001: with checksum but no encryption; b' 0010: no checksum but with encryption; b' 0011: with both checksum and encryption.
0x2 (b'000010)	Set the opmode of Wi-Fi.	The frame contains opmode settings for configuring the Wi-Fi mode of ESP device.	data[0] is for opmode settings, including: <ul style="list-style-type: none"> 0x00: NULL 0x01: STA 0x02: SoftAP 0x03: SoftAP & STA Please set the SSID/Password/Max Connection Number of the AP mode in the first place if an AP gets involved.
0x3 (b'000011)	Connect ESP device to the AP.	To notify ESP device that the essential information has been sent and it is allowed to connect to the AP.	No data field is contained.
0x4 (b'000100)	Disconnect ESP device from the AP.		No data field is contained.
0x5 (b'000101)	To get the information of ESP device's Wi-Fi mode and it's status.		<ul style="list-style-type: none"> No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi connection state report to the mobile phone with the information of the current opmode, connection status, SSID and so on. The types of information sent to the mobile phone is defined by the application installed on the phone.
0x6 (b'000110)	Disconnect the STA device from the SoftAP (in SoftAP mode).		Date[0~5] is taken as the MAC address for the STA device. If there is a second STA device, then it uses data[6-11] and the rest can be done in the same manner.
0x7 (b'000111)	Get the version information.		
0x8 (b'001000)	Disconnect the BLE GATT link.		ESP device will disconnect the BLE GATT link after receives this command.
0x9 (b'001001)	Get the Wi-Fi list.	To get ESP device to scan the Wi-Fi access points around.	No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi list report to the mobile phone.

1.2 Data Frame (Binary: 0x1 b' 01)

Data Frame	Implication	Explanation	Note
0x0 (b' 000000)	Send the negotiation data.	The negotiation data will be sent to the callback function registered in the application layer.	The length of the data depends on the length field.
0x1 (b' 000001)	Send the BSSID for STA mode.	To send the BSSID of the AP for the STA device to connect under the condition that the SSID is hidden.	Please refer to Note 1 below.
0x2 (b' 000010)	Send the SSID for STA mode.	To send the SSID of the AP for the STA device to connect.	Please refer to Note 1 below.
0x3 (b' 000011)	Send the password for STA mode.	To send the password of the AP for the STA device to connect.	Please refer to Note 1 below.
0x4 (b' 000100)	Send the SSID for SoftAP mode.		Please refer to Note 1 below.
0x5 (b' 000101)	Send the password for SoftAP mode.		Please refer to Note 1 below.
0x6 (b' 000110)	Set the maximum connection number for SoftAP mode.		data[0] represents the value of the connection number, ranging from 1 to 4. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x7 (b' 000111)	Set the authentication mode for the SoftAP.		data[0]: <ul style="list-style-type: none"> • 0x00: OPEN • 0x01: WEP • 0x02: WPA_PSK • 0x03: WPA2_PSK • 0x04: WPA_WPA2_PSK When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x8 (b' 001000)	Set the number of channels for SoftAP mode.		data[0] represents the quantity of the supported channels, ranging from 1 to 14. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x9 (b' 001001)	Username	It provides the username of the GATT client when using encryption of enterprise level.	The length of the data depends on the length field.
0xa (b' 001010)	CA Certification	It provides the CA Certification when using encryption of enterprise level.	Please refer to Note 2 below.
0xb (b' 001011)	Client Certification	It provides the client certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification.	Please refer to Note 2 below.
0xc (b' 001100)	Server Certification	It provides the sever certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification.	Please refer to Note 2 below.
0xd (b' 001101)	Client Private Key	It provides the private key of the client when using encryption of enterprise level.	Please refer to Note 2 below.
0xe	Server Private Key	It provides the private key of	Please refer to Note 2 below.

Note:

- Note 1: The length of the data depends on the length field. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
- Note 2: The length of the data depends on the length field. The frame supports to be fragmented if the data length is not enough.

2. Frame Control

Control field, takes 1 byte and each bit has a different meaning.

Bit	Meaning
0x01	Indicates whether the frame is encrypted. <ul style="list-style-type: none"> • 1 means encryption • 0 means unencrypted The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum). Control frame is not encrypted, so this bit is 0.
0x02	The data field that indicates whether a frame contains a checksum (such as SHA1,MD5,CRC, etc.) for the end of the frame. Data field includes sequence + data length + clear text. Both the control frame and the data frame can contain a check bit or not.
0x04	Represents the data direction. <ul style="list-style-type: none"> • 0 means the mobile phone to ESP device; • 1 means ESP device to the mobile phone.
0x08	Indicates whether the other person is required to reply to an ACK. <ul style="list-style-type: none"> • 0 indicates no requirement; • 1 indicates to reply ACK.
0x10	Indicates whether there are subsequent data fragments. <ul style="list-style-type: none"> • 0 indicates that there are no subsequent data fragments for this frame; • 1 indicates that there are subsequent data fragments and used to transmit longer data. In the case of a frag frame, the total length of the current content section + subsequent content section is given, in the first 2 bytes of the data field (that is, the content data of the maximum support 64 K).
0x10~0x80	reserved

3. Sequence Control

Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

4. Length

The length of the data field that does not include CheckSum.

5. Data

The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

6. CheckSum

This field takes 2 bytes that is used to check “sequence + data length + clear text data” .

4.3.5 The Security Implementation of ESP32-S3

1. Securing data

To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

2. Ensuring data integrity

To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

3. Securing identity (signature)

Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as an companion for signature.

4. Replay attack prevention

It is added to the Sequence field and used during the checksum verification.

For the coding of ESP32-S3, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32-S3 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.

The application layer needs to register several security-related functions to BluFi:

```
typedef void (*esp_blufi_negotiate_data_handler_t) (uint8_t *data, int len, uint8_t *
↳ *output_data, int *output_len, bool *need_free)
```

This function is for ESP32-S3 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output_data and Output_len.

BluFi will send output_data from Negotiate_data_handler after Negotiate_data_handler is called.

Here are two “*” , because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED_FREE.

```
typedef int (* esp_blufi_encrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳ crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef int (* esp_blufi_decrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳ crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t iv8, uint8_t *data, int len)
```

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

4.3.6 GATT Related Instructions

UUID

BluFi Service UUID: 0xFFFF, 16 bit

BluFi (the mobile -> ESP32-S3): 0xFF01, writable

Blufi (ESP32-S3 -> the mobile phone): 0xFF02, readable and callable

4.4 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Initialize *Flash Encryption* and/or *Secure* features, if configured;
3. Select the application partition to boot, based on the partition table and ota_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to the image that was just loaded.

Bootloader is located at the address 0x0 in the flash.

For a full description of the startup process including the the ESP-IDF bootloader, see [Application Startup Flow](#).

4.4.1 Bootloader compatibility

It is recommended to update to newer *versions of ESP-IDF*: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

Note: If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

SPI Flash Configuration

Each ESP-IDF application or bootloader .bin file contains a header with [CONFIG_ESPTOOLPY_FLASHMODE](#), [CONFIG_ESPTOOLPY_FLASHFREQ](#), [CONFIG_ESPTOOLPY_FLASHSIZE](#) embedded in it. These are used to configure the SPI flash during boot.

The *First stage bootloader* in ROM reads the *Second stage bootloader* header information from flash and uses this information to load the rest of the *Second stage bootloader* from flash. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the *Second stage bootloader* then runs, it will reconfigure the flash using values read from the currently selected app binary's header (and NOT from the *Second stage bootloader* header). This allows an OTA update to change the SPI flash settings in use.

4.4.2 Log Level

The default bootloader log level is “Info” . By setting the [CONFIG_BOOTLOADER_LOG_LEVEL](#) option, it's possible to increase or decrease this level. This log level is separate from the log level used in the app (see [Logging library](#)).

Reducing bootloader log verbosity can improve the overall project boot time by a small amount.

4.4.3 Factory reset

Sometimes it is desirable to have a way for the device to fall back to a known-good state, in case of some problem with an update.

To roll back to the original “factory” device configuration and clear any user settings, configure the config item [CONFIG_BOOTLOADER_FACTORY_RESET](#) in the bootloader.

The factory reset mechanism allows the device to be factory reset in two ways:

- Clear one or more data partitions. The [CONFIG_BOOTLOADER_DATA_FACTORY_RESET](#) option allows users to specify which data partitions will be erased when the factory reset is executed. Users can specify the names of partitions as a comma-delimited list with optional spaces for readability. (Like this: `nvs, phy_init, nvs_custom`). Make sure that the names of partitions specified in the option are the same as those found in the partition table. Partitions of type “app” cannot be specified here.
- Boot from “factory” app partition. Enabling the [CONFIG_BOOTLOADER_OTA_DATA_ERASE](#) option will cause the device to boot from the default “factory” app partition after a factory reset (or if there is no factory app partition in the partition table then the default ota app partition is selected instead). This reset process

involves erasing the OTA data partition which holds the currently selected OTA partition slot. The “factory” app partition slot (if it exists) is never updated via OTA, so resetting to this allows reverting to a “known good” firmware application.

Either or both of these configuration options can be enabled independently.

In addition, the following configuration options control the reset condition:

- [*CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET*](#) - The input GPIO number used to trigger a factory reset. This GPIO must be pulled low or high (configurable) on reset to trigger this.
- [*CONFIG_BOOTLOADER_HOLD_TIME_GPIO*](#) - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
- [*CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL*](#) - configure whether a factory reset should trigger on a high or low level of the GPIO. If the GPIO has an internal pullup then this is enabled before the pin is sampled, consult the ESP32-S3 datasheet for details on pin internal pullups.

4.4.4 Boot from Test Firmware

It’s possible to write a special firmware app for testing in production, and boot this firmware when needed. The project partition table will need a dedicated app partition entry for this testing app, type `app` and subtype `test` (see [Partition Tables](#)).

Implementing a dedicated test app firmware requires creating a totally separate ESP-IDF project for the test app (each project in ESP-IDF only builds one app). The test app can be developed and tested independently of the main project, and then integrated at production testing time as a pre-compiled `.bin` file which is flashed to the address of the main project’s test app partition.

To support this functionality in the main project’s bootloader, set the configuration item [*CONFIG_BOOTLOADER_APP_TEST*](#) and configure the following two items:

- [*CONFIG_BOOTLOADER_NUM_PIN_APP_TEST*](#) - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset.
Once the GPIO input is released (allowing it to be pulled up) and the device has been reboot, the normally configured application will boot (factory or any OTA app partition slot).
- [*CONFIG_BOOTLOADER_HOLD_TIME_GPIO*](#) - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

4.4.5 Rollback

Rollback and anti-rollback features must be configured in the bootloader as well.

Consult the [App rollback](#) and [Anti-rollback](#) sections in the [OTA API reference document](#).

4.4.6 Watchdog

By default, the hardware RTC Watchdog timer remains running while the bootloader is running and will automatically reset the chip if no app has successfully started after 9 seconds.

- The timeout period can be adjusted by setting [*CONFIG_BOOTLOADER_WDT_TIME_MS*](#) and recompiling the bootloader.
- The app’s behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset (i.e., fed) by the app to avoid a reset. To do this, set the [*CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE*](#) option, modify the app as needed, and then recompile the app.
- The RTC Watchdog can be disabled in the bootloader by disabling the [*CONFIG_BOOTLOADER_WDT_ENABLE*](#) setting and recompiling the bootloader. This is not recommended.

4.4.7 Bootloader Size

When enabling additional bootloader functions, including *Flash Encryption* or Secure Boot, and especially if setting a high `CONFIG_BOOTLOADER_LOG_LEVEL` level, then it is important to monitor the bootloader .bin file's size.

When using the default `CONFIG_PARTITION_TABLE_OFFSET` value 0x8000, the size limit is 0x8000 (32768) bytes.

If the bootloader binary is too large, then the bootloader build will fail with an error “Bootloader binary size [...] is too large for partition table offset” . If the bootloader binary is flashed anyhow then the ESP32-S3 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

Note: The bootloader size check only happens in the CMake Build System, when using the legacy GNU Make Build System the size is not checked but the ESP32-S3 will fail to boot if bootloader is too large.

Options to work around this are:

- Set *bootloader compiler optimization* back to “Size” if it has been changed from this default value.
- Reduce *bootloader log level*. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set `CONFIG_PARTITION_TABLE_OFFSET` to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the *partition table* CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.)

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 64KB (0x10000 bytes) (excluding the 4 KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

4.4.8 Fast boot from Deep Sleep

The bootloader has the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` option which allows the wake-up time from deep sleep to be reduced (useful for reducing power consumption). This option is available when `CONFIG_SECURE_BOOT` option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

4.4.9 Custom bootloader

The current bootloader implementation allows a project to extend it or modify it. There are two ways of doing it: by implementing hooks or by overriding it. Both ways are presented in `custom_bootloader` folder in ESP-IDF examples:

- *bootloader_hooks* which presents how to connect some hooks to the bootloader initialization
- *bootloader_override* which presents how to override the bootloader implementation

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project's *bootloader_components* directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the *partition table offset* value to place the partition table later in the flash. This increases the space available for the bootloader.

Note: Customize the bootloader by using either method is only supported with CMake build system (i.e. not supported with legacy Make build system).

4.5 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components” . Read this document if you want to know how to organize and build a new ESP-IDF project or component.

4.5.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. A full list of supported targets in your version if ESP-IDF can be seen by running `idf.py -list-targets`.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line `PATH`.

4.5.2 Using the Build System

`idf.py`

The `idf.py` command-line tool provides a front-end for easily managing your project builds. It manages the following tools:

- [CMake](#), which configures the project to be built
- A command-line build tool (either [Ninja](#) build or *GNU Make*)

- `esptool.py` for flashing the target.

The *getting started guide* contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

`idf.py` should be run in an ESP-IDF “project” directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a Makefile will not work with `idf.py`.

Type `idf.py --help` for a list of commands. Here are a summary of the most useful ones:

- `idf.py set-target <target>` sets the target (chip) for which the project is built. See *Selecting the Target*.
- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
 - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
 - Run `CMake` as necessary to configure the project and generate build files for the main build tool.
 - Run the main build tool (`Ninja` or `GNU Make`). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete `CMake` configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all `CMake` configuration output. The next time the project is built, `CMake` will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.
- `idf.py flash` will automatically build the project if necessary, and then flash it to the target. The `-p` and `-b` options can be used to set serial port name and flasher baud rate, respectively.
- `idf.py monitor` will display serial output from the target. The `-p` option can be used to set the serial port name. Type `Ctrl-]` to exit the monitor. See *IDF Monitor* for more details about using the monitor.

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports [shell autocompletion](#) for bash, zsh and fish shells.

In order to make [shell autocompletion](#) supported, please make sure you have at least Python 3.5 and [click 7.1](#) or newer (*see also*).

To enable autocompletion for `idf.py` use the `export` command (*see this*). Autocompletion is initiated by pressing the TAB key. Type “`idf.py -`” and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

Note: The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

Advanced Commands

- `idf.py app`, `idf.py bootloader`, `idf.py partition-table` can be used to build only the app, bootloader, or partition table from the project as applicable.
- There are matching commands `idf.py app-flash`, etc. to flash only that single part of the project to the target.
- `idf.py -p PORT erase-flash` will use `esptool.py` to erase the target’s entire flash chip.
- `idf.py size` prints some size information about the app. `size-components` and `size-files` are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable `-DOUTPUT_JSON=1` when running `CMake` (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.

- `idf.py reconfigure` re-runs [CMake](#) even if it doesn't seem to need re-running. This isn't necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.
- `idf.py python-clean` deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.
- `idf.py docs` will open direct link to documentation for project's chip target and version in browser. To see all options use `idf.py docs --help`

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

idf.py options To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable [CCache](#) when compiling source files, if the [CCache](#) tool is installed. This can dramatically reduce some build times.

Note that some older versions of [CCache](#) may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling [CCache](#) and build again. [CCache](#) can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.

Start a new project

Use the command `idf.py create-project` for starting a new project. Execute `idf.py create-project --help` for more information.

Example:

```
idf.py create-project --path my_projects my_new_project
```

This example will create a new project called `my_new_project` directly into the directory `my_projects`.

Using CMake Directly

`idf.py` is a wrapper around [CMake](#) for convenience. However, you can also invoke CMake directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):

```
mkdir -p build
cd build
cmake .. -G Ninja # or 'Unix Makefiles'
ninja
```

In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is [Ninja](#): running `ninja` actually builds the project.

It's not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

Note: If you're already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake's functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more "CMake style" components.

Flashing with ninja or make It's possible to build and flash directly from `ninja` or `make` by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

Note: Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won't work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

Note: Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project's `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these "generators") to build the source files as part of the IDE.

When adding custom non-build steps like "flash" to the IDE, it is recommended to execute `idf.py` for these "special" commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).

Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default `python` interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

`idf.py` and other Python scripts will run with the default Python interpreter, i.e. `python`. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py . . .`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 . . .` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the `PYTHON` value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools [pyenv](#) or [virtualenv](#). These let you change the default Python version.

Possible issues The user of `idf.py` may sometimes experience `ImportError` described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in
↪<module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

The exception is often caused by `.pyc` files generated by different Python versions. To solve the issue run the following command:

```
idf.py python-clean
```

4.5.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project `CMakeLists.txt` file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file [/tools/cmake/project.cmake](#) which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “`sdkconfig`” project configuration file. This file is created/updated when `idf.py menuconfig` runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “`sdkconfig`” file may or may not be added to the source control system of the project.
- Optional “`components`” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, `EXTRA_COMPONENT_DIRS` can be set in the top-level `CMakeLists.txt` to look for components in other places. See the [renaming main](#) section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “`main`” .

- “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable `COMPONENT_DIRS` includes this component but you can modify this variable.
- “build” directory is where build output is created. This directory is created by `idf.py` if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component `CMakeLists.txt` file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See [Component CMakeLists Files](#) for more details.

Each component may also include a `Kconfig` file defining the *component configuration* options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for *overriding parts of the project*.

4.5.4 Project CMakeLists File

Each project has a single top-level `CMakeLists.txt` file that contains build settings for the entire project. By default, the project `CMakeLists` can be quite minimal.

Minimal Example CMakeLists

Minimal project:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

- `cmake_minimum_required(VERSION 3.5)` tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the `CMakeLists.txt` file.
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie `myProject.elf`, `myProject.bin`. Only one project can be defined per `CMakeLists` file.

Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in [/tools/cmake/project.cmake](#) for all of the implementation details.

- `COMPONENT_DIRS`: Directories to search for components. Defaults to `IDF_PATH/components`, `PROJECT_DIR/components`, and `EXTRA_COMPONENT_DIRS`. Override this variable if you don’t want to search for components in these places.
- `EXTRA_COMPONENT_DIRS`: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
- `COMPONENTS`: A list of component names to build into the project. Defaults to all components found in the `COMPONENT_DIRS` directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the `REQUIRES` or `PRIV_REQUIRES` arguments on component registration will automatically have it added to this list, so the `COMPONENTS` list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` ie `set(VARIABLE "VALUE")`. The `set()` commands should be placed after the `cmake_minimum(...)` line but before the `include(...)` line.

Renaming main component

The build system provides special treatment to the `main` component. It is a component that gets automatically added to the build provided that it is in the expected location, `PROJECT_DIR/main`. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the `main` component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming `main` are as follows:

1. Rename `main` directory.
2. Set `EXTRA_COMPONENT_DIRS` in the project `CMakeLists.txt` to include the renamed `main` directory.
3. Specify the dependencies in the renamed component's `CMakeLists.txt` file via `REQUIRES` or `PRIV_REQUIRES` arguments *on component registration*.

Overriding default build specifications

The build sets some global build specifications (compile flags, definitions, etc.) that gets used in compiling all sources from all components.

For example, one of the default build specifications set is the compile option `-Wextra`. Suppose a user wants to use override this with `-Wno-extra`, it should be done after `project()`:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILER_OPTIONS "-Wno-error" APPEND)
```

This ensures that the compile options set by the user won't be overridden by the default build specifications, since the latter are set inside `project()`.

4.5.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project's own components directory, or added from custom component directories (*see above*).

A component is any directory in the `COMPONENT_DIRS` list which contains a `CMakeLists.txt` file.

Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project's components. Directories in this list can either be components themselves (ie they contain a `CMakeLists.txt` file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`; by default, this means ESP-IDF's internal components first (`IDF_PATH/components`), then any components in directories specified in `EXTRA_COMPONENT_DIRS`, and finally the project's components

(PROJECT_DIR/components). If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

Note: If a component is overridden in an existing project by moving it to a new location, the project will not automatically see the new component path. Run `idf.py reconfigure` (or delete the project build folder) and then build again.

Minimal Component CMakeLists

The minimal component `CMakeLists.txt` file simply registers the component to the build system using `idf_component_register`:

```
idf_component_register(SRCS "foo.c" "bar.c"
                      INCLUDE_DIRS "include"
                      REQUIRES mbedtls)
```

- `SRCS` is a list of source files (`*.c`, `*.cpp`, `*.cc`, `*.S`). These source files will be compiled into the component library.
- `INCLUDE_DIRS` is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- `REQUIRES` is not actually required, but it is very often required to declare what other components this component will use. See [Component Requirements](#).

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the `CMakeLists.txt` file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed [here](#).

See [example component requirements](#) and [example component CMakeLists](#) for more complete component `CMakeLists.txt` examples.

Create a new component

Use the command `idf.py create-component` for creating a new component. The new component will contain set of files necessary for building a component. You may include the component's header file into your project and use its functionality. For more information execute `idf.py create-component --help`.

Example:

```
idf.py -C components create-component my_component
```

The example will create a new component in the subdirectory `components` under the current working directory. For more information about components follow the documentation page [see above](#).

Preset Component Variables

The following component-specific variables are available for use inside component `CMakeLists`, but should not be modified:

- `COMPONENT_DIR`: The component directory. Evaluates to the absolute path of the directory containing `CMakeLists.txt`. The component path cannot contain spaces. This is the same as the `CMAKE_CURRENT_SOURCE_DIR` variable.
- `COMPONENT_NAME`: Name of the component. Same as the name of the component directory.

- `COMPONENT_ALIAS`: Alias of the library created internally by the build system for the component.
- `COMPONENT_LIB`: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- `CONFIG_*`: Each value in the project configuration has a corresponding variable available in cmake. All names begin with `CONFIG_`. [More information here](#).
- `ESP_PLATFORM`: Set to 1 when the CMake file is processed within ESP-IDF build system.

Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using `idf_build_get_property` from the component CMakeLists.txt:

- `PROJECT_NAME`: Name of the project, as set in project CMakeLists.txt file.
- `PROJECT_DIR`: Absolute path of the project directory containing the project CMakeLists. Same as the `CMAKE_SOURCE_DIR` variable.
- `COMPONENTS`: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- `IDF_VER`: Git version of ESP-IDF (produced by `git describe`)
- `IDF_VERSION_MAJOR`, `IDF_VERSION_MINOR`, `IDF_VERSION_PATCH`: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. `v4.0-dev-*`, `v4.0-beta1`, `v4.0-rc1` and `v4.0` will all have the same values of `IDF_VERSION_*` variables, but different `IDF_VER` values.
- `IDF_TARGET`: Name of the target for which the project is being built.
- `PROJECT_VER`: Project version.
 - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
 - Else, if `PROJECT_VER` variable is set in project CMakeLists.txt file, its value will be used.
 - Else, if the `PROJECT_DIR/version.txt` exists, its contents will be used as `PROJECT_VER`.
 - Else, if the project is located inside a Git repository, the output of `git describe` will be used.
 - Otherwise, `PROJECT_VER` will be “1” .

Other build properties are listed [here](#).

Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the `target_compile_options` function:

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake `set_source_files_properties` command:

```
set_source_files_properties(mysrc.c
  PROPERTIES COMPILE_FLAGS
  -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.

4.5.6 Component Configuration

Each component can also have a `Kconfig` file, alongside `CMakeLists.txt`. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see [Adding conditional configuration](#).

4.5.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- `ESP_PLATFORM`: Can be used to detect that build happens within ESP-IDF.
- `IDF_VER`: Defined to a git version string. E.g. `v2.0` for a tagged release or `v1.0-275-g0efaa4f` for an arbitrary commit.

4.5.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on (“requires”).

When writing a component

```
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` should be set to all components whose header files are `#included` from the *public* header files of this component.
- `PRIV_REQUIRES` should be set to all components whose header files are `#included` from *any source files* in this component, unless already listed in `REQUIRES`. Also any component which is required to be linked in order for this component to function correctly.
- The values of `REQUIRES` and `PRIV_REQUIRES` should not depend on any configuration choices (`CONFIG_XXX` macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both `REQUIRES` variables is fine. If the component has no requirements except for the *Common component requirements* needed for RTOS, libc, etc.

If a components only supports some target chips (values of `IDF_TARGET`) then it can specify `REQUIRED_IDF_TARGETS` in the `idf_component_register` call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

Note: In CMake terms, `REQUIRES` & `PRIV_REQUIRES` are approximate wrappers around the CMake functions `target_link_libraries(... PUBLIC ...)` and `target_link_libraries(... PRIVATE ...)`.

Example of component requirements

Imagine there is a `car` component, which uses the `engine` component, which uses the `spark_plug` component:

```
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
                    - car.c
                    - car.h
  - engine/ - CMakeLists.txt
```

(continues on next page)

(continued from previous page)

```

- engine.c
- include/ - engine.h
- spark_plug/ - CMakeLists.txt
- plug.c
- plug.h

```

Car component The `car.h` header file is the public interface for the `car` component. This header includes `engine.h` directly because it uses some declarations from this header:

```

/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif

```

And `car.c` includes `car.h` as well:

```

/* car.c */
#include "car.h"

```

This means the `car/CMakeLists.txt` file needs to declare that `car` requires `engine`:

```

idf_component_register(SRCS "car.c"
                      INCLUDE_DIRS "."
                      REQUIRES engine)

```

- `SRCS` gives the list of source files in the `car` component.
- `INCLUDE_DIRS` gives the list of public include directories for this component. Because the public interface is `car.h`, the directory containing `car.h` is listed here.
- `REQUIRES` gives the list of components required by the public interface of this component. Because `car.h` is a public header and includes a header from `engine`, we include `engine` here. This makes sure that any other component which includes `car.h` will be able to recursively include the required `engine.h` also.

Engine component The `engine` component also has a public header file `include/engine.h`, but this header is simpler:

```

/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);

```

The implementation is in `engine.c`:

```

/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...

```

In this component, `engine` depends on `spark_plug` but this is a private dependency. `spark_plug.h` is needed to compile `engine.c`, but not needed to include `engine.h`.

This means that the `engine/CMakeLists.txt` file can use `PRIV_REQUIRES`:

```

idf_component_register(SRCS "engine.c"
                      INCLUDE_DIRS "include"
                      PRIV_REQUIRES spark_plug)

```

As a result, source files in the `car` component don't need the `spark_plug` include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

Spark Plug Component The `spark_plug` component doesn't depend on anything else. It has a public header file `spark_plug.h`, but this doesn't include headers from any other components.

This means that the `spark_plug/CMakeLists.txt` file doesn't need any `REQUIRES` or `PRIV_REQUIRES` clauses:

```
idf_component_register(SRCS "spark_plug.c"
                      INCLUDE_DIRS ".")
```

Source File Include Directories

Each component's source file is compiled with these include path directories, as specified in the passed arguments to `idf_component_register`:

```
idf_component_register(..
                      INCLUDE_DIRS "include"
                      PRIV_INCLUDE_DIRS "other")
```

- The current component's `INCLUDE_DIRS` and `PRIV_INCLUDE_DIRS`.
- The `INCLUDE_DIRS` belonging to all other components listed in the `REQUIRES` and `PRIV_REQUIRES` parameters (ie all the current component's public and private dependencies).
- Recursively, all of the `INCLUDE_DIRS` of those components `REQUIRES` lists (ie all public dependencies of this component's dependencies, recursively expanded).

Main component requirements

The component named `main` is special because it automatically requires all other components in the build. So it's not necessary to pass `REQUIRES` or `PRIV_REQUIRES` to this component. See [renaming main](#) for a description of what needs to be changed if no longer using the `main` component.

Common component requirements

To avoid duplication, every component automatically requires some "common" IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: `cxx`, `newlib`, `freertos`, `esp_hw_support`, `heap`, `log`, `lwip`, `soc`, `hal`, `esp_rom`, `esp_common`, `esp_system`.

Including components in the build

- By default, every component is included in the build.
- If you set the `COMPONENTS` variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
 - Components mentioned explicitly in `COMPONENTS`.
 - Those components' requirements (evaluated recursively).
 - The "common" components that every component depends on.
- Setting `COMPONENTS` to the minimal list of required components can significantly reduce compile times.

Circular Dependencies

It's possible for a project to contain Component A that requires (REQUIRES or PRIV_REQUIRES) Component B, and Component B that requires Component A. This is known as a dependency cycle or a circular dependency.

CMake will usually handle circular dependencies automatically by repeating the component library names twice on the linker command line. However this strategy doesn't always work, and it's possible the build will fail with a linker error about "Undefined reference to ...", referencing a symbol defined by one of the components inside the circular dependency. This is particularly likely if there is a large circular dependency, i.e. A->B->C->D->A.

The best solution is to restructure the components to remove the circular dependency. In most cases, a software architecture without circular dependencies has desirable properties of modularity and clean layering and will be more maintainable in the long term. However, removing circular dependencies is not always possible.

To bypass a linker error caused by a circular dependency, the simplest workaround is to increase the CMake `LINK_INTERFACE_MULTIPLICITY` property of one of the component libraries. This causes CMake to repeat this library and its dependencies more than two times on the linker command line.

For example:

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If possible, place this line in the component that creates the circular dependency by depending on a lot of other components. However, the line can be placed inside any component that is part of the cycle. Choosing the component that owns the source file shown in the linker error message, or the component that defines the symbol(s) mentioned in the linker error message, is a good place to start.
- Usually increasing the value to 3 (default is 2) is enough, but if this doesn't work then try increasing the number further.
- Adding this option will make the linker command line longer, and the linking stage slower.

Advanced Workaround: Undefined Symbols If only one or two symbols is causing a circular dependency, and all other dependencies are linear, then there is an alternative method to avoid linker errors: Specify the specific symbols required for the "reverse" dependency as undefined symbols at link time.

For example, if component A depends on component B but component B also needs to reference `reverse_ops` from component A (but nothing else), then you can add a line like the following to the component B CMakeLists.txt to resolve the cycle at link time:

```
# This symbol is provided by 'Component A' at link time
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- The `-u` argument means that the linker will always include this symbol in the link, regardless of dependency ordering.
- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If 'Component B' doesn't need to access any headers of 'Component A', only link to a few symbol(s), then this line can be used instead of any REQUIRES from B to A. This further simplifies the component structure in the build system.

See the [target_link_libraries](#) documentation for more information about this CMake function.

Requirements in the build system implementation

- Very early in the CMake configuration process, the script `expand_requirements.cmake` is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this *graph may have cycles*). The graph is used to generate a file `component_depends.cmake` in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal `BUILD_COMPONENTS` variable). The `BUILD_COMPONENTS` variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed

for all components. The order should be deterministic given the same set of components and component dependencies.

- The value of `BUILD_COMPONENTS` is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the `CMakeLists.txt` file is evaluated again to add the component libraries to the build.

Component Dependency Order The order of components in the `BUILD_COMPONENTS` variable determines other orderings during the build:

- Order that `project_include.cmake` files are included into the project.
- Order that the list of header paths is generated for compilation (via `-I` argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

4.5.9 Overriding Parts of the Project

`project_include.cmake`

For components that have build requirements which must be evaluated before any component `CMakeLists` files are evaluated, you can create a file called `project_include.cmake` in the component directory. This CMake file is included when `project.cmake` is evaluating the entire project.

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app” .

Unlike component `CMakeLists.txt` files, when including a `project_include.cmake` file the current source directory (`CMAKE_CURRENT_SOURCE_DIR` and working directory) is the project directory. Use the variable `COMPONENT_DIR` for the absolute directory of the component.

Note that `project_include.cmake` isn’t necessary for the most common component uses - such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customised via the `CMakeLists.txt` file itself. See [Optional Project Variables](#) for details.

`project_include.cmake` files are included in the order given in `BUILD_COMPONENTS` variable (as logged by CMake). This means that a component’s `project_include.cmake` file will be included after it’s all dependencies’ `project_include.cmake` files, unless both components are part of a dependency cycle. This is important if a `project_include.cmake` file relies on variables set by another component. See also [above](#).

Take great care when setting variables or targets in a `project_include.cmake` file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

`KConfig.projbuild`

This is an equivalent to `project_include.cmake` for [Component Configuration](#) `KConfig` files. If you want to include configuration options at the top-level of `menuconfig`, rather than inside the “Component Configuration” sub-menu, then these can be defined in the `KConfig.projbuild` file alongside the `CMakeLists.txt` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a `KConfig` file for [Component Configuration](#).

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app” .

4.5.10 Configuration-Only Components

Special components which contain no source files, only `Kconfig.projbuild` and `KConfig`, can have a one-line `CMakeLists.txt` file which calls the function `idf_component_register()` with no arguments specified. This function will include the component in the project build, but no library will be built *and* no header files will be added to any include paths.

4.5.11 Debugging CMake

For full details about [CMake](#) and CMake commands, see the [CMake v3.5 documentation](#).

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the [cmake command line documentation](#).

When included from a project CMakeLists file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in [CMake](#) `project` function. This function is overridden to add all of the ESP-IDF specific project functionality.

Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to [CMake](#) so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don't want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the [/tools/cmake/project.cmake](#) file and supporting functions in [/tools/cmake/](#) for more details.

4.5.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component `CMakeLists.txt` can be very small or even empty (see [Minimal Component CMakeLists](#)). However, overriding [component variables](#) is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

Adding conditional configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
    list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
    set(srcs lcd-real.c lcd-spi.c)
else()
    set(srcs lcd-dummy.c)
endif()

# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
    list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

Conditions which depend on the target

The current target is available to CMake files via `IDF_TARGET` variable.

In addition to that, if target `xyz` is used (`IDF_TARGET=xyz`), then Kconfig variable `CONFIG_IDF_TARGET_XYZ` will be set.

Note that component dependencies may depend on `IDF_TARGET` variable, but not on Kconfig variables. Also one can not use Kconfig variables in `include` statements in CMake files, but `IDF_TARGET` can be used in such context.

Source Code Generation

Some components will have a situation where a source file isn't supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called `bmp2h`. The header file is then included in as C source file called `graphics_lib.c`:

```
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)
```

(continues on next page)

(continued from previous page)

```
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
  ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

This answer is adapted from the [CMake FAQ entry](#), which contains some other examples that will also work with ESP-IDF builds.

In this example, `logo.h` will be generated in the current directory (the build directory) while `logo.bmp` comes with the component and resides under the component path. Because `logo.h` is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the `ADDITIONAL_MAKE_CLEAN_FILES` property.

Note: If generating files as part of the project `CMakeLists.txt` file, not a component `CMakeLists.txt`, then use build property `PROJECT_DIR` instead of `COMPONENT_DIR` and `PROJECT_NAME` instead of `COMPONENT_LIB`.

If a source file from another component included `logo.h`, then `add_dependencies` would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

Embedding Binary Data

Sometimes you have a file with some binary or text data that you'd like to make available to your component - but you don't want to reformat the file as C source.

You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```
idf_component_register(...
  EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```
idf_component_register(...
  EMBED_TXTFILES server_root_cert.pem)
```

The file's contents will be added to the `.rodata` section in flash, and are available via symbol names as follows:

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters `/`, `.`, etc. are replaced with underscores. The `_binary` prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project `CMakeLists.txt` file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see the “main” component of the [file_serving example protocols/http_server/file_serving/main/CMakeLists.txt](#) - two files are loaded at build time and linked into the firmware.

It is also possible embed a generated file:

```
add_custom_command(OUTPUT my_processed_file.bin
                   COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

In the example above, `my_processed_file.bin` is generated from `my_unprocessed_file.bin` through some command `my_process_file_cmd`, then embedded into the target.

To specify a dependence on a target, use the `DEPENDS` argument:

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

The `DEPENDS` argument to `target_add_binary_data` ensures that the target executes first.

Code and Data Placements

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See [Linker Script Generation](#) for a quick start guide as well as a detailed discussion of the mechanism.

Fully Overriding The Component Build Process

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it's possible to forego the ESP-IDF build system entirely by using a CMake feature called [ExternalProject](#). Example component CMakeLists:

```
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
  PREFIX ${COMPONENT_DIR}
  SOURCE_DIR ${COMPONENT_DIR}/quirc
  CONFIGURE_COMMAND ""
  BUILD_IN_SOURCE 1
  BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
  INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
  ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
  ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
  "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named `quirc` that builds the `quirc` project using its own Makefile.)

- `externalproject_add` defines an external build system.
 - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
 - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise you can set `BUILD_DIR`.

- Consult the [ExternalProject](#) documentation for more details about `externalproject_add()`
- The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
- Finally, the generated library is added to `ADDITIONAL_MAKE_CLEAN_FILES`. This means `make clean` will delete this library. (Note that the other object files from the build won't be deleted.)

ExternalProject dependencies, clean builds CMake has some unusual behaviour around external project builds:

- `ADDITIONAL_MAKE_CLEAN_FILES` only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won't delete these files when cleaning.
- However, the [ExternalProject](#) configure & build commands will *always* be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
 1. Have the external `BUILD_COMMAND` run a full clean compile of all sources. The build command will be run if any of the dependencies passed to `externalproject_add` with `DEPENDS` have changed, or if this is a clean build (ie any of `idf.py clean`, `ninja clean`, or `make clean` was run.)
 2. Have the external `BUILD_COMMAND` be an incremental build command. Pass the parameter `BUILD_ALWAYS 1` to `externalproject_add`. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn't take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

4.5.13 Custom sdkconfig defaults

For example projects or other projects where you don't want to specify a full `sdkconfig` configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn't yet been set in the `sdkconfig` file.

To override the name of this file or to specify multiple files, set the `SDKCONFIG_DEFAULTS` environment variable or set `SDKCONFIG_DEFAULTS` in top-level `CMakeLists.txt`. If specifying multiple files, use semicolon as the list separator. File names not specified as full paths are resolved relative to current project.

Some of the IDF examples include a `sdkconfig.ci` file. This is part of the continuous integration (CI) test framework and is ignored by the normal build process.

Target-dependent sdkconfig defaults

In addition to `sdkconfig.defaults` file, build system will also load defaults from `sdkconfig.defaults.TARGET_NAME` file, where `TARGET_NAME` is the value of `IDF_TARGET`. For example, for `esp32` target, default settings will be taken from `sdkconfig.defaults` first, and then from `sdkconfig.defaults.esp32`.

If `SDKCONFIG_DEFAULTS` is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from `SDKCONFIG_DEFAULTS` value/values using the rule above.

4.5.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, `esptool.py` and `esptool write_flash` arguments. It's simple to write a script to save binaries and `esptool.py`.

After running a project build, the build directory contains binary output files (`.bin` files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.

- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

4.5.15 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMakeLists.txt file and builds separate .ELF and .BIN files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

4.5.16 Selecting the Target

ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py --list-targets`.

To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

Important: `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

Note: The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)
 2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
 3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)
-

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the `_default_` value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

4.5.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```
add_library(json STATIC
  cJSON/cJSON.c
  cJSON/cJSON_Utils.c)

target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF `json` component [/components/json/CMakeLists.txt](#).
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.)
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

4.5.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects —code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library `foo` to be used in the `main` component:

```
# Register the component
idf_component_register(...)

# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at [build_system/cmake/import_lib](#). Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the `mbedtls` component is a wrapper for Espressif’s fork of `mbedtls`. See its [component CMakeLists.txt](#).

The CMake variable `ESP_PLATFORM` is set to 1 whenever the ESP-IDF build system is being used. Tests such as `if (ESP_PLATFORM)` can be used in generic CMake code if special IDF-specific logic is required.

Using ESP-IDF components from external libraries

The above example assumes that the external library `foo` (or `tinyclib` in the case of the `import_lib` example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as `libc`, `libstdc++`, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target `idf::<componentname>`.

For example, in the `foo/CMakeLists.txt` file:

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

4.5.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (`.a` file), built by some other build process.

The ESP-IDF build system provides a utility function `add_prebuilt_library` for users to be able to easily import and use prebuilt libraries:

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES_
↳req1 req2 ...])
```

where:

- `target_name`- name that can be used to reference the imported library, such as when linking to other targets
- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments `REQUIRES` and `PRIV_REQUIRES` specify dependency on other components. These have the same meaning as the arguments for `idf_component_register`.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at [build_system/cmake/import_prebuilt](#).

4.5.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user's targets (libraries/ executables).

It is possible to do so by using the *build system APIs provided* by `tools/cmake/idf.cmake`. For example:

```
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include(${ENV{IDF_PATH}}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF.
↳build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets,
↳dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in [build_system/cmake/idf_as_lib](#) demonstrates the creation of an application equivalent to [hello world application](#) using a custom CMake project.

4.5.21 ESP-IDF CMake Build System API

idf-build-commands

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a *build property* *property* and store it in *var* accessible from the current scope. Specifying *GENERATOR_EXPRESSION* will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_build_set_property(property val [APPEND])
```

Set a *build property* *property* with value *val*. Specifying *APPEND* will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_build_component(component_dir)
```

Present a directory *component_dir* that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before *idf_build_process*.

This command does not guarantee that the component will be processed during build (see the *COMPONENTS* argument description for *idf_build_process*)

```
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user's perspective is the libraries creation by calling each component's *idf_component_register*. This command creates the libraries for each component, which are accessible using aliases in the form *idf::component_name*. These aliases can be used to link the components to the user's own targets, either libraries or executables.

The call requires the target chip to be specified with *target* argument. Optional arguments for the call include:

- **PROJECT_DIR** - directory of the project; defaults to **CMAKE_SOURCE_DIR**
- **PROJECT_NAME** - name of the project; defaults to **CMAKE_PROJECT_NAME**
- **PROJECT_VER** - version/revision of the project; defaults to "1"
- **SDKCONFIG** - output path of generated *sdkconfig* file; defaults to **PROJECT_DIR/sdkconfig** or **CMAKE_SOURCE_DIR/sdkconfig** depending if **PROJECT_DIR** is set
- **SDKCONFIG_DEFAULTS** - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value *filename* in the list, the config from file *filename.target*, if it exists, is also loaded.
- **BUILD_DIR** - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to **CMAKE_BINARY_DIR**
- **COMPONENTS** - select components to process among the components known by the build system (added via *idf_build_component*). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```
idf_build_executable(executable)
```

Specify the executable *executable* for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after `idf_build_process`.

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying *GENERATOR_EXPRESSION* will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to `idf_build_process`, however.

idf-build-properties

These are properties that describe the build. Values of build properties can be retrieved by using the build command `idf_build_get_property`. For example, to get the Python interpreter used for the build:

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- `BUILD_DIR` - build directory; set from `idf_build_process BUILD_DIR` argument
- `BUILD_COMPONENTS` - list of components included in the build; set by `idf_build_process`
- `BUILD_COMPONENT_ALIASES` - list of library alias of components included in the build; set by `idf_build_process`
- `C_COMPILE_OPTIONS` - compile options applied to all components' C source files
- `COMPILE_OPTIONS` - compile options applied to all components' source files, regardless of it being C or C++
- `COMPILE_DEFINITIONS` - compile definitions applied to all component source files
- `CXX_COMPILE_OPTIONS` - compile options applied to all components' C++ source files
- `EXECUTABLE` - project executable; set by call to `idf_build_executable`
- `EXECUTABLE_NAME` - name of project executable without extension; set by call to `idf_build_executable`
- `EXECUTABLE_DIR` - path containing the output executable
- `IDF_COMPONENT_MANAGER` - the component manager is enabled by default, but if this property is set to 0 it was disabled by the `IDF_COMPONENT_MANAGER` environment variable
- `IDF_PATH` - ESP-IDF path; set from `IDF_PATH` environment variable, if not, inferred from the location of `idf.cmake`
- `IDF_TARGET` - target chip for the build; set from the required target argument for `idf_build_process`
- `IDF_VER` - ESP-IDF version; set from either a version file or the Git revision of the `IDF_PATH` repository
- `INCLUDE_DIRECTORIES` - include directories for all component source files
- `KCONFIGS` - list of Kconfig files found in components in build; set by `idf_build_process`
- `KCONFIG_PROJBUILDS` - list of Kconfig.projbuild files found in components in build; set by `idf_build_process`
- `PROJECT_NAME` - name of the project; set from `idf_build_process PROJECT_NAME` argument
- `PROJECT_DIR` - directory of the project; set from `idf_build_process PROJECT_DIR` argument
- `PROJECT_VER` - version of the project; set from `idf_build_process PROJECT_VER` argument
- `PYTHON` - Python interpreter used for the build; set from `PYTHON` environment variable if available, if not "python" is used
- `SDKCONFIG` - full path to output config file; set from `idf_build_process SDKCONFIG` argument
- `SDKCONFIG_DEFAULTS` - list of files containing default config to use in the build; set from `idf_build_process SDKCONFIG_DEFAULTS` argument
- `SDKCONFIG_HEADER` - full path to C/C++ header file containing component configuration; set by `idf_build_process`
- `SDKCONFIG_CMAKE` - full path to CMake file containing component configuration; set by `idf_build_process`
- `SDKCONFIG_JSON` - full path to JSON file containing component configuration; set by `idf_build_process`

- `SDKCONFIG_JSON_MENUS` - full path to JSON file containing config menus; set by `idf_build_process`

idf-component-commands

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

Retrieve a specified *component*'s *component property*, *property* and store it in *var* accessible from the current scope. Specifying *GENERATOR_EXPRESSION* will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_component_set_property(component property val [APPEND])
```

Set a specified *component*'s *component property*, *property* with value *val*. Specifying *APPEND* will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
→SRCS src1 src2 ...]]
                        [INCLUDE_DIRS dir1 dir2 ...]
                        [PRIV_INCLUDE_DIRS dir1 dir2 ...]
                        [REQUIRES component1 component2 ...]
                        [PRIV_REQUIRES component1 component2 ...]
                        [LDFRAGMENTS ldfragment1 ldfragment2 ...]
                        [REQUIRED_IDF_TARGETS target1 target2 ...]
                        [EMBED_FILES file1 file2 ...]
                        [EMBED_TXTFILES file1 file2 ...]
                        [KCONFIG kconfig]
                        [KCONFIG_PROJBUILD kconfig_projbuild])
```

Register a component to the build system. Much like the `project()` CMake command, this should be called from the component's `CMakeLists.txt` directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can **not** be called before `idf_component_register`:

- commands that are not valid in CMake script mode
- custom commands defined in `project_include.cmake`
- build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`.

The arguments for `idf_component_register` include:

- `SRCS` - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- `SRC_DIRS`, `EXCLUDE_SRCS` - used to glob source files (`.c`, `.cpp`, `.S`) by specifying directories, instead of specifying source files manually via `SRCS`. Note that this is subject to the *limitations of globbing in CMake*. Source files specified in `EXCLUDE_SRCS` are removed from the globbed files.
- `INCLUDE_DIRS` - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
- `PRIV_INCLUDE_DIRS` - directory paths, must be relative to the component directory, which will be added to the include search path for this component's source files only
- `REQUIRES` - public component requirements for the component
- `PRIV_REQUIRES` - private component requirements for the component; ignored on config-only components
- `LDFRAGMENTS` - component linker fragment files
- `REQUIRED_IDF_TARGETS` - specify the only target the component supports
- `KCONFIG` - override the default Kconfig file
- `KCONFIG_PROJBUILD` - override the default Kconfig.projbuild file

The following are used for *embedding data into the component*, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- `EMBED_FILES` - binary files to be embedded in the component
- `EMBED_TXTFILES` - text files to be embedded in the component

idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the `freertos` component:

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- `COMPONENT_ALIAS` - alias for `COMPONENT_LIB` used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- `COMPONENT_DIR` - component directory; set by `idf_build_component`
- `COMPONENT_OVERRIDEN_DIR` - contains the directory of the original component if *this component overrides another component*
- `COMPONENT_LIB` - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- `COMPONENT_NAME` - name of the component; set by `idf_build_component` based on the component directory name
- `COMPONENT_TYPE` - type of the component, whether `LIBRARY` or `CONFIG_ONLY`. A component is of type `LIBRARY` if it specifies source files or embeds a file
- `EMBED_FILES` - list of files to embed in component; set from `idf_component_register` `EMBED_FILES` argument
- `EMBED_TXTFILES` - list of text files to embed in component; set from `idf_component_register` `EMBED_TXTFILES` argument
- `INCLUDE_DIRS` - list of component include directories; set from `idf_component_register` `INCLUDE_DIRS` argument
- `KCONFIG` - component Kconfig file; set by `idf_build_component`
- `KCONFIG_PROJBUILD` - component Kconfig.projbuild; set by `idf_build_component`
- `LDFRAGMENTS` - list of component linker fragment files; set from `idf_component_register` `LDFRAGMENTS` argument
- `PRIV_INCLUDE_DIRS` - list of component private include directories; set from `idf_component_register` `PRIV_INCLUDE_DIRS` on components of type `LIBRARY`
- `PRIV_REQUIRES` - list of private component dependences; set from `idf_component_register` `PRIV_REQUIRES` argument
- `REQUIRED_IDF_TARGETS` - list of targets the component supports; set from `idf_component_register` `EMBED_TXTFILES` argument
- `REQUIRES` - list of public component dependencies; set from `idf_component_register` `REQUIRES` argument
- `SRCS` - list of component source files; set from `SRCS` or `SRC_DIRS/EXCLUDE_SRCS` argument of `idf_component_register`

4.5.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via `SRCS` argument to `idf_component_register`:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
    ...)
```

This preference reflects the [CMake best practice](#) of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using `SRC_DIRS`:

```
idf_component_register(SRC_DIRS library platform
    ...)
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won't know to automatically re-run and this file won't be added to the build.

The trade-off is acceptable when you're adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git...

For components which are part of ESP-IDF, we use a third party Git CMake integration module ([/tools/cmake/third_party/GetGitRevisionDescription.cmake](#)) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use `SRCS` argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

4.5.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains `esptool.py` arguments to flash the project's binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See [Flash arguments](#).
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in `menuconfig`, for use in external IDE UIs.

JSON Configuration Server

A tool called `confserver.py` is provided to allow IDEs to easily integrate with the configuration system logic. `confserver.py` is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run `confserver.py` from a project via `idf.py confserver` or `ninja confserver`, or a similar target triggered from a different build generator.

For more information about `confserver.py`, see [tools/kconfig_new/README.md](#).

4.5.24 Build System Internals

Build Scripts

The listfiles for the ESP-IDF build system reside in `/tools/cmake`. The modules which implement core build system functionality are as follows:

- `build.cmake` - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- `component.cmake` - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- `kconfig.cmake` - Generation of configuration files (`sdkconfig`, `sdkconfig.h`, `sdkconfig.cmake`, etc.) from `Kconfig` files.
- `ldgen.cmake` - Generation of final linker script from linker fragment files.
- `target.cmake` - Setting build target and toolchain file.
- `utilities.cmake` - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in `/tools/cmake`:

- `idf.cmake` - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- `project.cmake` - Includes `idf.cmake` and provides a custom `project()` command that takes care of all the heavy lifting of building an executable. Included in the top-level `CMakeLists.txt` of standard ESP-IDF projects.

The rest of the files in `/tools/cmake` are support or third-party scripts used in the build process.

Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

Fig. 3: ESP-IDF Build System Process

Initialization This phase sets up necessary parameters for the build.

- **Upon inclusion of `idf.cmake` in `project.cmake`, the following steps are performed:**
 - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level `CMakeLists.txt`.
 - Add `/tools/cmake` to `CMAKE_MODULE_PATH` and include core modules plus the various helper/third-party scripts.
 - Set build tools/executables such as default Python interpreter.
 - Get ESP-IDF git revision and store as `IDF_VER`.
 - Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
 - Add components in `components` to the build.
- **The initial part of the custom `project()` command performs the following steps:**
 - Set `IDF_TARGET` from environment variable or CMake cache and the corresponding `CMAKE_TOOLCHAIN_FILE` to be used.
 - Add components in `EXTRA_COMPONENTS_DIRS` to the build.

- Prepare arguments for calling command `idf_build_process()` from variables such as `COMPONENTS/EXCLUDE_COMPONENTS`, `SDKCONFIG`, `SDKCONFIG_DEFAULTS`.

The call to `idf_build_process()` command marks the end of this phase.

Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of `idf_build_process()`.

- Retrieve each component's public and private requirements. A child process is created which executes each component's `CMakeLists.txt` in script mode. The values of `idf_component_register` `REQUIRES` and `PRIV_REQUIRES` argument is returned to the parent build process. This is called early expansion. The variable `CMAKE_BUILD_EARLY_EXPANSION` is defined during this step.
- Recursively include components based on public and private requirements.

Processing

This phase processes the components in the build, and is the second half of `idf_build_process()`.

- Load project configuration from `sdkconfig` file and generate an `sdkconfig.cmake` and `sdkconfig.h` header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
- Include each component's `project_include.cmake`.
- Add each component as a subdirectory, processing its `CMakeLists.txt`. The component `CMakeLists.txt` calls the registration command, `idf_component_register` which adds source files, include directories, creates component library, links dependencies, etc.

Finalization

This phase is everything after `idf_build_process()`.

- Create executable and link the component libraries to it.
- Generate project metadata files such as `project_description.json` and display relevant information about the project built.

Browse </tools/cmake/project.cmake> for more details.

4.5.25 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, `idf_component_register`.

Automatic Conversion Tool

An automatic project conversion tool is available in /tools/cmake/convert_to_cmake.py. Run this command line tool with the path to a project like this:

```
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
```

The project directory must contain a Makefile, and GNU Make (`make`) must be installed and available on the `PATH`.

The tool will convert the project Makefile and any component `component.mk` files to their equivalent `CMakeLists.txt` files.

It does so by running `make` to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent `CMakeLists` files to set the same variables.

Important: When the conversion tool converts a `component.mk` file, it doesn't determine what other components that component depends on. This information needs to be added manually by editing the new component `CMakeLists.txt` file and adding `REQUIRES` and/or `PRIV_REQUIRES` clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See [Component Requirements](#).

The conversion tool is not capable of dealing with complex Makefile logic or unusual targets. These will need to be converted by hand.

No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- `COMPONENT_BUILD_DIR`: Use `CMAKE_CURRENT_BINARY_DIR` instead.
- `COMPONENT_LIBRARY`: Defaulted to `$(COMPONENT_NAME).a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- `CC`, `LD`, `AR`, `OBJCOPY`: Full paths to each tool from the `gcc xtensa` cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. [Full list here](#).
- `HOSTCC`, `HOSTLD`, `HOSTAR`: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- `COMPONENT_ADD_LDFLAGS`: Used to override linker flags. Use the CMake [target_link_libraries](#) command instead.
- `COMPONENT_ADD_LINKER_DEPS`: List of files that linking should depend on. [target_link_libraries](#) will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- `COMPONENT_SUBMODULES`: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- `COMPONENT_EXTRA_INCLUDES`: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- `COMPONENT_OBJS`: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRC` argument to `idf_component_register`.
- `COMPONENT_OBJEXCLUDE`: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- `COMPONENT_EXTRA_CLEAN`: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note [CMake has some restrictions around this functionality](#).
- `COMPONENT_OWNBUILDTARGET` & `COMPONENT_OWNCLEANTARGET`: Use CMake [ExternalProject](#) instead. See [Fully Overriding The Component Build Process](#) for full details.
- `COMPONENT_CONFIG_ONLY`: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](#).
- `CFLAGS`, `CPPFLAGS`, `CXXFLAGS`: Use equivalent CMake commands instead. See [Controlling Component Compilation](#).

No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)
- Include directories (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)

No Longer Necessary

- In the legacy Make-based build system, it is required to also set `COMPONENT_SRCDIRS` if `COMPONENT_SRCS` is set. In CMake, the equivalent is not necessary i.e. specifying `SRC_DIRS` to `idf_component_register` if `SRCS` is also specified (in fact, `SRCS` is ignored if `SRC_DIRS` is specified).

Flashing from make

`make flash` and similar targets still work to build and flash. However, `project sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See [Flashing with ninja or make](#) for more details.

4.6 Deep Sleep Wake Stubs

ESP32-S3 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

4.6.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main `esp-idf` app. During normal running of `esp-idf`, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.6.2 Implementing A Stub

The wake stub in `esp-idf` is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in `esp-idf`, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`.

It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under `components/esp32s3`.

4.6.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

4.6.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named `CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM`. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the `CONFIG_FREERTOS_UNICORE` because RTC fast memory can be accessed only by `PRO_CPU`.

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into `RTC_FAST` and `RTC_SLOW` memory respectively. Any access to data marked with `RTC_FAST_ATTR` is allowed by `PRO_CPU` only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` Kconfig option, see more information in [Fast boot from Deep Sleep](#).

4.6.5 CRC Check For Wake Stubs

During deep sleep, only the wake stubs area of RTC Fast memory is validated with CRC. When ESP32-S3 wakes up from deep sleep, the wake stubs area is validated again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader, and esp-idf codes will be executed.

Note: When the `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

4.7 Device Firmware Upgrade through USB

Device Firmware Upgrade (DFU) is a mechanism for upgrading the firmware of devices through Universal Serial Bus (USB). DFU is supported by ESP32-S3 chips. The necessary connections for the USB peripheral are shown in the following table.

GPIO	USB
20	D+ (green)
19	D- (white)
GND	GND (black)
+5V	+5V (red)

By default, `USB_SERIAL_JTAG` module is connected to the internal PHY of the ESP32-S3, while USB_OTG peripheral can be used only if the external USB PHY is connected. Since DFU mode is provided via USB_OTG peripheral, it cannot be used through the internal PHY in this configuration.

You can permanently switch the internal USB PHY to work with USB_OTG peripheral instead of `USB_SERIAL_JTAG` by burning `USB_PHY_SEL` eFuse. See ESP32-S3 Technical Reference Manual for more details about `USB_SERIAL_JTAG` and `USB_OTG`.

Note: The ESP32-S3 chip needs to be in bootloader mode for the detection as a DFU device and flashing. This can be achieved by pulling GPIO0 down (e.g. pressing the BOOT button), pulsing RESET down for a moment and releasing GPIO0.

Warning: Some cables are wired up with non-standard colors and some drivers are able to work with swapped D+ and D- connections. Please try to swap the cables connecting to D+ and D- if your device is not detected.

The software requirements of DFU are included in [Step 1. Install prerequisites](#) of the Getting Started Guide.

Section [Building the DFU Image](#) describes how to build firmware for DFU with ESP-IDF and Section [Flashing the Chip with the DFU Image](#) deals with flashing the firmware.

4.7.1 Building the DFU Image

The DFU image can be created by running:

```
idf.py dfu
```

which creates `dfu.bin` in the build directory.

Note: Don't forget to set the target chip by `idf.py set-target` before running `idf.py dfu`. Otherwise, you might create an image for a different chip or receive an error message something like `unknown target`

```
'dfu'.
```

4.7.2 Flashing the Chip with the DFU Image

The DFU image is downloaded into the chip by running:

```
idf.py dfu-flash
```

which relies on `dfu-util`. Please see [Step 1. Install prerequisites](#) for installing `dfu-util`. `dfu-util` needs additional setup for [USB drivers \(Windows only\)](#) or setting up an [udev rule \(Linux only\)](#). Mac OS users should be able to use `dfu-util` without further setup.

If there are more boards with the same chip connected then `idf.py dfu-list` can be used to list the available devices, for example:

```
Found Runtime: [303a:0002] ver=0723, devnum=4, cfg=1, intf=2, path="1-10", alt=0, ↵  
↳name="UNKNOWN", serial="0"  
Found Runtime: [303a:0002] ver=0723, devnum=6, cfg=1, intf=2, path="1-2", alt=0, ↵  
↳name="UNKNOWN", serial="0"
```

Consequently, the desired device can be selected for flashing by the `--path` argument. For example, the devices listed above can be flashed individually by the following commands:

```
idf.py dfu-flash --path 1-10  
idf.py dfu-flash --path 1-2
```

Note: The vendor and product identifiers are set based on the selected chip target by the `idf.py set-target` command and it is not selectable during the `idf.py dfu-flash` call.

See [Common errors and known issues](#) and their solutions.

udev rule (Linux only)

udev is a device manager for the Linux kernel. It allows us to run `dfu-util` (and `idf.py dfu-flash`) without `sudo` for gaining access to the chip.

Create file `/etc/udev/rules.d/40-dfuse.rules` with the following content:

```
SUBSYSTEMS=="usb", ATTRS{idVendor}=="303a", ATTRS{idProduct}=="00??", GROUP=  
↳"plugdev", MODE="0666"
```

Note: Please check the output of command `groups`. The user has to be a member of the `GROUP` specified above. You may use some other existing group for this purpose (e.g. `uucp` on some systems instead of `plugdev`) or create a new group for this purpose.

Restart your computer so the previous setting could take into affect or run `sudo udevadm trigger` to force manually udev to trigger your new rule.

USB drivers (Windows only)

`dfu-util` uses `libusb` to access the device. You have to register on Windows the device with the `WinUSB` driver. Please see the [libusb wiki](#) for more details.

The drivers can be installed by the [Zadig tool](#). Please make sure that the device is in download mode before running the tool and that it detects the ESP32-S3 device before installing the drivers. The Zadig tool might detect several

USB interfaces of ESP32-S3. Please install the WinUSB driver for only that interface for which there is no driver installed (probably it is Interface 2) and don't re-install the driver for the other interface.

Warning: The manual installation of the driver in Device Manager of Windows is not recommended because the flashing might not work properly.

Common errors and known issues

- `dfu-util: command not found` might indicate that the tool hasn't been installed or is not available from the terminal. An easy way of checking the tool is running `dfu-util --version`. Please see [Step 1. Install prerequisites](#) for installing `dfu-util`.
- The reason for `No DFU capable USB device available` could be that the USB driver wasn't properly installed on Windows (see [USB drivers \(Windows only\)](#)), `udev` rule was not setup on Linux (see [udev rule \(Linux only\)](#)) or the device isn't in bootloader mode.
- Flashing with `dfu-util` on Windows fails on the first attempt with error `Lost device after RESET?`. Please retry the flashing and it should succeed the next time.

4.8 Error Handling

4.8.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
 - Errors indicated by functions through return values (error codes)
 - C++ exceptions, thrown using `throw` keyword
- Unrecoverable (fatal) errors:
 - Failed assertions (using `assert` macro and equivalent methods, see [Assertions](#)) and `abort()` calls.
 - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
 - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see [Fatal Errors](#).

4.8.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with `ESP_OK` code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR_` prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see [Error Code Reference](#).

4.8.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing `0x101` to `esp_err_to_name()` will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a [standard POSIX error code](#), if no matching `ESP_ERR_` value is found. This is done using `strerror_r` function. POSIX error codes (such as `ENOENT`, `ENOMEM`) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#). When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return `UNKNOWN_ERROR`, and `esp_err_to_name_r()` will return `Unknown error 0xXXXX(YYYYY)`, where `0xXXXX` and `YYYYY` are the hexadecimal and decimal representations of the error code, respectively.

4.8.4 ESP_ERROR_CHECK macro

`ESP_ERROR_CHECK()` macro serves similar purpose as `assert`, except that it checks `esp_err_t` value rather than a `bool` condition. If the argument of `ESP_ERROR_CHECK()` is not equal `ESP_OK`, then an error message is printed on the console, and `abort()` is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030_
↳0x400d0816:0x3ffb5050
```

Note: If *IDF monitor* is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#) option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where `ESP_ERROR_CHECK()` macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See [Fatal Errors](#) for more information about the backtrace.

4.8.5 ESP_ERROR_CHECK_WITHOUT_ABORT macro

`ESP_ERROR_CHECK_WITHOUT_ABORT()` macro serves similar purpose as `ESP_ERROR_CHECK`, except that it won't call `abort()`.

4.8.6 ESP_RETURN_ON_ERROR macro

`ESP_RETURN_ON_ERROR()` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message and returns.

4.8.7 ESP_GOTO_ON_ERROR macro

`ESP_GOTO_ON_ERROR()` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message, sets the local variable `ret` to the code, and then exits by jumping to `goto_tag`.

4.8.8 ESP_RETURN_ON_FALSE macro

`ESP_RETURN_ON_FALSE()` macro checks the condition, if the condition is not equal `true`, it prints the message and returns with the supplied `err_code`.

4.8.9 ESP_GOTO_ON_FALSE macro

`ESP_GOTO_ON_FALSE()` macro checks the condition, if the condition is not equal `true`, it prints the message, sets the local variable `ret` to the supplied `err_code`, and then exits by jumping to `goto_tag`.

4.8.10 CHECK MACROS Examples

Some examples:

```
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message_
    ↪printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message_
    ↪printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message_
    ↪printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message_
    ↪printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message_
    ↪printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message_
    ↪printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to_
    ↪`err`.

err:
    // clean up
    return ret;
}
```

Note: If the option `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` in Kconfig is enabled, the err message will be discarded, while the other action works as is.

The `ESP_RETURN_XX` and `ESP_GOTO_XX` macros can't be called from ISR. While there are `xx_ISR` versions for each of them, e.g., `ESP_RETURN_ON_ERROR_ISR`, these macros could be used in ISR.

4.8.11 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g. reset an external peripheral which is not responding).

Example:

```
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}
```

2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.

Example:

```
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g. to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}
```

3. Convert into unrecoverable error, for example using `ESP_ERROR_CHECK`. See [ESP_ERROR_CHECK macro](#) section for details.

Terminating the application in case of an error is usually undesirable behaviour for middleware components, but is sometimes acceptable at application level.

Many ESP-IDF examples use `ESP_ERROR_CHECK` to handle errors from various APIs. This is not the best practice for applications, and is done to make example code more concise.

Example:

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

4.8.12 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using `CONFIG_COMPILER_CXX_EXCEPTIONS` option.

Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` variable.

If an exception is thrown, but there is no `catch` block, the program will be terminated by `abort` function, and backtrace will be printed. See [Fatal Errors](#) for more information about backtraces.

See [cxx/exceptions](#) for an example of C++ exception handling.

4.9 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation, sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is dependent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the [ESP-BLE-MESH Architecture](#) for information about the implementation of ESP-BLE-MESH architecture and [ESP-BLE-MESH API Reference](#) for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer [here](#) for the certification details of ESP-BLE-MESH.

Note: If you are looking for Wi-Fi based implementation of mesh for ESP32-S3, please check another product by Espressif called ESP-WIFI-MESH. For more information and documentation see [ESP-WIFI-MESH](#).

4.9.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32-S3 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF [Get Started](#) documentation.

What You Need

Hardware:

- Three ESP32-S3 boards, see [options](#).
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

Software:

- Example application [bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server](#) code to load to the ESP32-S3 boards.
- Mobile App: **nRF Mesh** for Android or iOS. Optionally you can use some other Apps:
 - [EspBleMesh](#) Android App
 - Silicon Labs Android or iOS App

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

Step 1. Check Hardware Both [ESP32-DevKitC](#) and [ESP-WROVER-KIT](#) development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: `idf.py menuconfig`
>Example Configuration>Board selection for ESP-BLE-MESH

Note: If you plan to use [ESP32-DevKitC](#), connect a RGB LED to GPIO pins 25, 26 and 27.

Step 2. Configure Software Enter the [bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server](#) example directory, run `idf.py menuconfig` to select your board and then run `idf.py build` to compile the example.

Step 3. Upload Application to Nodes After the [bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server](#) example is compiled successfully, users can run `idf.py flash` to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn **GREEN**.

Fig. 4: ESP-BLE-MESH Devices Power On

Step 4. Provision Nodes In this section, we will use the **nRF Mesh Android App** to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

4.1 Scanner The Scanner is App's functionality to search for unprovisioned devices in range. Open the App, press **Scanner** at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

4.2 Identify Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the **IDENTIFY** interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

Fig. 5: nRF Mesh - Scanner

Note: The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the **IDENTIFY** interface button, no signs can be seen from the device except from the log on the serial monitor.

After the **IDENTIFY** interface button is pressed, users can see the **PROVISION** interface button.

4.3 Provision Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing **OK**, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing **OK**, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press **CONNECT** on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing **CONNECT**, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.

Fig. 6: nRF Mesh - IDENTIFY - PROVISION

Fig. 7: nRF Mesh - Configuration Complete

Fig. 8: nRF Mesh - Initial Configuration Failed

Fig. 9: nRF Mesh - Reconnect - Initial Configuration

- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

Fig. 10: nRF Mesh - Reconnect - Three Nodes

4.4 Configuration When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.

Note: No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

Step 5. Operate Network After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the [bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server](#) example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

The following screenshot shows different board with different color on.

Note: For **nRF Mesh** iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

Fig. 11: nRF Mesh - Model Bind AppKey

Fig. 12: nRF Mesh - Generic OnOff Control

Fig. 13: Three ESP-BLE-MESH Nodes On

4.9.2 ESP-BLE-MESH Examples

- [ESP-BLE-MESH Node OnOff Server](#) - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see [example code](#) .
- [ESP-BLE-MESH Node OnOff Client](#) - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Provisioner](#) - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Fast Provisioning - Client](#) and [Server](#) - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see [example client code](#) and [example server code](#) .
- [ESP-BLE-MESH and Wi-Fi Coexistence](#) - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32-S3. Simply put, users can use the Wi-Fi while operating Bluetooth, see [example code](#) .
- [ESP-BLE-MESH Console](#) - an example that implements BLE Mesh basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see [example node code](#) .

ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

- ESP-BLE-MESH Architecture Overview
 - Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
- ESP-BLE-MESH Architecture Implementation
 - Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
- ESP-BLE-MESH Auxiliary Routines
 - Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

1. ESP-BLE-MESH Architecture Overview Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth [certification](#).

ESP-BLE-MESH architecture includes five key parts:

- Mesh Protocol Stack
 - Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
 - Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
 - Mesh Models is responsible for the implementation of SIG-defined models.
- Network Management
 - Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
- Features
 - Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
- Mesh Bearer Layer

Fig. 14: Figure 1.1 ESP-BLE-MESH Architecture Diagram

- Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.
- Applications
 - Based on ESP-BLE-MESH protocol stack and Mesh Models.
 - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

1.1 Mesh Protocol Stack

1.1.1 Mesh Networking Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

Table 1: Table 1.1 Mesh Networking Architecture Description

Layer	Function
Access Layer	Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.
Upper Transport Layer	Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages” , including messages related to “friendship” and heartbeat messages.
Lower Transport Layer	Lower Transport Layer handles segmentation and reassembly of PDU.
Network Layer	Network Layer defines the address type and format of the network messages, and implements the relay function of the device.

1.1.2 Mesh Provisioning Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

Table 2: Table 1.2 Mesh Provisioning Architecture Description

Layer	Function
Provisioning PDUs	Provisioning PDUs from different layers are handled using provisioning protocol.
Generic Provisioning PDU/Proxy PDU	The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.
PB-ADV/PB-GATT	These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.
Advertising/Provisioning Service	The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.

1.1.3 Mesh Models `Mesh Models` in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:

Table 3: Table 1.3 Mesh Models Architecture Description

Layer	Function
Model Layer	Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.
Foundation Model Layer	Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.

1.2 Mesh Network Management `Network Management` implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node's IV Index.
- IV update procedure is used to update the nodes' IV Index.
- Key refresh procedure is used to update the nodes' NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node's networking information.

1.3 Mesh Features `Features` includes the following options:

- Low Power feature is used to reduce node's power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

1.4 Mesh Bearer Layer `Bearers` in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

`Bearers` can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

Table 4: Table 1.3 Mesh Bearers Description

Layer	Function
GATT Bearer	The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.
Advertising Bearer	When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.

1.5 Mesh Applications The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
 - Call the provisioning-related API for provisioning.
 - Call the model-related API to send messages.
 - Call the device-attributes-related API to get local information about the device.
- Application layer processes Event

The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.

 - **The events completed by calling API.**
 - * Such as nodes sending messages.
 - **The events that the protocol stack actively reports to the application layer.**
 - * The Event that the protocol stack actively reports.
 - * The Event that Model actively reports.
- The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between API / Event and ESP-BLE-MESH protocol stack

- API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
- The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.

2. ESP-BLE-MESH Architecture Implementation The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

- **Layer-based Approach:** With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.
- **Module-based Approach:** Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

2.1 Mesh Protocol Stack Implementation

2.1.1 Mesh Networking Implementation The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

Fig. 15: Figure 2.1 ESP-BLE-MESH Architecture Implementation Diagram

Table 5: Table 2.1 Mesh Networking File Description :widths: 40 150
:header-rows: 1

File	Functionality
ac- cess.c	ESP-BLE-MESH Access Layer
trans- port.c	ESP-BLE-MESH Lower/Upper Transport Layer
net.c	ESP-BLE-MESH Network Layer
adv.c	A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers

2.1.2 Mesh Provisioning Implementation The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

Table 6: Table 2.2 Mesh Provisioning (Node) File Description

File	Functionality
prov.c	ESP-BLE-MESH Node provisioning (PB-ADV & PB-GATT)
proxy_server.c	ESP-BLE-MESH Proxy Server related functionalities
beacon.c	APIs used to handle ESP-BLE-MESH Beacons

Specific files that implement functions of Provisioner are shown in Table 2.3:

Table 7: Table 2.3 Mesh Provisioning (Provisioner) File Description

File	Functionality
provisioner_prov.c	ESP-BLE-MESH Provisioner provisioning (PB-ADV & PB-GATT)
proxy_client.c	ESP-BLE-MESH Proxy Client related functionalities
provisioner_main.c	ESP-BLE-MESH Provisioner networking related functionalities

2.1.3 Mesh Models Implementation Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

Table 8: Table 2.4 Mesh Models File Description

File	Functionality
cfg_cli.c	Send Configuration Client messages and receive corresponding response messages
cfg_srv.c	Receive Configuration Client messages and send proper response messages
health_cli.c	Send Health Client messages and receive corresponding response messages
health_srv.c	Receive Health Client messages and send proper response messages
client_common.c	ESP-BLE-MESH model related operations
generic_client.c	Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages
lighting_client.c	Send ESP-BLE-MESH Lighting Client messages and receive corresponding response messages
sensor_client.c	Send ESP-BLE-MESH Sensor Client messages and receive corresponding response messages
time_scene_client.c	Send ESP-BLE-MESH Time Scene Client messages and receive corresponding response messages
generic_server.c	Receive ESP-BLE-MESH Generic Client messages and send corresponding response messages
lighting_server.c	Receive ESP-BLE-MESH Lighting Client messages and send corresponding response messages
sensor_server.c	Receive ESP-BLE-MESH Sensor Client messages and send corresponding response messages
time_scene_server.c	Receive ESP-BLE-MESH Time Scene Client messages and send corresponding response messages

2.2 Mesh Bearers Implementation Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify [mesh_bearer_adapt.c](#) (example of [NimBLE version](#)).

Table 9: Table 2.5 Mesh Bearers File Description

File	Functionality
mesh_bearer_adapt.c	ESP-BLE-MESH Bearer Layer adapter , This file provides the interfaces used to receive and send ESP-BLE-MESH ADV & GATT related packets.

Note: [mesh_bearer_adapt.c](#) is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

2.3 Mesh Applications Implementation We have provided a series of application examples for customer development, and users can develop products based on [ESP-BLE-MESH Examples](#).

3. Auxiliary Routine Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through [CONFIG_BLE_MESH](#).

3.1 Features

- Low Power
- Friend
- Relay
- Proxy Client/Server

3.2 Network Management

- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

3.3 Auxiliary Routine Implementation When adopting the design of independent module, the two main factors should be considered:

- The module can not be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

Table 10: Table 3.1 Module File Description

File	Functionality
lpn.c	ESP-BLE-MESH Low Power functionality
friend.c	ESP-BLE-MESH Friend functionality
net.c	ESP-BLE-MESH Relay feature, network creation, IV Update procedure, IV Index recovery procedure, Key Refresh procedure related functionalities
proxy_server.c	ESP-BLE-MESH Proxy Server related functionalities
proxy_client.c	ESP-BLE-MESH Proxy Client related functionalities
settings.c	ESP-BLE-MESH NVS storage functionality
main.c	ESP-BLE-MESH stack initialize, stack enable, node removal related functionalities

ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:

- [1. Provisioner Development](#)
- [2. Node Development](#)
- [3. ESP-BLE-MESH and Wi-Fi Coexistence](#)
- [4. Fast Provisioning](#)
- [5. Log Help](#)
- [6. Example Help](#)
- [7. Others](#)

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

1. Provisioner Development Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.

1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.

- The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

- Client model that corresponds to server model of the node is required.
- NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
- The address owned by the node shall be known, which could be its unicast address or subscription address.

1.3 How can NetKey and AppKey be used?

- NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
- AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

- The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
- The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can't be changed afterwards.

1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message ?

The unicast address of Provisioner can be set only once during initialization and can't be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address. Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.

1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed ?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can't be changed afterwards.

1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.

1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner set to unprovisioned device during provisioning. It can be set only once during initialization and can't be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.

1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples ?

There are four authentication methods, i.e. No OOB, Static OOB, Output OOB and Input OOB. In the provided examples, No OOB is used.

1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?

- Device UUID
- OOB Info
- URL Hash (optional)

1.12 Can such information be used for device identification?

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?

- Provisioner can get the Composition Data of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `comp_data_get` in the parameter `esp_ble_mesh_cfg_client_get_state_t` set properly.
- Users can refer to the following code to parse the Composition Data:

```
#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A0001000800030000010501000000800100001003103F002A00
//0C00 1A00 0100 0800 0300 0001 05 01 0000 0080 0100 0010 0310 3F002A00

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000,
→ 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model_
→Identifier 0x002A

int ret;

ret = decode_comp_data(&head, &data, mystr, sizeof(mystr));
if (ret == -1) {
    printf("decode_comp_data error");
}
}

```

1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()`.

- Add AppKey to nodes with `app_key_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Add subscription address to the models of nodes with `model_sub_add` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Set publication information to the models of nodes with `model_pub_set` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```

esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t_
→group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == group_addr) {
                break;
            }
        }
    }
}

```

(continues on next page)

(continued from previous page)

```

    }
}
if (j != ARRAY_SIZE(model->groups)) {
    ESP_LOGW(TAG, "%s: Group address already exists, element_
↪index: %d", __func__, i);
    continue;
}
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
        model->groups[j] = group_addr;
        break;
    }
}
if (j == ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element_
↪index: %d", __func__, i);
}
}

return ESP_OK;
}

```

Note: When the NVS storage of the node is enabled, group address added and AppKey bound by this method will not be saved in the NVS when the device is powered off currently. These configuration information can only be saved if they are configured by Configuration Client Model.

1.17 How does Provisioner control nodes by grouping?

Generally there are two approaches to implement group control in ESP-BLE-MESH network, group address approach and virtual address approach. And supposing there are 10 devices, i.e., five devices with blue lights and five devices with red lights.

- Method 1: 5 blue lights can subscribe to a group address, 5 red lights subscribe to another one. By sending messages to different group addresses, Provisioner can realize group control.
- Method 2: 5 blue lights can subscribe to a virtual address, 5 red lights subscribe to another one. By sending messages to different virtual addresses, Provisioner can realize group control.

1.18 How does Provisioner add nodes to multiple subnets?

Provisioner can add multiple NetKeys to nodes during configuration, and nodes sharing the same NetKey belong to the same subnet. Provisioner can communicate with nodes on different subnets by using different NetKeys.

1.19 How does Provisioner know if a node in the mesh network is offline?

Node offline is usually defined as: the condition that the node cannot be properly communicated with other nodes in the mesh network due to power failure or some other reasons.

There is no connection between nodes and nodes in the ESP-BLE-MESH network. They communicate with each other through advertising channels.

An example is given here to show how to detect a node is offline by Provisioner.

- The node can periodically send heartbeat messages to Provisioner. And if Provisioner failed to receive heartbeat messages in a certain period, the node is considered to be offline.

Note: The heartbeat message should be designed into a single package (less than 11 bytes), so the transmission and reception of it can be more efficient.

1.20 What operations should be performed when Provisioner removes nodes from the network?

Usually when Provisioner tries to remove node from the mesh network, the procedure includes three main steps:

- Firstly, Provisioner adds the node that need to be removed to the “blacklist” .
- Secondly, Provisioner performs the *Key Refresh procedure*.
- Lastly, the node performs node reset procedure, and switches itself to an unprovisioned device.

1.21 In the Key Refresh procedure, how does Provisioner update the Netkey owned by nodes?

- Provisioner updates the NetKey of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `net_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
- Provisioner updates the AppKey of nodes using the *Configuration Client Model* API `esp_ble_mesh_config_client_set_state()` with `app_key_update` in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

1.22 How does Provisioner manage nodes in the mesh network?

ESP-BLE-MESH implements several functions related to basic node management in the example, such as `esp_ble_mesh_store_node_info()`. And ESP-BLE-MESH also provides the API `esp_ble_mesh_provisioner_set_node_name()` which can be used to set the node’s local name and the API `esp_ble_mesh_provisioner_get_node_name()` which can be used to get the node’s local name.

1.23 What does Provisioner need when trying to control the server model of nodes?

Provisioner must include corresponding client model before controlling the server model of nodes.

Provisioner shall add its local NetKey and AppKey.

- Provisioner add NetKey by calling the API `esp_ble_mesh_provisioner_add_local_net_key()`.
- Provisioner add AppKey by calling the API `esp_ble_mesh_provisioner_add_local_app_key()`.

Provisioner shall configure its own client model.

- Provisioner bind AppKey to its own client model by calling the API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()`.

1.24 How does Provisioner control the server model of nodes?

ESP-BLE-MESH supports all SIG-defined client models. Provisioner can use these client models to control the server models of nodes. And the client models are divided into 6 categories with each category has the corresponding functions.

- Configuration Client Model
 - The API `esp_ble_mesh_config_client_get_state()` can be used to get the `esp_ble_mesh_cfg_client_get_state_t` values of Configuration Server Model.
 - The API `esp_ble_mesh_config_client_set_state()` can be used to set the `esp_ble_mesh_cfg_client_set_state_t` values of Configuration Server Model.
- Health Client Model
 - The API `esp_ble_mesh_health_client_get_state()` can be used to get the `esp_ble_mesh_health_client_get_state_t` values of Health Server Model.

- The API `esp_ble_mesh_health_client_set_state()` can be used to set the `esp_ble_mesh_health_client_set_state_t` values of Health Server Model.
- **Generic Client Models**
 - The API `esp_ble_mesh_generic_client_get_state()` can be used to get the `esp_ble_mesh_generic_client_get_state_t` values of Generic Server Models.
 - The API `esp_ble_mesh_generic_client_set_state()` can be used to set the `esp_ble_mesh_generic_client_set_state_t` values of Generic Server Models.
- **Lighting Client Models**
 - The API `esp_ble_mesh_light_client_get_state()` can be used to get the `esp_ble_mesh_light_client_get_state_t` values of Lighting Server Models.
 - The API `esp_ble_mesh_light_client_set_state()` can be used to set the `esp_ble_mesh_light_client_set_state_t` values of Lighting Server Models.
- **Sensor Client Models**
 - The API `esp_ble_mesh_sensor_client_get_state()` can be used to get the `esp_ble_mesh_sensor_client_get_state_t` values of Sensor Server Model.
 - The API `esp_ble_mesh_sensor_client_set_state()` can be used to set the `esp_ble_mesh_sensor_client_set_state_t` values of Sensor Server Model.
- **Time and Scenes Client Models**
 - The API `esp_ble_mesh_time_scene_client_get_state()` can be used to get the `esp_ble_mesh_time_scene_client_get_state_t` values of Time and Scenes Server Models.
 - The API `esp_ble_mesh_time_scene_client_set_state()` can be used to set the `esp_ble_mesh_time_scene_client_set_state_t` values of Time and Scenes Server Models.

2. Node Development

2.1 What kind of models are included by nodes?

- In ESP-BLE-MESH, nodes are all composed of a series of models with each model implements some functions of the node.
- Model has two types, client model and server model. Client model can get and set the states of server model.
- Model can also be divided into SIG model and vendor model. All behaviors of SIG models are officially defined while behaviors of vendor models are defined by users.

2.2 Is the format of messages corresponding to each model fixed?

- Messages, which consist of opcode and payload, are divided by opcode.
- The type and the format of the messages corresponding to models are both fixed, which means the messages transmitted between models are fixed.

2.3 Which functions can be used to send messages with the models of nodes?

- For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` to send messages.
- For server models, users can use the API `esp_ble_mesh_server_model_send_msg()` to send messages.
- For publication, users call the API `esp_ble_mesh_model_publish()` to publish messages.

2.4 How to achieve the transmission of messages without packet loss?

Acknowledged message is needed if users want to transmit messages without packet loss. The default time to wait for corresponding response is set in `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`. If the sender waits for the response until the timer expires, the corresponding timeout event would be triggered.

Note: Response timeout can be set in the API `esp_ble_mesh_client_model_send_msg()`. The default value (4 seconds) would be applied if the parameter `msg_timeout` is set to **0**.

2.5 How to send unacknowledged messages?

For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` to send unacknowledged messages.

For server models, the messages sent by using the API `esp_ble_mesh_server_model_send_msg()` are always unacknowledged messages.

2.6 How to add subscription address to models?

Subscription address can be added through Configuration Client Model.

2.7 What is the difference between messages sent and published by models?

Messages sent by calling the API `esp_ble_mesh_client_model_send_msg()` or `esp_ble_mesh_server_model_send_msg()` will be sent in the duration determined by the Network Transmit state.

Messages published by calling the API `esp_ble_mesh_model_publish()` will be published determined by the Model Publication state. And the publication of messages is generally periodic or with a fixed number of counts. The publication period and publication count are controlled by the Model Publication state, and can be configured through Configuration Client Model.

2.8 How many bytes can be carried when sending unsegmented messages?

The total payload length (which can be set by users) of unsegmented message is 11 octets, so if the opcode of the message is 2 octets, then the message can carry 9-octets of valid information. For vendor messages, due to the 3-octets opcode, the remaining payload length is 8 octets.

2.9 When should the Relay feature of nodes be enabled?

Users can enable the Relay feature of all nodes when nodes detected in the mesh network are sparse.

For dense mesh network, users can choose to just enable the Relay feature of several nodes.

And users can enable the Relay feature by default if the mesh network size is unknown.

2.10 When should the Proxy feature of node be enabled?

If the unprovisioned device is expected to be provisioned by a phone, then it should enable the Proxy feature since almost all the phones do not support sending ESP-BLE-MESH packets through advertising bearer currently. And after the unprovisioned device is provisioned successfully and becoming a Proxy node, it will communicate with the phone using GATT bearer and using advertising bearer to communicate with other nodes in the mesh network.

2.11 How to use the Proxy filter?

The Proxy filter is used to reduce the number of Network PDUs exchanged between a Proxy Client (e.g. the phone) and a Proxy Server (e.g. the node). And with the Proxy filter, Proxy Client can explicitly request to receive only mesh messages with certain destination addresses from Proxy Server.

2.12 When a message can be relayed by a Relay node?

If a message need to be relayed, the following conditions should be met.

- The message is in the mesh network.
- The message is not sent to the unicast address of the node.
- The value of TTL in the message is greater than 1.

2.13 If a message is segmented into several segments, should the other Relay nodes just relay when one of these segments is received or wait until the message is received completely?

Relay nodes will forward segments when one of them are received rather than keeping waiting until all the segments are received.

2.14 What is the principle of reducing power consumption using Low Power feature?

- When the radio is turned on for listening, the device is consuming energy. When low power feature of the node is enabled, it will turn off its radio in the most of the time.
- And cooperation is needed between low power node and friend node, thus low power node can receive messages at an appropriate or lower frequency without the need to keep listening.
- When there are some new messages for low power node, its friend node will store the messages for it. And low power node can poll friend nodes to see if there are new messages at a fixed interval.

2.15 How to continue the communication on the network after powering-down and powering-up again?

Enable the configuration `Store ESP-BLE-MESH Node configuration persistently` in `menuconfig`.

2.16 How to send out the self-test results of nodes?

It is recommended that nodes can publish its self-test results periodically through Health Server Model.

2.17 How to transmit information between nodes?

One possible application scenario for transmitting information between nodes is that spray nodes would be triggered once smoke alarm detected high smoke concentration. There are two approaches in implementation.

- Approach 1 is that spray node subscribes to a group address. When smoke alarm detects high smoke concentration, it will publish a message whose destination address is the group address which has been subscribed by spray node.
- Approach 2 is that Provisioner can configure the unicast address of spray node to the smoke alarm. When high smoke concentration is detected, smoke alarm can use send messages to the spray node with the spray node's unicast address as the destination address.

2.18 Is gateway a must for nodes communication?

- Situation 1: nodes only communicate within the mesh network. In this situation, no gateway is need. ESP-BLE-MESH network is a flooded network, messages in the network have no fixed paths, and nodes can communicate with each other freely.
- Situation 2: if users want to control the nodes remotely, for example turn on some nodes before getting home, then a gateway is needed.

2.19 When will the IV Update procedure be performed?

IV Update procedure would be performed once sequence number of messages sent detected by the bottom layer of node reached a critical value.

2.20 How to perform IV Update procedure?

Nodes can perform IV Update procedure with Secure Network Beacon.

3. ESP-BLE-MESH and Wi-Fi Coexistence

3.1 Which modes does Wi-Fi support when it coexists with ESP-BLE-MESH?

Currently only Wi-Fi station mode supports the coexistence.

3.2 Why is the Wi-Fi throughput so low when Wi-Fi and ESP-BLE-MESH coexist?

Some configurations in menuconfig shall be enabled to support PSRAM.

- `ESP32-S3-specific` --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
- `Bluetooth` --> `Bluedroid Enable` --> BT/BLE will first malloc the memory from the PSRAM
- `Bluetooth` --> `Bluedroid Enable` --> Use dynamic memory allocation in BT/BLE stack.
- `Bluetooth` --> `Bluetooth controller` --> BLE full scan feature supported.
- `Wi-Fi` --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi

4. Fast Provisioning

4.1 Why is fast provisioning needed?

Normally when they are several unprovisioned devices, users can provision them one by one. But when it comes to a large number of unprovisioned devices (e.g. 100), provisioning them one by one will take huge amount of time. With fast provisioning, users can provision 100 unprovisioned devices in about 50 seconds.

4.2 Why EspBleMesh App would wait for a long time during fast provisioning?

After the App provisioned one Proxy node, it will disconnect from the App during fast provisioning, and reconnect with the App when all the nodes are provisioned.

4.3 Why is the number of node addresses displayed in the App is more than that of existing node addresses?

Each time after a fast provisioning process, and before starting a new one, the node addresses in the App should be cleared, otherwise the number of the node address will be incorrect.

4.4 What is the usage of the count value which was input in EspBleMesh App?

The **count** value is provided to the Proxy node which is provisioned by the App so as to determine when to start Proxy advertising in advance.

4.5 When will Configuration Client Model of the node running fast_prov_server example start to work?

Configuration Client Model will start to work after the Temporary Provisioner functionality is enabled.

4.6 Will the Temporary Provisioner functionality be enabled all the time?

After the nodes receive messages used to turn on/off lights, all the nodes will disable its Temporary Provisioner functionality and become nodes.

5. Log Help You can find meaning of errors or warnings when they appear at the bottom of ESP-BLE-MESH stack.

5.1 What is the meaning of warning **ran out of retransmit attempts?**

When the node transmits a segmented message, and due to some reasons, the receiver doesn't receive the complete message. Then the node will retransmit the message. When the retransmission count reaches the maximum number, which is 4 currently, then this warning will appear.

5.2 What is the meaning of warning **Duplicate found in Network Message Cache?**

When the node receives a message, it will compare the message with the ones stored in the network cache. If the same has been found in the cache, which means it has been received before, then the message will be dropped.

5.3 What is the meaning of warning **Incomplete timer expired?**

When the node doesn't receive all the segments of a segmented message during a certain period (e.g. 10 seconds), then the Incomplete timer will expire and this warning will appear.

5.4 What is the meaning of warning **No matching TX context for ack?**

When the node receives a segment ack and it doesn't find any self-send segmented message related with this ack, then this warning will appear.

5.5 What is the meaning of warning **No free slots for new incoming segmented messages?**

When the node has no space for receiving new segmented message, this warning will appear. Users can make the space larger through the configuration `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`.

5.6 What is the meaning of error **Model not bound to Appkey 0x0000 ?**

When the node sends messages with a model and the model has not been bound to the AppKey with AppKey Index 0x000, then this error will appear.

5.7 What is the meaning of error **Busy sending message to DST xxxx?**

This error means client model of the node has transmitted a message to the target node and now is waiting for a response, users can not send messages to the same node with the same unicast address. After the corresponding response is received or timer is expired, then another message can be sent.

6. Example Help

6.1 How are the ESP-BLE-MESH callback functions classified?

- The API `esp_ble_mesh_register_prov_callback()` is used to register callback function used to handle provisioning and networking related events.
- The API `esp_ble_mesh_register_config_client_callback()` is used to register callback function used to handle Configuration Client Model related events.
- The API `esp_ble_mesh_register_config_server_callback()` is used to register callback function used to handle Configuration Server Model related events.
- The API `esp_ble_mesh_register_health_client_callback()` is used to register callback function used to handle Health Client Model related events.
- The API `esp_ble_mesh_register_health_server_callback()` is used to register callback function used to handle Health Server Model related events.

- The API `esp_ble_mesh_register_generic_client_callback()` is used to register callback function used to handle Generic Client Models related events.
- The API `esp_ble_mesh_register_light_client_callback()` is used to register callback function used to handle Lighting Client Models related events.
- The API `esp_ble_mesh_register_sensor_client_callback()` is used to register callback function used to handle Sensor Client Model related events.
- The API `esp_ble_mesh_register_time_scene_client_callback()` is used to register callback function used to handle Time and Scenes Client Models related events.
- The API `esp_ble_mesh_register_custom_model_callback()` is used to register callback function used to handle vendor model and unrealized server models related events.

7. Others

7.1 How to print the message context?

The examples use `ESP_LOG_BUFFER_HEX()` to print the message context while the ESP-BLE-MESH protocol stack uses `bt_hex()`.

7.2 Which API can be used to restart ESP32-S3?

The API `esp_restart()`.

7.3 How to monitor the remaining space of the stack of a task?

The API `vTaskList()` can be used to print the remaining space of the task stack periodically.

7.4 How to change the level of log without changing the menuconfig output level?

The API `esp_log_level_set()` can be used to change the log output level rather than using menuconfig to change it.

ESP-BLE-MESH Terminology

Table 11: Table 1 ESP-BLE-MESH Terminology - Role

Term	Official Definition	Detailed Explanation
Un-provisioned Device	A device that is not a member of a mesh network is known as an unprovisioned device.	Examples: lighting devices, temperature control devices, manufacturing equipments and electric doors, etc.
Node	A node is a provisioned device.	The role of unprovisioned device will change to node after being provisioned to ESP-BLE-MESH network. Nodes (such as lighting devices, temperature control devices, manufacturing equipments, and electric doors) are devices that can send, receive, or relay messages in ESP-BLE-MESH network, and they can optionally support one or more subnets.
Relay Node	A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.	Relay nodes can receive and resend ESP-BLE-MESH messages, so the messages can be transferred further. Users can decide whether or not to enable forwarding function of nodes according to nodes' status. Messages can be relayed for multiple times, and each relay is considered as a "hop". Messages can hop up to 126 times, which is enough for message transmission in a wide area.
Proxy Node	A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.	Proxy nodes receive messages from one bearer (it generally includes advertising bearer and GATT bearer) and resend it from another one. The purpose is to connect communication equipments that only support GATT bearer to ESP-BLE-MESH network. Generally, mobile apps need a Proxy node to access Mesh network. Without Proxy nodes, mobile apps cannot communicate with members in Mesh network.
Friend Node	A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.	Friend node, like the backup of Low Power node (LPN), can store messages that are sent to Low Power node and security updates; the stored information will be transferred to Low Power node when Low Power node needs it. Low Power node must establish "friendship" with another node that supports the Friend Feature to reduce duty cycle of its receiver, thus power consumption of Low Power node can be reduced. Low Power node needs to find a Friend node to establish a friendship with it. The process involved is called "friendship establishment". Cooperation between Low Power node and Friend nodes enables Low Power node to schedule the use of the radio, thus Low Power node can receive messages at an appropriate or lower frequency without the need of keeping listening. Low Power node will poll Friend node to see if there is new message.
Low Power Node	A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.	By polling, Low Power node gets information from Friend node, such as messages, security updates, and etc.
Provisioner	A node that is capable of adding a device to a mesh network.	The device that can provision unprovisioned devices is called a Provisioner. This process usually needs to be implemented through an app that is typically provided by the product manufacturer and can be used on a gateway, a smartphone, tablet or other carriers.

Table 12: Table 2 ESP-BLE-MESH Terminology - Composition

Term	Official Definition	Detailed Explanation
State	A value representing a condition of an element that is exposed by an element of a node.	Each node in a ESP-BLE-MESH network has an independent set of state values that indicate certain states of the device, like brightness, and color of lighting device. Change of state value will lead to change of the physical state of devices. For example, changing the on/off state of a device is actually turning on/off the device.
Model	A model defines the basic functionality of a node.	A node may contain multiple models, and each model defines basic functionalities of nodes, like the states needed by the nodes, the messages controlling the states, and actions resulted from messages handling. The function implementation of the nodes is based on models, which can be divided into SIG Model and Vendor Model, with the former defined by SIG and latter defined by users.
Element	An addressable entity within a device.	A node can contain one or more elements, with each having a unicast address and one or more models, and the models contained by the same element must not be the same.
Composition Data State	The Composition Data state contains information about a node, the elements it includes, and the supported models.	By reading the value of the Composition Data state, users can know basic information of the node, such as the number of elements, and the models in each element. Provisioner gets this message to further provision the device, such as configuring subscription address and publishing address of nodes.

Table 13: Table 3 ESP-BLE-MESH Terminology - Features

Term	Official Definition	Detailed Explanation
Low Power Feature	The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.	Low Power feature reduces power consumption of nodes. When a Low Power node is searching for a Friend node, and there are multiple Friend nodes nearby, it selects the most suitable Friend node through algorithm.
Friend Feature	The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.	By enabling friend feature, the node can help to store information for Low Power node. The nodes enabled with friend feature may cause more power and memory consumption.
Relay Feature	The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.	The relay feature enables ESP-BLE-MESH messages to hop among nodes for multiple times, and the transmission distance can exceed the range of direct radio transmission between two nodes, thereby covering the entire network. When a node is enabled with the relay feature to relay messages, it only relays the messages of its own subnet, and does not relay the messages of other subnets. The data integrity will not be considered when the node enabled with relay feature relays segmented messages. The node would relay every segmented message once it receives one rather than waiting for the complete message.
Proxy Feature	The ability to receive and retransmit mesh messages between GATT and advertising bearers.	The purpose of the proxy feature is to allow nodes without an advertising bearer to access the ESP-BLE-MESH network. The proxy feature is typically used in nodes that need to connect to mobile apps.

Table 14: Table 4 ESP-BLE-MESH Terminology - Provisioning

Term	Official Definition	Detailed Explanation
PB-ADV	PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.	PB-ADV transfers packets generated during the provisioning process over the advertising channels. This way can only be used for provisioning when provisioner and unprovisioned device both support PB-ADV.
PB-GATT	PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.	PB-GATT uses connection channels to transfer packets generated during the provisioning process. If an unprovisioned device wants to be provisioned through this method, it needs to implement the related Mesh Provisioning Service. Unprovisioned devices which don't implement such service cannot be provisioned into mesh network through PB-GATT bearer.
Provisioning	Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.	The process of provisioning turns the "unprovisioned device" into a "node", making it a member of the ESP-BLE-MESH network.
Authentication Method	Authentication is a step during the provisioning of nodes.	There are four authentication methods for unprovisioned devices: Output OOB, Input OOB, Static OOB, and No OOB.
Input OOB	Input Out-of-Band	For example, a Provisioner generates and displays a random number, and then prompts users to take appropriate actions to input the random number into the unprovisioned device. Taking lighting switch as an example, users can press the button for several times in a certain period of time to input the random number displayed on the Provisioner. Authentication method of the Input OOB is similar to that of Output OOB, but the role of the device is reversed.
Output OOB	Output Out-of-Band	For example, an unprovisioned device will choose a random number and output the number in a way that is compatible with its functionality. If the unprovisioned device is a bulb, it can flash a specified number of times. If the unprovisioned device has an LCD screen, the random number can display as a multi-digit value. Users who start provisioning should input the observed number to authenticate the unprovisioned device.
Static OOB	Static Out-of-Band	Authentication method of Static OOB: use Static OOB information. Use 0 as Static OOB information if No OOB information is needed. Use Static OOB information to authenticate devices which are going through provisioning if OOB information is needed.
No OOB	No Out-of-Band	Authentication method of No OOB: Set the value of the Static OOB field to 0. Using this way is like not authenticating the unprovisioned devices.

Table 15: Table 5 ESP-BLE-MESH Terminology - Address

Term	Official Definition	Detailed Explanation
Unassigned Address	This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.	The addresses owned by elements which has not been configured yet or no address has been allocated are unassigned addresses. These elements will not be used for messages transfer because they have no fixed address. Unassigned address is recommended to set as the value of the address before setting the address of user code.
Unicast Address	A unicast address is a unique address allocated to each element.	During provisioning, the Provisioner will assign a unicast address to each element of node within the life cycle of the nodes in the network. A unicast address may appear in the source/destination address field of a message. Messages sent to a unicast address can only be processed by the element that owns the unicast address.
Virtual Address	A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.	Associated with specific UUID labels, a virtual address may serve as the publishing or subscription address of the model. A UUID label is a 128-bit value associated with elements of one or more nodes. For virtual addresses, the 15th and 14th bits are set to 1 and 0 respectively; bits from 13th to 0 are set to hash values (providing 16384 hash values). The hash is a derivation of the Label UUID. To use subscribing elements to check the full 128-bit UUID is very inefficient while hash values provide a more efficient way to determine which elements that which messages are finally sent to.
Group Address	A group address is an address that is programmed into zero or more elements	Group address is another kind of multicast address in the ESP-BLE-MESH network, which is usually used to group nodes. A message sent to the all-proxies address shall be processed by the primary element of all nodes that have the proxy functionality enabled. A message sent to the all-friends address shall be processed by the primary element of all nodes that have the friend functionality enabled. A message sent to the all-relays address shall be processed by the primary element of all nodes that have the relay functionality enabled. A message sent to the all-nodes address shall be processed by the primary element of all nodes.

Table 16: Table 6 ESP-BLE-MESH Terminology - Security

Term	Official Definition	Detailed Explanation
Device Key (DevKey)	There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.	The device key enables you to provision the devices, configure the nodes. The device key is used to encrypt Configuration Messages, i.e. the message transferred between the Provisioner and the node when the device is configured.
Application Key (App-Key)	Application keys are used to secure communications at the upper transport layer.	Application key is used for decryption of application data before delivering application data to application layer and encryption of them during the delivery of application layer. Some nodes in the network have a specific purpose and can restrict access to potentially sensitive data based on the needs of the application. With specific application keys, these nodes are associated with specific applications. Generally speaking, the fields using different application keys include security (access control of buildings, machine rooms and CEO offices), lighting (plant, exterior building and sidewalks) and HVAC systems. Application keys are bound to Network keys. This means application keys are only used in a context of a Network key they are bound to. An application key shall only be bound to a single Network key.
Master Security Material	The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network.	The corresponding friendship messages encrypted with the friendship security material: 1. Friend Poll, 2. Friend Update, 3. Friend Subscription List, add/delete/confirm, 4. The Stored Messages” sent by friend nodes to Low Power node. The corresponding friendship messages encrypted with the master security material: 1. Friend Clear, 2. Friend Clear Confirm. Based on the setup of the applications, the messages sent from the Low Power node to the friend nodes will be encrypted with the friendship security material or master security material, with the former being used by the messages transmitted between Low Power node and friend nodes and the latter being used by other network messages.

Table 17: Table 7 ESP-BLE-MESH Terminology - Message

Term	Official Definition	Detailed Explanation
Re-assembly / Segmentation	Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and reassembled in a proper order at the communication receiving end.	The lower transport layer will automatically segment the message whose size is too big. The receiving end will return a response message, and the transmitting end will send the data packet again that the receiving end does not receive according to the response message. This is automatically completed by the lower transport layer. Unsegmented messages have at most 15 bytes, of which 4 bytes are transMIC, so the remaining is 11 bytes; in the case of segmentation, there are 12 valid bytes in the first several packets, and 8 in the last one. Special case: A shorter packet requires mandatory segmentation from lower transport layer, in which case the valid byte is 8 bytes.
Unacknowledged / Acknowledged	There are two types of messages: Unacknowledged or Acknowledged	Based on the whether or not the receiving end needs to send the response message, the messages sent are divided into two kinds. The sending end should set the maximum number of retransmission.

Table 18: Table 8 ESP-BLE-MESH Terminology - Foundation Models

Term	Official Definition	Detailed Explanation
Configuration Server Model	This model is used to represent a mesh network configuration of a device.	The node must contain the Configuration Server Model, which is responsible for maintaining configuration-related states. The states that Configuration Server Model maintains include: NetKey List, AppKey List, Model to AppKey List, Node Identity, Key Refresh Phase, Heartbeat Publish, Heartbeat Subscription, Network Transmit, Relay Retransmit etc.
Configuration Client Model	The model is used to represent an element that can control and monitor the configuration of a node.	The Configuration Client Model uses messages to control the state maintained by the Configuration Server Model. The Provisioner must contain the Configuration Client Model, with which the configuration messages, like Configuration Composition Data Get can be sent.
Health Server Model	This model is used to represent a mesh network diagnostics of a device.	The Health Server Model is primarily used by devices to check their states and see if there is an error. The states maintained by Health Server model include: Current Fault, Registered Fault, Health Period, and Attention Timer.
Health Client Model	The model is used to represent an element that can control and monitor the health of a node.	The Health Client Model uses messages to control the state maintained by the Health Server Model. The model can get the self-test information of other nodes through the message "Health Fault Get" .

Table 19: Table 9 ESP-BLE-MESH Terminology - Network Management

Term	Official Definition	Detailed Explanation
Key Refresh procedure	This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.	Key Refresh Procedure is used to update network key and application key of ESP-BLE-MESH network. Key Refresh Procedure is used when the security of one or more network keys and/or one or more application keys is threatened or potentially threatened. Keys are usually updated after some nodes in the network are removed.
IV (Initialisation Vector) Update Procedure	A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.	The IV Update procedure is used to update the value of ESP-BLE-MESH network's IV Index. This value is related to the random number required for message encryption. To ensure that the value of the random number is not repeated, this value is periodically incremented. IV Index is a 32-bit value and a shared network resource. For example, all nodes in a mesh network share the same IV Index value. Starting from 0x00000000, the IV Index increments during the IV Update procedure and maintained by a specific process, ensuring the IV Index shared in the mesh network is the same. This can be done when the node believes that it has the risk of exhausting its sequence number, or when it determines that another node is nearly exhausting its sequence number. Note: The update time must not be less than 96 hours. It can be triggered when a secure network beacon is received, or when the node determines that its sequence number is greater than a certain value.

4.10 ESP-WIFI-MESH

This guide provides information regarding the ESP-WIFI-MESH protocol. Please see the [ESP-WIFI-MESH API Reference](#) for more information about API usage.

4.10.1 Overview

ESP-WIFI-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-WIFI-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-WIFI-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-WIFI-MESH guide is split into the following sections:

1. [Introduction](#)
2. [ESP-WIFI-MESH Concepts](#)
3. [Building a Network](#)
4. [Managing a Network](#)
5. [Data Transmission](#)
6. [Channel Switching](#)
7. [Performance](#)
8. [Further Notes](#)

4.10.2 Introduction

Fig. 16: Traditional Wi-Fi Network Architecture

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

Fig. 17: ESP-WIFI-MESH Network Architecture

ESP-WIFI-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for relaying each others transmissions. This allows an ESP-WIFI-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-WIFI-MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

4.10.3 ESP-WIFI-MESH Concepts

Terminology

Term	Description
Node	Any device that is or can be part of an ESP-WIFI-MESH network
Root Node	The top node in the network
Child Node	A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).
Parent Node	The converse notion of a child node
Descendant Node	Any node reachable by repeated proceeding from parent to child
Sibling Nodes	Nodes that share the same parent node
Connection	A traditional Wi-Fi association between an AP and a station. A node in ESP-WIFI-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.
Upstream Connection	The connection from a node to its parent node
Downstream Connection	The connection from a node to one of its child nodes
Wireless Hop	The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as single-hop whereas traversing multiple connections is known as multi-hop .
Subnetwork	A subnetwork is subdivision of an ESP-WIFI-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-WIFI-MESH network.
MAC Address	Media Access Control Address used to uniquely identify each node or router within an ESP-WIFI-MESH network.
DS	Distribution System (External IP Network)

Tree Topology

ESP-WIFI-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-WIFI-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-WIFI-MESH can have **multiple downstream connections using its softAP interface**, whilst simultaneously having **a single upstream connection using its station interface**. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-WIFI-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-WIFI-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-WIFI-MESH network can communicate.

Note: The size (total number of nodes) in an ESP-WIFI-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.

Node Types

Root Node: The root node is the top node in the network and serves as the only interface between the ESP-WIFI-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-WIFI-MESH network. **There can only be one root node within an ESP-WIFI-MESH network** and the root node's upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.

Fig. 18: ESP-WIFI-MESH Tree Topology

Fig. 19: ESP-WIFI-MESH Node Types

Leaf Nodes: A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network's maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the network's maximum permitted layer hence have been assigned as leaf nodes.

Intermediate Parent Nodes: Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

Idle Nodes: Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see *Automatic Root Node Selection*). Referring to the diagram above, nodes K and O are idle nodes.

Beacon Frames & RSSI Thresholding

Every node in ESP-WIFI-MESH that is able to form downstream connections (i.e. has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-WIFI-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)
- Current layer of Node
- Maximum number of layers permitted in the network
- Current number of child nodes
- Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-WIFI-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

Panel A of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has.

Panel B of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

Note: Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-WIFI-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.

Preferred Parent Node

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the **preferred parent node**. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has

Fig. 20: Effects of RSSI Thresholding

The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-WIFI-MESH network when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

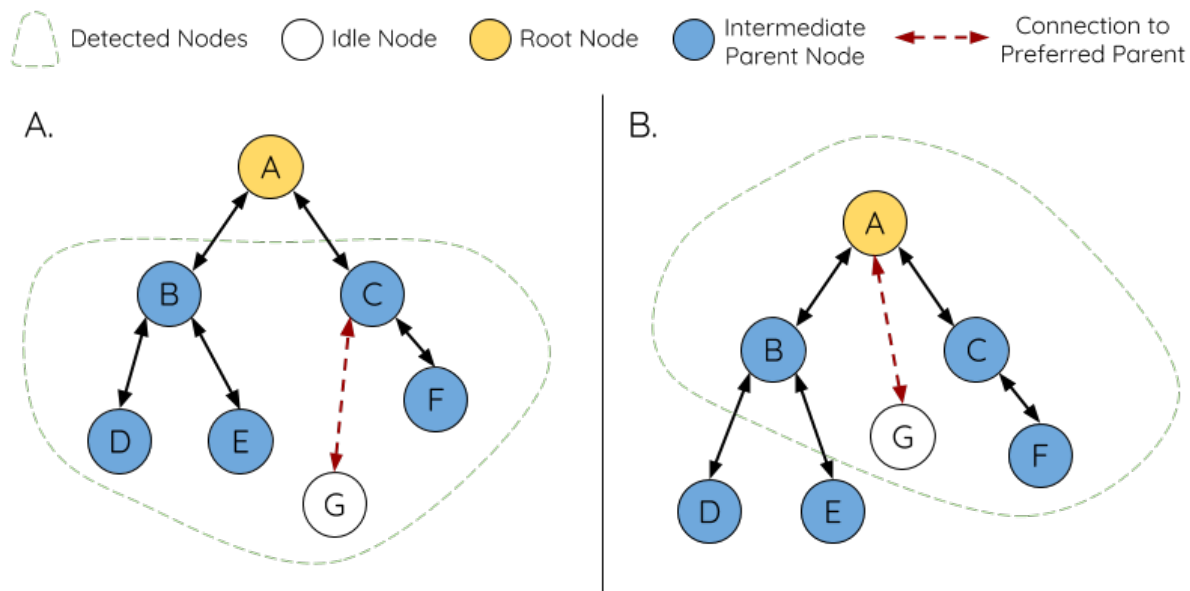

Fig. 21: Preferred Parent Node Selection

Panel A of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due to it having fewer downstream connections (fewer child nodes) compared to node B.

Panel B of the illustration above demonstrates the case where the root node is within range of the idle node G. In

other words, the root node's beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-WIFI-MESH network hence is always the preferred parent node given multiple parent node candidates.

Note: Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the [Mesh Manual Networking Example](#)).

Routing Tables

Each node within an ESP-WIFI-MESH network will maintain its individual routing table used to correctly route ESP-WIFI-MESH packets (see [ESP-WIFI-MESH Packet](#)) to the correct destination node. The routing table of a particular node will **consist of the MAC addresses of all nodes within the particular node's subnetwork** (including the MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

Fig. 22: ESP-WIFI-MESH Routing Tables Example

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e. equivalent to the subnetwork of node B). Node B's routing table is internally partitioned into two subtables containing nodes C to F and nodes G to I (i.e. equivalent to the subnetworks of nodes C and G respectively).

ESP-WIFI-MESH utilizes routing tables to determine whether an ESP-WIFI-MESH packet should be forwarded upstream or downstream based on the following rules.

1. If the packet's destination MAC address is within the current node's routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.
2. If the destination MAC address is not within the current node's routing table, forward the data packet upstream to the current node's parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

Note: Users can call `esp_mesh_get_routing_table()` to obtain a node's routing table, or `esp_mesh_get_routing_table_size()` to obtain the size of a node's routing table. `esp_mesh_get_subnet_nodes_list()` can be used to obtain the corresponding subtable of a specific child node. Likewise `esp_mesh_get_subnet_nodes_num()` can be used to obtain the size of the

subtable.

4.10.4 Building a Network

General Process

Warning: Before the ESP-WIFI-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with **the same Mesh Network ID, router configuration, and softAP configuration.**

An ESP-WIFI-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-WIFI-MESH network building process can be generalized into the following steps:

Fig. 23: ESP-WIFI-MESH Network Building Process

1. Root Node Selection The root node can be designated during configuration (see section on *User Designated Root Node*), or dynamically elected based on the signal strength between each node and the router (see *Automatic Root Node Selection*). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

2. Second Layer Formation Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected, the second layer nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore nodes B to D form upstream connections with the root node and become intermediate parent nodes.

3. Formation of remaining layers The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idles nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle

nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.

4. Limiting Tree Depth To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer from forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network's number of maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. **The MAC address is used to uniquely identify each node in the network** whilst the **router RSSI** is used to indicate a node's signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e. voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its **vote percentage** (number of votes/number of nodes participating in election) to determine if it should become the root node. **If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.**

The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is automatically selected.

Fig. 24: Root Node Election Example

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.
2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10 dB) hence its beacon frame is propagated

throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.

3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e. the shallowest node). Nodes A/B/D/E form the second layer of the network.

4. Node F and G connect with nodes D and E respectively and the network building process is complete.

Note: The minimum number of iterations for the election process can be configured using `esp_mesh_set_attempts()`. Users should adjust the number of iterations based on the number of nodes within the network (i.e. the larger the network the larger number of scan iterations required).

Warning: `Vote percentage threshold` can also be configured using `esp_mesh_set_vote_percentage()`. Setting a low vote percentage threshold **can result in two or more nodes becoming root nodes** within the same ESP-WIFI-MESH network leading to the building of multiple networks. If such is the case, ESP-WIFI-MESH has internal mechanisms to autonomously resolve the **root node conflict**. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

User Designated Root Node

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-WIFI-MESH network is built when the root node is designated by the user.

Fig. 25: Root Node Designation Example (Root Node = A, Max Layers = 4)

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.

2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.

3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.
4. Node G connects with node E, forming the fourth layer of the network. However the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.

Note: When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.

Parent Node Selection

By default, ESP-WIFI-MESH is self organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-WIFI-MESH network and to balance the number of downstream connections between potential parent nodes (see section on [Preferred Parent Node](#)).

However ESP-WIFI-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the [Mesh Manual Networking Example](#)).

Asynchronous Power-on Reset

ESP-WIFI-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e. separated by several minutes), **the final structure of the network could differ from the ideal case where all nodes are powered on synchronously**. Nodes that are delayed in powering on will adhere to the following rules:

Rule 1: If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

Rule 2: If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e. being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see [Parent Node Switching](#)).

Rule 3: If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.

1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.
2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.
3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20 dB and -10 dB) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both nodes B/E become intermediate parent nodes after connecting.
4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.

Fig. 26: Network Building with Asynchronous Power On Example

Synchronous Power-On: Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10 dB). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. **However the synchronous power-on network layout can still be reached if the user manually switches the root node** (see `esp_mesh_waive_root()`).

Note: Differences in parent node selection caused by asynchronous power-on are autonomously corrected for to some extent in ESP-WIFI-MESH (see *Parent Node Switching*)

Loop-back Avoidance, Detection, and Handling

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node's subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-WIFI-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node's routing table (see *Routing Tables*) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-WIFI-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

4.10.5 Managing a Network

ESP-WIFI-MESH is a self healing network meaning it can detect and correct for failures in network routing. Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-WIFI-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-WIFI-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

Root Node Failure

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. **The second layer node with the strongest router RSSI will be elected as the new root node** whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g. root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.
3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

Note: If a designated root node breaks down, the remaining nodes **will not autonomously attempt to elect a new root node** as an election process will never be attempted whilst a designated root node is used.

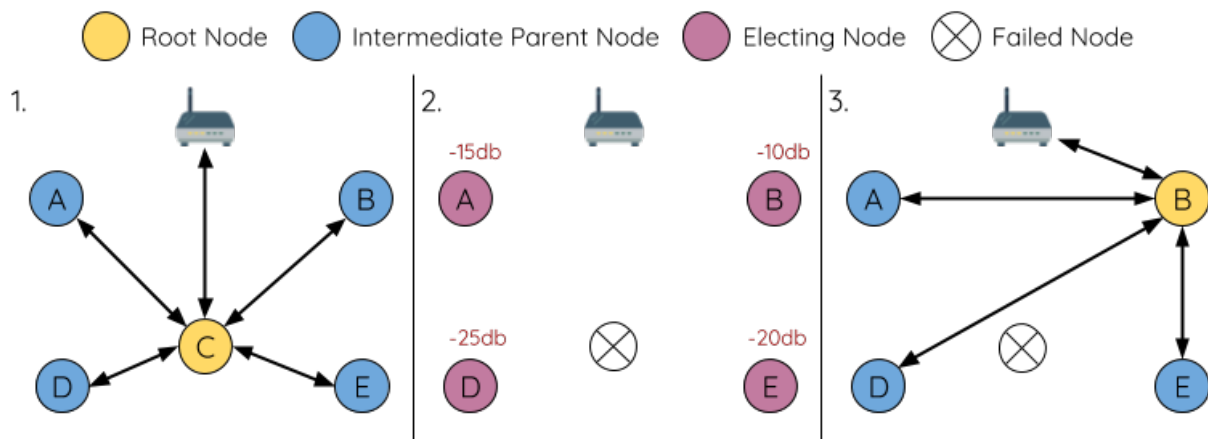

Fig. 27: Self Healing From Root Node Failure

Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see *Beacon Frames & RSSI Thresholding*).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see *Preferred Parent Node*) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

Fig. 28: Self Healing From Intermediate Parent Node Failure

1. The following branch of the network consists of nodes A to G.
2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.
3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

Note: If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.

Root Node Switching

ESP-WIFI-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node's router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.

To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see [Automatic Root Node Selection](#)) **whilst remaining connected to the network (i.e. not idle)**. If another node receives more votes than the current root node, a root node switch will be initiated. **The root node will remain unchanged otherwise.**

A newly elected root node sends a **switch request** to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router **whilst maintaining all of its downstream connections** and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

Fig. 29: Root Node Switch Example

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames **whilst still being connected**.

2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a **switch request** and node C responds with an acknowledgment.

3. Node B disconnects from its parent and connects with the router becoming the network's new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. **Node C maintains all its downstream connections throughout this process.**

4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C's subnetwork has been placed one layer deeper as a result of the switch. [Parent Node Switching](#) may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.

Note: Root node switching must require an election hence is only supported when using a self-organized ESP-WIFI-MESH network. In other words, root node switching cannot occur if a designated root node is used.

Parent Node Switching

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e. due to a *Asynchronous Power-on Reset*).

All potential parent nodes periodically transmit beacon frames (see *Beacon Frames & RSSI Thresholding*) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-WIFI-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

4.10.6 Data Transmission

ESP-WIFI-MESH Packet

ESP-WIFI-MESH network data transmissions use ESP-WIFI-MESH packets. ESP-WIFI-MESH packets are **entirely contained within the frame body of a Wi-Fi data frame**. A multi-hop data transmission in an ESP-WIFI-MESH network will involve a single ESP-WIFI-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-WIFI-MESH packet and its relation with a Wi-Fi data frame.

Fig. 30: ESP-WIFI-MESH Packet

The header of an ESP-WIFI-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-WIFI-MESH packets such as a group transmission or a packet originating from the external IP network (see *MESH_OPT_SEND_GROUP* and *MESH_OPT_RECV_DS_ADDR*).

The payload of an ESP-WIFI-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see *mesh_proto_t*).

Note: When sending an ESP-WIFI-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see *mesh_addr_t*). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

Group Control & Multicasting

Multicasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-WIFI-MESH can be achieved by either specifying a list

of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via `esp_mesh_send()`.

To multicast by specifying a list of target nodes, users must first set the ESP-WIFI-MESH packet's destination address to the **Multicast-Group Address** (01:00:5E:xx:xx:xx). This signifies that the ESP-WIFI-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see `mesh_opt_t` and `MESH_OPT_SEND_GROUP`). This method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node's MAC address must be listed in the options field of the header.

Multicasting by group allows a ESP-WIFI-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via `esp_mesh_set_group_id()`. Multicasting to a group involves setting the destination address of the ESP-WIFI-MESH packet to the target group ID. Furthermore, the `MESH_DATA_GROUP` flag must set. Using groups to multicast incurs less overhead, but requires nodes to be previously added into groups.

Note: During a multicast, all nodes within the network still receive the ESP-WIFI-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

Broadcasting

Broadcasting is a feature that allows a single ESP-WIFI-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-WIFI-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to its parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet.

Upstream Flow Control

ESP-WIFI-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node's message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a **receiving window** for each of its child nodes. **Each child node must apply for a receiving window before it is permitted to transmit upstream.** The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node's data packet that is pending transmission.

2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.

3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving windows by sending a request before it is permitted to continue transmitting.

Note: ESP-WIFI-MESH does not support any downstream flow control.

Warning: Due to *Parent Node Switching*, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node's connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-WIFI-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling `esp_mesh_post_toDS_state()`.

Bi-Directional Data Stream

The following diagram illustrates the various network layers involved in an ESP-WIFI-MESH Bidirectional Data Stream.

Fig. 31: ESP-WIFI-MESH Bidirectional Data Stream

Due to the use of *Routing Tables*, **ESP-WIFI-MESH is able to handle pack forwarding entirely on the mesh layer**. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP network.

4.10.7 Channel Switching

Background

In traditional Wi-Fi networks, **channels** are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.

In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for **network channel switching**. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a **Channel Switch Announcement (CSA)** element within the AP's periodically transmitted beacon frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the **New Channel Number** and a **Channel Switch Count** which indicates the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

ESP-WIFI-MESH Network Channel Switching

ESP-WIFI-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-WIFI-MESH is more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e. in a single hop). Therefore, an ESP-WIFI-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e. with the same **New Channel Number** and **Channel Switch Count**). Given that all nodes within an ESP-WIFI-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-WIFI-MESH network channel switch can be triggered by either the router or the root node.

Root Node Triggered A root node triggered channel switch can only occur when the ESP-WIFI-MESH network is not connected to a router. By calling `esp_mesh_switch_channel()`, the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in their own beacon frames.

Router Triggered When an ESP-WIFI-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, **the root node will not be permitted to trigger a channel switch when it is connected to a router.**

When the root node receives beacon frame containing a CSA element from the router, **the root node will set Channel Switch Count value in the CSA element to a custom value before forwarding it downstream via beacon frames.** It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-WIFI-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by the router is irrelevant to an ESP-WIFI-MESH network. By using a custom value, nodes within the ESP-WIFI-MESH network are able to switch channels synchronously relative to the ESP-WIFI-MESH network's beacon interval. However, this will also result in the ESP-WIFI-MESH network's channel switch being unsynchronized with the channel switch of the router and its connected stations.

Impact of Network Channel Switching

- **Due to the ESP-WIFI-MESH network channel switch being unsynchronized with the router's channel switch, there will be a delay in the network's channel switch.**
 - The ESP-WIFI-MESH network's channel switch time is dependent on the ESP-WIFI-MESH network's beacon interval and the root node's custom Channel Switch Count value.

- The channel discrepancy prevents any data exchange between the root node and the router during that ESP-WIFI-MESH network’s switch.
- In the ESP-WIFI-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the **Channel Switch Mode** field in the CSA element to 1.
- Frequent router triggered network channel switches can degrade the ESP-WIFI-MESH network’s performance. Note that this can be caused by the ESP-WIFI-MESH network itself (e.g. due to wireless medium contention with ESP-WIFI-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.
- **When there is a temporary channel discrepancy, the root node remains technically connected to the router.**
 - Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.
 - Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.
- **If the root node is unable to receive any of the router’s CSA beacon frames (e.g. due to short switch time given by the router).**
 - After the router switches channels, the root node will no longer be able to receive the router’s beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.
 - The root node will re-scan all channels for the router after disconnection.
 - The root node will maintain downstream connections throughout this process.

Note: Although ESP-WIFI-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g. due to reasons such as node failures).

Channel and Router Switching Configuration

ESP-WIFI-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e. when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

Allow Channel Switch: This parameter is set via the `allow_channel_switch` field of the `mesh_cfg_t` structure and permits an ESP-WIFI-MESH network to dynamically switch channels when set.

Preset Channel: An ESP-WIFI-MESH network can have a preset channel by setting the `channel` field of the `mesh_cfg_t` structure to the desired channel number. If this field is unset, the `allow_channel_switch` parameter is overridden such that channel switches are always permitted.

Allow Router Switch: This parameter is set via the `allow_router_switch` field of the `mesh_router_t` and permits an ESP-WIFI-MESH to dynamically switch to a different router when set.

Preset Router BSSID: An ESP-WIFI-MESH network can have a preset router by setting the `bssid` field of the `mesh_router_t` structure to the BSSID of the desired router. If this field is unset, the `allow_router_switch` parameter is overridden such that router switches are always permitted.

Root Node Present: The presence of a root node will can also affect whether or a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that X represents a “don’t care” for the parameter.

Preset Channel	Allow Channel Switch	Preset Router BSSID	Allow Router Switch	Root Node Present	Permitted Switches ?
N	X	N	X	X	Channel and Router
N	X	Y	N	X	Channel Only
N	X	Y	Y	X	Channel and Router
Y	Y	N	X	X	Channel and Router
Y	N	N	X	N	Router Only
Y	N	N	X	Y	Channel and Router
Y	Y	Y	N	X	Channel Only
Y	N	Y	N	N	N
Y	N	Y	N	Y	Channel Only
Y	Y	Y	Y	X	Channel and Router
Y	N	Y	Y	N	Router Only
Y	N	Y	Y	Y	Channel and Router

4.10.8 Performance

The performance of an ESP-WIFI-MESH network can be evaluated based on multiple metrics such as the following:

Network Building Time: The amount of time taken to build an ESP-WIFI-MESH network from scratch.

Healing Time: The amount of time taken for the network to detect a node break down and carry out appropriate actions to heal the network (such as generating a new root node or forming new connections).

Per-hop latency: The latency of data transmission over one wireless hop. In other words, the time taken to transmit a data packet from a parent node to a child node or vice versa.

Network Node Capacity: The total number of nodes the ESP-WIFI-MESH network can simultaneously support. This number is determined by the maximum number of downstream connections a node can accept and the maximum number of layers permissible in the network.

The following table lists the common performance figures of an ESP-WIFI-MESH network:

- Network Building Time: < 60 seconds
- **Healing time:**
 - Root node break down: < 10 seconds
 - Child node break down: < 5 seconds
- Per-hop latency: 10 to 30 milliseconds

Note: The following test conditions were used to generate the performance figures above.

- Number of test devices: **100**
- Maximum Downstream Connections to Accept: **6**
- Maximum Permissible Layers: **6**

Note: Throughput depends on packet error rate and hop count.

Note: The throughput of root node's access to the external IP network is directly affected by the number of nodes in the ESP-WIFI-MESH network and the bandwidth of the router.

Note: The performance figures can vary greatly between installations based on network configuration and operating environment.

4.10.9 Further Notes

- Data transmission uses Wi-Fi WPA2-PSK encryption
- Mesh networking IE uses AES encryption

4.11 Core Dump

4.11.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script *espcoredump.py* to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- `info_corefile` - prints crashed task's registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `dbg_corefile` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

4.11.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

Core dump data destination (Components -> Core dump -> Data destination)

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

Core dump data format (Components -> Core dump -> Core dump data format)

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)

- Use CRC32 for core dump integrity verification

Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)**Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)**

The value is in ms.

Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)

The value is base64 encoded.

- Decode and show summary (info_corefile)
- Don't decode

4.11.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash. But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets.
↳to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump,, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be 'data' and sub-type should be 'coredump'. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: `espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file>` or `espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>`

4.11.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: `espcoredump.py --chip <target_chip_type> info_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>` or `espcoredump.py --chip <target_chip_type> dbg_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>`

Base64-encoded body of core dump will be between the following header and footer:

```
===== CORE DUMP START =====
<body of base64-encoded core dump, save it to file on disk>
===== CORE DUMP END =====
```

The CORE DUMP START and CORE DUMP END lines must not be included in core dump text file.

4.11.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions' prologues to accomplish that. In that case callstack printing will be

broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32s3_rom.elf) and pass it to ‘`espcoredump.py`’.

4.11.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

Supported notations and RAM regions

- `COREDUMP_DRAM_ATTR` places variable into DRAM area which will be included into dump.
- `COREDUMP_RTC_ATTR` places variable into RTC area which will be included into dump.
- `COREDUMP_RTC_FAST_ATTR` places variable into RTC_FAST area which will be included into dump.

Example

1. In *Project Configuration Menu*, enable *COREDUMP TO FLASH*, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

```
// uint8_t global_var;
COREDUMP_DRAM_ATTR uint8_t global_var;
```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

```
global_var = 25;
assert(0);
```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where `PORT` is the device USB port:

```
espcoredump.py -p PORT dbg_corefile <path/to/elf>
```

6. In GDB shell, type `p global_var` to get the variable content:

```
(gdb) p global_var
$1 = 25 '\031'
```

4.11.7 Running `espcoredump.py`

Generic command syntax: `espcoredump.py [options] command [args]`

Script Options

- chip** {`auto,esp32,esp32s2,esp32s3,esp32c3`} Target chip type. Default value is “auto”
- port** `PORT`, –**p** `PORT` Serial port device. Either “chip” or “port” need to be specified to determine the port when you have multi-target connected at the same time.
- baud** `BAUD`, –**b** `BAUD` Serial port baud rate used when flashing/reading
- gdb-timeout-sec** `GDB_TIMEOUT_SEC` Overwrite the default internal delay for gdb responses

Commands `dbg_corefile` Starts GDB debugging session with specified corefile

`info_corefile` Print core dump info from file

Command Arguments

- debug** `DEBUG`, –**d** `DEBUG` Log level (0..3)
- gdb** `GDB`, –**g** `GDB` Path to gdb
- core** `CORE`, –**c** `CORE` Path to core dump file (if skipped core dump will be read from flash)

--core-format {b64,elf,raw}, -t {b64,elf,raw} File specified with “-c” is an ELF (“elf”), raw (raw) or base64-encoded (b64) binary
--off OFF, -o OFF Offset of coredump partition in flash (type “make partition_table” to see).
--save-core SAVE_CORE, -s SAVE_CORE Save core to file. Otherwise temporary core file will be deleted. Does not work with “-c”
--rom-elf ROM_ELF, -r ROM_ELF Path to ROM ELF file. Will use “<target>_rom.elf” if not specified
--print-mem, -m Print memory dump. Only valid when info_corefile.
<prog> Path to program ELF file.

4.12 Event Handling

Several ESP-IDF components use *events* to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

4.12.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of *esp_event library*, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called *legacy event loop*. The following sections explain each of the methods.

esp_event Library Event Loop

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in *system_event_id_t* enumeration and *system_event_info_t* union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See *esp_event library API reference* for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the *default event loop* provided by this library.

Legacy Event Loop

This event loop implementation is started using *esp_event_loop_init()* function. Application typically supplies an *event handler*, a function with the following signature:

```

esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
  
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to *esp_event_loop_init()*.

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority *event* task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using *CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE* and *CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE* options, respectively.

Event handler receives a pointer to the event structure (*system_event_t*) which describes current event. This structure follows a *tagged union* pattern: *event_id* member indicates the type of event, and *event_info* member is a union of description structures. Application event handler will typically use *switch(event->event_id)* to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

Event IDs and Corresponding Data Structures

Event ID (legacy event ID)	Event data structure
Wi-Fi	
WIFI_EVENT_WIFI_READY (SYSTEM_EVENT_WIFI_READY)	n/a
WIFI_EVENT_SCAN_DONE (SYSTEM_EVENT_SCAN_DONE)	wifi_event_sta_scan_done_t
WIFI_EVENT_STA_START (SYSTEM_EVENT_STA_START)	n/a
WIFI_EVENT_STA_STOP (SYSTEM_EVENT_STA_STOP)	n/a
WIFI_EVENT_STA_CONNECTED (SYSTEM_EVENT_STA_CONNECTED)	wifi_event_sta_connected_t
WIFI_EVENT_STA_DISCONNECTED (SYSTEM_EVENT_STA_DISCONNECTED)	wifi_event_sta_disconnected_t
WIFI_EVENT_STA_AUTHMODE_CHANGE (SYSTEM_EVENT_STA_AUTHMODE_CHANGE)	wifi_event_sta_authmode_change_t
WIFI_EVENT_STA_WPS_ER_SUCCESS (SYSTEM_EVENT_STA_WPS_ER_SUCCESS)	n/a
WIFI_EVENT_STA_WPS_ER_FAILED (SYSTEM_EVENT_STA_WPS_ER_FAILED)	wifi_event_sta_wps_fail_reason_t
WIFI_EVENT_STA_WPS_ER_TIMEOUT (SYSTEM_EVENT_STA_WPS_ER_TIMEOUT)	n/a
WIFI_EVENT_STA_WPS_ER_PIN (SYSTEM_EVENT_STA_WPS_ER_PIN)	wifi_event_sta_wps_er_pin_t
WIFI_EVENT_AP_START (SYSTEM_EVENT_AP_START)	n/a
WIFI_EVENT_AP_STOP (SYSTEM_EVENT_AP_STOP)	n/a
WIFI_EVENT_AP_STACONNECTED (SYSTEM_EVENT_AP_STACONNECTED)	wifi_event_ap_staconnected_t
WIFI_EVENT_AP_STADISCONNECTED (SYSTEM_EVENT_AP_STADISCONNECTED)	wifi_event_ap_stadisconnected_t
WIFI_EVENT_AP_PROBEREQRCVD (SYSTEM_EVENT_AP_PROBEREQRCVD)	wifi_event_ap_probe_req_rx_t
Ethernet	
ETHERNET_EVENT_START (SYSTEM_EVENT_ETH_START)	n/a
ETHERNET_EVENT_STOP (SYSTEM_EVENT_ETH_STOP)	n/a
ETHERNET_EVENT_CONNECTED (SYSTEM_EVENT_ETH_CONNECTED)	n/a
ETHERNET_EVENT_DISCONNECTED (SYSTEM_EVENT_ETH_DISCONNECTED)	n/a
IP	
IP_EVENT_STA_GOT_IP (SYSTEM_EVENT_STA_GOT_IP)	ip_event_got_ip_t
IP_EVENT_STA_LOST_IP (SYSTEM_EVENT_STA_LOST_IP)	n/a
IP_EVENT_AP_STAIPASSIGNED (SYSTEM_EVENT_AP_STAIPASSIGNED)	n/a
IP_EVENT_GOT_IP6 (SYSTEM_EVENT_GOT_IP6)	ip_event_got_ip6_t
IP_EVENT_ETH_GOT_IP (SYSTEM_EVENT_ETH_GOT_IP)	ip_event_got_ip_t
IP_EVENT_ETH_LOST_IP (SYSTEM_EVENT_ETH_LOST_IP)	n/a

4.12.2 Mesh Events

ESP-WIFI-MESH uses a system similar to the [Legacy Event Loop](#) to deliver events to the application. See [System Events](#) for details.

4.12.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameters type.

- BLE GAP: `esp_ble_gap_register_callback()`, `esp_gap_ble_cb_event_t`, `esp_ble_gap_cb_param_t`.
- BT GAP: `esp_bt_gap_register_callback()`, `esp_bt_gap_cb_event_t`, `esp_bt_gap_cb_param_t`.
- GATT: `esp_ble_gattc_register_callback()`, `esp_bt_gattc_cb_event_t`, `esp_bt_gattc_cb_param_t`.
- GATTS: `esp_ble_gatts_register_callback()`, `esp_bt_gatts_cb_event_t`, `esp_bt_gatts_cb_param_t`.
- SPP: `esp_spp_register_callback()`, `esp_spp_cb_event_t`, `esp_spp_cb_param_t`.
- Blufi: `esp_blufi_register_callbacks()`, `esp_blufi_cb_event_t`, `esp_blufi_cb_param_t`.
- A2DP: `esp_a2d_register_callback()`, `esp_a2d_cb_event_t`, `esp_a2d_cb_param_t`.
- AVRC: `esp_avrc_ct_register_callback()`, `esp_avrc_ct_cb_event_t`, `esp_avrc_ct_cb_param_t`.
- HFP Client: `esp_hf_client_register_callback()`, `esp_hf_client_cb_event_t`, `esp_hf_client_cb_param_t`.
- HFP AG: `esp_hf_ag_register_callback()`, `esp_hf_ag_cb_event_t`, `esp_hf_ag_cb_param_t`.

4.13 Support for external RAM

4.13.1 Introduction

ESP32-S3 has a few hundred kilobytes of internal RAM, residing on the same die as the rest of the chip components. It can be insufficient for some purposes, so ESP32-S3 has the ability to also use up to 16 MB of external SPI RAM memory. The external memory is incorporated in the memory map and, with certain restrictions, is usable in the same way as internal data RAM.

4.13.2 Hardware

ESP32-S3 supports SPI PSRAM connected in parallel with the SPI flash chip. While ESP32-S3 is capable of supporting several types of RAM chips, ESP-IDF currently only supports Espressif branded PSRAM chips (ESP-PSRAM32, ESP-PSRAM64, etc).

Note: Some PSRAM chips are 1.8 V devices and some are 3.3 V. The working voltage of the PSRAM chip must match the working voltage of the flash component. Consult the datasheet for your PSRAM chip and ESP32-S3 device to find out the working voltages. For a 1.8 V PSRAM chip, make sure to either set the MTDI pin to a high signal level on bootup, or program ESP32-S3 eFuses to always use the VDD_SIO level of 1.8 V. Not doing this can damage the PSRAM and/or flash chip.

Note: Espressif produces both modules and system-in-package chips that integrate compatible PSRAM and flash and are ready to mount on a product PCB. Consult the Espressif website for more information.

For specific details about connecting the SoC or module pins to an external PSRAM chip, consult the SoC or module datasheet.

4.13.3 Configuring External RAM

ESP-IDF fully supports the use of external memory in applications. Once the external RAM is initialized at startup, ESP-IDF can be configured to handle it in several ways:

- *Integrate RAM into the ESP32-S3 memory map*
- *Add external RAM to the capability allocator*
- *Provide external RAM via malloc() (default)*

Integrate RAM into the ESP32-S3 memory map

Select this option by choosing “Integrate RAM into memory map” from `CONFIG_SPIRAM_USE`.

This is the most basic option for external SPI RAM integration. Most likely, you will need another, more advanced option.

During the ESP-IDF startup, external RAM is mapped into the data address space, starting at address 0x3D000000 (byte-accessible). The length of this region is the same as the SPI RAM size (up to the limit of 16 MB).

Applications can manually place data in external memory by creating pointers to this region. So if an application uses external memory, it is responsible for all management of the external SPI RAM: coordinating buffer usage, preventing corruption, etc.

Add external RAM to the capability allocator

Select this option by choosing “Make RAM allocatable using heap_caps_malloc(..., MALLOC_CAP_SPIRAM)” from `CONFIG_SPIRAM_USE`.

When enabled, memory is mapped to address 0x3D000000 and also added to the *capabilities-based heap memory allocator* using `MALLOC_CAP_SPIRAM`.

To allocate memory from external RAM, a program should call `heap_caps_malloc(size, MALLOC_CAP_SPIRAM)`. After use, this memory can be freed by calling the normal `free()` function.

Provide external RAM via malloc()

Select this option by choosing “Make RAM allocatable using malloc() as well” from `CONFIG_SPIRAM_USE`. This is the default option.

In this case, memory is added to the capability allocator as described for the previous option. However, it is also added to the pool of RAM that can be returned by the standard `malloc()` function.

This allows any application to use the external RAM without having to rewrite the code to use `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)`.

An additional configuration item, `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`, can be used to set the size threshold when a single allocation should prefer external memory:

- When allocating a size less than the threshold, the allocator will try internal memory first.
- When allocating a size equal to or larger than the threshold, the allocator will try external memory first.

If a suitable block of preferred internal/external memory is not available, the allocator will try the other type of memory.

Because some buffers can only be allocated in internal memory, a second configuration item `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL` defines a pool of internal memory which is reserved for *only* explicitly internal allocations (such as memory for DMA use). Regular `malloc()` will not allocate from this pool. The `MALLOC_CAP_DMA` and `MALLOC_CAP_INTERNAL` flags can be used to allocate memory from this pool.

4.13.4 Restrictions

External RAM use has the following restrictions:

- When flash cache is disabled (for example, if the flash is being written to), the external RAM also becomes inaccessible; any reads from or writes to it will lead to an illegal cache access exception. This is also the reason why ESP-IDF does not by default allocate any task stacks in external RAM (see below).
 - External RAM cannot be used as a place to store DMA transaction descriptors or as a buffer for a DMA transfer to read from or write into. Therefore when External RAM is enabled, any buffers that will be used in combination with DMA must be allocated using `heap_caps_malloc(size, MALLOC_CAP_DMA | MALLOC_CAP_INTERNAL)` and can be freed using a standard `free()` call.

Note, although ESP32-S3 has hardware support for DMA to/from external RAM, this is not yet supported in ESP-IDF.

- External RAM uses the same cache region as the external flash. This means that frequently accessed variables in external RAM can be read and modified almost as quickly as in internal ram. However, when accessing large chunks of data (>32 KB), the cache can be insufficient, and speeds will fall back to the access speed of the external RAM. Moreover, accessing large chunks of data can “push out” cached flash, possibly making the execution of code slower afterwards.
- In general, external RAM will not be used as task stack memory. `xTaskCreate()` and similar functions will always allocate internal memory for stack and task TCBS.

The option `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` can be used to place task stacks into external memory. In these cases `xTaskCreateStatic()` must be used to specify a task stack buffer allocated from external memory, otherwise task stacks will still be allocated from internal memory.

4.13.5 Failure to initialize

By default, failure to initialize external RAM will cause the ESP-IDF startup to abort. This can be disabled by enabling the config item `CONFIG_SPIRAM_IGNORE_NOTFOUND`.

4.13.6 Encryption

It is possible to enable automatic encryption for data stored in external RAM. When this is enabled any data read and written through the cache will automatically be encrypted/decrypted by the external memory encryption hardware.

This feature is enabled whenever flash encryption is enabled. For more information on how to enable and how it works see [Flash Encryption](#).

4.14 Fatal Errors

4.14.1 Overview

In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:

- CPU Exceptions: Illegal Instruction, Load/Store Alignment Error, Load/Store Prohibited error, Double Exception.
- System level checks and safeguards:
 - *Interrupt watchdog* timeout

- *Task watchdog* timeout (only fatal if `CONFIG_ESP_TASK_WDT_PANIC` is set)
- Cache access error
- Brownout detection event
- Stack overflow
- Stack smashing protection check
- Heap integrity check
- Undefined behavior sanitizer (UBSAN) checks
- Failed assertions, via `assert`, `configASSERT` and similar macros.

This guide explains the procedure used in ESP-IDF for handling these errors, and provides suggestions on troubleshooting the errors.

4.14.2 Panic Handler

Every error cause listed in the *Overview* will be handled by the *panic handler*.

The panic handler will start by printing the cause of the error to the console. For CPU exceptions, the message will be similar to

```
Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was unhandled.
```

For some of the system level checks (interrupt watchdog, cache access error), the message will be similar to

```
Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory region accessed). Exception was unhandled.
```

In all cases, the error cause will be printed in parentheses. See *Guru Meditation Errors* for a list of possible error causes.

Subsequent behavior of the panic handler can be set using `CONFIG_ESP_SYSTEM_PANIC` configuration choice. The available options are:

- Print registers and reboot (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`) — default option.
This will print register values at the point of the exception, print the backtrace, and restart the chip.
- Print registers and halt (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`)
Similar to the above option, but halt instead of rebooting. External reset is required to restart the program.
- Silent reboot (`CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT`)
Don't print registers or backtrace, restart the chip immediately.
- Invoke GDB Stub (`CONFIG_ESP_SYSTEM_PANIC_GDBSTUB`)
Start GDB server which can communicate with GDB over console UART port. This option will only provide read-only debugging or post-mortem debugging. See *GDB Stub* for more details.
- Invoke dynamic GDB Stub (`ESP_SYSTEM_GDBSTUB_RUNTIME`)
Start GDB server which can communicate with GDB over console UART port. This option allows the user to debug a program at run time and set break points, alter the execution, etc. See *GDB Stub* for more details.

The behavior of the panic handler is affected by two other configuration options.

- If `CONFIG_ESP32S3_DEBUG_OCDAWARE` is enabled (which is the default), the panic handler will detect whether a JTAG debugger is connected. If it is, execution will be halted and control will be passed to the debugger. In this case, registers and backtrace are not dumped to the console, and GDBStub / Core Dump functions are not used.
- If the *Core Dump* feature is enabled, then the system state (task stacks and registers) will be dumped to either Flash or UART, for later analysis.
- If `CONFIG_ESP_PANIC_HANDLER_IRAM` is disabled (disabled by default), the panic handler code is placed in flash memory, not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.
If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM, and hence will decrease the usable memory space in SRAM. But this may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

The following diagram illustrates the panic handler behavior:

Fig. 32: Panic Handler Flowchart (click to enlarge)

4.14.3 Register Dump and Backtrace

Unless the `CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT` option is enabled, the panic handler prints some of the CPU registers, and the backtrace, to the console

```

Core 0 register dump:
PC      : 0x400e14ed  PS      : 0x00060030  A0      : 0x800d0805  A1      : _

↳0xfffffffff

Backtrace: 0x400e14ed:0x3ffb5030 0x400d0802:0x3ffb5050

```

The register values printed are the register values in the exception frame, i.e., values at the moment when the CPU exception or another fatal error has occurred.

A Register dump is not printed if the panic handler has been executed as a result of an `abort()` call.

In some cases, such as interrupt watchdog timeout, the panic handler may print additional CPU registers (EPC1-EPC4) and the registers/backtrace of the code running on the other CPU.

The backtrace line contains PC:SP pairs, where PC is the Program Counter and SP is Stack Pointer, for each stack frame of the current task. If a fatal error happens inside an ISR, the backtrace may include PC:SP pairs both from the task which was interrupted, and from the ISR.

If *IDF Monitor* is used, Program Counter values will be converted to code locations (function name, file name, and line number), and the output will be annotated with additional lines:

```

Core 0 register dump:
PC       : 0x400e14ed  PS       : 0x00060030  A0       : 0x800d0805  A1       : ̣

↳0xfffffffff

Backtrace: 0x400e14ed:0x3ffb5030 0x400d0802:0x3ffb5050
0x400e14ed: app_main at /Users/user/esp/example/main/main.cpp:36

0x400d0802: main_task at /Users/user/esp/esp-idf/components/esp32s3/cpu_start.c:470

```

To find the location where a fatal error has happened, look at the lines which follow the “Backtrace” line. Fatal error location is the top line, and subsequent lines show the call stack.

4.14.4 GDB Stub

If the `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` option is enabled, the panic handler will not reset the chip when a fatal error happens. Instead, it will start a GDB remote protocol server, commonly referred to as GDB Stub. When this happens, a GDB instance running on the host computer can be instructed to connect to the ESP32-S3 UART port.

If *IDF Monitor* is used, GDB is started automatically when a GDB Stub prompt is detected on the UART. The output looks like this:

```
Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>

This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-
↳esp32s3-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:
<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
    at /Users/user/esp/example/main/main.cpp:36
36      *((int*) 0) = 0;
(gdb)
```

The GDB prompt can be used to inspect CPU registers, local and static variables, and arbitrary locations in memory. It is not possible to set breakpoints, change the PC, or continue execution. To reset the program, exit GDB and perform an external reset: Ctrl-T Ctrl-R in IDF Monitor, or using the external reset button on the development board.

4.14.5 Guru Meditation Errors

This section explains the meaning of different error causes, printed in parens after the `Guru Meditation Error: Core panic'ed` message.

Note: See the [Guru Meditation Wikipedia article](#) for historical origins of “Guru Meditation” .

IllegalInstruction

This CPU exception indicates that the instruction which was executed was not a valid instruction. Most common reasons for this error include:

- FreeRTOS task function has returned. In FreeRTOS, if a task function needs to terminate, it should call `vTaskDelete()` and delete itself, instead of returning.
- Failure to read next instruction from SPI flash. This usually happens if:
 - Application has reconfigured the SPI flash pins as some other function (GPIO, UART, etc.). Consult the Hardware Design Guidelines and the datasheet for the chip or module for details about the SPI flash pins.
 - Some external device has accidentally been connected to the SPI flash pins, and has interfered with communication between ESP32-S3 and SPI flash.

InstrFetchProhibited

This CPU exception indicates that the CPU could not read an instruction because the address of the instruction does not belong to a valid region in instruction RAM or ROM.

Usually, this means an attempt to call a function pointer, which does not point to valid code. PC (Program Counter) register can be used as an indicator: it will be zero or will contain a garbage value (not `0x4xxxxxxxx`).

LoadProhibited, StoreProhibited

These CPU exceptions happen when an application attempts to read from or write to an invalid memory location. The address which has been written/read is found in the EXCVADDR register in the register dump. If this address is zero, it usually means that the application has attempted to dereference a NULL pointer. If this address is close to zero, it usually means that the application has attempted to access a member of a structure, but the pointer to the structure is NULL. If this address is something else (garbage value, not in `0x3fxxxxxxx - 0x6xxxxxxx` range), it likely means that the pointer used to access the data is either not initialized or has been corrupted.

IntegerDivideByZero

Application has attempted to do an integer division by zero.

LoadStoreAlignment

Application has attempted to read or write a memory location, and the address alignment does not match the load/store size. For example, a 32-bit read can only be done from a 4-byte aligned address, and a 16-bit write can only be done to a 2-byte aligned address.

LoadStoreError

This exception may happen in the following cases:

- If the application has attempted to do an 8- or 16- bit read to, or write from, a memory region which only supports 32-bit reads/writes. For example, dereferencing a `char*` pointer to instruction memory (IRAM, IROM) will result in such an error.
- If the application has attempted to write to a read-only memory region, such as IROM or DROM.

Unhandled debug exception

This will usually be followed by a message like:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

This error indicates that the application has written past the end of the stack of the task with name `task_name`. Note that not every stack overflow is guaranteed to trigger this error. It is possible that the task writes to memory beyond the stack canary location, in which case the watchpoint will not be triggered.

Interrupt wdt timeout on CPU0 / CPU1

Indicates that an interrupt watchdog timeout has occurred. See [Watchdogs](#) for more information.

Cache disabled but cached memory region accessed

In some situations, ESP-IDF will temporarily disable access to external SPI Flash and SPI RAM via caches. For example, this happens when `spi_flash` APIs are used to read/write/erase/mmap regions of SPI Flash. In these situations, tasks are suspended, and interrupt handlers not registered with `ESP_INTR_FLAG_IRAM` are disabled. Make sure that any interrupt handlers registered with this flag have all the code and data in IRAM/DRAM. Refer to the [SPI flash API documentation](#) for more details.

4.14.6 Other Fatal Errors

Brownout

ESP32-S3 has a built-in brownout detector, which is enabled by default. The brownout detector can trigger a system reset if the supply voltage goes below a safe level. The brownout detector can be configured using `CONFIG_ESP32S3_BROWNOUT_DET` and `CONFIG_ESP32S3_BROWNOUT_DET_LVL_SEL` options.

When the brownout detector triggers, the following message is printed:

```
Brownout detector was triggered
```

The chip is reset after the message is printed.

Note that if the supply voltage is dropping at a fast rate, only part of the message may be seen on the console.

Corrupt Heap

ESP-IDF's heap implementation contains a number of run-time checks of the heap structure. Additional checks ("Heap Poisoning") can be enabled in menuconfig. If one of the checks fails, a message similar to the following will be printed:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/
↳multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

Consult [Heap Memory Debugging](#) documentation for further information.

Stack Smashing

Stack smashing protection (based on GCC `-fstack-protector*` flags) can be enabled in ESP-IDF using `CONFIG_COMPILER_STACK_CHECK_MODE` option. If stack smashing is detected, message similar to the following will be printed:

```
Stack smashing protect failure!

abort() was called at PC 0x400d2138 on core 0

Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0_
↳0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0_
↳0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910_
↳0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80
0
```

The backtrace should point to the function where stack smashing has occurred. Check the function code for unbounded access to local arrays.

Undefined behavior sanitizer (UBSAN) checks

Undefined behavior sanitizer (UBSAN) is a compiler feature which adds run-time checks for potentially incorrect operations, such as:

- overflows (multiplication overflow, signed integer overflow)
- shift base or exponent errors (e.g. shift by more than 32 bits)
- integer conversion errors

See [GCC documentation](#) of `-fsanitize=undefined` option for the complete list of supported checks.

Enabling UBSAN UBSAN is disabled by default. It can be enabled at file, component, or project level by adding the `-fsanitize=undefined` compiler option in the build system.

When enabling UBSAN for code which uses the SoC hardware register header files (`soc/xxx_reg.h`), it is recommended to disable shift-base sanitizer using `-fno-sanitize=shift-base` option. This is due to the fact that ESP-IDF register header files currently contain patterns which cause false positives for this specific sanitizer option.

To enable UBSAN at project level, add the following code at the end of the project's `CMakeLists.txt` file:

```
idf_build_set_property(COMPILER_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-
↪base" APPEND)
```

Alternatively, pass these options through the `EXTRA_CFLAGS` and `EXTRA_CXXFLAGS` environment variables.

Enabling UBSAN results in significant increase of code and data size. Most applications, except for the trivial ones, will not fit into the available RAM of the microcontroller when UBSAN is enabled for the whole application. Therefore it is recommended that UBSAN is instead enabled for specific components under test.

To enable UBSAN for a specific component (`component_name`) from the project's `CMakeLists.txt` file, add the following code at the end of the file:

```
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-
↪base")
```

Note: See the build system documentation for more information about [build properties](#) and [component properties](#).

To enable UBSAN for a specific component (`component_name`) from `CMakeLists.txt` of the same component, add the following at the end of the file:

```
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-
↪sanitize=shift-base")
```

UBSAN output When UBSAN detects an error, a message and the backtrace are printed, for example:

```
Undefined behavior of type out_of_bounds

Backtrace:0x4008b383:0x3ffcd8b0 0x4008c791:0x3ffcd8d0 0x4008c587:0x3ffcd8f0_
↪0x4008c6be:0x3ffcd950 0x400db74f:0x3ffcd970 0x400db99c:0x3ffcd9a0
```

When using *IDF Monitor*, the backtrace will be decoded to function names and source code locations, pointing to the location where the issue has happened (here it is `main.c:128`):

```
0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367

0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api.
↪c:106

0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/
↪ubsan.c:152

0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/
↪ubsan.c:223

0x400db74f: test_ub at main.c:128

0x400db99c: app_main at main.c:56 (discriminator 1)
```

The types of errors reported by UBSAN can be as follows:

Name	Meaning
<code>type_mismatch</code> , <code>type_mismatch_v1</code>	Incorrect pointer value: null, unaligned, not compatible with the given type.
<code>add_overflow</code> , <code>sub_overflow</code> , <code>mul_overflow</code> , <code>negate_overflow</code>	Integer overflow during addition, subtraction, multiplication, negation.
<code>divrem_overflow</code>	Integer division by 0 or <code>INT_MIN</code> .
<code>shift_out_of_bounds</code>	Overflow in left or right shift operators.
<code>out_of_bounds</code>	Access outside of bounds of an array.
<code>unreachable</code>	Unreachable code executed.
<code>missing_return</code>	Non-void function has reached its end without returning a value (C++ only).
<code>vla_bound_not_positive</code>	Size of variable length array is not positive.
<code>load_invalid_value</code>	Value of <code>bool</code> or <code>enum</code> (C++ only) variable is invalid (out of bounds).
<code>nonnull_arg</code>	Null argument passed to a function which is declared with a <code>nonnull</code> attribute.
<code>nonnull_return</code>	Null value returned from a function which is declared with <code>returns_nonnull</code> attribute.
<code>builtin_unreachable</code>	<code>__builtin_unreachable</code> function called.
<code>pointer_overflow</code>	Overflow in pointer arithmetic.

4.15 Flash Encryption

This is a quick start guide to ESP32-S3's flash encryption feature. Using an application code example, it demonstrates how to test and verify flash encryption operations during development and production.

4.15.1 Introduction

Flash encryption is intended for encrypting the contents of the ESP32-S3's off-chip flash memory. Once this feature is enabled, firmware is flashed as plaintext, and then the data is encrypted in place on the first boot. As a result, physical readout of flash will not be sufficient to recover most flash contents.

With flash encryption enabled, the following types of data are encrypted by default:

- Firmware bootloader
- Partition Table
- All “app” type partitions

Other types of data can be encrypted conditionally:

- Any partition marked with the `encrypted` flag in the partition table. For details, see [Encrypted Partition Flag](#).
- Secure Boot bootloader digest if Secure Boot is enabled (see below).

Important: For production use, flash encryption should be enabled in the “Release” mode only.

Important: Enabling flash encryption limits the options for further updates of ESP32-S3. Before using this feature, read the document and make sure to understand the implications.

4.15.2 Relevant eFuses

The flash encryption operation is controlled by various eFuses available on ESP32-S3. The list of eFuses and their descriptions is given in the table below. The names in eFuse column are also used by `espefuse.py` tool. For usage in the eFuse API, modify the name by adding `ESP_EFUSE_`, for example: `esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)`.

Table 20: eFuses Used in Flash Encryption

eFuse	Description	Bit Depth
BLOCK_KEYN	AES key storage. N is between 0 and 5.	One 256 bit key block for XTS_AES_128, Two 256 bit key blocks for XTS_AES_256 (512 bit total)
KEY_PURPOSE_N	Controls the purpose of eFuse block BLOCK_KEYN, where N is between 0 and 5. Possible values: 2 for XTS_AES_256_KEY_1, 3 for XTS_AES_256_KEY_2, and 4 for XTS_AES_128_KEY. Final AES key is derived based on the value of one or two of these purpose eFuses. For a detailed description of the possible combinations, see <i>ESP32-S3 Technical Reference Manual > External Memory Encryption and Decryption (XTS_AES)</i> [PDF].	4
DIS_DOWNLOAD_MANUAL_ENCRYPT	If set, disables flash encryption when in download boot-modes.	1
SPI_BOOT_CRYPT_CNT	Enables encryption and decryption, when an SPI boot mode is set. Feature is enabled if 1 or 3 bits are set in the eFuse, disabled otherwise.	3

Note:

- R/W access control is available for all the eFuse bits listed in the table above.
- The default value of these bits is 0 after manufacturing.

Read and write access to eFuse bits is controlled by appropriate fields in the registers `WR_DIS` and `RD_DIS`. For more information on ESP32-S3 eFuses, see *eFuse manager*. To change protection bits of eFuse field using `espefuse.py`, use these two commands: `read_protect_efuse` and `write_protect_efuse`. Example `espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT`.

4.15.3 Flash Encryption Process

Assuming that the eFuse values are in their default states and the firmware bootloader is compiled to support flash encryption, the flash encryption process executes as shown below:

1. On the first power-on reset, all data in flash is un-encrypted (plaintext). The ROM bootloader loads the firmware bootloader.
2. Firmware bootloader reads the `SPI_BOOT_CRYPT_CNT` eFuse value (0b000). Since the value is 0 (even number of bits set), it configures and enables the flash encryption block. For more information on the flash encryption block, see *ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse) > Auto Encryption Block* [PDF].

3. Firmware bootloader uses RNG (random) module to generate an 256 bit or 512 bit key, depending on the value of *Size of generated AES-XTS key*, and then writes it into respectively one or two *BLOCK_KEYN* eFuses. The software also updates the *KEY_PURPOSE_N* for the blocks where the keys were stored. The key cannot be accessed via software as the write and read protection bits for one or two *BLOCK_KEYN* eFuses are set. *KEY_PURPOSE_N* field is write-protected as well. The flash encryption operations happen entirely by hardware, and the key cannot be accessed via software.
4. Flash encryption block encrypts the flash contents - the firmware bootloader, applications and partitions marked as *encrypted*. Encrypting in-place can take time, up to a minute for large partitions.
5. Firmware bootloader sets the first available bit in *SPI_BOOT_CRYPT_CNT* (0b001) to mark the flash contents as encrypted. Odd number of bits is set.
6. For *Development Mode*, the firmware bootloader allows the UART bootloader to re-flash encrypted binaries. Also, the *SPI_BOOT_CRYPT_CNT* eFuse bits are NOT write-protected. In addition, the firmware bootloader by default sets the eFuse bits *DIS_BOOT_REMAP*, *DIS_DOWNLOAD_ICACHE*, *DIS_DOWNLOAD_DCACHE*, *HARD_DIS_JTAG* and *DIS_LEGACY_SPI_BOOT*.
7. For *Release Mode*, the firmware bootloader sets all the eFuse bits set under development mode as well as *DIS_DOWNLOAD_MANUAL_ENCRYPT*. It also write-protects the *SPI_BOOT_CRYPT_CNT* eFuse bits. To modify this behavior, see *Enabling UART Bootloader Encryption/Decryption*.
8. The device is then rebooted to start executing the encrypted image. The firmware bootloader calls the flash decryption block to decrypt the flash contents and then loads the decrypted contents into IRAM.

During the development stage, there is a frequent need to program different plaintext flash images and test the flash encryption process. This requires that Firmware Download mode is able to load new plaintext images as many times as it might be needed. However, during manufacturing or production stages, Firmware Download mode should not be allowed to access flash contents for security reasons.

Hence, two different flash encryption configurations were created: for development and for production. For details on these configurations, see Section *Flash Encryption Configuration*.

4.15.4 Flash Encryption Configuration

The following flash encryption modes are available:

- *Development Mode* - recommended for use ONLY DURING DEVELOPMENT, as it does not prevent modification and readout of encrypted flash contents.
- *Release Mode* - recommended for manufacturing and production to prevent physical readout of encrypted flash contents.

This section provides information on the mentioned flash encryption modes and step by step instructions on how to use them.

Development Mode

During development, you can encrypt flash using either an ESP32-S3 generated key or external host-generated key.

Using ESP32-S3 Generated Key Development mode allows you to download multiple plaintext images using Firmware Download mode.

To test flash encryption process, take the following steps:

1. Ensure that you have an ESP32-S3 device with default flash encryption eFuse settings as shown in *Relevant eFuses*.
See how to check *ESP32-S3 Flash Encryption Status*.
2. In *Project Configuration Menu*, do the following:
 - *Enable flash encryption on boot*
 - *Select encryption mode* (**Development mode** by default)
 - *Select UART ROM download mode* (**enabled** by default.)

- Set *Size of generated AES-XTS key*
- *Select the appropriate bootloader log verbosity*
- Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See [Bootloader Size](#).

3. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```

Note: This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-S3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as `encrypted` then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

A sample output of the first ESP32-S3 boot after enabling flash encryption is given below:

```

Example to check Flash Encryption status
This is esp32s3 chip with 2 CPU core(s), WiFi/BLE, silicon revision 0, 2MB ↵
↵external flash
FLASH_CRYPT_CNT eFuse value is 1
Flash encryption feature is enabled in DEVELOPMENT mode

```

At this stage, if you need to update and re-flash binaries, see [Re-flashing Updated Partitions](#).

Using Host Generated Key It is possible to pre-generate a flash encryption key on the host computer and burn it into the eFuse. This allows you to pre-encrypt data on the host and flash already encrypted data without needing a plaintext flash update. This feature can be used in both [Development Mode](#) and [Release Mode](#). Without a pre-generated key, data is flashed in plaintext and then ESP32-S3 encrypts the data in-place.

Note: This option is not recommended for production, unless a separate key is generated for each individual device.

To use a host generated key, take the following steps:

1. Ensure that you have an ESP32-S3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

See how to check [ESP32-S3 Flash Encryption Status](#).

2. Generate a random key by running:

If [Size of generated AES-XTS key](#) is AES-128 (256-bit key):

```
espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```

else if *Size of generated AES-XTS key* is AES-256 (512-bit key):

```
espsecure.py generate_flash_encryption_key --keylen 512 my_flash_
↳ encryption_key.bin
```

3. **Before the first encrypted boot**, burn the key into your device's eFuse using the command below. This action can be done **only once**.

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin_
↳ KEYPURPOSE
```

where BLOCK is a free keyblock between BLOCK_KEY0 and BLOCK_KEY5. And KEYPURPOSE is either AES_256_KEY_1, XTS_AES_256_KEY_2, XTS_AES_128_KEY. See [ESP32-S3 Technical Reference Manual](#) for a description of the key purposes.

For AES-128 (256-bit key) - XTS_AES_128_KEY:

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳ AES_128_KEY
```

For AES-256 (512-bit key) - XTS_AES_256_KEY_1 and XTS_AES_256_KEY_2. espefuse.py supports burning both these two key purposes together with a 512 bit key to two separate key blocks via the virtual key purpose XTS_AES_256_KEY. When this is used espefuse.py will burn the first 256 bit of the key to the specified BLOCK and burn the corresponding block key purpose to XTS_AES_256_KEY_1. The last 256 bit of the key will be burned to the first free key block after BLOCK and the corresponding block key purpose to XTS_AES_256_KEY_2

```
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin XTS_
↳ AES_256_KEY
```

If you wish to specify exactly which two blocks are used then it is possible to divide key into two 256 bit keys, and manually burn each half with XTS_AES_256_KEY_1 and XTS_AES_256_KEY_2 as key purposes:

```
split -b 32 my_flash_encryption_key.bin my_flash_encryption_key.bin.
espefuse.py --port PORT burn_key BLOCK my_flash_encryption_key.bin.aa_
↳ XTS_AES_256_KEY_1
espefuse.py --port PORT burn_key BLOCK+1 my_flash_encryption_key.bin.ab_
↳ XTS_AES_256_KEY_2
```

If the key is not burned and the device is started after enabling flash encryption, the ESP32-S3 will generate a random key that software cannot access or modify.

4. In *Project Configuration Menu*, do the following:
 - *Enable flash encryption on boot*
 - *Select encryption mode (Development mode by default)*
 - *Select the appropriate bootloader log verbosity*
 - Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See [Bootloader Size](#).

5. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```

Note: This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be

encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-S3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as encrypted then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

If using Development Mode, then the easiest way to update and re-flash binaries is [Re-flashing Updated Partitions](#).

If using Release Mode, then it is possible to pre-encrypt the binaries on the host and then flash them as ciphertext. See [Manually Encrypting Files](#).

Re-flashing Updated Partitions If you update your application code (done in plaintext) and want to re-flash it, you will need to encrypt it before flashing. To encrypt the application and flash it in one step, run:

```
idf.py encrypted-app-flash monitor
```

If all partitions needs to be updated in encrypted format, run:

```
idf.py encrypted-flash monitor
```

Release Mode

In Release mode, UART bootloader cannot perform flash encryption operations. New plaintext images can ONLY be downloaded using the over-the-air (OTA) scheme which will encrypt the plaintext image before writing to flash.

To use this mode, take the following steps:

1. Ensure that you have an ESP32-S3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

See how to check [ESP32-S3 Flash Encryption Status](#).

2. In [Project Configuration Menu](#), do the following:

- [Enable flash encryption on boot](#)
- [Select Release mode](#) (Note that once Release mode is selected, the EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT eFuse bit will be burned to disable flash encryption hardware in ROM Download Mode.)
- [Select UART ROM download mode \(Permanently switch to Secure mode \(recommended\)\)](#). This is the default option, and is recommended. It is also possible to change this configuration setting to permanently disable UART ROM download mode, if this mode is not needed.
- [Select the appropriate bootloader log verbosity](#)
- Save the configuration and exit.

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See [Bootloader Size](#).

3. Run the command given below to build and flash the complete images.

```
idf.py flash monitor
```

Note: This command does not include any user files which should be written to the partitions on the flash memory. Please write them manually before running this command otherwise the files should be encrypted separately before writing.

This command will write to flash memory unencrypted images: the firmware bootloader, the partition table and applications. Once the flashing is complete, ESP32-S3 will reset. On the next boot, the firmware bootloader encrypts: the firmware bootloader, application partitions and partitions marked as `encrypted` then resets. Encrypting in-place can take time, up to a minute for large partitions. After that, the application is decrypted at runtime and executed.

Once the flash encryption is enabled in Release mode, the bootloader will write-protect the `SPI_BOOT_CRYPT_CNT` eFuse.

For subsequent plaintext field updates, use [OTA scheme](#).

Note: If you have pre-generated the flash encryption key and stored a copy, and the UART download mode is not permanently disabled via `CONFIG_SECURE_UART_ROM_DL_MODE`, then it is possible to update the flash locally by pre-encrypting the files and then flashing the ciphertext. See [Manually Encrypting Files](#).

Best Practices

When using Flash Encryption in production:

- Do not reuse the same flash encryption key between multiple devices. This means that an attacker who copies encrypted data from one device cannot transfer it to a second device.
- The UART ROM Download Mode should be disabled entirely if it is not needed, or permanently set to “Secure Download Mode” otherwise. Secure Download Mode permanently limits the available commands to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`). The default behaviour is to set Secure Download Mode on first boot in Release mode. To disable Download Mode entirely select the `CONFIG_SECURE_UART_ROM_DL_MODE` to “Permanently disable ROM Download Mode (recommended)” or call `esp_efuse_disable_rom_download_mode()` at runtime.
- Enable *Secure Boot* as an extra layer of protection, and to prevent an attacker from selectively corrupting any part of the flash before boot.

4.15.5 Possible Failures

Once flash encryption is enabled, the `SPI_BOOT_CRYPT_CNT` eFuse value will have an odd number of bits set. It means that all the partitions marked with the encryption flag are expected to contain encrypted ciphertext. Below are the three typical failure cases if the ESP32-S3 is erroneously loaded with plaintext data:

1. If the bootloader partition is re-flashed with a **plaintext firmware bootloader image**, the ROM bootloader will fail to load the firmware bootloader resulting in the following failure:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
invalid header: 0xb414f76b
```

Note: The value of invalid header will be different for every application.

Note: This error also appears if the flash contents are erased or corrupted.

- If the firmware bootloader is encrypted, but the partition table is re-flashed with a **plaintext partition table image**, the bootloader will fail to read the partition table resulting in the following failure:

```

rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00

I (102) boot:  2 factory                factory app          00 00 00020000 00100000
I (109) boot: End of partition table
E (113) esp_image: image at 0x20000 has invalid magic byte
W (120) esp_image: image at 0x20000 has invalid SPI mode 108
W (126) esp_image: image at 0x20000 has invalid SPI size 11
E (132) boot: Factory app partition is not bootable
E (138) boot: No bootable app partitions in the partition table

```

4.15.6 ESP32-S3 Flash Encryption Status

- Ensure that you have an ESP32-S3 device with default flash encryption eFuse settings as shown in [Relevant eFuses](#).

To check if flash encryption on your ESP32-S3 device is enabled, do one of the following:

- flash the application example [security/flash_encryption](#) onto your device. This application prints the SPI_BOOT_CRYPT_CNT eFuse value and if flash encryption is enabled or disabled.

- *Find the serial port name* under which your ESP32-S3 device is connected, replace `PORT` with your port name in the following command, and run it:

```
espefuse.py -p PORT summary
```

4.15.7 Reading and Writing Data in Encrypted Flash

ESP32-S3 application code can check if flash encryption is currently enabled by calling `esp_flash_encryption_enabled()`. Also, a device can identify the flash encryption mode by calling `esp_get_flash_encryption_mode()`.

Once flash encryption is enabled, be more careful with accessing flash contents from code.

Scope of Flash Encryption

Whenever the `SPI_BOOT_CRYPT_CNT` eFuse is set to a value with an odd number of bits, all flash content accessed via the MMU's flash cache is transparently decrypted. It includes:

- Executable application code in flash (IROM).
- All read-only data stored in flash (DROM).
- Any data accessed via `spi_flash_mmap()`.
- The firmware bootloader image when it is read by the ROM bootloader.

Important: The MMU flash cache unconditionally decrypts all existing data. Data which is stored unencrypted in flash memory will also be “transparently decrypted” via the flash cache and will appear to software as random garbage.

Reading from Encrypted Flash

To read data without using a flash cache MMU mapping, you can use the partition read function `esp_partition_read()`. This function will only decrypt data when it is read from an encrypted partition. Data read from unencrypted partitions will not be decrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also use the following SPI flash API functions:

- `esp_flash_read()` to read raw (encrypted) data which will not be decrypted
- `esp_flash_read_encrypted()` to read and decrypt data

The ROM function `SPIRead()` can read data without decryption, however, this function is not supported in esp-idf applications.

Data stored using the Non-Volatile Storage (NVS) API is always stored and read decrypted from the perspective of flash encryption. It is up to the library to provide encryption feature if required. Refer to *NVS Encryption* for more details.

Writing to Encrypted Flash

It is recommended to use the partition write function `esp_partition_write()`. This function will only encrypt data when it is written to an encrypted partition. Data written to unencrypted partitions will not be encrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

You can also pre-encrypt and write data using the function `esp_flash_write_encrypted()`

Also, the following ROM function exist but not supported in esp-idf applications:

- `esp_rom_spiflash_write_encrypted` pre-encrypts and writes data to flash
- `SPIWrite` writes unencrypted data to flash

Since data is encrypted in blocks, the minimum write size for encrypted data is 16 bytes and the alignment is also 16 bytes.

4.15.8 Updating Encrypted Flash

OTA Updates

OTA updates to encrypted partitions will automatically write encrypted data if the function `esp_partition_write()` is used.

Before building the application image for OTA updating of an already encrypted device, enable the option *Enable flash encryption on boot* in project configuration menu.

For general information about ESP-IDF OTA updates, please refer to *OTA*

Updating Encrypted Flash via Serial

Flashing an encrypted device via serial bootloader requires that the serial bootloader download interface has not been permanently disabled via eFuse.

In Development Mode, the recommended method is *Re-flashing Updated Partitions*.

In Release Mode, if a copy of the same key stored in eFuse is available on the host then it's possible to pre-encrypt files on the host and then flash them. See *Manually Encrypting Files*.

4.15.9 Disabling Flash Encryption

If flash encryption was enabled accidentally, flashing of plaintext data will soft-brick the ESP32-S3. The device will reboot continuously, printing the error `flash read err, 1000` or `invalid header: 0xFFFFFFFF`.

For flash encryption in Development mode, encryption can be disabled by burning the `SPI_BOOT_CRYPT_CNT` eFuse. It can only be done one time per chip by taking the following steps:

1. In *Project Configuration Menu*, disable *Enable flash encryption on boot*, then save and exit.
2. Open project configuration menu again and **double-check** that you have disabled this option! If this option is left enabled, the bootloader will immediately re-enable encryption when it boots.
3. With flash encryption disabled, build and flash the new bootloader and application by running `idf.py flash`.
4. Use `espefuse.py` (in `components/esptool_py/esptool`) to disable the `SPI_BOOT_CRYPT_CNT` by running:

```
espefuse.py burn_efuse SPI_BOOT_CRYPT_CNT
```

Reset the ESP32-S3. Flash encryption will be disabled, and the bootloader will boot as usual.

4.15.10 Key Points About Flash Encryption

- Flash memory contents is encrypted using XTS-AES-128 or XTS-AES-256. The flash encryption key is 256 bits and 512 bits respectively and stored in one or two `BLOCK_KEYN` eFuses internal to the chip and, by default, is protected from software access.
- Flash access is transparent via the flash cache mapping feature of ESP32-S3 - any flash regions which are mapped to the address space will be transparently decrypted when read.
Some data partitions might need to remain unencrypted for ease of access or might require the use of flash-friendly update algorithms which are ineffective if the data is encrypted. NVS partitions for non-volatile storage cannot be encrypted since the NVS library is not directly compatible with flash encryption. For details, refer to *NVS Encryption*.

- If flash encryption might be used in future, the programmer must keep it in mind and take certain precautions when writing code that *uses encrypted flash*.
- If secure boot is enabled, re-flashing the bootloader of an encrypted device requires a “Re-flashable” secure boot digest (see *Flash Encryption and Secure Boot*).

Enabling flash encryption will increase the size of bootloader, which might require updating partition table offset. See *Bootloader Size*.

Important: Do not interrupt power to the ESP32-S3 while the first boot encryption pass is running. If power is interrupted, the flash contents will be corrupted and will require flashing with unencrypted data again. In this case, re-flashing will not count towards the flashing limit.

4.15.11 Limitations of Flash Encryption

Flash encryption protects firmware against unauthorised readout and modification. It is important to understand the limitations of the flash encryption feature:

- Flash encryption is only as strong as the key. For this reason, we recommend keys are generated on the device during first boot (default behaviour). If generating keys off-device, ensure proper procedure is followed and don't share the same key between all production devices.
- Not all data is stored encrypted. If storing data on flash, check if the method you are using (library, API, etc.) supports flash encryption.
- Flash encryption does not prevent an attacker from understanding the high-level layout of the flash. This is because the same AES key is used for every pair of adjacent 16 byte AES blocks. When these adjacent 16 byte blocks contain identical content (such as empty or padding areas), these blocks will encrypt to produce matching pairs of encrypted blocks. This may allow an attacker to make high-level comparisons between encrypted devices (i.e. to tell if two devices are probably running the same firmware version).
- Flash encryption alone may not prevent an attacker from modifying the firmware of the device. To prevent unauthorised firmware from running on the device, use flash encryption in combination with *Secure Boot*.

4.15.12 Flash Encryption and Secure Boot

It is recommended to use flash encryption in combination with Secure Boot. However, if Secure Boot is enabled, additional restrictions apply to device re-flashing:

- *OTA Updates* are not restricted, provided that the new app is signed correctly with the Secure Boot signing key.

4.15.13 Advanced Features

The following section covers advanced features of flash encryption.

Encrypted Partition Flag

Some partitions are encrypted by default. Other partitions can be marked in the partition table description as requiring encryption by adding the flag `encrypted` to the partitions' flag field. As a result, data in these marked partitions will be treated as encrypted in the same manner as an app partition.

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
secret_data, 0x40, 0x01, 0x20000, 256K, encrypted
```

For details on partition table description, see [partition table](#).

Further information about encryption of partitions:

- Default partition tables do not include any encrypted data partitions.
- With flash encryption enabled, the `app` partition is always treated as encrypted and does not require marking.
- If flash encryption is not enabled, the flag “encrypted” has no effect.
- You can also consider protecting `phy_init` data from physical access, readout, or modification, by marking the optional `phy` partition with the flag `encrypted`.
- The `nvs` partition cannot be encrypted, because the NVS library is not directly compatible with flash encryption.

Enabling UART Bootloader Encryption/Decryption

On the first boot, the flash encryption process burns by default the following eFuses:

- `DIS_DOWNLOAD_MANUAL_ENCRYPT` which disables flash encryption operation when running in UART bootloader boot mode.
- `DIS_DOWNLOAD_ICACHE` and `DIS_DOWNLOAD_DCACHE` which disables the entire MMU flash cache when running in UART bootloader mode.
- `HARD_DIS_JTAG` and `DIS_USB_JTAG` which disables JTAG.
- `DIS_LEGACY_SPI_BOOT` which disables Legacy SPI boot mode

However, before the first boot you can choose to keep any of these features enabled by burning only selected eFuses and write-protect the rest of eFuses with unset value 0. For example:

```
espfuse.py --port PORT burn_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
espfuse.py --port PORT write_protect_efuse DIS_DOWNLOAD_MANUAL_ENCRYPT
```

Note: Set all appropriate bits before write-protecting!

Write protection of all the three eFuses is controlled by one bit. It means that write-protecting one eFuse bit will inevitably write-protect all unset eFuse bits.

Write protecting these eFuses to keep them unset is not currently very useful, as `esptool.py` does not support reading encrypted flash.

JTAG Debugging

By default, when Flash Encryption is enabled (in either Development or Release mode) then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables flash encryption.

See [JTAG with Flash Encryption or Secure Boot](#) for more information about using JTAG Debugging with Flash Encryption.

Manually Encrypting Files

Manually encrypting or decrypting files requires the flash encryption key to be pre-burned in eFuse (see [Using Host Generated Key](#)) and a copy to be kept on the host. If the flash encryption is configured in Development Mode then it's not necessary to keep a copy of the key or follow these steps, the simpler [Re-flashing Updated Partitions](#) steps can be used.

The key file should be a single raw binary file (example: `key.bin`).

For example, these are the steps to encrypt the file `build/my-app.bin` to flash at offset `0x10000`. Run `espsecure.py` as follows:

```
espsecure.py encrypt_flash_data --aes_xts --keyfile /path/to/key.bin --address_
↪0x10000 --output my-app-ciphertext.bin build/my-app.bin
```

The file `my-app-ciphertext.bin` can then be flashed to offset `0x10000` using `esptool.py`. To see all of the command line options recommended for `esptool.py`, see the output printed when `idf.py build` succeeds.

Note: If the flashed ciphertext file is not recognized by the ESP32-S3 when it boots, check that the keys match and that the command line arguments match exactly, including the correct offset.

The command `espsecure.py decrypt_flash_data` can be used with the same options (and different input/output files), to decrypt ciphertext flash contents or a previously encrypted file.

4.15.14 External RAM

When Flash Encryption is enabled any data read from and written to external SPI RAM through the cache will also be encrypted/decrypted. This happens the same way and with the same key as for Flash Encryption. If Flash Encryption is enabled then encryption for external SPI RAM is also always enabled, it is not possible to separately control this functionality.

4.15.15 Technical Details

The following sections provide some reference information about the operation of flash encryption.

Flash Encryption Algorithm

- ESP32-S3 use the XTS-AES block cipher mode with 256 bit or 512 bit key size for flash encryption.
- XTS-AES is a block cipher mode specifically designed for disc encryption and addresses the weaknesses other potential modes (e.g. AES-CTR) have for this use case. A detailed description of the XTS-AES algorithm can be found in [IEEE Std 1619-2007](#).
- The flash encryption key is stored in one or two `BLOCK_KEYN` eFuses and, by default, is protected from further writes or software readout.
- To see the full flash encryption algorithm implemented in Python, refer to the `_flash_encryption_operation()` function in the `espsecure.py` source code.

4.16 SPI Flash and External SPI RAM Configuration

This page is a guide for configuring SPI Flash and external SPI RAM. Supported frequency and mode combination, error handling are also elaborated.

4.16.1 Terminology

Term	Definition
SPI	Serial Peripheral Interface
MSPI	Memory SPI Peripheral, SPI Peripheral dedicated for memory
SDR	Single Data Rate
DDR	Double Data Rate
line mode	Number of signals used to transfer data in the data phase of SPI transactions. e.g., for 4-bit-mode, the speed of the data phase would be 4 bit per clock cycle.
FxRx	F stands for Flash, R stands for PSRAM, x stands for line mode. e.g. F4R4 stands for an ESP32-S3 with Quad Flash and Quad PSRAM

Note: On ESP32-S3, MSPI stands for the SPI0/1. SPI0 and SPI1 share a common SPI bus. The main Flash and PSRAM are connected to the MSPI peripheral. CPU accesses them via Cache.

4.16.2 How to configure Flash and PSRAM

`idf.py menuconfig` is used to open the configuration menu.

Configure the Flash

The Flash related configurations are under `Serial flasher config` menu.

1. Flash type used on the board. For Octal Flash, select `CONFIG_ESPTOOLPY_OCT_FLASH`. For Quad Flash, uncheck this configuration.
2. Flash line mode. Select a line mode in `CONFIG_ESPTOOLPY_FLASHMODE`. The higher the line mode is, the faster the SPI speed is. See terminology above about the line mode.
3. Flash sample mode. Select a sample mode in `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`. DDR mode is faster than SDR mode. See terminology above about SDR and DDR mode.
4. Flash speed. Select a Flash frequency in `CONFIG_ESPTOOLPY_FLASHFREQ`.
5. Flash size. Flash size, in megabytes. Select a Flash size in `CONFIG_ESPTOOLPY_FLASHSIZE`.

Configure the PSRAM

To enable PSRAM, please enable the `CONFIG_ESP32S3_SPIRAM_SUPPORT` under `Component config / ESP32-S3-Specific` menu. Then all the PSRAM related configurations will be visible under `SPI RAM config` menu.

1. PSRAM type used on the board. Select a type in `CONFIG_SPIRAM_MODE` for Quad or Octal PSRAM.
2. PSRAM speed. Select a PSRAM frequency in `CONFIG_SPIRAM_SPEED`.

Note: Configuration 1 of Flash and PSRAM should be selected according to your actual hardware.

For the reset of the above configurations:

- Flash and PSRAM share the same internal clock.
- Quad Flash only supports STR mode. Octal Flash may support either/both STR/DTR modes under OPI mode, depending on the flash model and the vendor.
- Quad PSRAM only supports STR mode, while Octal PSRAM only supports DTR mode.

Therefore, some limitations should be noticed when configuring configuration 2, 3 and 4 of Flash, and configuration 2 of PSRAM. Please refer to [All Supported Modes and Speeds](#)

Note: If a board with Octal Flash resets before the second-stage bootloader, please refer to [Error Handling Chapter](#)

4.16.3 All Supported Modes and Speeds

Note: For MSPI DDR mode, the data are sampled on both the positive edge and the negative edge. e.g.: if a Flash is set to 80 MHz and DDR mode, then the final speed of the Flash is 160 MHz. This is faster than the Flash setting to 120 MHz and STR mode.

F8R8 Hardware

Group	Flash mode	Group	PSRAM mode
A	120 MHz SDR	A	N.A.
B	80 MHz DDR	B	80 MHz DDR
C	80 MHz SDR	C	40 MHz DDR
C	40 MHz DDR	C	
C	< 40 MHz	C	
D		D	disable

1. Flash mode in group A works with PSRAM mode in group A/D
2. Flash mode in group B/C works with PSRAM mode in group B/C/D

F4R8 Hardware

Group	Flash mode	Group	PSRAM mode
A	120 MHz SDR	A	N.A.
B	80 MHz SDR	B	80MHz DDR
C	40 MHz SDR	C	40MHz DDR
C	20 MHz SDR	C	
D		D	disable

1. Flash mode in group A works with PSRAM mode in group A/D
2. Flash mode in group B/C works with PSRAM mode in group B/C/D

F4R4 Hardware

Type	Flash	Type	PSRAM
A	120 MHz	A	120MHz
B	80 MHz	B	80MHz
C	40 MHz	C	40MHz
C	20 MHz	C	
D		D	disable

1. Flash in A works with PSRAM in A/C/D
2. Flash in B works with PSRAM in B/C/D
3. Flash in C works with PSRAM in A/B/C/D

4.16.4 Error handling

1. If a board with Octal Flash resets before the second-stage bootloader:

```
ESP-ROM:esp32s3-20210327
Build:Mar 27 2021
rst:0x7 (TG0WDT_SYS_RST),boot:0x18 (SPI_FAST_FLASH_BOOT)
Saved PC:0x400454d5
SPIWP:0xee
mode:DOUT, clock div:1
load:0x3fcd0108,len:0x171c
ets_loader.c 78
```

it may mean that the necessary efuses are not correctly burnt. please check the eFuse bits of the chip using command `espefuse.py summary`.

The 1st bootloader relies on an eFuse bit `FLASH_TYPE` to reset the Flash into the default mode (SPI mode). If this bit is not burnt and the flash is working in OPI mode, 1st bootloader may not be able to read from the flash and load the following images.

Run this command to burn the eFuse bit:

```
python3 ./esefuse.py -p /dev/<serial_device> --do-not-confirm burn_efuse FLASH_
↪TYPE 1
```

Note: This step is irreversible. Please do check if your hardware is actually using an Octal Flash.

4.17 ESP-IDF FreeRTOS (SMP)

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS (its features, behavior, and API usage). Refer to the [Vanilla FreeRTOS documentation](#) for more details.

This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS that were made in order to support Symmetric Multiprocessing (SMP). This document is split into the following parts.

Contents

- *ESP-IDF FreeRTOS (SMP)*
 - *Overview*
 - *Symmetric Multiprocessing*
 - * *Basic Concepts*
 - * *SMP on an ESP Target*

 - * *Restrictions and Considerations*
 - *Misc*
 - * *Floating Point Usage*
 - * *ESP-IDF FreeRTOS Single Core*

4.17.1 Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a small and efficient Real Time Operating System supported on many single-core MCUs and SoCs. However, numerous ESP targets (such as the ESP32 and

ESP32-S3) are capable of dual core symmetric multiprocessing (SMP). Therefore, the version of FreeRTOS used in ESP-IDF (hereinafter referred to as ESP-IDF FreeRTOS) is a modified version of Vanilla FreeRTOS v10.4.3. These modifications allow ESP-IDF FreeRTOS to utilize the dual core SMP capabilities of ESP SoCs.

Note:

- For information regarding features that have been added to ESP-IDF FreeRTOS, see [ESP-IDF FreeRTOS Additions](#).
 - For a detailed ESP-IDF FreeRTOS API Reference, see [FreeRTOS API reference](#).
-

4.17.2 Symmetric Multiprocessing

Basic Concepts

SMP (Symmetric Multiprocessing) is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system ...

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus a piece of code that accesses a particular memory address will have the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single core or Asymmetric Multiprocessing systems are that...

- the presence of multiple CPUs allows for multiple hardware threads, thus increases overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This in general can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP systems will also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core will only be able to run on that core
- A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

SMP on an ESP Target

ESP targets (such as the ESP32, ESP32-S3) are dual core SMP SoCs. These targets have the following hardware features that make them SMP capable:

- Two identical cores known as CPU0 (i.e., Protocol CPU or PRO_CPU) and CPU1 (i.e., Application CPU or APP_CPU). This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
 - If multiple cores access the same memory address, their access will be serialized at the memory bus level.
 - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger and interrupt on another CPU. This allows cores to signal each other.

Note: The “PRO_CPU” and “APP_CPU” aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical IDF applications will utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., WiFi or Bluetooth) will be pinned to CPU0 (thus the name PRO_CPU), whereas the tasks handling the remainder of the application will be pinned to CPU1 (thus the name APP_CPU).

4.17.3 Tasks

Creation

Vanilla FreeRTOS provides the following functions to create a task:

- `xTaskCreate()` creates a task. The task's memory is dynamically allocated
- `xTaskCreateStatic()` creates a task. The task's memory is statically allocated (i.e., provided by the user)

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a `PinnedToCore` version of Vanilla FreeRTOS' s task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task's memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task's memory is statically allocated (i.e., provided by the user)

The `PinnedToCore` versions of the task creation functions API differ from their vanilla counterparts by having an extra `xCoreID` parameter that is used to specify the created task's core affinity. The valid values for core affinity are:

- 0 which pins the created task to CPU0
- 1 which pins the created task to CPU1
- `tskNO_AFFINITY` which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, they have been modified to simply call their `PinnedToCore` counterparts with `tskNO_AFFINITY`.

Note: ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

Execution

The anatomy of a task in ESP-IDF FreeRTOS is the same as Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop
- Task functions should never return

Deletion

Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task (if the provided task handle is `NULL`). The actual freeing of the task's memory is sometimes delegated to the idle task (if the task being deleted is the currently running task).

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

- When deleting a task that is pinned to the other core, that task's memory is always freed by the idle task of the other core (due to the need to clear FPU registers).
- When deleting a task that is currently running on the other core, a yield is triggered on the other core and the task's memory is freed by one of the idle tasks (depending on the task's core affinity)
- A deleted task's memory is freed immediately if...
 - The task is currently running on this core and is also pinned to this core
 - The task is not currently running and is not pinned to any core

Users should avoid calling `vTaskDelete()` on a task that is currently running on the other core. This is due to the fact that it is difficult to know what the task currently running on the other core is executing, thus can lead to unpredictable behavior such as...

- Deleting a task that is holding a mutex
- Deleting a task that has yet to free memory it previously allocated

Where possible, users should design their application such that `vTaskDelete()` is only ever called on tasks in a known state. For example:

- Tasks self deleting (via `vTaskDelete(NULL)`) when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state (via `vTaskSuspend()`) before being deleted by another task.

4.17.4 SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a **Fixed Priority Preemptive scheduler with Time Slicing** meaning that:

- Each task is given a constant priority upon creation. The scheduler executes highest priority ready state task
- The scheduler can switch execution to another task without the cooperation of the currently running task
- The scheduler will periodically switch execution between ready state tasks of the same priority (in a round robin fashion). Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features (i.e., Fixed Priority, Preemption, and Time Slicing) albeit with some small behavioral differences.

Fixed Priority

In Vanilla FreeRTOS, when scheduler selects a new task to run, it will always select the current highest priority ready state task. In ESP-IDF FreeRTOS, each core will independently schedule tasks to run. When a particular core selects a task, the core will select the highest priority ready state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity (i.e., is either pinned to that core or is unpinned)
- The task is not currently being run by another core

However, users should not assume that the two highest priority ready state tasks are always run by the scheduler as a task's core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second highest priority task.

Preemption

In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher priority task can run on that core.

However, there are some instances where a higher priority task that becomes ready can be run on multiple cores. In this case, the scheduler will only preempt one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1

- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing

The Vanilla FreeRTOS scheduler implements time slicing meaning that if current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield)

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready state tasks of the same priority AX, B0, C1, D1 where: - The priority is the current highest priority with ready state tasks - The first character represents the task's names (i.e., A, B, C, D) - And the second character represents the tasks core pinning (and X means unpinned)
- The task list is always searched from the head

```

-----
1. Starting state. None of the ready state tasks have been selected to run
Head [ AX , B0 , C1 , D0 ] Tail
-----
2. Core 0 has tick interrupt and searches for a task to run.
   Task A is selected and is moved to the back of the list

Core0--|
Head [ AX , B0 , C1 , D0 ] Tail
           0
Head [ B0 , C1 , D0 , AX ] Tail
-----
3. Core 1 has a tick interrupt and searches for a task to run.
   Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.
   Task C is selected and is moved to the back of the list

Core1-----|
Head [ B0 , C1 , D0 , AX ] Tail
           0      1
Head [ B0 , D0 , AX , C1 ] Tail
-----
4. Core 0 has another tick interrupt and searches for a task to run.
   Task B is selected and moved to the back of the list

```

(continues on next page)

```
Core0--|           1
Head [ B0 , D0 , AX , C1 ] Tail
```

```
           1   0
Head [ D0 , AX , C1 , B0 ] Tail
```

5. Core 1 has another tick and searches for a task to run.
 Task D cannot be run due to incompatible affinity, so core 1 skips to Task A
 Task A is selected and moved to the back of the list

```
Core1-----|           0
Head [ D0 , AX , C1 , B0 ] Tail
```

```
           0   1
Head [ D0 , C1 , B0 , AX ] Tail
```

The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler's tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

In ESP-IDF FreeRTOS, each core will receive a periodic interrupt and independently run the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. Furthermore, the tick interrupt responsibilities listed above are not run by all cores:

- CPU0 will execute all of the tick interrupt responsibilities listed above
- CPU1 will only check for time slicing and execute the application tick hook

Note: CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore anything that prevents CPU0 from incrementing the tick count (such as suspending the scheduler on CPU0) will cause the entire scheduler's time keeping to lag behind.

Idle Tasks

Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension

Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen (but the tick interrupt will still occur to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called:

- Task switching is disabled only on the current core but interrupts for the current core are left enabled
- Calling any blocking/yielding function on the current core is forbidden. Time slicing is disabled on the current core.
- If suspending on CPU0, the tick count is frozen. The tick interrupt will still occur to execute the application tick hook.

When resuming the scheduler on CPU0, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

Warning: Given that scheduler suspension on ESP-IDF FreeRTOS will only suspend scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

Disabling Interrupts

Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts will only disabled or enabled on the current core.

Warning: Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

Startup and Termination

ESP-IDF FreeRTOS **does not** require users to call `vTaskStartScheduler()` to start the scheduler. The startup flow of an ESP-IDF application will already call this automatically. The entry point for user code is a user defined `void app_main(void)` function. For more details regarding the startup of ESP-IDF FreeRTOS applications, see [ESP-IDF FreeRTOS Applications](#).

ESP-IDF FreeRTOS **does not** support scheduler termination. Calling `vTaskEndScheduler()` will simply cause the application to abort.

4.17.5 Critical Sections

API Changes

Vanilla FreeRTOS implements critical sections by disabling interrupts. This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&mux)` enters a critical from a task context
- `taskEXIT_CRITICAL(&mux)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&mux)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&mux)` exits a critical section from an interrupt context

Note: The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid dead locking when entering critical sections recursively.

Implementation

In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&mux)` (or `taskENTER_CRITICAL_ISR(&mux)`)
 1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
 2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock's owner value to the core's ID.
 3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.
- For `taskEXIT_CRITICAL(&mux)` (or `taskEXIT_CRITICAL_ISR(&mux)`)
 1. The core releases the spinlock by clearing the spinlock's owner value
 2. The core re-enables interrupts (or interrupt nesting)

Restrictions and Considerations

Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
 - The longer the critical section lasts, the longer a pending interrupt can be delayed.
 - A typical critical section should only access a few data structures and/or hardware registers
 - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

4.17.6 Misc

Floating Point Usage

Usually, when a context switch occurs:

- the current state of a CPU's registers are saved to the stack of task being switch out
- the previously saved state of the CPU's registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core's FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU's registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that will save the FPU registers to Task A's stack.
- Task A get's scheduled to the same core and continues execution. Saving and restoring the FPU's registers is not necessary in this case.

However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU's registers across cores. Therefore, when a task utilizes the FPU (by using a `float` type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that uses the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU's register state is tied to a particular task.

Note: ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (`double`). Instead `double` is implemented via software hence the behavioral restrictions regarding the `float` type do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations may consume significantly more CPU time in comparison to `float`.

ESP-IDF FreeRTOS Single Core

Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to `1` (i.e., the `CONFIG_FREERTOS_UNICORE` will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set. This will result in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

Note: Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is **NOT equivalent to running Vanilla FreeRTOS**. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS will incur a small amount of overhead even when compiled for only a single core.

4.18 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. *Architecture*
2. *LL (Low Level) Layer*
3. *HAL (Hardware Abstraction Layer)*

Warning: Hardware abstraction API (excluding the driver and `xxx_types.h`) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF's versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

Note: Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU's features are partially abstracted).

4.18.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the `hal` component. Each layer is dependent on the layer below it (i.e, driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral `xxx`, its hardware abstraction will generally consist of the header files described in the table below. Files that are **Target Specific** will have a separate implementation for each target (i.e., a separate copy for each chip). However, the `#include` directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.

Table 21: Hardware Abstraction Header Files

Include Directive	Target Specific	Description
<code>#include 'soc/xxx_caps.h'</code>	Y	This header contains a list of C macros specifying the various capabilities of the ESP32-S3's peripheral <code>xxx</code> . Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc.
<code>#include "soc/xxx_struct.h"</code> <code>#include "soc/xxx_reg.h"</code>	Y	The two headers contain a representation of a peripheral's registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files.
<code>#include "soc/xxx_pins.h"</code>	Y	If certain signals of a peripheral are mapped to a particular pin of the ESP32-S3, their mappings are defined in this header as C macros.
<code>#include "soc/xxx_periph.h"</code>	N	This header is mainly used as a convenience header file to automatically include <code>xxx_caps.h</code> , <code>xxx_struct.h</code> , and <code>xxx_reg.h</code> .
<code>#include "hal/xxx_types.h"</code>	N	This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following: <ul style="list-style-type: none"> • Protocol related types/macros such a frames, modes, common bus speeds, etc. • Features/characteristics of an <code>xxx</code> peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc.
<code>#include "hal/xxx_ll.h"</code>	Y	This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions.
<code>#include "hal/xxx_hal.h"</code>	Y	The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer.
<code>#include "driver/xxx.h"</code>	N	The driver layer is the highest level of ESP-IDF's hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can used in a multi-threaded environment.

4.18.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
                                       xxx_ll_clk_src_t clock_source,
                                       uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_
↪FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
```

(continues on next page)

(continued from previous page)

```

hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}

static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}

```

The code snippet above illustrates typical LL functions for a peripheral `xxx`. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral's registers, thus the first argument is always a pointer to the starting address of the peripheral's registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

4.18.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral's register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modelling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT's operation life cycle, thus illustrating how a HAL abstracts a peripheral's operation into functional steps.

```

// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler,
↳bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t
↳timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);

```

HAL functions will generally have the following characteristics:

- The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e. the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
 - The channel number of this instance
 - Pointer to the peripheral's (or channel's) registers (i.e., a `xxx_dev_t *` type)
 - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
 - Some configuration values for the instance (e.g., channel configurations)
 - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)
- HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
- Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
- Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

4.19 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 7 levels (levels 1 to 7, with 7 being an NMI), plus an assortment of exceptions. On the ESP32-S3, the interrupt mux allows most interrupt sources to be routed to these interrupts using the *interrupt allocator*. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, resulting in very low interrupt latencies.

4.19.1 Interrupt Levels

Level	Symbol	Remark
1	N/A	Exception and level 0 interrupts. Handled by ESP-IDF
2-3	N/A	Medium level interrupts. Handled by ESP-IDF
4	<code>xt_highint4</code>	Normally used by ESP-IDF debug logic
5	<code>xt_highint5</code>	Free to use
NMI	<code>xt_nmi</code>	Free to use
dbg	<code>xt_debugexception</code>	Debug exception. Called on e.g. a BREAK instruction.

Using these symbols is done by creating an assembly file (suffix `.S`) and defining the named symbols, like this:

```
.section .iram1,"ax"
.global xt_highint5
.type xt_highint5,@function
.align 4
xt_highint5:
... your code here
rsr a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the `esp_system/port/soc/esp32s3/highint_hdl.S` file; the panic handler interrupt is implemented there.

4.19.2 Notes

- Do not call C code from a high-level interrupt; as these interrupts are run from a critical section, this can cause the target to crash. Note that although the panic handler interrupt does call normal C code, this exception is allowed due to the fact that this handler never returns (i.e., the application will not continue to run after the panic handler). so breaking C code execution flow is not a problem.

- Make sure your assembly code gets linked in. Indeed, as the free-to-use symbols are declared as weak, the linker may discard the file containing the symbol. This will happen if the only symbol defined, or used, from the user file is the `xt_*` free-to-use symbol. To avoid this, in the assembly file containing the `xt_*` symbol, define another symbol, like:

```

.global ld_include_my_isr_file
ld_include_my_isr_file:

```

Here it is called `ld_include_my_isr_file` but can have any name, as long as it is not defined anywhere else in the project.

Then, in the component `CMakeLists.txt`, add this name as an unresolved symbol to the ld command line arguments:

```

target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")

```

This should cause the linker to always include the file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

This should cause the linker to always include a file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using `esp_intr_alloc()` and associated functions. The handler and handler arguments to `esp_intr_alloc()` must be NULL, however.
- In theory, medium priority interrupts could also be handled in this way. ESP-IDF does not support this yet.

If using the legacy Make build system, add the following to `component.mk`, instead:

```
COMPONENT_ADD_LDFLAGS := -u ld_include_my_isr_file
```

4.20 JTAG Debugging

This document provides a guide to installing OpenOCD for ESP32-S3 and debugging using GDB. The document is structured as follows:

Introduction Introduction to the purpose of this guide.

How it Works? Description how ESP32-S3, JTAG interface, OpenOCD and GDB are interconnected and working together to enable debugging of ESP32-S3.

Selecting JTAG Adapter What are the criteria and options to select JTAG adapter hardware.

Setup of OpenOCD Procedure to install OpenOCD and verify that it is installed.

Configuring ESP32-S3 Target Configuration of OpenOCD software and setting up of JTAG adapter hardware, which together make up the debugging target.

Launching Debugger Steps to start up a debug session with GDB from *Eclipse* and from *Command Line*.

Debugging Examples If you are not familiar with GDB, check this section for debugging examples provided from *Eclipse* as well as from *Command Line*.

Building OpenOCD from Sources Procedure to build OpenOCD from sources for *Windows*, *Linux* and *macOS* operating systems.

Tips and Quirks This section provides collection of tips and quirks related to JTAG debugging of ESP32-S3 with OpenOCD and GDB.

4.20.1 Introduction

Espressif has ported OpenOCD to support the ESP32-S3 processor and the multi-core FreeRTOS (which is the foundation of most ESP32-S3 apps). Additionally, some extra tools have been written to provide extra features that OpenOCD does not support natively.

This document provides a guide to installing OpenOCD for ESP32-S3 and debugging using GDB under Linux, Windows and macOS. Except for OS specific installation procedures, the s/w user interface and use procedures are the same across all supported operating systems.

Note: Screenshots presented in this document have been made for Eclipse Neon 3 running on Ubuntu 16.04 LTS. There may be some small differences in what a particular user interface looks like, depending on whether you are using Windows, macOS or Linux and / or a different release of Eclipse.

4.20.2 How it Works?

The key software and hardware components that perform debugging of ESP32-S3 with OpenOCD over JTAG (Joint Test Action Group) interface is presented in the diagram below under the “Debugging With JTAG” label. These components include xtensa-esp32s3-elf-gdb debugger, OpenOCD on chip debugger, and the JTAG adapter connected to ESP32-S3 target.

Fig. 33: JTAG debugging - overview diagram

Likewise, the “Application Loading and Monitoring” label indicates the key software and hardware components that allow an application to be compiled, built, and flashed to ESP32-S3, as well as to provide means to monitor diagnostic messages from ESP32-S3.

“Debugging With JTAG” and “Application Loading and Monitoring” is integrated under the [Eclipse IDE](#) in order to provide a quick and easy transition between writing/compiling/loading/debugging code. The Eclipse IDE (and the integrated debugging software) is available for Windows, Linux and macOS platforms. Depending on user preferences, both the debugger and `idf.py build` can also be used directly from terminal/command line, instead of Eclipse.

The connection from PC to ESP32-S3 is done effectively with a single USB cable. This is made possible by the ESP32-S3 chip itself, which provides two USB channels, one for JTAG and the other for the USB terminal connection. The USB cable should be connected to the D+/D- USB pins of ESP32-S3 and not to the serial Rx/D/TxD through a USB-to-UART chip. The proper connection is explained later in subsection [Configuring ESP32-S3 Target](#).

4.20.3 Selecting JTAG Adapter

The quickest and most convenient way to start with JTAG debugging is through a USB cable connected to the D+/D-USB pins of ESP32-S3. No need for an external JTAG adapter and extra wiring / cable to connect JTAG to ESP32-S3.

If you decide to use separate JTAG adapter, look for one that is compatible with both the voltage levels on the ESP32-S3 as well as with the OpenOCD software. The JTAG port on the ESP32-S3 is an industry-standard JTAG port which lacks (and does not need) the TRST pin. The JTAG I/O pins all are powered from the VDD_3P3_RTC pin (which normally would be powered by a 3.3 V rail) so the JTAG adapter needs to be able to work with JTAG pins in that voltage range.

On the software side, OpenOCD supports a fair amount of JTAG adapters. See <http://openocd.org/doc/html/Debug-Adapter-Hardware.html> for an (unfortunately slightly incomplete) list of the adapters OpenOCD works with. This page lists SWD-compatible adapters as well; take note that the ESP32-S3 does not support SWD. JTAG adapters that are hardcoded to a specific product line, e.g. ST-LINK debugging adapters for STM32 families, will not work.

The minimal signalling to get a working JTAG connection are TDI, TDO, TCK, TMS and GND. Some JTAG debuggers also need a connection from the ESP32-S3 power line to a line called e.g. Vtar to set the working voltage. SRST can optionally be connected to the CH_PD of the ESP32-S3, although for now, support in OpenOCD for that line is pretty minimal.

ESP-Prog is an example for using an external board for debugging by connecting it to the JTAG pins of ESP32-S3.

4.20.4 Setup of OpenOCD

If you have already set up ESP-IDF with CMake build system according to the *Getting Started Guide*, then OpenOCD is already installed. After *setting up the environment* in your terminal, you should be able to run OpenOCD. Check this by executing the following command:

```
openocd --version
```

The output should be as follows (although the version may be more recent than listed here):

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
  http://openocd.org/doc/doxygen/bugs.html
```

You may also verify that OpenOCD knows where its configuration scripts are located by printing the value of OPENOCD_SCRIPTS environment variable, by typing `echo $OPENOCD_SCRIPTS` (for Linux and macOS) or `echo %OPENOCD_SCRIPTS%` (for Windows). If a valid path is printed, then OpenOCD is set up correctly.

If any of these steps do not work, please go back to the *setting up the tools* section of the Getting Started Guide.

Note: It is also possible to build OpenOCD from source. Please refer to *Building OpenOCD from Sources* section for details.

4.20.5 Configuring ESP32-S3 Target

Once OpenOCD is installed, you can proceed to configuring the ESP32-S3 target (i.e ESP32-S3 board with JTAG interface). Configuring the target is split into the following three steps:

- Configure and connect JTAG interface
- Run OpenOCD
- Upload application for debugging

Configure and connect JTAG interface

This step depends on the JTAG and ESP32-S3 board you are using (see the two cases described below).

Configure ESP32-S3 built-in JTAG Interface ESP32-S3 has a built-in JTAG circuitry and can be debugged without any additional chip. Only an USB cable connected to the D+/D- pins is necessary. The necessary connections are shown in the following section.

Configure Hardware

Table 22: ESP32-S3 pins and USB signals

ESP32-S3 Pin	USB Signal
GPIO19	D-
GPIO20	D+
5V	V_BUS
GND	Ground

Please verify that the ESP32-S3 pins used for USB communication are not connected to some other HW that may disturb the JTAG operation.

Configure USB Drivers JTAG communication should work on all supported platforms. Windows users might get `LIBUSB_ERROR_NOT_FOUND` errors. Please use version 2.8 (or newer) of the [ESP-IDF Tools Installer](#) and select the driver “Espressif - WinUSB support for JTAG (ESP32-C3/S3)” in order to resolve this issue. If you don't want to re-run the installer then the same can be achieved with `idf-env` by running the following command from PowerShell:

```
Invoke-WebRequest 'https://dl.espressif.com/dl/idf-env/idf-env.exe' -OutFile .\idf-
↵env.exe; .\idf-env.exe driver install --espressif
```

Configure Other JTAG Interfaces

For guidance about which JTAG interface to select when using OpenOCD with ESP32-S3, refer to the section [Selecting JTAG Adapter](#). Then follow the configuration steps below to get it working.

Configure eFuses By default, ESP32-S3 JTAG interface is connected to the [built-in USB_SERIAL_JTAG peripheral](#). To use an external JTAG adapter instead, you need to switch the JTAG interface to the GPIO pins. This can be done by burning eFuses using `espefuse.py` tool.

- Burning `DIS_USB_JTAG` eFuse will permanently disable the connection between `USB_SERIAL_JTAG` and the JTAG port of the CPU. JTAG interface can then be connected to GPIO39-GPIO42. Note that USB CDC functionality of `USB_SERIAL_JTAG` will still be usable, i.e., flashing and monitoring over USB CDC will still work.
- Burning `STRAP_JTAG_SEL` eFuse will enable selection of JTAG interface by a strapping pin, GPIO3. If the strapping pin is low when ESP32-S3 is reset, JTAG interface will use GPIO39-GPIO42. If the strapping pin is high, `USB_SERIAL_JTAG` will be used as the JTAG interface.

Warning: Burning eFuses is an irreversible operation, so please consider the above options before starting the process.

Configure Hardware

1. Identify all pins/signals on JTAG interface and ESP32-S3 board that should be connected to establish communication.

Table 23: ESP32-S3 pins and JTAG signals

ESP32-S3 Pin	JTAG Signal
MTDO / GPIO40	TDO
MTDI / GPIO41	TDI
MTCK / GPIO39	TCK
MTMS / GPIO42	TMS

2. Verify if ESP32-S3 pins used for JTAG communication are not connected to some other hardware that may disturb JTAG operation.
3. Connect identified pin/signals of ESP32-S3 and JTAG interface.

Configure Drivers You may need to install driver software to make JTAG work with computer. Refer to documentation of your JTAG adapter for related details.

Connect Connect JTAG interface to the computer. Power on ESP32-S3 and JTAG interface boards. Check if the JTAG interface is visible on the computer.

To carry on with debugging environment setup, proceed to section [Run OpenOCD](#).

Run OpenOCD

Once target is configured and connected to computer, you are ready to launch OpenOCD.

Open a terminal and set it up for using the ESP-IDF as described in the [setting up the environment](#) section of the Getting Started Guide. Then run OpenOCD (this command works on Windows, Linux, and macOS):

```
openocd -f board/esp32s3-builtin.cfg
```

Note: The files provided after `-f` above are specific for ESP32-S3. You may need to provide different files depending on the hardware that is used. For guidance see [Configuration of OpenOCD for specific target](#).

For example, `board/esp32c3-ftdi.cfg` can be used for a custom board with an FT2232H or FT232H chip used for JTAG connection, or with ESP-Prog.

You should now see similar output (this log is for ESP32-S3):

```
user-name@computer-name:~/esp/esp-idf$ openocd -f board/esp32s3-builtin.cfg
Open On-Chip Debugger v0.10.0-esp32-20210902 (2021-10-05-23:44)
Licensed under GNU GPL v2
For bug reports, read
  http://openocd.org/doc/doxygen/bugs.html
debug_level: 2

Info : only one transport option; autoselect 'jtag'
Warn : Transport "jtag" was already selected
Info : Listening on port 6666 for tcl connections
Info : Listening on port 4444 for telnet connections
Info : esp_usb_jtag: Device found. Base speed 40000KHz, div range 1 to 255
Info : clock speed 40000 kHz
Info : JTAG tap: esp32s3.cpu0 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
↔ part: 0x2003, ver: 0x1)
Info : JTAG tap: esp32s3.cpu1 tap/device found: 0x120034e5 (mfg: 0x272 (Tensilica),
↔ part: 0x2003, ver: 0x1)
Info : esp32s3.cpu0: Debug controller was reset.
```

(continues on next page)

(continued from previous page)

```
Info : esp32s3.cpu0: Core was reset.
Info : esp32s3.cpu1: Debug controller was reset.
Info : esp32s3.cpu1: Core was reset.
Info : Listening on port 3333 for gdb connections
```

- If there is an error indicating permission problems, please see section on “Permissions delegation” in the OpenOCD README file located in the `~/esp/openocd-esp32` directory.
- In case there is an error in finding the configuration files, e.g. `Can't find board/esp32s3-builtin.cfg`, check if the `OPENOCD_SCRIPTS` environment variable is set correctly. This variable is used by OpenOCD to look for the files specified after the `-f` option. See [Setup of OpenOCD](#) section for details. Also check if the file is indeed under the provided path.
- If you see JTAG errors (e.g., `...all ones` or `...all zeroes`), please check your JTAG connections, whether other signals are connected to JTAG besides ESP32-S3's pins, and see if everything is powered on correctly.

Upload application for debugging

Build and upload your application to ESP32-S3 as usual, see [Step 8. Build the Project](#).

Another option is to write application image to flash using OpenOCD via JTAG with commands like this:

```
openocd -f board/esp32s3-builtin.cfg -c "program_esp filename.bin 0x10000 verify_
↵exit"
```

OpenOCD flashing command `program_esp` has the following format:

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - Path to program image file.
- `offset` - Offset in flash bank to write image.
- `verify` - Optional. Verify flash contents after writing.
- `reset` - Optional. Reset target after programing.
- `exit` - Optional. Finally exit OpenOCD.

You are now ready to start application debugging. Follow the steps described in the section below.

4.20.6 Launching Debugger

The toolchain for ESP32-S3 features GNU Debugger, in short GDB. It is available with other toolchain programs under filename: `xtensa-esp32s3-elf-gdb`. GDB can be called and operated directly from command line in a terminal. Another option is to call it from within IDE (like Eclipse, Visual Studio Code, etc.) and operate indirectly with help of GUI instead of typing commands in a terminal.

Both options of using debugger are discussed under links below.

- [Eclipse](#)
- [Command Line](#)

It is recommended to first check if debugger works from [Command Line](#) and then move to using [Eclipse](#).

4.20.7 Debugging Examples

This section is intended for users not familiar with GDB. It presents example debugging session from [Eclipse](#) using simple application available under [get-started/blink](#) and covers the following debugging actions:

1. [Navigating through the code, call stack and threads](#)
2. [Setting and clearing breakpoints](#)
3. [Halting the target manually](#)
4. [Stepping through the code](#)

5. *Checking and setting memory*
6. *Watching and setting program variables*
7. *Setting conditional breakpoints*

Similar debugging actions are provided using GDB from *Command Line*.

Before proceeding to examples, set up your ESP32-S3 target and load it with [get-started/blink](#).

4.20.8 Building OpenOCD from Sources

Please refer to separate documents listed below, that describe build process.

Building OpenOCD from Sources for Windows

Note: This document outlines how to build a binary of OpenOCD from its source files instead of downloading the pre-built binary. For a quick setup, users can download a pre-built binary of OpenOCD from [Espressif GitHub](#) instead of compiling it themselves (see *Setup of OpenOCD* for more details).

Note: All code snippets in this document are assumed to be running in an MSYS2 shell with the MINGW32 subsystem.

Install Dependencies Install packages that are required to compile OpenOCD:

```
pacman -S --noconfirm --needed autoconf automake git make \  
mingw-w64-i686-gcc \  
mingw-w64-i686-toolchain \  
mingw-w64-i686-libtool \  
mingw-w64-i686-pkg-config \  
mingw-w64-cross-winpthreads-git \  
p7zip
```

Download Sources of OpenOCD The sources for the ESP32-S3-enabled variant of OpenOCD are available from Espressif's GitHub under <https://github.com/espressif/openocd-esp32>. These source files can be pulled via Git using the following commands:

```
cd ~/esp  
git clone --recursive https://github.com/espressif/openocd-esp32.git
```
