

ESP32-C3

ESP-IDF Programming Guide

Release v4.4.7
Espressif Systems
Feb 27, 2024

Table of contents

Table of contents	i
1 Get Started	3
1.1 Introduction	3
1.2 What You Need	3
1.3 Development Board Overviews	4
1.3.1 ESP32-C3-DevKitM-1	4
1.3.2 ESP32-C3-DevKitC-02	9
1.4 Installation Step by Step	13
1.4.1 Setting up Development Environment	13
1.4.2 Creating Your First Project	13
1.5 Step 1. Install prerequisites	14
1.5.1 Standard Setup of Toolchain for Windows	14
1.5.2 Standard Setup of Toolchain for Linux	18
1.5.3 Standard Setup of Toolchain for Mac OS	19
1.6 Step 2. Get ESP-IDF	21
1.6.1 Linux and macOS	21
1.6.2 Windows	21
1.7 Step 3. Set up the tools	21
1.7.1 Windows	21
1.7.2 Linux and macOS	22
1.7.3 Alternative File Downloads	22
1.7.4 Customizing the tools installation path	22
1.8 Step 4. Set up the environment variables	22
1.8.1 Windows	23
1.8.2 Linux and macOS	23
1.9 Step 5. Start a Project	23
1.9.1 Linux and macOS	23
1.9.2 Windows	23
1.10 Step 6. Connect Your Device	24
1.11 Step 7. Configure	24
1.11.1 Linux and macOS	24
1.11.2 Windows	24
1.12 Step 8. Build the Project	25
1.13 Step 9. Flash onto the Device	25
1.13.1 Encountered Issues While Flashing?	26
1.13.2 Normal Operation	26
1.14 Step 10. Monitor	27
1.15 Updating ESP-IDF	28
1.16 Related Documents	28
1.16.1 Establish Serial Connection with ESP32-C3	28
1.16.2 Build and Flash with Eclipse IDE	34
1.16.3 Getting Started with VS Code IDE	34
1.16.4 IDF Monitor	35
1.16.5 Customized Setup of Toolchain	40
2 API Reference	47

2.1	Bluetooth API	47
2.1.1	Controller && VHCI	47
2.1.2	BT COMMON	56
2.1.3	BT LE	65
2.1.4	NimBLE-based host APIs	195
2.1.5	ESP-BLE-MESH	197
2.2	Networking APIs	480
2.2.1	Wi-Fi	480
2.2.2	Ethernet	587
2.2.3	Thread	612
2.2.4	IP Network Layer	617
2.2.5	Application Layer	636
2.3	Peripherals API	636
2.3.1	Analog to Digital Converter (ADC)	636
2.3.2	General Purpose Timer	661
2.3.3	GPIO & RTC GPIO	672
2.3.4	Dedicated GPIO	689
2.3.5	Hash-based Message Authentication Code (HMAC)	693
2.3.6	Digital Signature (DS)	697
2.3.7	Inter-Integrated Circuit (I2C)	702
2.3.8	Inter-IC Sound (I2S)	720
2.3.9	LCD	737
2.3.10	LED Control (LEDC)	748
2.3.11	Remote Control (RMT)	765
2.3.12	SD SPI Host Driver	786
2.3.13	Sigma-delta Modulation	791
2.3.14	SPI Master Driver	794
2.3.15	SPI Slave Driver	815
2.3.16	Temperature Sensor	821
2.3.17	Two-Wire Automotive Interface (TWAI)	824
2.3.18	Universal Asynchronous Receiver/Transmitter (UART)	842
2.4	Application Protocols	866
2.4.1	ASIO port	867
2.4.2	ESP-MQTT	867
2.4.3	ESP-TLS	880
2.4.4	OpenSSL-APIs	892
2.4.5	ESP HTTP Client	920
2.4.6	HTTP Server	936
2.4.7	HTTPS server	962
2.4.8	ICMP Echo	965
2.4.9	ESP Local Control	970
2.4.10	mDNS Service	979
2.4.11	ESP-Modbus	993
2.4.12	ESP WebSocket Client	994
2.4.13	ESP Serial Slave Link	1002
2.4.14	ESP x509 Certificate Bundle	1016
2.4.15	IP Network Layer	1018
2.5	Provisioning API	1019
2.5.1	Protocol Communication	1019
2.5.2	Unified Provisioning	1030
2.5.3	Wi-Fi Provisioning	1035
2.6	Storage API	1052
2.6.1	FAT Filesystem Support	1052
2.6.2	Manufacturing Utility	1058
2.6.3	Non-volatile storage library	1063
2.6.4	NVS Partition Generator Utility	1085
2.6.5	SD/SDIO/MMC Driver	1092
2.6.6	SPI Flash API	1102

2.6.7	SPIFFS Filesystem	1134
2.6.8	Virtual filesystem component	1138
2.6.9	Wear Levelling API	1153
2.7	System API	1157
2.7.1	App Image Format	1157
2.7.2	Application Level Tracing	1164
2.7.3	The Async memcpy API	1169
2.7.4	Chip Revision	1172
2.7.5	Console	1175
2.7.6	eFuse Manager	1183
2.7.7	Error Codes and Helper Functions	1204
2.7.8	ESP HTTPS OTA	1206
2.7.9	POSIX Threads Support	1211
2.7.10	Event Loop Library	1215
2.7.11	FreeRTOS	1234
2.7.12	FreeRTOS Additions	1345
2.7.13	Heap Memory Allocation	1364
2.7.14	Heap Memory Debugging	1377
2.7.15	High Resolution Timer	1387
2.7.16	Call function with external stack	1393
2.7.17	Interrupt allocation	1394
2.7.18	Logging library	1400
2.7.19	Miscellaneous System APIs	1407
2.7.20	Over The Air Updates (OTA)	1412
2.7.21	Power Management	1425
2.7.22	Random Number Generation	1430
2.7.23	Sleep Modes	1432
2.7.24	Watchdogs	1442
2.7.25	System Time	1445
2.7.26	Internal and Unstable APIs	1451
2.8	API Conventions	1452
2.8.1	Error handling	1452
2.8.2	Configuration structures	1452
2.8.3	Private APIs	1453
2.8.4	Components in example projects	1453
2.8.5	API Stability	1453
2.9	Project Configuration	1454
2.9.1	Introduction	1454
2.9.2	Project Configuration Menu	1455
2.9.3	Using sdkconfig.defaults	1455
2.9.4	Kconfig Formatting Rules	1455
2.9.5	Backward Compatibility of Kconfig Options	1455
2.9.6	Configuration Options Reference	1456
2.9.7	Customisations	1706
2.10	Error Codes Reference	1707
3	ESP32-C3 Hardware Reference	1715
3.1	Chip Series Comparison	1715
3.1.1	Related Documents	1717
4	API Guides	1719
4.1	Application Level Tracing library	1719
4.1.1	Overview	1719
4.1.2	Modes of Operation	1719
4.1.3	Configuration Options and Dependencies	1720
4.1.4	How to use this library	1721
4.2	Application Startup Flow	1729
4.2.1	First stage bootloader	1730

4.2.2	Second stage bootloader	1730
4.2.3	Application startup	1731
4.3	BluFi	1732
4.3.1	Overview	1732
4.3.2	The BluFi Flow	1732
4.3.3	The Flow Chart of BluFi	1733
4.3.4	The Frame Formats Defined in BluFi	1733
4.3.5	The Security Implementation of ESP32-C3	1738
4.3.6	GATT Related Instructions	1739
4.4	Bootloader	1739
4.4.1	Bootloader compatibility	1740
4.4.2	Log Level	1740
4.4.3	Factory reset	1740
4.4.4	Boot from Test Firmware	1741
4.4.5	Rollback	1741
4.4.6	Watchdog	1741
4.4.7	Bootloader Size	1742
4.4.8	Fast boot from Deep Sleep	1742
4.4.9	Custom bootloader	1742
4.5	Build System	1743
4.5.1	Overview	1743
4.5.2	Using the Build System	1743
4.5.3	Example Project	1747
4.5.4	Project CMakeLists File	1748
4.5.5	Component CMakeLists Files	1749
4.5.6	Component Configuration	1751
4.5.7	Preprocessor Definitions	1752
4.5.8	Component Requirements	1752
4.5.9	Overriding Parts of the Project	1756
4.5.10	Configuration-Only Components	1756
4.5.11	Debugging CMake	1757
4.5.12	Example Component CMakeLists	1757
4.5.13	Custom sdkconfig defaults	1761
4.5.14	Flash arguments	1761
4.5.15	Building the Bootloader	1762
4.5.16	Selecting the Target	1762
4.5.17	Writing Pure CMake Components	1763
4.5.18	Using Third-Party CMake Projects with Components	1763
4.5.19	Using Prebuilt Libraries with Components	1764
4.5.20	Using ESP-IDF in Custom CMake Projects	1764
4.5.21	ESP-IDF CMake Build System API	1765
4.5.22	File Globbing & Incremental Builds	1768
4.5.23	Build System Metadata	1769
4.5.24	Build System Internals	1770
4.5.25	Migrating from ESP-IDF GNU Make System	1771
4.6	Deep Sleep Wake Stubs	1773
4.6.1	Rules for Wake Stubs	1773
4.6.2	Implementing A Stub	1773
4.6.3	Loading Code Into RTC Memory	1774
4.6.4	Loading Data Into RTC Memory	1774
4.6.5	CRC Check For Wake Stubs	1774
4.6.6	Example	1775
4.7	Error Handling	1775
4.7.1	Overview	1775
4.7.2	Error codes	1775
4.7.3	Converting error codes to error messages	1775
4.7.4	ESP_ERROR_CHECK macro	1776
4.7.5	ESP_ERROR_CHECK_WITHOUT_ABORT macro	1776

4.7.6	ESP_RETURN_ON_ERROR macro	1776
4.7.7	ESP_GOTO_ON_ERROR macro	1776
4.7.8	ESP_RETURN_ON_FALSE macro	1777
4.7.9	ESP_GOTO_ON_FALSE macro	1777
4.7.10	CHECK MACROS Examples	1777
4.7.11	Error handling patterns	1777
4.7.12	C++ Exceptions	1778
4.8	ESP-BLE-MESH	1778
4.8.1	Getting Started with ESP-BLE-MESH	1779
4.8.2	ESP-BLE-MESH Examples	1785
4.8.3	ESP-BLE-MESH Demo Videos	1786
4.8.4	ESP-BLE-MESH FAQ	1786
4.8.5	Related Documents	1786
4.9	ESP-WIFI-MESH	1815
4.9.1	Overview	1815
4.9.2	Introduction	1815
4.9.3	ESP-WIFI-MESH Concepts	1816
4.9.4	Building a Network	1822
4.9.5	Managing a Network	1827
4.9.6	Data Transmission	1830
4.9.7	Channel Switching	1832
4.9.8	Performance	1835
4.9.9	Further Notes	1836
4.10	Core Dump	1836
4.10.1	Overview	1836
4.10.2	Configurations	1836
4.10.3	Save core dump to flash	1837
4.10.4	Print core dump to UART	1837
4.10.5	ROM Functions in Backtraces	1838
4.10.6	Dumping variables on demand	1838
4.10.7	Running <code>espcoredump.py</code>	1838
4.11	Event Handling	1839
4.11.1	Wi-Fi, Ethernet, and IP Events	1839
4.11.2	Mesh Events	1841
4.11.3	Bluetooth Events	1841
4.12	Fatal Errors	1841
4.12.1	Overview	1841
4.12.2	Panic Handler	1842
4.12.3	Register Dump and Backtrace	1842
4.12.4	GDB Stub	1845
4.12.5	Guru Meditation Errors	1846
4.12.6	Other Fatal Errors	1847
4.13	Flash Encryption	1849
4.13.1	Introduction	1850
4.13.2	Relevant eFuses	1850
4.13.3	Flash Encryption Process	1851
4.13.4	Flash Encryption Configuration	1851
4.13.5	Possible Failures	1857
4.13.6	ESP32-C3 Flash Encryption Status	1858
4.13.7	Reading and Writing Data in Encrypted Flash	1858
4.13.8	Updating Encrypted Flash	1859
4.13.9	Disabling Flash Encryption	1860
4.13.10	Key Points About Flash Encryption	1860
4.13.11	Limitations of Flash Encryption	1861
4.13.12	Flash Encryption and Secure Boot	1861
4.13.13	Advanced Features	1861
4.13.14	Technical Details	1863
4.14	ESP-IDF FreeRTOS (SMP)	1863

4.14.1	Overview	1864
4.14.2	Symmetric Multiprocessing	1864
4.14.3	Tasks	1865
4.14.4	SMP Scheduler	1866
4.14.5	Critical Sections	1870
4.14.6	Misc	1871
4.15	Hardware Abstraction	1872
4.15.1	Architecture	1872
4.15.2	LL (Low Level) Layer	1873
4.15.3	HAL (Hardware Abstraction Layer)	1874
4.16	JTAG Debugging	1875
4.16.1	Introduction	1875
4.16.2	How it Works?	1876
4.16.3	Selecting JTAG Adapter	1876
4.16.4	Setup of OpenOCD	1877
4.16.5	Configuring ESP32-C3 Target	1877
4.16.6	Launching Debugger	1880
4.16.7	Debugging Examples	1880
4.16.8	Building OpenOCD from Sources	1880
4.16.9	Tips and Quirks	1885
4.16.10	Related Documents	1889
4.17	Linker Script Generation	1914
4.17.1	Overview	1914
4.17.2	Quick Start	1914
4.17.3	Linker Script Generation Internals	1917
4.18	Memory Types	1924
4.18.1	DRAM (Data RAM)	1924
4.18.2	IRAM (Instruction RAM)	1924
4.18.3	IROM (code executed from Flash)	1925
4.18.4	RTC fast memory	1925
4.18.5	DROM (data stored in Flash)	1925
4.18.6	DMA Capable Requirement	1926
4.18.7	DMA Buffer in the stack	1926
4.19	lwIP	1927
4.19.1	Supported APIs	1927
4.19.2	BSD Sockets API	1927
4.19.3	Netconn API	1931
4.19.4	lwIP FreeRTOS Task	1931
4.19.5	IPv6 Support	1932
4.19.6	esp-lwip custom modifications	1932
4.19.7	Performance Optimization	1933
4.20	OpenThread	1935
4.20.1	Mode of the OpenThread stack	1935
4.20.2	How To Write an OpenThread Application	1936
4.20.3	The OpenThread border router	1936
4.21	Partition Tables	1937
4.21.1	Overview	1937
4.21.2	Built-in Partition Tables	1937
4.21.3	Creating Custom Tables	1937
4.21.4	Generating Binary Partition Table	1940
4.21.5	Partition Size Checks	1940
4.21.6	Flashing the partition table	1940
4.21.7	Partition Tool (parttool.py)	1941
4.22	Performance	1942
4.22.1	How to Optimize Performance	1942
4.22.2	Guides	1942
4.23	RF calibration	1958
4.23.1	Partial calibration	1959

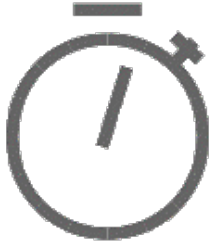

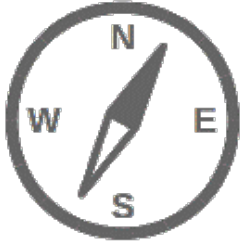

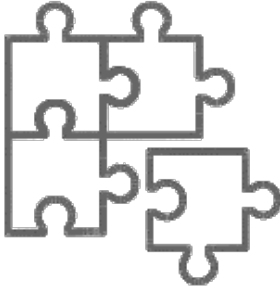

4.23.2	Full calibration	1959
4.23.3	No calibration	1959
4.23.4	PHY initialization data	1959
4.24	Secure Boot V2	1959
4.24.1	Background	1960
4.24.2	Advantages	1960
4.24.3	Secure Boot V2 Process	1960
4.24.4	Signature Block Format	1961
4.24.5	Verifying a Signature Block	1961
4.24.6	Verifying an Image	1961
4.24.7	Bootloader Size	1962
4.24.8	eFuse usage	1962
4.24.9	How To Enable Secure Boot V2	1962
4.24.10	Restrictions after Secure Boot is enabled	1963
4.24.11	Generating Secure Boot Signing Key	1963
4.24.12	Remote Signing of Images	1963
4.24.13	Secure Boot Best Practices	1964
4.24.14	Key Management	1964
4.24.15	Multiple Keys	1964
4.24.16	Key Revocation	1965
4.24.17	Technical Details	1965
4.24.18	Secure Boot & Flash Encryption	1966
4.24.19	Signed App Verification Without Hardware Secure Boot	1966
4.24.20	Advanced Features	1966
4.25	Thread Local Storage	1967
4.25.1	Overview	1967
4.25.2	FreeRTOS Native API	1967
4.25.3	Pthread API	1967
4.25.4	C11 Standard	1967
4.26	Tools	1968
4.26.1	Downloadable Tools	1968
4.26.2	IDF Docker Image	1980
4.26.3	IDF Windows Installer	1982
4.26.4	IDF Component Manager	1983
4.26.5	IDF Clang Tidy	1984
4.27	Unit Testing in ESP32-C3	1985
4.27.1	Normal Test Cases	1985
4.27.2	Multi-device Test Cases	1986
4.27.3	Multi-stage Test Cases	1987
4.27.4	Tests For Different Targets	1987
4.27.5	Building Unit Test App	1988
4.27.6	Running Unit Tests	1989
4.27.7	Timing Code with Cache Compensated Timer	1990
4.27.8	Mocks	1990
4.28	Unit Testing on Linux	1992
4.28.1	Embedded Software Tests	1992
4.28.2	IDF Unit Tests on Linux Host	1993
4.29	USB Serial/JTAG Controller Console	1994
4.29.1	Hardware Requirements	1994
4.29.2	Software Configuration	1994
4.29.3	Uploading the Application	1994
4.29.4	Limitations	1994
4.30	Wi-Fi Driver	1995
4.30.1	ESP32-C3 Wi-Fi Feature List	1995
4.30.2	How To Write a Wi-Fi Application	1995
4.30.3	ESP32-C3 Wi-Fi API Error Code	1996
4.30.4	ESP32-C3 Wi-Fi API Parameter Initialization	1997
4.30.5	ESP32-C3 Wi-Fi Programming Model	1997

4.30.6	ESP32-C3 Wi-Fi Event Description	1997
4.30.7	ESP32-C3 Wi-Fi Station General Scenario	2000
4.30.8	ESP32-C3 Wi-Fi AP General Scenario	2003
4.30.9	ESP32-C3 Wi-Fi Scan	2003
4.30.10	ESP32-C3 Wi-Fi Station Connecting Scenario	2010
4.30.11	ESP32-C3 Wi-Fi Station Connecting When Multiple APs Are Found	2017
4.30.12	Wi-Fi Reconnect	2017
4.30.13	Wi-Fi Beacon Timeout	2017
4.30.14	ESP32-C3 Wi-Fi Configuration	2018
4.30.15	Wi-Fi Easy Connect™ (DPP)	2024
4.30.16	Wireless Network Management	2024
4.30.17	Radio Resource Measurement	2024
4.30.18	Wi-Fi Location	2025
4.30.19	ESP32-C3 Wi-Fi Power-saving Mode	2025
4.30.20	ESP32-C3 Wi-Fi Throughput	2026
4.30.21	Wi-Fi 80211 Packet Send	2026
4.30.22	Wi-Fi Sniffer Mode	2027
4.30.23	Wi-Fi Multiple Antennas	2028
4.30.24	Wi-Fi Channel State Information	2029
4.30.25	Wi-Fi Channel State Information Configure	2031
4.30.26	Wi-Fi HT20/40	2031
4.30.27	Wi-Fi QoS	2031
4.30.28	Wi-Fi AMSDU	2032
4.30.29	Wi-Fi Fragment	2032
4.30.30	WPS Enrollee	2032
4.30.31	Wi-Fi Buffer Usage	2032
4.30.32	How to improve Wi-Fi performance	2033
4.30.33	Wi-Fi Menuconfig	2035
4.30.34	Troubleshooting	2038
4.31	Wi-Fi Security	2041
4.31.1	ESP32-C3 Wi-Fi Security Features	2041
4.31.2	Protected Management Frames (PMF)	2044
4.31.3	WiFi Enterprise	2044
4.31.4	WPA3-Personal	2045
5	Libraries and Frameworks	2047
5.1	Cloud Frameworks	2047
5.1.1	ESP RainMaker	2047
5.1.2	AWS IoT	2047
5.1.3	Azure IoT	2047
5.1.4	Google IoT Core	2047
5.1.5	Aliyun IoT	2047
5.1.6	Joylink IoT	2047
5.1.7	Tencent IoT	2048
5.1.8	Tencentyun IoT	2048
5.1.9	Baidu IoT	2048
5.2	Espressif's Frameworks	2048
5.2.1	Espressif Audio Development Framework	2048
5.2.2	ESP-CSI	2048
5.2.3	Espressif DSP Library	2048
5.2.4	ESP-WIFI-MESH Development Framework	2049
5.2.5	ESP-WHO	2049
5.2.6	ESP RainMaker	2049
5.2.7	ESP-IoT-Solution	2049
6	Contributions Guide	2051
6.1	How to Contribute	2051
6.2	Before Contributing	2051

6.3	Pull Request Process	2051
6.4	Legal Part	2052

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#) and [ESP32-C](#) Series SoCs.

This document describes using ESP-IDF with the ESP32-C3 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C3 board.

Note: This is documentation for stable version v4.4.7 of ESP-IDF. Other *ESP-IDF Versions* are also available.

1.1 Introduction

ESP32-C3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

Hardware:

- An **ESP32-C3** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

Software:

You have a choice to either download and install the following software manually

- **Toolchain** to compile code for ESP32-C3
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C3 and scripts to operate the **Toolchain**

or get through the onboarding process using the following official plugins for integrated development environments (IDE) described in separate documents

- [Eclipse Plugin \(installation link\)](#)
- [VS Code Extension \(setup\)](#)

Fig. 1: Development of applications for ESP32-C3

1.3 Development Board Overviews

If you have one of ESP32-C3 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-C3-DevKitM-1

This user guide will help you get started with ESP32-C3-DevKitM-1 and will also provide more in-depth information.

ESP32-C3-DevKitM-1 is an entry-level development board based on [ESP32-C3-MINI-1](#), a module named for its small size. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the ESP32-C3-MINI-1 module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitM-1 on a breadboard.

The document consists of the following major sections:

- *Getting Started*: Overview of ESP32-C3-DevKitM-1 and hardware/software setup instructions to get started.

Fig. 2: ESP32-C3-DevKitM-1

- [Hardware Reference](#): More detailed information about the ESP32-C3-DevKitM-1's hardware.
- [Hardware Revision Details](#): Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitM-1.
- [Related Documents](#): Links to related documentation.

Getting Started

This section provides a brief introduction of ESP32-C3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

Description of Components The key components of the board are described in a counter-clockwise direction.

Key Component	Description
ESP32-C3-MINI-1	ESP32-C3-MINI-1 is a general-purpose Wi-Fi and Bluetooth LE combo module that comes with a PCB antenna. At the core of this module is ESP32-C3FN4 , a chip that has an embedded flash of 4 MB. Since flash is packaged in the ESP32-C3FN4 chip, rather than integrated into the module, ESP32-C3-MINI-1 has a smaller package size.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block .
Boot Button	Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3FN4 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

Fig. 3: ESP32-C3-DevKitM-1 - front

Start Application Development Before powering up your ESP32-C3-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- ESP32-C3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Software Setup Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an application example onto your ESP32-C3-DevKitM-1.

Contents and Packaging

Retail Orders If you order one or several samples, each ESP32-C3-DevKitM-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/company/contact/buy-a-sample>.

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

Hardware Reference

Block Diagram The block diagram below shows the components of ESP32-C3-DevKitM-1 and their interconnections.

Fig. 4: ESP32-C3-DevKitM-1 (click to enlarge)

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro-USB Port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

Header Block The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in *ESP32-C3-DevKitM-1 - front*. The numbering is the same as in the *ESP32-C3-DevKitM-1 Schematic* (PDF).

J1

No.	Name	Type ¹	Function
1	GND	G	Ground

1.3.2 ESP32-C3-DevKitC-02

This user guide will help you get started with ESP32-C3-DevKitC-02 and will also provide more in-depth information.

ESP32-C3-DevKitC-02 is an entry-level development board based on [ESP32-C3-WROOM-02](#), a general-purpose module with 4 MB SPI flash. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitC-02 on a breadboard.

Fig. 6: ESP32-C3-DevKitC-02

The document consists of the following major sections:

- [Getting Started](#): Overview of ESP32-C3-DevKitC-02 and hardware/software setup instructions to get started.
- [Hardware Reference](#): More detailed information about the ESP32-C3-DevKitC-02's hardware.
- [Hardware Revision Details](#): Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitC-02.
- [Related Documents](#): Links to related documentation.

Getting Started

This section provides a brief introduction of ESP32-C3-DevKitC-02, instructions on how to do the initial hardware setup and how to flash firmware onto it.

Fig. 7: ESP32-C3-DevKitC-02 - front

Description of Components The key components of the board are described in a counter-clockwise direction.

Key Component	Description
ESP32-C3-WROOM-02	ESP32-C3-WROOM-02 from Espressif is a powerful and general-purpose module that offers Wi-Fi and Bluetooth LE coexistence. It has a PCB antenna and a 4 MB SPI flash.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block .
Boot Button	Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

Start Application Development Before powering up your ESP32-C3-DevKitC-02, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- ESP32-C3-DevKitC-02
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Software Setup Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an application example into your ESP32-C3-DevKitC-02.

Contents and Packaging

Retail orders If you order a few samples, each ESP32-C3-DevKitC-02 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/company/contact/buy-a-sample>.

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

Hardware Reference

Block Diagram The block diagram below shows the components of ESP32-C3-DevKitC-02 and their interconnections.

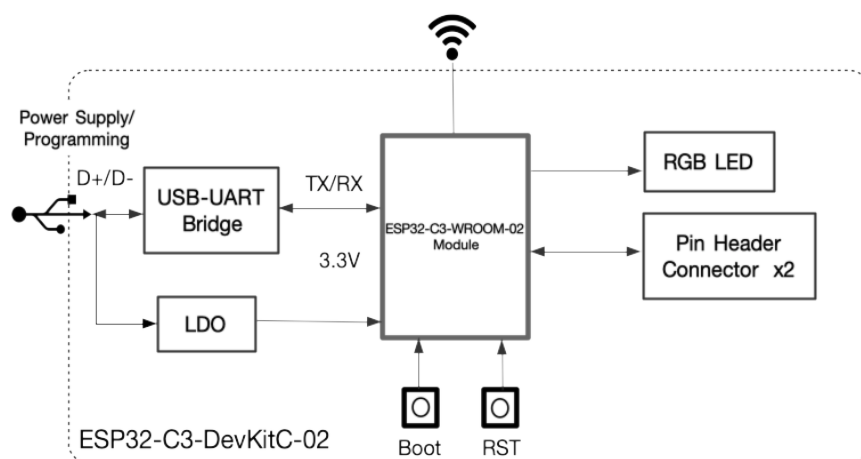

Fig. 8: ESP32-C3-DevKitC-02 (click to enlarge)

Power Supply Options There are three mutually exclusive ways to provide power to the board:

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- *Step 1. Install prerequisites for Windows, Linux, or macOS*
- *Step 2. Get ESP-IDF*
- *Step 3. Set up the tools*
- *Step 4. Set up the environment variables*

1.4.2 Creating Your First Project

- *Step 5. Start a Project*
- *Step 6. Connect Your Device*
- *Step 7. Configure*
- *Step 8. Build the Project*
- *Step 9. Flash onto the Device*
- *Step 10. Monitor*

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use *Eclipse* or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers from this URL: <https://dl.espressif.com/dl/esp-idf/?idf=4.4>

What is the usecase for Online and Offline Installer Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

Components of the installation The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.

Fig. 10: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

```

Python 3.8.7
Using Git in C:/Program Files/Git/cmd/
git version 2.29.2.windows.1
Setting IDF_PATH: C:\Users\developer\Desktop\esp-idf
Adding ESP-IDF tools to PATH...
C:\Users\developer\.espressif\tools\xtensa-esp32-elf\esp-2020r3-8.4.0\xtensa-esp32-elf\bin
C:\Users\developer\.espressif\tools\xtensa-esp32s2-elf\esp-2020r3-8.4.0\xtensa-esp32s2-elf\bin
C:\Users\developer\.espressif\tools\esp32ulp-elf\2.28.51-esp-20191205\esp32ulp-elf-binutils\bin
C:\Users\developer\.espressif\tools\esp32s2ulp-elf\2.28.51-esp-20191205\esp32s2ulp-elf-binutils\bin
C:\Users\developer\.espressif\tools\cmake\3.13.4\bin
C:\Users\developer\.espressif\tools\openocd-esp32\v0.10.0-esp32-20200709\openocd-esp32\bin
C:\Users\developer\.espressif\tools\ninja\1.9.0\
C:\Users\developer\.espressif\tools\idf-exe\1.0.1\
C:\Users\developer\.espressif\tools\ccache\3.7\
C:\Users\developer\Desktop\esp-idf\tools
Checking if Python packages are up to date...
Python requirements from C:\Users\developer\Desktop\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:
  idf.py build

PS C:\Users\developer\Desktop\esp-idf>
```

Fig. 11: ESP-IDF PowerShell

Launching ESP-IDF Environment At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (`cmd.exe`). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (`cmd.exe`):

Fig. 12: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (`cmd.exe`)

Using the Command Prompt

For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

```
ESP-IDF Command Prompt (cmd.exe)
Using Python in C:\Users\test\AppData\Local\Programs\Python\Python37\
Python 3.7.8
Using Git in C:\Users\test\Git\cmd\
git version 2.30.0.windows.1
Setting IDF_PATH: C:\Users\test\esp\esp-idf

Adding ESP-IDF tools to PATH...
  C:\Users\test\.espressif\tools\xtensa-esp32-elf\esp-2020r3-8.4.0\xtensa-esp32-elf\bin

For advanced users who want to customize the install process:

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

Add ESP-IDF tools to PATH using an export script ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

1.5.2 Standard Setup of Toolchain for Linux

Install Prerequisites

To compile with ESP-IDF you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-  
→setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.  
→0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3-  
→python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja-  
→ccache dfu-util libusb
```

Note:

- CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .
 - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
-

Additional Tips

Permission issues /dev/ttyUSB0 With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C3. *This can be solved by adding the current user to the dialout group.*

Python compatibility

ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:

```
sudo easy_install pip
```

- install CMake & Ninja build:
 - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

Note: If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), -  
→missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

Installing Python 3 Basing on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

Next Steps

To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

Note: This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

1.6 Step 2. Get ESP-IDF

To build applications for the ESP32-C3, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4.7 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

1.6.2 Windows

In addition to installing the tools, [ESP-IDF Tools Installer](#) for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these [instructions](#).

1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

1.7.1 Windows

[ESP-IDF Tools Installer](#) for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat esp32c3
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32c3
```

1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh esp32c3
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c3
```

Note: To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32, esp32c3, esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`.

1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

Note: This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

Windows

To prefer the Espressif download server when running the ESP-IDF Tools Installer, mark the **Use Espressif download mirror instead of GitHub** in the screen **Select Components** section **Optimization**.

Linux and macOS

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux and macOS, `%USERPROFILE%\espressif` on Windows. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

ESP-IDF Tools Installer for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell

```
.$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
.$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
.$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell’s profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the `esp-idf` environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32-C3. You can start with [get-started/hello_world](#) project from [examples](#) directory in IDF.

Copy the project [get-started/hello_world](#) to `~/esp` directory:

1.9.1 Linux and macOS

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10 Step 6. Connect Your Device

Now connect your ESP32-C3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C3](#) for full details.

Note: Keep the port name handy as you will need it in the next steps.

1.11 Step 7. Configure

Navigate to your `hello_world` directory from [Step 5. Start a Project](#), set ESP32-C3 chip as the target and run the project configuration utility `menuconfig`.

1.11.1 Linux and macOS

```
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

1.11.2 Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32c3` should be done once, after opening a new project. If the project contains some existing builds and configuration, they will be cleared and initialized. The target may be saved in environment variable to skip this step at all. See [Selecting the Target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “`hello_world`”. This example will run with default configuration.

Note: The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

Fig. 14: Project configuration - Home window

1.12 Step 8. Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build will finish by generating the firmware binary .bin files.

1.13 Step 9. Flash onto the Device

Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with your ESP32-C3 board's serial port name from [Step 6. Connect Your Device](#).

You can also change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

Note: The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

1.13.1 Encountered Issues While Flashing?

If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C3](#)). The DTR and RTS control lines are in turn connected to `GPIO9` and `CHIP_PU (EN)` pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the **Boot** button (`GPIO9`) and press the **EN** button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO9` down.

1.13.2 Normal Operation

When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB
↳0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000
↳hello_world.bin
esptool.py v3.0

Leaving...
Hard resetting via RTS pin...
Done

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out the [Eclipse guide](#), [VS Code guide](#).

1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```

$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_
↳world/build/hello_world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```

...
Hello world!
Restarting in 10 seconds...
This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB
↳external flash
Minimum free heap size: 337332 bytes

```

(continues on next page)

(continued from previous page)

```
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

That's all that you need to get started with ESP32-C3!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

Important: Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

1.16 Related Documents

1.16.1 Establish Serial Connection with ESP32-C3

This section provides guidance how to establish serial connection between ESP32-C3 and PC.

Connect ESP32-C3 to PC

Connect the ESP32-C3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-C3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

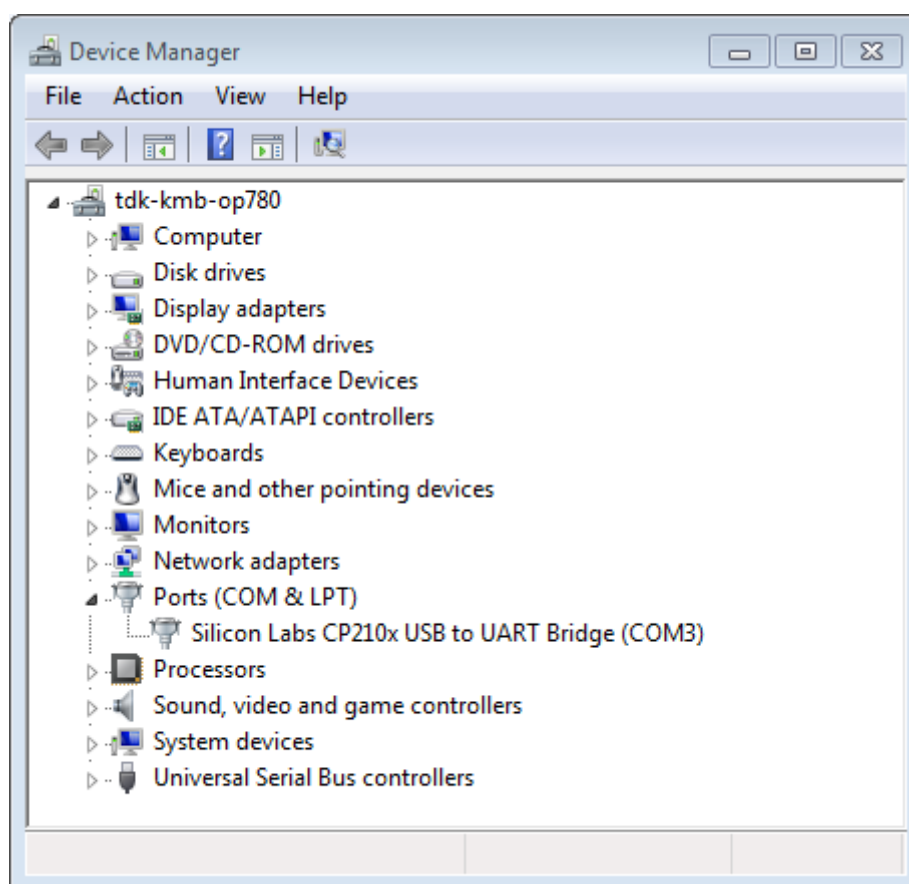

Fig. 15: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Check port on Linux and macOS

To check the device name for the serial port of your ESP32-C3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

Fig. 16: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

```
ls /dev/cu.*
```

Note: macOS users: if you don't see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux

The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C3.

Windows and Linux In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-C3. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#).

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

Fig. 17: Setting Serial Communication in PuTTY on Windows

Fig. 18: Setting Serial Communication in PuTTY on Linux

- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#). To exit the **screen** session type Ctrl-A + \.

Note: Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

Example Output An example log by ESP32-C3 is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TGW0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-C3.

Note: For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

If you got here from [Step 6. Connect Your Device](#) when installing s/w for ESP32-C3 development, then you can continue with [Step 7. Configure](#).

1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [Espressif IDF Eclipse Plugins](#) IDF for further instructions.

Note: In [Espressif IDF Eclipse Plugins](#), though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

1.16.3 Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

Quick Install Guide

Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from [VS Code Marketplace](#) or following [Quick Installation Guide](#).

Review the *tutorials* <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/toc.md>> for ESP-IDF Visual Studio Code Extension to learn how to use all features.

Supported Features

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <<https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the `.svdat` files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

Bugs & Feature Requests

If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the [forum](#), or open a [github issue](#) for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, [raise your feature request on github](#).

1.16.4 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

For the legacy GNU Make system, run `make monitor`.

Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+]]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+]]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	
Ctrl+C	Interrupt running application	Pauses IDF monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

IDF-specific features

Automatic Address Decoding Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_____, IDF Monitor uses [addr2line](#) to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
abort() was called at PC 0x42067cd5 on core 0
Stack dump detected
```

(continues on next page)

(continued from previous page)

```

Core 0 register dump:

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

Note: Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

Launching GDB with GDBStub By default, if `esp-idf` crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with [GDB](#) project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (`idf.py menuconfig`) and set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic or set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↪interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

Output Filtering IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, *} referring to a level for *logging*.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

Note: Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples Of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID ↪
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

1.16.5 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see [Step 3. Set up the tools](#)) you may build the toolchain yourself.

If you can't think of a reason why you need to build it yourself, then probably it's better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don't trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the *ESP-IDF Tools Installer* for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section [Standard Setup of Toolchain for Windows](#).

Note: The GNU Make based build system requires the [MSYS2](#) Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

Get ESP-IDF

Note: Previous versions of ESP-IDF used the **MSYS2 bash terminal** command line. The current cmake-based build system can run in the regular **Windows Command Prompt** which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4.7 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

Note: The `git clone` option `-b v4.4.7` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

Note: As a fallback, it is also possible to download a zip file of this stable release from the [Releases page](#). Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

Note: Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

Tools

CMake Download the latest stable release of [CMake](#) for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user” .

Ninja build

Note: Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

Download the [Ninja](#) latest stable Windows release from the ([download page](#)).

The Ninja for Windows download is a .zip file containing a single `ninja.exe` file which needs to be unzipped to a directory which is then *added to your Path* (or you can choose a directory which is already on your Path).

Python Download the latest [Python](#) for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path” . Change this option to select “Will be installed” .

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

Toolchain Setup Download the precompiled Windows toolchain:

https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-patch5-win32.zip

Unzip the zip file to C:\Program Files (or some other location). The zip file contains a single directory riscv32-esp-elf.

Next, the bin subdirectory of this directory must be *added to your Path*. For example, the directory to add may be C:\Program Files\riscv32-esp-elf\bin.

Note: If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory C:\msys32\opt\riscv32-esp-elf\bin to the Path instead, as the toolchain is included in the MSYS2 environment.

Adding Directory to Path To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ; <new value>.

Next Steps To carry on with development environment setup, proceed to *Step 3. Set up the tools*.

Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section *Standard Setup of Toolchain for Linux*.

Note: The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).

Install Prerequisites To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf ↵  
↳python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-  
↳pip python3-setuptools python3-serial python3-cryptography python3-future ↵  
↳python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev ↵  
↳libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial_
↳python-cryptography python-future python-pyparsing python-pyelftools cmake_
↳ninja ccache dfu-util libusb
```

Note: CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake” .

Compile the Toolchain from Source

- Install dependencies:

- CentOS 7:

```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-
↳devel automake bison flex texinfo help2man libtool make
```

- Ubuntu pre-16.04:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳dev automake bison flex texinfo help2man libtool make
```

- Ubuntu 16.04 or newer:

```
sudo apt-get install gawk gperf grep gettext python python-dev automake_
↳bison flex texinfo help2man libtool libtool-bin make
```

- Debian 9:

```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
↳dev automake bison flex texinfo help2man libtool libtool-bin make
```

- Arch:

```
sudo pacman -Sy --needed python-pip
```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Note: To create a toolchain with support for 64-bit `time_t`, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

Build the toolchain:

```
./ct-ng riscv32-esp-elf
./ct-ng build
chmod -R u+w builds/riscv32-esp-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/riscv32-esp-elf`.

Add Toolchain to PATH The custom toolchain needs to be copied to a binary directory and added to the PATH. Choose a directory, for example `~/esp/riscv32-esp-elf/`, and copy the build output to this directory.

To use it, you will need to update your PATH environment variable in `~/.profile` file. To make `riscv32-esp-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

```
export PATH="$HOME/esp/riscv32-esp-elf/bin:$PATH"
```

Note: If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, `alias` should set in `.bashrc`.

Log off and log in back to make the `.profile` changes effective. Run the following command to verify if PATH is correctly set:

```
printenv PATH
```

You are looking for similar result containing toolchain's path at the beginning of displayed string:

```
$ printenv PATH
/home/user-name/esp/riscv32-esp-elf/bin:/home/user-name/bin:/home/user-name/.local/
↪bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/
↪local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

Next Steps To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

Setup Toolchain for Mac OS from Scratch

Package Manager To set up the toolchain from scratch, rather than [downloading a pre-compiled toolchain](#), you will need to install either the [MacPorts](#) or [Homebrew](#) package manager.

MacPorts needs a full XCode installation, while Homebrew only needs XCode command line tools.

See [Customized Setup of Toolchain](#) section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:

```
sudo easy_install pip
```

- install pyserial:

```
pip install --user pyserial
```

- install CMake & Ninja build:

- If you have Homebrew, you can run:

```
brew install cmake ninja dfu-util
```

- If you have MacPorts, you can run:

```
sudo port install cmake ninja dfu-util
```

Compile the Toolchain from Source Install dependencies:

- with MacPorts:

```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf_
↳ automake make
```

- with Homebrew:

```
brew install gnu-sed gawk binutils gperf tools gettext wget help2man libtool_
↳ autoconf automake make
```

Create a case-sensitive filesystem image:

```
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_
↳ HFS+"
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2-patch5
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng riscv32-esp-elf
./ct-ng build
chmod -R u+w builds/riscv32-esp-elf
```

Toolchain will be built in `~/esp/ctng-volume/crosstool-NG/builds/riscv32-esp-elf`. To use it, you need to add `~/esp/ctng-volume/crosstool-NG/builds/riscv32-esp-elf/bin` to PATH environment variable.

Next Steps To carry on with development environment setup, proceed to [Step 2. Get ESP-IDF](#).

Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller & VHCI

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller_vhci_ble_adv](#).

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

`esp_err_t esp_ble_tx_power_set` (`esp_ble_power_type_t` power_type, `esp_power_level_t` power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Parameters

- **power_type** -: The type of which tx power, could set Advertising/Connection/Default and etc
- **power_level** -Power level(index) corresponding to absolute value(dbm)

Returns ESP_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get` (`esp_ble_power_type_t` power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Parameters **power_type** -: The type of which tx power, could set Advertising/Connection/Default and etc

Returns ≥ 0 - Power level, < 0 - Invalid

esp_err_t **esp_bredr_tx_power_set** (*esp_power_level_t* min_power_level, *esp_power_level_t* max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

Parameters

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bredr_tx_power_get** (*esp_power_level_t* *min_power_level, *esp_power_level_t* *max_power_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Parameters

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bredr_sco_datapath_set** (*esp_sco_data_path_t* data_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Parameters **data_path** –SCO data path

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_controller_init** (*esp_bt_controller_config_t* *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Parameters **cfg** –Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_controller_deinit** (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_controller_enable** (*esp_bt_mode_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

Parameters **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of `esp_bt_controller_init()`.

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_controller_disable** (void)

Disable BT controller.

Returns `ESP_OK` - success, other - failed

esp_bt_controller_status_t **esp_bt_controller_get_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

Returns status value

bool **esp_vhci_host_check_send_available** (void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

Returns true for ready to send, false means cannot send packet

void **esp_vhci_host_send_packet** (uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

- **data** –the packet point
- **len** –the packet length

esp_err_t **esp_vhci_host_register_callback** (const *esp_vhci_host_callback_t* *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Parameters **callback** –*esp_vhci_host_callback* type variable

Returns ESP_OK - success, ESP_FAIL - failed

esp_err_t **esp_bt_controller_mem_release** (*esp_bt_mode_t* mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Parameters **mode** –: the mode want to release memory

Returns ESP_OK - success, other - failed

esp_err_t **esp_bt_mem_release** (*esp_bt_mode_t* mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note: In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

Parameters mode –: the mode whose memory is to be released

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_sleep_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

Returns

- `ESP_OK` : success
- other : failed

esp_err_t **esp_bt_sleep_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

Returns

- `ESP_OK` : success
- other : failed

esp_err_t **esp_ble_scan_duplicate_list_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

Note: This function name is incorrectly spelled, it will be fixed in release 5.x version.

Returns

- ESP_OK : success
- other : failed

void **esp_wifi_bt_power_domain_on** (void)

bt Wi-Fi power domain power on

void **esp_wifi_bt_power_domain_off** (void)

bt Wi-Fi power domain power off

Structures

struct **esp_bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t **controller_task_stack_size**

Bluetooth controller task stack size

uint8_t **controller_task_prio**

Bluetooth controller task priority

uint8_t **hci_uart_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t **hci_uart_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t **scan_duplicate_mode**

scan duplicate mode

uint8_t **scan_duplicate_type**

scan duplicate type

uint16_t **normal_adv_size**

Normal adv size for scan duplicate

uint16_t **mesh_adv_size**

Mesh adv size for scan duplicate

uint16_t **send_adv_reserved_size**

Controller minimum memory value

uint32_t **controller_debug_flag**

Controller debug log flag

uint8_t **mode**

Controller mode: BR/EDR, BLE or Dual Mode

uint8_t **ble_max_conn**

BLE maximum connection numbers

uint8_t **bt_max_acl_conn**

BR/EDR maximum ACL connection numbers

uint8_t **bt_sco_datapath**

SCO data path, i.e. HCI or PCM module

bool **auto_latency**

BLE auto latency, used to enhance classic BT performance

bool **bt_legacy_auth_vs_evt**

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t **bt_max_sync_conn**

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t **ble_sca**

BLE low power crystal accuracy index

uint8_t **pcm_role**

PCM role (master & slave)

uint8_t **pcm_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16_t **dup_list_refresh_period**

Duplicate scan list refresh period

uint32_t **magic**

Magic number

struct **esp_vhci_host_callback**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (***notify_host_send_available**)(void)

callback used to notify that the host can send packet to controller

int (***notify_host_recv**)(uint8_t *data, uint16_t len)

callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct *esp_vhci_host_callback* **esp_vhci_host_callback_t**
esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum **esp_bt_mode_t**
Bluetooth mode for controller enable/disable.

Values:

enumerator **ESP_BT_MODE_IDLE**
Bluetooth is not running

enumerator **ESP_BT_MODE_BLE**
Run BLE mode

enumerator **ESP_BT_MODE_CLASSIC_BT**
Run Classic BT mode

enumerator **ESP_BT_MODE_BTDM**
Run dual mode

enum [**anonymous**]
BLE sleep clock accuracy(SCA), values for ble_sca field in *esp_bt_controller_config_t*, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

enumerator **ESP_BLE_SCA_500PPM**
BLE SCA at 500ppm

enumerator **ESP_BLE_SCA_250PPM**
BLE SCA at 250ppm

enumerator **ESP_BLE_SCA_150PPM**
BLE SCA at 150ppm

enumerator **ESP_BLE_SCA_100PPM**
BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**
BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**
BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**

BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**

BLE SCA at 20ppm

enum **esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

enum **esp_ble_power_type_t**

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL0**

For connection handle 0

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL1**

For connection handle 1

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL2**

For connection handle 2

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL3**

For connection handle 3

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL4**

For connection handle 4

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL5**

For connection handle 5

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL6**

For connection handle 6

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL7**

For connection handle 7

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL8**

For connection handle 8

enumerator **ESP_BLE_PWR_TYPE_ADV**

For advertising

enumerator **ESP_BLE_PWR_TYPE_SCAN**

For scan

enumerator **ESP_BLE_PWR_TYPE_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP_BLE_PWR_TYPE_NUM**

TYPE numbers

enum **esp_power_level_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

Values:

enumerator **ESP_PWR_LVL_N12**

Corresponding to -12dbm

enumerator **ESP_PWR_LVL_N9**

Corresponding to -9dbm

enumerator **ESP_PWR_LVL_N6**

Corresponding to -6dbm

enumerator **ESP_PWR_LVL_N3**

Corresponding to -3dbm

enumerator **ESP_PWR_LVL_N0**

Corresponding to 0dbm

enumerator **ESP_PWR_LVL_P3**

Corresponding to +3dbm

enumerator **ESP_PWR_LVL_P6**

Corresponding to +6dbm

enumerator **ESP_PWR_LVL_P9**

Corresponding to +9dbm

enumerator **ESP_PWR_LVL_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP_PWR_LVL_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP_PWR_LVL_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP_PWR_LVL_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP_PWR_LVL_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP_PWR_LVL_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP_PWR_LVL_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP_PWR_LVL_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp_sco_data_path_t**

Bluetooth audio data transport path.

Values:

enumerator **ESP_SCO_DATA_PATH_HCI**

data over HCI transport

enumerator **ESP_SCO_DATA_PATH_PCM**

data over PCM interface

2.1.2 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_defs.h](#)

Structures

struct **esp_bt_uuid_t**

UUID type.

Public Members

`uint16_t len`

UUID length, 16bit, 32bit or 128bit

`uint16_t uuid16`

16bit UUID

`uint32_t uuid32`

32bit UUID

`uint8_t uuid128[16]`

128bit UUID

union `esp_bt_uuid_t`::[anonymous] `uuid`

UUID

Macros

`ESP_BLUEDROID_STATUS_CHECK` (status)

`ESP_BT_STATUS_BASE_FOR_HCI_ERR`

`ESP_BT_OCTET16_LEN`

`ESP_BT_OCTET8_LEN`

`ESP_DEFAULT_GATT_IF`

Default GATT interface id.

`ESP_BLE_PRIM_ADV_INT_MIN`

Minimum advertising interval for undirected and low duty cycle directed advertising

`ESP_BLE_PRIM_ADV_INT_MAX`

Maximum advertising interval for undirected and low duty cycle directed advertising

`ESP_BLE_CONN_INT_MIN`

relate to `BTM_BLE_CONN_INT_MIN` in `stack/btm_ble_api.h`

`ESP_BLE_CONN_INT_MAX`

relate to `BTM_BLE_CONN_INT_MAX` in `stack/btm_ble_api.h`

`ESP_BLE_CONN_LATENCY_MAX`

relate to `ESP_BLE_CONN_LATENCY_MAX` in `stack/btm_ble_api.h`

relate to `BTM_BLE_CONN_SUP_TOUT_MIN` in `stack/btm_ble_api.h`

`ESP_BLE_CONN_SUP_TOUT_MAX`

relate to `ESP_BLE_CONN_SUP_TOUT_MAX` in `stack/btm_ble_api.h`

ESP_BLE_IS_VALID_PARAM (x, min, max)

Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN

Bluetooth address length.

ESP_BLE_ENC_KEY_MASK

Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK

Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK

Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN

Minimum of the application id.

ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX (addr)

Type Definitions

```
typedef uint8_t esp_bt_octet16_t[16]

enumerator **ESP_BT_DEVICE_TYPE_BREDR**

enumerator **ESP_BT_DEVICE_TYPE_BLE**

enumerator **ESP_BT_DEVICE_TYPE_DUMO**

enum **esp_ble_addr_type_t**

BLE device address type.

Values:

enumerator **BLE_ADDR_TYPE_PUBLIC**

Public Device Address

enumerator **BLE_ADDR_TYPE_RANDOM**

Random Device Address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enumerator **BLE_ADDR_TYPE_RPA_PUBLIC**

Resolvable Private Address (RPA) with public identity address

enumerator **BLE_ADDR_TYPE_RPA_RANDOM**

Resolvable Private Address (RPA) with random identity address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enum **esp_ble_wl_addr_type_t**

white list address type

Values:

enumerator **BLE_WL_ADDR_TYPE_PUBLIC**

enumerator **BLE_WL_ADDR_TYPE_RANDOM**

BT MAIN API

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_bt_main.h`

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status` (void)

Get bluetooth stack status.

Returns Bluetooth stack status

`esp_err_t esp_bluedroid_enable` (void)

Enable bluetooth, must after `esp_bluedroid_init()`.

Returns

- `ESP_OK` : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_disable** (void)

Disable bluetooth, must prior to esp_bluedroid_deinit().

Returns

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Returns

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Returns

- ESP_OK : Succeed
- Other : Failed

Enumerations

enum **esp_bluedroid_status_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

enumerator **ESP_BLUEDROID_STATUS_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP_BLUEDROID_STATUS_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP_BLUEDROID_STATUS_ENABLED**

Bluetooth initialized and enabled

BT DEVICE APIs

Overview Bluetooth device reference APIs.

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_device.h](#)

Functions

const uint8_t ***esp_bt_dev_get_address** (void)

Get bluetooth device address. Must use after “esp_bluedroid_enable” .

Returns bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t **esp_bt_dev_set_device_name** (const char *name)

Set bluetooth device name. This function should be called after `esp_bluedroid_enable()` completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Parameters **name** –[in] : device name to be set

Returns

- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
- ESP_FAIL : others

2.1.3 BT LE

GAP API

Application Example Check `bluetooth/bluedroid/ble` folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_client](#)
 - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_server](#)
 - [GATT Security Server Example Walkthrough](#)

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h`

Functions

esp_err_t **esp_ble_gap_register_callback** (*esp_gap_ble_cb_t* callback)

This function is called to occur gap event, such as scan result.

Parameters **callback** –[in] callback function

Returns

- ESP_OK : success
- other : failed

esp_gap_ble_cb_t **esp_ble_gap_get_callback** (void)

This function is called to get the current gap callback.

Returns

- *esp_gap_ble_cb_t* : callback function

esp_err_t **esp_ble_gap_config_adv_data** (*esp_ble_adv_data_t* *adv_data)

This function is called to override the BTA default ADV parameters.

Parameters **adv_data** –[in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of `config_adv_data` is received.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_scan_params** (*esp_ble_scan_params_t* *scan_params)

This function is called to set scan parameters.

Parameters **scan_params** –[in] Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_scanning** (uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

Parameters **duration** –[in] Keeping the scanning time, the unit is second.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_advertising** (*esp_ble_adv_params_t* *adv_params)

This function is called to start advertising.

Parameters **adv_params** –[in] pointer to User defined adv_params data structure.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_advertising** (void)

This function is called to stop advertising.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_conn_params** (*esp_ble_conn_update_params_t* *params)

Update connection parameters, can only be used when connection is up.

Parameters **params** –[in] - connection update parameters

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_pkt_data_len** (*esp_bd_addr_t* remote_device, uint16_t tx_data_length)

This function is to set maximum LE data packet size.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_rand_addr** (*esp_bd_addr_t* rand_addr)

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

Parameters **rand_addr** –[in] The address to be configured. Refer to the table below for possible address subtypes:

address [47:46]	Address Type
-----	-----
0b00	Non-Resolvable Private

(continues on next page)

(continued from previous page)

	Address	
0b11	Static Random Address	

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_rand_addr** (void)

This function clears the random address for the application.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_privacy** (bool privacy_enable)

Enable/disable privacy (including address resolution) on the local device.

Parameters **privacy_enable** –[in] - enable/disable privacy on remote device.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_icon** (uint16_t icon)

set local gap appearance icon

Parameters **icon** –[in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/assigned-numbers/>

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_whitelist** (bool add_remove, *esp_bd_addr_t* remote_bda, *esp_ble_wl_addr_type_t* wl_addr_type)

Add or remove device from white list.

Parameters

- **add_remove** –[in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** –[in] the remote device address add/remove from the white list.
- **wl_addr_type** –[in] whitelist address type

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_whitelist** (void)

Clear all white list.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_whitelist_size** (uint16_t *length)

Get the whitelist size in the controller.

Parameters **length** –[out] the white list length.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_prefer_conn_params** (*esp_bd_addr_t* bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Parameters

- **bd_addr** –[in] BD address of the peripheral
- **min_conn_int** –[in] minimum preferred connection interval
- **max_conn_int** –[in] maximum preferred connection interval
- **slave_latency** –[in] preferred slave latency
- **supervision_tout** –[in] preferred supervision timeout

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_device_name** (const char *name)

Set device name to the local device Note: This API don't affect the advertising data.

Parameters **name** –[in] - device name.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_device_name** (void)

Get device name of the local device.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_local_used_addr** (*esp_bd_addr_t* local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

Parameters

- **local_used_addr** –[in] - current local used ble address (six bytes)
- **addr_type** –[in] - ble address type

Returns - ESP_OK : success

- other : failed

uint8_t ***esp_ble_resolve_adv_data** (uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

Parameters

- **adv_data** –[in] - pointer of ADV data which to be resolved
- **type** –[in] - finding ADV data type
- **length** –[out] - return the length of ADV data not including type

Returns pointer of ADV data

esp_err_t **esp_ble_gap_config_adv_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters

- **raw_data** –[in] : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2] ...
- **raw_data_len** –[in] : raw advertising data length , less than 31 bytes

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_scan_rsp_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

Parameters

- **raw_data** –[in] : raw scan response data
- **raw_data_len** –[in] : raw scan response data length , less than 31 bytes

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_read_rssi** (*esp_bd_addr_t* remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Parameters **remote_addr** –[in] : The remote connection device address.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_add_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to add a device info into the duplicate scan exceptional list.

Parameters

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_remove_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

Parameters

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clean_duplicate_scan_exceptional_list** (*esp_duplicate_scan_exceptional_list_type_t* list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Parameters **list_type** –[in] duplicate scan exceptional list type, the value can be one or more of *esp_duplicate_scan_exceptional_list_type_t*.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_security_param** (*esp_ble_sm_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only `secure connection` mode, it is necessary do as following:

- a. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
- b. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

Parameters

- **param_type** –[in]: the type of the param which to be set
- **value** –[in]: the param value
- **len** –[in]: the length of the param value

Returns - `ESP_OK` : success

- other : failed

esp_err_t **esp_ble_gap_security_rsp** (*esp_bd_addr_t* bd_addr, bool accept)

Grant security request access.

Parameters

- **bd_addr** –[in]: BD address of the peer
- **accept** –[in]: accept the security request or not

Returns - `ESP_OK` : success

- other : failed

esp_err_t **esp_ble_set_encryption** (*esp_bd_addr_t* bd_addr, *esp_ble_sec_act_t* sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

Parameters

- **bd_addr** –[in]: the address of the peer device need to encryption
- **sec_act** –[in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

Returns - `ESP_OK` : success

- other : failed

esp_err_t **esp_ble_passkey_reply** (*esp_bd_addr_t* bd_addr, bool accept, *uint32_t* passkey)

Reply the key value to the peer device in the legacy connection stage.

Parameters

- **bd_addr** –[in]: BD address of the peer
- **accept** –[in]: passkey entry successful or declined.
- **passkey** –[in]: passkey value, must be a 6 digit number, can be lead by 0.

Returns - `ESP_OK` : success

- other : failed

esp_err_t **esp_ble_confirm_reply** (*esp_bd_addr_t* bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

Parameters

- **bd_addr** –[in]: BD address of the peer device
- **accept** –[in]: numbers to compare are the same or different.

Returns - `ESP_OK` : success

- other : failed

esp_err_t **esp_ble_remove_bond_device** (*esp_bd_addr_t* bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Parameters **bd_addr** –[in] : BD address of the peer device

Returns - ESP_OK : success

- other : failed

int **esp_ble_get_bond_device_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Returns - >= 0 : bonded devices number.

- ESP_FAIL : failed

esp_err_t **esp_ble_get_bond_device_list** (int *dev_num, *esp_ble_bond_dev_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Parameters

- **dev_num** –[inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** –[out] an array(buffer) of *esp_ble_bond_dev_t* type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **TK** –[in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** –[in] length of temporary key, should always be 128-bit

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_sc_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t p_c[16], uint8_t p_r[16])

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **p_c** –[in] Confirmation value, it shall be a 128-bit random number
- **p_r** –[in] Randomizer value, it should be a 128-bit random number

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_create_sc_oob_data** (void)

This function is called to create the OOB data for SMP when secure connection.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_disconnect** (*esp_bd_addr_t* remote_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Parameters **remote_device** –[in] : BD address of the peer device

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_get_current_conn_params** (*esp_bd_addr_t* bd_addr, *esp_gap_conn_params_t* *conn_params)

This function is called to read the connection parameters information of the device.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **conn_params** –[out] the connection parameters information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_gap_ble_set_channels** (*esp_gap_ble_channels* channels)

BLE set channels.

Parameters channels –[in] : The nth such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

Returns - ESP_OK : success

- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

esp_err_t **esp_gap_ble_set_authorization** (*esp_bd_addr_t* bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **authorize** –[out] Authorized the link or not.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_read_phy** (*esp_bd_addr_t* bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Parameters bd_addr –[in] : BD address of the peer device

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_set_prefered_default_phy** (*esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Parameters

- **tx_phy_mask** –[in] : indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –[in] : indicates the receiver PHYs that the Host prefers the Controller to use

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_set_prefered_phy** (*esp_bd_addr_t* bd_addr, *esp_ble_gap_all_phys_t* all_phys_mask, *esp_ble_gap_phy_mask_t* tx_phy_mask, *esp_ble_gap_phy_mask_t* rx_phy_mask, *esp_ble_gap_prefer_phy_options_t* phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Parameters

- **bd_addr** –[in] : remote address
- **all_phys_mask** –[in] : a bit field that allows the Host to specify

- **tx_phy_mask** –[in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
 - **rx_phy_mask** –[in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
 - **phy_options** –[in]: a bit field that allows the Host to specify options for PHYs
- Returns** - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_rand_addr** (uint8_t instance, *esp_bd_addr_t* rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

Parameters

- **instance** –[in]: Used to identify an advertising set
- **rand_addr** –[in]: Random Device Address

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_params** (uint8_t instance, const *esp_ble_gap_ext_adv_params_t* *params)

This function is used by the Host to set the advertising parameters.

Parameters

- **instance** –[in]: identifies the advertising set whose parameters are being configured.
- **params** –[in]: advertising parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

Parameters

- **instance** –[in]: identifies the advertising set whose data are being configured
- **length** –[in]: data length
- **data** –[in]: data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_scan_rsp_data_raw** (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

Parameters

- **instance** –[in]: identifies the advertising set whose response data are being configured.
- **length** –[in]: response data length
- **scan_rsp_data** –[in]: response data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_start** (uint8_t num_adv, const *esp_ble_gap_ext_adv_t* *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters

- **num_adv** –[in]: Number of advertising sets to enable or disable
- **ext_adv** –[in]: adv parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_stop** (uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters

- **num_adv** –[in] : Number of advertising sets to enable or disable
- **ext_adv_inst** –[in] : ext adv instance

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_remove** (uint8_t instance)

This function is used to remove an advertising set from the Controller.

Parameters **instance** –[in] : Used to identify an advertising set**Returns** - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_params** (uint8_t instance, const *esp_ble_gap_periodic_adv_params_t* *params)

This function is used by the Host to set the parameters for periodic advertising.

Parameters

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** –[in] : periodic adv parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

Parameters

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** –[in] : the length of periodic data
- **data** –[in] : periodic data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Parameters **instance** –[in] : Used to identify an advertising set**Returns** - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_stop** (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Parameters **instance** –[in] : Used to identify an advertising set**Returns** - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_set_ext_scan_params** (const *esp_ble_ext_scan_params_t* *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

Parameters **params** –[in] : scan parameters**Returns** - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_start_ext_scan** (uint32_t duration, uint16_t period)

This function is used to enable scanning.

Parameters

- **duration** –[in] Scan duration time, where Time = N * 10 ms. Range: 0x0001 to 0xFFFF.
- **period** –[in] Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration. Time = N * 1.28 sec. Range: 0x0001 to 0xFFFF.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_create_sync** (const *esp_ble_gap_periodic_adv_sync_params_t* *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Parameters **params** –[in] : sync parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_terminate** (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Parameters **sync_handle** –[in] : identify the periodic advertiser

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_add_dev_to_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Parameters

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_remove_dev_from_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Parameters

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Returns - ESP_OK : success
• other : failed

esp_err_t **esp_ble_gap_prefer_ext_connect_params_set** (*esp_bd_addr_t* addr,
esp_ble_gap_phy_mask_t phy_mask,
const *esp_ble_gap_conn_params_t*
*phy_1m_conn_params, const
esp_ble_gap_conn_params_t
*phy_2m_conn_params, const
esp_ble_gap_conn_params_t
*phy_coded_conn_params)

This function is used to set aux connection parameters.

Parameters

- **addr** –[in] : device address
- **phy_mask** –[in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** –[in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** –[in] : Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** –[in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

Returns - ESP_OK : success
• other : failed

esp_err_t **esp_ble_gap_periodic_adv_recv_enable** (uint16_t sync_handle, uint8_t enable)

This function is used to set periodic advertising receive enable.

Parameters

- **sync_handle** –[in] : Handle of periodic advertising sync
- **enable** –[in] : Determines whether reporting and duplicate filtering are enabled or disabled

Returns - ESP_OK : success
• other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_trans** (*esp_bd_addr_t* addr, uint16_t service_data,
uint16_t sync_handle)

This function is used to transfer periodic advertising sync.

Parameters

- **addr** –[in] : Peer device address
- **service_data** –[in] : Service data used by Host
- **sync_handle** –[in] : Handle of periodic advertising sync

Returns - ESP_OK : success
• other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_info_trans** (*esp_bd_addr_t* addr, uint16_t service_data,
uint8_t adv_handle)

This function is used to transfer periodic advertising set info.

Parameters

- **addr** –[in] : Peer device address
- **service_data** –[in] : Service data used by Host
- **adv_handle** –[in] : Handle of advertising set

Returns - ESP_OK : success
• other : failed

esp_err_t **esp_ble_gap_set_periodic_adv_sync_trans_params** (*esp_bd_addr_t* addr, const *esp_ble_gap_past_params_t* *params)

This function is used to set periodic advertising sync transfer params.

Parameters

- **addr** –[in] : Peer device address
- **params** –[in] : Params of periodic advertising sync transfer

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_clear_advertising** (void)

This function is used to clear legacy advertising.

Returns - ESP_OK : success

- other : failed

periodic advertising sync handle

uint8_t **sid**

periodic advertising sid

esp_ble_addr_type_t **adv_addr_type**

periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **ble_periodic_adv_sync_lost_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT.

Public Members

uint16_t **sync_handle**

sync handle

struct **ble_periodic_adv_sync_trans_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Periodic advertising sync transfer status

esp_bd_addr_t **bda**

The remote device address

struct **ble_periodic_adv_sync_trans_rcv_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT.

Public Members

esp_bt_status_t **status**

Periodic advertising sync transfer received status

esp_bd_addr_t **bda**

The remote device address

uint16_t **service_data**

The value provided by the peer device

uint16_t **sync_handle**

Periodic advertising sync handle

uint8_t **adv_sid**

Periodic advertising set id

uint8_t **adv_addr_type**

Periodic advertiser address type

esp_bd_addr_t **adv_addr**

Periodic advertiser address

esp_ble_gap_phy_t **adv_phy**

Periodic advertising PHY

uint16_t **adv_interval**

Periodic advertising interval

uint8_t **adv_clk_accuracy**

Periodic advertising clock accuracy

struct **ble_phy_update_cmpl_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

phy update status

esp_bd_addr_t **bda**

address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_pkt_data_length_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set pkt data length operation success status

esp_ble_pkt_data_length_params_t **params**

pkt data length value

struct **ble_read_phy_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_PHY_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

read phy complete status

esp_bd_addr_t **bda**

read phy address

esp_ble_gap_phy_t **tx_phy**

tx phy type

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_read_rssi_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the read adv tx power operation success status

int8_t **rssi**

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

esp_bd_addr_t **remote_addr**

The remote device address

struct **ble_remove_bond_dev_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the remove bond device operation success status

esp_bd_addr_t **bd_addr**

The device address which has been remove from the bond list

struct **ble_scan_param_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set scan param operation success status

struct **ble_scan_req_received_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT.

Public Members

uint8_t **adv_instance**

extend advertising handle

esp_ble_addr_type_t **scan_addr_type**

scanner address type

esp_bd_addr_t **scan_addr**

scanner address

struct **ble_scan_result_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.

Public Members

esp_gap_search_evt_t **search_evt**

Search event type

esp_bd_addr_t **bda**

Bluetooth device address which has been searched

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_addr_type_t **ble_addr_type**

Ble device address type

esp_ble_evt_type_t **ble_evt_type**

Ble scan result event type

int **rssi**

Searched device' s RSSI

uint8_t **ble_adv**[31 + 31]

Received EIR

int **flag**

Advertising data flag bit

int **num_resps**

Scan result number

uint8_t **adv_data_len**

Adv data length

uint8_t **scan_rsp_len**

Scan response length

uint32_t **num_dis**

The number of discard packets

struct **ble_scan_rsp_data_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members*esp_bt_status_t* **status**

Indicate the set scan response data operation success status

```
struct ble_scan_rsp_data_raw_cmpl_evt_param
```

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Indicate perf default phy set status

```
struct ble_set_perf_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate perf phy set status

```
struct ble_set_rand_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate set static rand address operation success status

```
struct ble_update_conn_params_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate update connection parameters success status

esp_bd_addr_t **bda**
Bluetooth device address

`uint16_t min_int`

Min connection interval

`uint16_t max_int`

Max connection interval

`uint16_t latency`

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t conn_int`

Current connection interval

`uint16_t timeout`

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct `ble_update_duplicate_exceptional_list_cmpl_evt_param`

`#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.`

Public Members

`esp_bt_status_t status`

Indicate update duplicate scan exceptional list operation success status

`uint8_t subcode`

Define in `esp_bt_duplicate_exceptional_subcode_type_t`

`uint16_t length`

The length of `device_info`

`esp_duplicate_info_t device_info`

device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

struct `ble_update_whitelist_cmpl_evt_param`

`#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.`

Public Members

`esp_bt_status_t status`

Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`

The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success, `ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

Structures

struct **esp_ble_adv_params_t**

Advertising parameters.

Public Members

uint16_t **adv_int_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

esp_ble_adv_type_t **adv_type**

Advertising type

esp_ble_addr_type_t **own_addr_type**

Owner bluetooth device address type

esp_bd_addr_t **peer_addr**

Peer device bluetooth device address

esp_ble_addr_type_t **peer_addr_type**

Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t **channel_map**

Advertising channel map

esp_ble_adv_filter_t **adv_filter_policy**

Advertising filter policy

struct **esp_ble_adv_data_t**

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

Public Members

bool **set_scan_rsp**

Set this advertising data as scan response or not

bool **include_name**

Advertising data include device name or not

bool **include_txpower**

Advertising data include TX power

int min_interval

Advertising data show slave preferred connection min interval. The connection interval in the following manner: $\text{connIntervalmin} = \text{Conn_Interval_Min} * 1.25 \text{ ms}$ Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval

Advertising data show slave preferred connection max interval. The connection interval in the following manner: $\text{connIntervalmax} = \text{Conn_Interval_Max} * 1.25 \text{ ms}$ Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance

External appearance of device

uint16_t manufacturer_len

Manufacturer data length

uint8_t *p_manufacturer_data

Manufacturer data point

uint16_t service_data_len

Service data length

uint8_t *p_service_data

Service data point

uint16_t service_uuid_len

Service uuid length

uint8_t *p_service_uuid

Service uuid array point

uint8_t flag

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t

Ble scan parameters.

Public Members*esp_ble_scan_type_t* **scan_type**

Scan type

esp_ble_addr_type_t **own_addr_type**

Owner address type

esp_ble_scan_filter_t **scan_filter_policy**

Scan filter policy

uint16_t scan_interval

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = $N * 0.625$ msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = $N * 0.625$ msec Time Range: 2.5 msec to 10240 msec

***esp_ble_scan_duplicate_t* scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp_gap_conn_params_t**

connection parameters information

Public Members**uint16_t interval**

connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = $N * 10$ msec Time Range: 100 msec to 32 seconds

struct **esp_ble_conn_update_params_t**

Connection update parameters.

Public Members***esp_bd_addr_t* bda**

Bluetooth device address

uint16_t min_int

Min connection interval

uint16_t max_int

Max connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct `esp_ble_pkt_data_length_params_t`

BLE pkt data length keys.

Public Members

`uint16_t rx_len`

pkt rx data length value

`uint16_t tx_len`

pkt tx data length value

struct `esp_ble_penc_keys_t`

BLE encryption keys.

Public Members

`esp_bt_octet16_t ltk`

The long term key

`esp_bt_octet8_t rand`

The random number

`uint16_t ediv`

The ediv value

`uint8_t sec_level`

The security level of the security link

`uint8_t key_size`

The key size(7~16) of the security link

struct `esp_ble_pcsrkeys_t`

BLE CSRK keys.

Public Members

`uint32_t counter`

The counter

`esp_bt_octet16_t csrkey`

The csrkey

uint8_t **sec_level**

The security level

struct **esp_ble_pid_keys_t**

BLE pid keys.

Public Members

esp_bt_octet16_t **irk**

The irk value

esp_ble_addr_type_t **addr_type**

The address type

esp_bd_addr_t **static_addr**

The static address

struct **esp_ble_lenc_keys_t**

BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t **ltk**

The long term key

uint16_t **div**

The div value

uint8_t **key_size**

The key size of the security link

uint8_t **sec_level**

The security level of the security link

struct **esp_ble_lcsrk_keys**

BLE SRK keys.

Public Members

uint32_t **counter**

The counter value

uint16_t **div**

The div value

uint8_t **sec_level**

The security level of the security link

esp_bt_octet16_t **csrkey**

The csrkey value

struct **esp_ble_sec_key_notif_t**

Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t **bd_addr**

peer address

uint32_t **passkey**

the numeric value for comparison. If just_works, do not show this number to UI

struct **esp_ble_sec_req_t**

Structure of the security request.

Public Members

esp_bd_addr_t **bd_addr**

peer address

struct **esp_ble_bond_key_info_t**

struct type of the bond key information value

Public Members

esp_ble_key_mask_t **key_mask**

the key mask to indicate which key is present

esp_ble_penc_keys_t **penc_key**

received peer encryption key

esp_ble_pcsrkey_t **pcsrkey**

received peer device SRK

esp_ble_pid_keys_t **pid_key**

peer device ID key

struct **esp_ble_bond_dev_t**

struct type of the bond device value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_bond_key_info_t **bond_key**

the bond key information

struct **esp_ble_key_t**

union type of the security key value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_key_type_t **key_type**

key type of the security link

esp_ble_key_value_t **p_key_value**

the pointer to the key value

struct **esp_ble_local_id_keys_t**

structure type of the ble local id keys value

Public Members

esp_bt_octet16_t **ir**

the 16 bits of the ir value

esp_bt_octet16_t **irk**

the 16 bits of the ir key value

esp_bt_octet16_t **dhk**

the 16 bits of the dh key value

struct **esp_ble_local_oob_data_t**

structure type of the ble local oob data value

Public Members

esp_bt_octet16_t **oob_c**

the 128 bits of confirmation value

esp_bt_octet16_t **oob_r**

the 128 bits of randomizer value

struct **esp_ble_auth_cmpl_t**

Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t **bd_addr**

BD address peer device.

bool **key_present**

Valid link key value in key element

esp_link_key **key**

Link key associated with peer device.

uint8_t **key_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8_t **fail_reason**

The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t **addr_type**

Peer device address type

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_auth_req_t **auth_mode**

authentication mode

struct **esp_ble_gap_ext_adv_params_t**

ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t **type**

ext adv type

uint32_t **interval_min**

ext adv minimum interval

uint32_t **interval_max**

ext adv maximum interval

esp_ble_adv_channel_t **channel_map**
ext adv channel map

esp_ble_addr_type_t **own_addr_type**
ext adv own address type

esp_ble_addr_type_t **peer_addr_type**
ext adv peer address type

esp_bd_addr_t **peer_addr**
ext adv peer address

esp_ble_adv_filter_t **filter_policy**
ext adv filter policy

int8_t **tx_power**
ext adv tx power

esp_ble_gap_pri_phy_t **primary_phy**
ext adv primary phy

uint8_t **max_skip**
ext adv maximum skip

esp_ble_gap_phy_t **secondary_phy**
ext adv secondary phy

uint8_t **sid**
ext adv sid

bool **scan_req_notif**
ext adv scan request event notify

struct **esp_ble_ext_scan_cfg_t**
ext scan config

Public Members

esp_ble_scan_type_t **scan_type**
ext scan type

uint16_t **scan_interval**
ext scan interval

uint16_t **scan_window**
ext scan window

struct **esp_ble_ext_scan_params_t**
ext scan parameters

Public Members

esp_ble_addr_type_t **own_addr_type**
ext scan own addresss type

esp_ble_scan_filter_t **filter_policy**
ext scan filter policy

esp_ble_scan_duplicate_t **scan_duplicate**
ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t **cfg_mask**
ext scan config mask

esp_ble_ext_scan_cfg_t **uncoded_cfg**
ext scan uncoded config parameters

esp_ble_ext_scan_cfg_t **coded_cfg**
ext scan coded config parameters

struct **esp_ble_gap_conn_params_t**
create extend connection parameters

Public Members

uint16_t **scan_interval**
init scan interval

uint16_t **scan_window**
init scan window

uint16_t **interval_min**
minimum interval

uint16_t **interval_max**
maximum interval

uint16_t **latency**
ext scan type

uint16_t **supervision_timeout**
connection supervision timeout

uint16_t **min_ce_len**
minimum ce length

uint16_t **max_ce_len**
maximum ce length

struct **esp_ble_gap_ext_adv_t**
extend adv enable parameters

Public Members

uint8_t **instance**
advertising handle

int **duration**
advertising duration

int **max_events**
maximum number of extended advertising events

struct **esp_ble_gap_periodic_adv_params_t**
periodic adv parameters

Public Members

uint16_t **interval_min**
periodic advertising minimum interval

uint16_t **interval_max**
periodic advertising maximum interval

uint8_t **properties**
periodic advertising properties

struct **esp_ble_gap_periodic_adv_sync_params_t**
periodic adv sync parameters

Public Members

esp_ble_gap_sync_t **filter_policy**
periodic advertising sync filter policy

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **addr**
periodic advertising address

uint16_t **skip**

the maximum number of periodic advertising events that can be skipped

uint16_t **sync_timeout**

synchronization timeout

struct **esp_ble_gap_ext_adv_reprot_t**

extend adv report parameters

Public Members

esp_ble_gap_adv_type_t **event_type**

extend advertising type

uint8_t **addr_type**

extend advertising address type

esp_bd_addr_t **addr**

extend advertising address

esp_ble_gap_pri_phy_t **primary_phy**

extend advertising primary phy

esp_ble_gap_phy_t **secondly_phy**

extend advertising secondary phy

uint8_t **sid**

extend advertising sid

uint8_t **tx_power**

extend advertising tx power

int8_t **rssi**

extend advertising rssi

uint16_t **per_adv_interval**

periodic advertising interval

uint8_t **dir_addr_type**

direct address type

esp_bd_addr_t **dir_addr**

direct address

esp_ble_gap_ext_adv_data_status_t **data_status**

data type

uint8_t **adv_data_len**
extend advertising data length

uint8_t **adv_data**[251]
extend advertising data

struct **esp_ble_gap_periodic_adv_report_t**
periodic adv report parameters

Public Members

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **tx_power**
periodic advertising tx power

int8_t **rssi**
periodic advertising rssi

esp_ble_gap_ext_adv_data_status_t **data_status**
periodic advertising data type

uint8_t **data_length**
periodic advertising data length

uint8_t **data**[251]
periodic advertising data

struct **esp_ble_gap_periodic_adv_sync_estab_t**
periodic adv sync establish parameters

Public Members

uint8_t **status**
periodic advertising sync status

uint16_t **sync_handle**
periodic advertising train handle

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising adv phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **esp_ble_gap_past_params_t**

periodic adv sync transfer parameters

Public Members

esp_ble_gap_past_mode_t **mode**

periodic advertising sync transfer mode

uint16_t **skip**

the number of periodic advertising packets that can be skipped

uint16_t **sync_timeout**

synchronization timeout for the periodic advertising train

uint8_t **cte_type**

periodic advertising sync transfer CET type

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC

BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE

relate to BTM_LE_KEY_xxx in stack/btm_api.h

No encryption key

ESP_LE_KEY_PENC

encryption key, encryption information of peer device

ESP_LE_KEY_PID

identity key of the peer device

ESP_LE_KEY_PCSRK

peer SRK

ESP_LE_KEY_PLK

Link key

ESP_LE_KEY_LLK

peer link key

ESP_LE_KEY_LENC

master role security information:div

ESP_LE_KEY_LID

master device ID key

ESP_LE_KEY_LCSRK

local CSRK has been deliver to peer

ESP_LE_AUTH_NO_BOND

relate to BTM_LE_AUTH_xxx in stack/btm_api.h

0 no bondingv

ESP_LE_AUTH_BOND

1 << 0 device in the bonding with peer

ESP_LE_AUTH_REQ_MITM

1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM

0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY

1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND

1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM

1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND

1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE

authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE

authentication enable

ESP_BLE_OOB_DISABLE

disbale the out of bond

ESP_BLE_OOB_ENABLE

enable the out of bond

ESP_IO_CAP_OUT

relate to BTM_IO_CAP_xxx in stack/btm_api.h

DisplayOnly

ESP_IO_CAP_IO

DisplayYesNo

ESP_IO_CAP_IN

KeyboardOnly

ESP_IO_CAP_NONE

NoInputNoOutput

ESP_IO_CAP_KBDISP

Keyboard display

ESP_BLE_APPEARANCE_UNKNOWN

relate to BTM_BLE_APPEARANCE_UNKNOWN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PHONE

relate to BTM_BLE_APPEARANCE_GENERIC_PHONE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_COMPUTER

relate to BTM_BLE_APPEARANCE_GENERIC_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WATCH

relate to BTM_BLE_APPEARANCE_GENERIC_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_SPORTS_WATCH

relate to BTM_BLE_APPEARANCE_SPORTS_WATCH in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CLOCK

relate to BTM_BLE_APPEARANCE_GENERIC_CLOCK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_DISPLAY

relate to BTM_BLE_APPEARANCE_GENERIC_DISPLAY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_REMOTE

relate to BTM_BLE_APPEARANCE_GENERIC_REMOTE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_EYEGLASSES

relate to BTM_BLE_APPEARANCE_GENERIC_EYEGLASSES in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_TAG

relate to BTM_BLE_APPEARANCE_GENERIC_TAG in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_KEYRING

relate to BTM_BLE_APPEARANCE_GENERIC_KEYRING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER

relate to BTM_BLE_APPEARANCE_GENERIC_MEDIA_PLAYER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER

relate to BTM_BLE_APPEARANCE_GENERIC_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_THERMOMETER

relate to BTM_BLE_APPEARANCE_GENERIC_THERMOMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_THERMOMETER_EAR

relate to BTM_BLE_APPEARANCE_THERMOMETER_EAR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HEART_RATE

relate to BTM_BLE_APPEARANCE_GENERIC_HEART_RATE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HEART_RATE_BELT

relate to BTM_BLE_APPEARANCE_HEART_RATE_BELT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE

relate to BTM_BLE_APPEARANCE_GENERIC_BLOOD_PRESSURE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_ARM

relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_ARM in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST

relate to BTM_BLE_APPEARANCE_BLOOD_PRESSURE_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_HID

relate to BTM_BLE_APPEARANCE_GENERIC_HID in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_KEYBOARD

relate to BTM_BLE_APPEARANCE_HID_KEYBOARD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_MOUSE

relate to BTM_BLE_APPEARANCE_HID_MOUSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_JOYSTICK

relate to BTM_BLE_APPEARANCE_HID_JOYSTICK in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_GAMEPAD

relate to BTM_BLE_APPEARANCE_HID_GAMEPAD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITIZER_TABLET

relate to BTM_BLE_APPEARANCE_HID_DIGITIZER_TABLET in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_CARD_READER

relate to BTM_BLE_APPEARANCE_HID_CARD_READER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_DIGITAL_PEN

relate to BTM_BLE_APPEARANCE_HID_DIGITAL_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_HID_BARCODE_SCANNER

relate to BTM_BLE_APPEARANCE_HID_BARCODE_SCANNER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_GLUKOSE

relate to BTM_BLE_APPEARANCE_GENERIC_GLUKOSE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WALKING

relate to BTM_BLE_APPEARANCE_GENERIC_WALKING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_IN_SHOE

relate to BTM_BLE_APPEARANCE_WALKING_IN_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_SHOE

relate to BTM_BLE_APPEARANCE_WALKING_ON_SHOE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_WALKING_ON_HIP

relate to BTM_BLE_APPEARANCE_WALKING_ON_HIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CYCLING

relate to BTM_BLE_APPEARANCE_GENERIC_CYCLING in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_COMPUTER

relate to BTM_BLE_APPEARANCE_CYCLING_COMPUTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_POWER

relate to BTM_BLE_APPEARANCE_CYCLING_POWER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_CYCLING_SPEED_CADENCE

relate to BTM_BLE_APPEARANCE_CYCLING_SPEED_CADENCE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER

relate to BTM_BLE_APPEARANCE_GENERIC_PULSE_OXIMETER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_FINGERTIP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_PULSE_OXIMETER_WRIST

relate to BTM_BLE_APPEARANCE_PULSE_OXIMETER_WRIST in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_WEIGHT

relate to BTM_BLE_APPEARANCE_GENERIC_WEIGHT in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE

relate to BTM_BLE_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_POWERED_WHEELCHAIR

relate to BTM_BLE_APPEARANCE_POWERED_WHEELCHAIR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_MOBILITY_SCOOTER

relate to BTM_BLE_APPEARANCE_MOBILITY_SCOOTER in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR

relate to BTM_BLE_APPEARANCE_GENERIC_CONTINUOUS_GLUCOSE_MONITOR in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_INSULIN_PUMP

relate to BTM_BLE_APPEARANCE_GENERIC_INSULIN_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_DURABLE_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN

relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY

relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS

relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

ESP_GAP_BLE_CHANNELS_LEN

channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT

This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX

Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX

Scan response data maximum length.

BLE_BIT (n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED

Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE

Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE

Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED

Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED

High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY

Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV

Omit advertiser's address from all PDUs ("anonymous advertising")

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR

Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0)ADV_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND

ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR

ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR

ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN

ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M

Secondary Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M

Secondary Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED

Secondary Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY

No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY

No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED

Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK

The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK

The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK

The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF

The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK

Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK

Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE

Advertising data.

extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE

extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED

extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO

Advertising SYNC policy.

sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST

periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND

Advertising report.

advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND

advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV

advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND

advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND

advertising report with legacy direct indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND

advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND

advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND

advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND

advertising report with legacy advertising with scan response indication type

EXT_ADV_TX_PWR_NO_PREFERENCE

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

ESP_BLE_GAP_PAST_MODE_NO_SYNC_EVT

Periodic advertising sync trans mode.

No attempt is made to sync and no periodic adv sync transfer received event

ESP_BLE_GAP_PAST_MODE_NO_REPORT_EVT

An periodic adv sync transfer received event and no periodic adv report events

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_DISABLED

Periodic adv report events will be enabled with duplicate filtering disabled

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_ENABLED

Periodic adv report events will be enabled with duplicate filtering enabled

Type Definitions

```
typedef uint8_t esp_ble_key_type_t
```

```
typedef uint8_t esp_ble_auth_req_t
```

combination of the above bit pattern

```
typedef uint8_t esp_ble_io_cap_t
```

combination of the io capability

```
typedef uint8_t esp_gap_ble_channels[5]
```

```
typedef uint8_t esp_duplicate_info_t[6]
```

```
typedef uint16_t esp_ble_ext_adv_type_mask_t
```

```
typedef uint8_t esp_ble_gap_phy_t
```

```
typedef uint8_t esp_ble_gap_all_phys_t
```

```
typedef uint8_t esp_ble_gap_pri_phy_t
```

```
typedef uint8_t esp_ble_gap_phy_mask_t
```

```
typedef uint16_t esp_ble_gap_prefer_phy_options_t
```

```
typedef uint8_t esp_ble_ext_scan_cfg_mask_t
```

```
typedef uint8_t esp_ble_gap_ext_adv_data_status_t
```

```
typedef uint8_t esp_ble_gap_sync_t
```

```
typedef uint8_t esp_ble_gap_adv_type_t
```

```
typedef uint8_t esp_ble_gap_past_mode_t
```

```
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
```

GAP callback function type.

Param event : Event type

Param param : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

Values:

enumerator **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**

When advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**

When scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**

When scan parameters set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RESULT_EVT**

When one scan result ready, the event comes each time

enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**

When raw scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**

When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**

When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**

Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**

BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**

BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**

passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**

passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**

OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**

BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**

Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**

When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**

When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**

When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**

When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**

When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**

When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**

When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**

When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

when reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**

when preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**

when preferred phy complete , this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**

when extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**

when extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**

when extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**

when extended scan response data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT**

when extended advertising start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT**

when extended advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT**

when extended advertising set remove complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT**

when extended advertising set clear complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT**

when periodic advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT**

when periodic advertising data complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT**

when periodic advertising start complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT**

when periodic advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT**

when periodic advertising create sync complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT**

when extended advertising sync cancel complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT**

when extended advertising sync terminate complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT**

when extended advertising add device complete , the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT**

when extended advertising remove device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT**

when extended advertising clear device, the event comes

enumerator **ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT**

when extended scan parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT**

when extended scan start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT**

when extended scan stop complete, the event comes

enumerator **ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT**

when extended prefer connection parameter set complete, the event comes

enumerator **ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT**

when ble phy update complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_REPORT_EVT**

when extended advertising report complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_TIMEOUT_EVT**

when scan timeout complete, the event comes

enumerator **ESP_GAP_BLE_ADV_TERMINATED_EVT**

when advertising terminate data complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT**

when scan req received complete, the event comes

enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**

when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**

when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**

when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**

when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_SC_OOB_REQ_EVT**

Secure Connection OOB request event

enumerator **ESP_GAP_BLE_SC_CR_LOC_OOB_EVT**

Secure Connection create OOB data complete event

enumerator **ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT**

When getting BT device name complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT**

when set periodic advertising receive enable complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT**

when periodic advertising sync transfer complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT**

when periodic advertising set info transfer complete, the event comes

enumerator **ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT**

when set periodic advertising sync transfer params complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT**

when periodic advertising sync transfer received, the event comes

enumerator **ESP_GAP_BLE_ADV_CLEAR_COMPLETE_EVT**

When clear advertising complete, the event comes

enumerator **ESP_GAP_BLE_EVT_MAX**

when maximum advertising event complete, the event comes

enum **esp_ble_adv_data_type**

The type of advertising data(not adv_type)

Values:

enumerator **ESP_BLE_AD_TYPE_FLAG**

enumerator **ESP_BLE_AD_TYPE_16SRV_PART**

enumerator **ESP_BLE_AD_TYPE_16SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_32SRV_PART**

enumerator **ESP_BLE_AD_TYPE_32SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_128SRV_PART**

enumerator **ESP_BLE_AD_TYPE_128SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_NAME_SHORT**

enumerator **ESP_BLE_AD_TYPE_NAME_CMPL**

enumerator **ESP_BLE_AD_TYPE_TX_PWR**

enumerator **ESP_BLE_AD_TYPE_DEV_CLASS**

enumerator **ESP_BLE_AD_TYPE_SM_TK**

enumerator **ESP_BLE_AD_TYPE_SM_OOB_FLAG**

enumerator **ESP_BLE_AD_TYPE_INT_RANGE**

enumerator **ESP_BLE_AD_TYPE_SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_128SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_PUBLIC_TARGET**

enumerator **ESP_BLE_AD_TYPE_RANDOM_TARGET**

enumerator **ESP_BLE_AD_TYPE_APPEARANCE**

enumerator **ESP_BLE_AD_TYPE_ADV_INT**

enumerator **ESP_BLE_AD_TYPE_LE_DEV_ADDR**

enumerator **ESP_BLE_AD_TYPE_LE_ROLE**

enumerator **ESP_BLE_AD_TYPE_SPAIR_C256**

enumerator **ESP_BLE_AD_TYPE_SPAIR_R256**

enumerator **ESP_BLE_AD_TYPE_32SOL_SRV_UUID**

enumerator **ESP_BLE_AD_TYPE_32SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_128SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_RANDOM**

enumerator **ESP_BLE_AD_TYPE_URI**

enumerator **ESP_BLE_AD_TYPE_INDOOR_POSITION**

enumerator **ESP_BLE_AD_TYPE_TRANS_DISC_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE**

enumerator **ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE**

enumerator **ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE**

enum **esp_ble_adv_type_t**

Advertising mode.

Values:

enumerator **ADV_TYPE_IND**

enumerator **ADV_TYPE_DIRECT_IND_HIGH**

enumerator **ADV_TYPE_SCAN_IND**

enumerator **ADV_TYPE_NONCONN_IND**

enumerator **ADV_TYPE_DIRECT_IND_LOW**

enum **esp_ble_adv_channel_t**

Advertising channel mask.

Values:

enumerator **ADV_CHNL_37**

enumerator **ADV_CHNL_38**

enumerator **ADV_CHNL_39**

enumerator **ADV_CHNL_ALL**

enum **esp_ble_adv_filter_t**

Values:

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST**

Allow scan and connection requests from White List devices only.

enum **esp_ble_sec_act_t**

Values:

enumerator **ESP_BLE_SEC_ENCRYPT**

relate to `BTA_DM_BLE_SEC_ENCRYPT` in `bta/bta_api.h`. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will use the default authentication request used by the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

relate to `BTA_DM_BLE_SEC_ENCRYPT_NO_MITM` in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

relate to `BTA_DM_BLE_SEC_ENCRYPT_MITM` in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enum **esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**

Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**

Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**

Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**

Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**

Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:

enumerator **BLE_SCAN_DUPLICATE_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE_SCAN_DUPLICATE_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE_SCAN_DUPLICATE_ENABLE_RESET**

Duplicate filtering enabled, reset for each scan period, only supported in BLE 5.0.

enumerator **BLE_SCAN_DUPLICATE_MAX**

Reserved for future use.

enum **esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator **ESP_GAP_SEARCH_INQ_RES_EVT**

Inquiry result for a peer device.

enumerator **ESP_GAP_SEARCH_INQ_CMPL_EVT**

Inquiry complete.

enumerator **ESP_GAP_SEARCH_DISC_RES_EVT**

Discovery result for a peer device.

enumerator **ESP_GAP_SEARCH_DISC_BLE_RES_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP_GAP_SEARCH_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT**

Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**

The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator **ESP_BLE_EVT_CONN_ADV**
Connectable undirected advertising (ADV_IND)

enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**
Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**
Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**
Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

Values:

enumerator **ESP_BLE_WHITELIST_REMOVE**
remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**
add address to whitelist

enumerator **ESP_BLE_WHITELIST_CLEAR**
clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
Remove device info from duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
BLE advertising address , device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SOLIC_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1859 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_URI_ADV**

BLE mesh URI adv, the format is ... | Len | 0x24 | data | ...

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with proxy service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SOLIC_ADV_LIST**

duplicate scan exceptional mesh adv with proxy solicitation PDU uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_URI_ADV_LIST**

duplicate scan exceptional URI list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h](#)

Unions

union **esp_gatt_rsp_t**

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t **attr_value**

Gatt attribute structure

uint16_t **handle**

Gatt attribute handle

Structures

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t **uuid**

UUID

uint8_t **inst_id**

Instance id

struct **esp_gatt_srv_id_t**

Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t **id**

Gatt id, include uuid and instance

bool **is_primary**

This service is primary or not

struct **esp_attr_desc_t**

Attribute description (used to create database)

Public Members

uint16_t **uuid_length**

UUID length

uint8_t ***uuid_p**

UUID value

uint16_t **perm**

Attribute permission

uint16_t **max_length**

Maximum length of the element

uint16_t **length**

Current length of the element

uint8_t ***value**

Element value array

struct **esp_attr_control_t**

attribute auto response flag

Public Members

uint8_t **auto_rsp**

if `auto_rsp` set to `ESP_GATT_RSP_BY_APP`, means the response of Write/Read operation will be replied by application. if `auto_rsp` set to `ESP_GATT_AUTO_RSP`, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp_gatts_attr_db_t**

attribute type added to the gatt server database

Public Members

[*esp_attr_control_t*](#) **attr_control**

The attribute control type

[*esp_attr_desc_t*](#) **att_desc**

The attribute type

struct **esp_attr_value_t**

set the attribute value type

Public Members

uint16_t **attr_max_len**

attribute max value length

uint16_t **attr_len**

attribute current value length

uint8_t ***attr_value**

the pointer to attribute value

struct **esp_gatts_incl_svc_desc_t**

Gatt include service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included service

uint16_t **end_hdl**

Gatt end handle value of included service

uint16_t **uuid**

Gatt attribute value UUID of included service

struct **esp_gatts_incl128_svc_desc_t**

Gatt include 128 bit service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included 128 bit service

uint16_t **end_hdl**

Gatt end handle value of included 128 bit service

struct **esp_gatt_value_t**

Gatt attribute value.

Public Members

uint8_t **value**[600]

Gatt attribute value

uint16_t **handle**

Gatt attribute handle

uint16_t **offset**

Gatt attribute value offset

uint16_t **len**

Gatt attribute value length

uint8_t **auth_req**

Gatt authentication request

struct **esp_gatt_conn_params_t**

Connection parameters information.

Public Members**uint16_t interval**

connection interval

uint16_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeoutSupervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 secondsstruct **esp_gattc_multi_t**

read multiple attribute

Public Members**uint8_t num_attr**

The number of the attribute

uint16_t handles[10]

The handles list

struct **esp_gattc_db_elem_t**

data base attribute element

Public Members*esp_gatt_db_attr_type_t* **type**

The attribute type

uint16_t attribute_handle

The attribute handle, it' s valid for all of the type

uint16_t start_handle

The service start handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle

The service end handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t **properties**

The characteristic properties, it' s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t **uuid**

The attribute uuid, it' s valid for all of the type

struct **esp_gattc_service_elem_t**
service element

Public Members

bool **is_primary**
The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**
The start handle of the service

uint16_t **end_handle**
The end handle of the service

esp_bt_uuid_t **uuid**
The uuid of the service

struct **esp_gattc_char_elem_t**
characteristic element

Public Members

uint16_t **char_handle**
The characteristic handle

esp_gatt_char_prop_t **properties**
The characteristic properties

esp_bt_uuid_t **uuid**
The characteristic uuid

struct **esp_gattc_descr_elem_t**
descriptor element

Public Members

uint16_t **handle**
The characteristic descriptor handle

esp_bt_uuid_t **uuid**
The characteristic descriptor uuid

struct **esp_gattc_incl_svc_elem_t**
include service element

Public Members

`uint16_t handle`

The include service current attribute handle

`uint16_t incl_srvc_s_handle`

The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`

The end handle of the service which has been included

`esp_bt_uuid_t uuid`

The include service uuid

ESP_GATT_IF_NONE

If callback report `gattc_if/gatts_if` as this macro, means this event is not correspond to any app

Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different `gatt_if`

Enumerations

enum **esp_gatt_prep_write_type**

Attribute write data type from the client.

Values:

enumerator **ESP_GATT_PREP_WRITE_CANCEL**

Prepare write cancel

enumerator **ESP_GATT_PREP_WRITE_EXEC**

Prepare write execute

enum **esp_gatt_status_t**

GATT success code and error codes.

Values:

enumerator **ESP_GATT_OK**

enumerator **ESP_GATT_INVALID_HANDLE**

enumerator **ESP_GATT_READ_NOT_PERMIT**

enumerator **ESP_GATT_WRITE_NOT_PERMIT**

enumerator **ESP_GATT_INVALID_PDU**

enumerator **ESP_GATT_INSUF_AUTHENTICATION**

enumerator **ESP_GATT_REQ_NOT_SUPPORTED**

enumerator **ESP_GATT_INVALID_OFFSET**

enumerator **ESP_GATT_INSUF_AUTHORIZATION**

enumerator **ESP_GATT_PREPARE_Q_FULL**

enumerator **ESP_GATT_NOT_FOUND**

enumerator **ESP_GATT_NOT_LONG**

enumerator **ESP_GATT_INSUF_KEY_SIZE**

enumerator **ESP_GATT_INVALID_ATTR_LEN**

enumerator **ESP_GATT_ERR_UNLIKELY**

enumerator **ESP_GATT_INSUF_ENCRYPTION**

enumerator **ESP_GATT_UNSUPPORT_GRP_TYPE**

enumerator **ESP_GATT_INSUF_RESOURCE**

enumerator **ESP_GATT_NO_RESOURCES**

enumerator **ESP_GATT_INTERNAL_ERROR**

enumerator **ESP_GATT_WRONG_STATE**

enumerator **ESP_GATT_DB_FULL**

enumerator **ESP_GATT_BUSY**

enumerator **ESP_GATT_ERROR**

enumerator **ESP_GATT_CMD_STARTED**

enumerator **ESP_GATT_ILLEGAL_PARAMETER**

enumerator **ESP_GATT_PENDING**

enumerator **ESP_GATT_AUTH_FAIL**

enumerator **ESP_GATT_PRC_IN_PROGRESS**

enumerator **ESP_GATT_OUT_OF_RANGE**

enum **esp_gatt_conn_reason_t**

Gatt Connection reason enum.

Values:

enumerator **ESP_GATT_CONN_UNKNOWN**

Gatt connection unknown

enumerator **ESP_GATT_CONN_L2C_FAILURE**

General L2cap failure

enumerator **ESP_GATT_CONN_TIMEOUT**

Connection timeout

enumerator **ESP_GATT_CONN_TERMINATE_PEER_USER**

Connection terminate by peer user

enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**

Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**

Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**

L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**

No connection to cancel

enum **esp_gatt_auth_req_t**

Gatt authentication request type.

Values:

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

Values:

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**

Gatt write type.

Values:

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**

Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**

the type of attribute element

Values:

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP_GATT_DB_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
 - [bluetooth/bluedroid/ble/gatt_server_service_table](#)
 - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
 - [bluetooth/bluedroid/ble/gatt_server](#)
 - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
 - [bluetooth/bluedroid/ble/ble_spp_server](#)

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gatts_api.h](#)

Functions

esp_err_t **esp_ble_gatts_register_callback** (*esp_gatts_cb_t* callback)

This function is called to register application callbacks with BTA GATTS module.

Returns

- ESP_OK : success
- other : failed

esp_gatts_cb_t **esp_ble_gatts_get_callback** (void)

This function is called to get the current application callbacks with BTA GATTS module.

Returns

- esp_gatts_cb_t : current callback

esp_err_t **esp_ble_gatts_app_register** (uint16_t app_id)

This function is called to register application identifier.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_unregister** (*esp_gatt_if_t* gatts_if)

unregister with GATT Server.

Parameters *gatts_if* –[in] GATT server access interface

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_service** (*esp_gatt_if_t* gatts_if, *esp_gatt_srvc_id_t* *service_id, *uint16_t* num_handle)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

Parameters

- **gatts_if** –[in] GATT server access interface
- **service_id** –[in] service ID.
- **num_handle** –[in] number of handle requested for this service.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_attr_tab** (const *esp_gatts_attr_db_t* *gatts_attr_db, *esp_gatt_if_t* gatts_if, *uint16_t* max_nb_attr, *uint8_t* srvc_inst_id)

Create a service attribute tab.

Parameters

- **gatts_attr_db** –[in] the pointer to the service attr tab
- **gatts_if** –[in] GATT server access interface
- **max_nb_attr** –[in] the number of attribute to be added to the service database.
- **srvc_inst_id** –[in] the instance id of the service

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_included_service** (*uint16_t* service_handle, *uint16_t* included_service_handle)

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Parameters

- **service_handle** –[in] service handle to which this included service is to be added.
- **included_service_handle** –[in] the service ID to be included.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char** (*uint16_t* service_handle, *esp_bt_uuid_t* *char_uuid, *esp_gatt_perm_t* perm, *esp_gatt_char_prop_t* property, *esp_attr_value_t* *char_val, *esp_attr_control_t* *control)

This function is called to add a characteristic into a service.

Parameters

- **service_handle** –[in] service handle to which this included service is to be added.
- **char_uuid** –[in] : Characteristic UUID.
- **perm** –[in] : Characteristic value declaration attribute permission.
- **property** –[in] : Characteristic Properties
- **char_val** –[in] : Characteristic value
- **control** –[in] : attribute response control byte

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char_descr** (*uint16_t* service_handle, *esp_bt_uuid_t* *descr_uuid, *esp_gatt_perm_t* perm, *esp_attr_value_t* *char_descr_val, *esp_attr_control_t* *control)

This function is called to add characteristic descriptor. When it's done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Parameters

- **service_handle** –[in] service handle to which this characteristic descriptor is to be added.
- **perm** –[in] descriptor access permission.
- **descr_uuid** –[in] descriptor UUID.
- **char_descr_val** –[in] : Characteristic descriptor value
- **control** –[in] : attribute response control byte

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_delete_service** (uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Parameters **service_handle** –[in] service_handle to be deleted.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_start_service** (uint16_t service_handle)

This function is called to start a service.

Parameters **service_handle** –[in] the service handle to be started.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_stop_service** (uint16_t service_handle)

This function is called to stop a service.

Parameters **service_handle** –[in] - service to be topped.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_indicate** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size,see “esp_ble_gattc_send_mtu_req”

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection id to indicate.
- **attr_handle** –[in] - attribute handle to indicate.
- **value_len** –[in] - indicate value length.
- **value** –[in] value to indicate.
- **need_confirm** –[in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_response** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint32_t trans_id, *esp_gatt_status_t* status, *esp_gatt_rsp_t* *rsp)

This function is called to send a response to a request.

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection identifier.
- **trans_id** –[in] - transfer id

- **status** –[in] - response status
- **rsp** –[in] - response data.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_set_attr_value** (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Parameters

- **attr_handle** –[in] the attribute handle which to be set
- **length** –[in] the value length
- **value** –[in] the pointer to the attribute value

Returns

- ESP_OK : success
- other : failed

esp_gatt_status_t **esp_ble_gatts_get_attr_value** (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

Parameters

- **attr_handle** –[in] Attribute handle.
- **length** –[out] pointer to the attribute value length
- **value** –[out] Pointer to attribute value payload, the value cannot be modified by user

Returns

- ESP_GATT_OK : success
- other : failed

esp_err_t **esp_ble_gatts_open** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

Parameters

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address.
- **is_direct** –[in] direct connection or background auto connection

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_close** (*esp_gatt_if_t* gatts_if, uint16_t conn_id)

Close a connection a remote device.

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] connection ID to be closed.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_service_change_indication** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda)

Send service change indication.

Parameters

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_show_local_database** (void)

Print local database (GATT service table)

Returns

- ESP_OK : success
- other : failed

Unions

union **esp_ble_gatts_cb_param_t**

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct *esp_ble_gatts_cb_param_t::gatts_reg_evt_param* **reg**

Gatt server callback param of ESP_GATTS_REG_EVT

struct *esp_ble_gatts_cb_param_t::gatts_read_evt_param* **read**

Gatt server callback param of ESP_GATTS_READ_EVT

struct *esp_ble_gatts_cb_param_t::gatts_write_evt_param* **write**

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param* **exec_write**

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_mtu_evt_param* **mtu**

Gatt server callback param of ESP_GATTS_MTU_EVT

struct *esp_ble_gatts_cb_param_t::gatts_conf_evt_param* **conf**

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct *esp_ble_gatts_cb_param_t::gatts_create_evt_param* **create**

Gatt server callback param of ESP_GATTS_CREATE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param* **add_incl_srvc**

Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_evt_param* **add_char**

Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param* **add_char_descr**

Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_delete_evt_param* **del**

Gatt server callback param of ESP_GATTS_DELETE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_start_evt_param* **start**

Gatt server callback param of ESP_GATTS_START_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop  
    Gatt server callback param of ESP_GATTS_STOP_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect  
    Gatt server callback param of ESP_GATTS_CONNECT_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect  
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open  
    Gatt server callback param of ESP_GATTS_OPEN_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open  
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close  
    Gatt server callback param of ESP_GATTS_CLOSE_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest  
    Gatt server callback param of ESP_GATTS_CONGEST_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp  
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab  
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val  
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT  
  
struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change  
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT  
  
struct gatts_add_attr_tab_evt_param  
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.
```

Public Members

esp_gatt_status_t **status**

Operation status

esp_bt_uuid_t **svc_uuid**

Service uuid type

uint8_t **svc_inst_id**

Service id

uint16_t **num_handle**

The number of the attribute handle to be added to the gatts database

uint16_t ***handles**

The number to the handles

struct **gatts_add_char_descr_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_DESCR_EVT.

Public Members

Operation status

struct **gatts_read_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_READ_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been read

uint16_t **handle**

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **is_long**
The value is too long or not

bool **need_rsp**
The read operation need to do response

struct **gatts_reg_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_REG_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

uint16_t **app_id**
Application id which input in register API

struct **gatts_rsp_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_RESPONSE_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

uint16_t **handle**
Attribute handle which send response

struct **gatts_send_service_change_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.

Public Members

esp_gatt_status_t **status**
Operation status

struct **gatts_set_attr_val_evt_param**
#include <esp_gatts_api.h> ESP_GATTS_SET_ATTR_VAL_EVT.

Public Members

uint16_t **srvc_handle**
The service handle

uint16_t **attr_handle**
The attribute handle

esp_gatt_status_t **status**

Operation status

struct **gatts_start_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_START_EVT.

Public Members

Operation status

uint16_t **service_handle**

Service attribute handle

struct **gatts_stop_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_STOP_EVT.

Public Members

esp_gatt_status_t **status**

Operation status

uint16_t **service_handle**

Service attribute handle

struct **gatts_write_evt_param**

#include <esp_gatts_api.h> ESP_GATTS_WRITE_EVT.

Public Members

uint16_t **conn_id**

Connection id

uint32_t **trans_id**

Transfer id

esp_bd_addr_t **bda**

The bluetooth device address which been written

uint16_t **handle**

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **need_rsp**
The write operation need to do response

bool **is_prep**
This write operation is prepare write

uint16_t **len**
The write attribute value length

uint8_t ***value**
The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL
Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC
Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (***esp_gatts_cb_t**)(*esp_gatts_cb_event_t* event, *esp_gatt_if_t* gatts_if, *esp_ble_gatts_cb_param_t* *param)

GATT Server callback function type.

Param event : Event type

Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gatts_cb_event_t**
GATT Server callback function events.

Values:

enumerator **ESP_GATTS_REG_EVT**
When register application id, the event comes

enumerator **ESP_GATTS_READ_EVT**
When gatt client request read operation, the event comes

enumerator **ESP_GATTS_WRITE_EVT**
When gatt client request write operation, the event comes

enumerator **ESP_GATTS_EXEC_WRITE_EVT**
When gatt client request execute write, the event comes

enumerator **ESP_GATTS_MTU_EVT**
When set mtu complete, the event comes

enumerator **ESP_GATTS_CONF_EVT**

When receive confirm, the event comes

enumerator **ESP_GATTS_UNREG_EVT**

When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**

When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**

When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**

When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**

When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**

When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**

When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**

When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**

When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**

When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**

When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**

When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**

When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**

When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**

When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**

When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**

When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**

When gatt send service change indication complete, the event comes

GATT CLIENT API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
 - [bluetooth/bluedroid/ble/gatt_client](#)
 - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
 - [bluetooth/bluedroid/ble/gattc_multi_connect](#)
 - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.

Functions

esp_err_t **esp_ble_gattc_register_callback** (*esp_gattc_cb_t* callback)

This function is called to register application callbacks with GATTC module.

Parameters **callback** **–[in]** : pointer to the application callback function.

Returns

- ESP_OK: success
- other: failed

esp_gattc_cb_t **esp_ble_gattc_get_callback** (void)

This function is called to get the current application callbacks with BTA GATTC module.

Returns

- *esp_gattc_cb_t* : current callback

esp_err_t **esp_ble_gattc_app_register** (uint16_t app_id)

This function is called to register application callbacks with GATTC module.

Parameters **app_id** **–[in]** : Application Identify (UUID), for different application

Returns

- ESP_OK: success

- other: failed

esp_err_t **esp_ble_gattc_app_unregister** (*esp_gatt_if_t* gattc_if)

This function is called to unregister an application from GATT module.

Parameters **gattc_if** –[in] Gatt client access interface.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **remote_bda** –[in] remote device bluetooth device address.
- **remote_addr_type** –[in] remote device bluetooth device the address type.
- **is_direct** –[in] direct connection or background auto connection (by now, background auto connection is not supported).

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_aux_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

esp_err_t **esp_ble_gattc_close** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID to be closed.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_send_mtu_req** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_search_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *filter_uuid)

This function is called to get service from local cache. This function report service search result by a call-back event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.
- **filter_uuid** –[in] a UUID of the service application is interested in. If Null, discover for all services.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *svc_uuid, *esp_gattc_service_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **svc_uuid** –[in] the pointer to the service uuid.
- **result** –[out] The pointer to the service which has been found in the gattc cache.
- **count** –[inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –[in] Offset of the service position to get.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_char_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle.
- **end_handle** –[in] the attribute end handle
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –[in] Offset of the characteristic position to get.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t char_handle, *esp_gattc_descr_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the given characteristic handle
- **result** –[out] The pointer to the descriptor in the characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –[in] Offset of the descriptor position to get.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the characteristic handle.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                    uint16_t start_handle, uint16_t end_handle,
                                                    esp_bt_uuid_t *incl_uuid,
                                                    esp_gattc_incl_svc_elem_t *result, uint16_t
                                                    *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **incl_uuid** –[in] the include service uuid
- **result** –[out] The pointer to the include service in the given service.
- **count** –[inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                esp_gatt_db_attr_type_t type, uint16_t start_handle,
                                                uint16_t end_handle, uint16_t char_handle, uint16_t
                                                *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **type** –[in] the attribute type.
- **start_handle** –[in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **end_handle** –[in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **char_handle** –[in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- **count** –[out] output the number of attribute has been found in the gattc cache with the given attribute type.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle,
                                         uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **conn_id** –[in] connection ID which identify the server.
- **db** –[in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –[in] number of elements in database.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service' s characteristics of the given characteristic handle.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteritic handle to read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_by_type** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *uuid, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service' s characteristics of the given characteristic UUID.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **start_handle** –[in] : the attribute start handle.
- **end_handle** –[in] : the attribute end handle
- **uuid** –[in] : The UUID of attribute which will be read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple_variable** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gattc_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple variable length characteristic or characteristic descriptors.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a characteristics descriptor.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : descriptor handle to read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic descriptor value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID
- **handle** –[in] : descriptor handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic descriptor value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic descriptor handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_execute_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **is_execute** –[in] : execute or cancel.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_register_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to register for notification of a service.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

Returns

- ESP_OK: registration succeeds
- other: failed

esp_err_t **esp_ble_gattc_unregister_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to de-register for notification of a service.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

Returns

- ESP_OK: unregister succeeds
- other: failed

esp_err_t **esp_ble_gattc_cache_refresh** (*esp_bd_addr_t* remote_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Parameters **remote_bda** –[in] remote device BD address.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_assoc** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* src_addr, *esp_bd_addr_t* assoc_addr, bool is_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device wants to use the database has stored in the local cache. The source address means that device wants to share the database to the associated address device.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **src_addr** –[in] the source address which provides the attribute table.
- **assoc_addr** –[in] the associated device address which wants to share the attribute table with the source address.
- **is_assoc** –[in] true adds the associated device address, false removes the associated device address.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_get_addr_list** (*esp_gatt_if_t* gattc_if)

Get the address list which has stored the attribute table in the gattc cache. There will be a callback ESP_GATTC_GET_ADDR_LIST_EVT event when the address list is complete.

Parameters **gattc_if** –[in] Gatt client access interface.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_clean** (*esp_bd_addr_t* remote_bda)

Clean the service cache of this device in the gattc stack.

Parameters **remote_bda** –[in] remote device BD address.

Returns

- ESP_OK: success
- other: failed

Unions

union **esp_ble_gattc_cb_param_t**

#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

struct *esp_ble_gattc_cb_param_t::gattc_reg_evt_param* **reg**
Gatt client callback param of ESP_GATTC_REG_EVT

struct *esp_ble_gattc_cb_param_t::gattc_open_evt_param* **open**
Gatt client callback param of ESP_GATTC_OPEN_EVT

struct *esp_ble_gattc_cb_param_t::gattc_close_evt_param* **close**
Gatt client callback param of ESP_GATTC_CLOSE_EVT

Operation status

uint16_t **conn_id**

Connection id

uint16_t **handle**

The Characteristic or descriptor handle

uint16_t **offset**

The prepare write offset, this value is valid only when prepare write

Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

Param event : Event type

Param gattc_if : GATT client access interface, normally different gattc_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

Values:

enumerator **ESP_GATTC_REG_EVT**

When GATT client is registered, the event comes

enumerator **ESP_GATTC_UNREG_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP_GATTC_OPEN_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP_GATTC_READ_CHAR_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP_GATTC_WRITE_CHAR_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP_GATTC_CLOSE_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP_GATTC_SEARCH_CMPL_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP_GATTC_SEARCH_RES_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP_GATTC_READ_DESCR_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP_GATTC_WRITE_DESCR_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP_GATTC_NOTIFY_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP_GATTC_PREP_WRITE_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP_GATTC_EXEC_EVT**

When write execution completes, the event comes

enumerator **ESP_GATTC_ACL_EVT**

When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**

When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**

When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**

When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**

When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**

When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**

When the ble discover service complete, the event comes

enumerator **ESP_GATTC_READ_MULTI_VAR_EVT**

When read multiple variable characteristic complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

API Reference

Header File

- [components/bt/common/api/include/api/esp_blufi_api.h](#)

Functions

esp_err_t **esp_blufi_register_callbacks** (*esp_blufi_callbacks_t**callbacks)

This function is called to receive blufi callback event.

Parameters **callbacks** –[in] callback functions

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_init** (void)

This function is called to initialize blufi_profile.

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_profile_deinit** (void)

This function is called to de-initialize blufi_profile.

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_conn_report** (*wifi_mode_t* opmode, *esp_blufi_sta_conn_state_t* sta_conn_state, *uint8_t* softap_conn_num, *esp_blufi_extra_info_t**extra_info)

This function is called to send wifi connection report.

Parameters

- **opmode** –: wifi opmode

- **sta_conn_state** –: station is already in connection or not
- **softap_conn_num** –: softap connection number
- **extra_info** –: extra information, such as sta_ssid, softap_ssid and etc.

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_wifi_list** (uint16_t apCount, *esp_blufi_ap_record_t* *list)

This function is called to send wifi list.

Parameters

- **apCount** –: wifi list count
- **list** –: wifi list

Returns ESP_OK - success, other - failed

uint16_t **esp_blufi_get_version** (void)

Get BLUFI profile version.

Returns Most 8bit significant is Great version, Least 8bit is Sub version

esp_err_t **esp_blufi_send_error_info** (*esp_blufi_error_state_t* state)

This function is called to send blufi error information.

Parameters **state** –: error state

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_custom_data** (uint8_t *data, uint32_t data_len)

This function is called to custom data.

Parameters

- **data** –: custom data value
- **data_len** –: the length of custom data

Returns ESP_OK - success, other - failed

Unions

union **esp_blufi_cb_param_t**

#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

struct *esp_blufi_cb_param_t::blufi_init_finish_evt_param* **init_finish**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_deinit_finish_evt_param* **deinit_finish**

Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct *esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param* **wifi_mode**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_connect_evt_param* **connect**

Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct *esp_blufi_cb_param_t::blufi_disconnect_evt_param* **disconnect**

Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

struct *esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param* **sta_bssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

```
struct esp_blufi_cb_param_t::blufi_rcv_sta_ssid_evt_param sta_ssid  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID
```

uint8_t **softap_channel**

channel of softap interface

bool **softap_channel_set**

is channel of softap interface set

uint8_t **sta_max_conn_retry**

max retry of sta establish connection

bool **sta_max_conn_retry_set**

is max retry of sta establish connection set

uint8_t **sta_conn_end_reason**

reason of sta connection end

bool **sta_conn_end_reason_set**

is reason of sta connection end set

int8_t **sta_conn_rssi**

rssi of sta connection

bool **sta_conn_rssi_set**

is rssi of sta connection set

struct **esp_blufi_ap_record_t**

Description of an WiFi AP.

Public Members

uint8_t **ssid**[33]

SSID of AP

int8_t **rssi**

signal strength of AP

struct **esp_blufi_callbacks_t**

BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t **event_cb**

BLUFI event callback

esp_blufi_negotiate_data_handler_t **negotiate_data_handler**

BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t **encrypt_func**

BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t **decrypt_func**

BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t **checksum_func**

BLUFI check sum function (FCS)

Macros

ESP_BLUFI_BD_ADDR_LEN

Bluetooth address length.

Type Definitions

typedef uint8_t **esp_blufi_bd_addr_t**[6]

Bluetooth device address.

typedef void (***esp_blufi_event_cb_t**)(*esp_blufi_cb_event_t* event, *esp_blufi_cb_param_t* *param)

BLUFI event callback function type.

Param event : Event type

Param param : Point to callback parameter, currently is union type

typedef void (***esp_blufi_negotiate_data_handler_t**)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone

Param len : length of data from phone

Param output_data : data want to send to phone

Param output_len : length of data want to send to phone
Param need_free : output reporting if memory needs to be freed or not *

typedef int (***esp_blufi_encrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt
Param crypt_len : length of plain text
Return Nonnegative number is encrypted length, if error, return negative number;

typedef int (***esp_blufi_decrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt
Param crypt_len : length of encrypted text
Return Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (***esp_blufi_checksum_func_t**)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number
Param data : data need to checksum
Param len : length of data

Enumerations

enum **esp_blufi_cb_event_t**

Values:

enumerator **ESP_BLUFI_EVENT_INIT_FINISH**

enumerator **ESP_BLUFI_EVENT_DEINIT_FINISH**

enumerator **ESP_BLUFI_EVENT_SET_WIFI_OPMODE**

enumerator **ESP_BLUFI_WIFI_SCAN_FAIL**

enumerator **ESP_BLUFI_MSG_STATE_ERROR**

2.1.4 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Returns

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init` (void)

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port_
    ↪stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ↪", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration

nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.

Returns

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note: This function should be called after the NimBLE host is deinitialized.

Returns

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

esp_err_t **esp_nimble_hci_and_controller_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

```
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();

    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with_
error: %d", ret);
    }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Note: This function should not be executed in the context of Bluetooth host task.

Note: This function should be called after the NimBLE host is deinitialized.

Returns

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

BLE_HCI_UART_H4_EVT

2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [Getting Started with ESP-BLE-MESH](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH Architecture](#).

Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH Examples](#) and [ESP-BLE-MESH Demo Videos](#).

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- [components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h](#)

Unions

```
union esp_ble_mesh_prov_cb_param_t  
    #include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param prov_register_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param  
provisioner_delete_node_with_addr_comp
```

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int **err_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]  
provisioner_enable_heartbeat_rcv_comp
```

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t **type**

Type of the filter used for receiving heartbeat messages

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]  
provisioner_set_heartbeat_filter_type_comp
```

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t **op**

Operation (add, remove, clean)

uint16_t **hb_src**

Heartbeat source address

uint16_t **hb_dst**

Heartbeat destination address

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_set_heartbeat_filter_info_comp

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t **init_ttl**

Heartbeat InitTTL

uint8_t **rx_ttl**

Heartbeat RxTTL

uint8_t **hops**

Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t **feature**

Bit field of currently active features of the node

int8_t **rss_i**

RSSI of the heartbeat message

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_rcv_heartbeat**

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

struct ble_mesh_friend_friendship_terminate_param
```

```
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
```

Public Types

```
enum [anonymous]
```

This enum value is the reason of friendship termination on the friend node side

Values:

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
```

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

```
enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
```

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**
Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**
Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**
Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t **lpn_addr**
Low Power Node unicast address

enum *esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]*
reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct **ble_mesh_heartbeat_msg_rcv_param**
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

Public Members

uint32_t **opcode**

Opcode of the received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the received message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_publish_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int **err_code**

Indicate the result of publishing a message

esp_ble_mesh_model_t ***model**

Pointer to the model which publishes the message

struct **ble_mesh_model_publish_update_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model which is going to update its publish message

struct **ble_mesh_model_send_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int **err_code**

Indicate the result of sending a message

uint32_t **opcode**

Opcode of the message

esp_ble_mesh_model_t ***model**

Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t ***ctx**

Context of the message

struct **ble_mesh_server_model_update_state_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating server model state

esp_ble_mesh_model_t ***model**

Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t **type**

Type of the updated server state

Structures

struct **esp_ble_mesh_deinit_param_t**

BLE Mesh deinit parameters

Public Members

bool **erase_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp_ble_mesh_elem_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

Public Members

uint16_t **element_addr**

Element Address, assigned during provisioning.

const uint16_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count**

SIG Model count

const uint8_t **vnd_model_count**

Vendor Model count

esp_ble_mesh_model_t ***sig_models**

SIG Models

esp_ble_mesh_model_t ***vnd_models**

Vendor Models

struct **esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t **publish_addr**

Publish Address.

uint16_t **app_idx**

Publish AppKey Index.

uint16_t **cred**

Friendship Credentials Flag.

uint16_t **send_rel**

Force reliable sending (segment acks)

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t **period_div**

Divisor for the Period.

uint8_t **fast_period**

Use FastPeriodDivisor

uint8_t **count**

Retransmissions left.

uint32_t **period_start**

Start of the current period.

struct net_buf_simple ***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t **update**

Callback used to update publish message. Initialized by the stack.

struct k_delayed_work **timer**

Publish Period Timer. Initialized by the stack.

uint8_t **dev_role**

Role of the device that is going to publish messages

struct **esp_ble_mesh_model_op_t**

Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t **opcode**

Message opcode

const size_t **min_len**

Message minimum length

esp_ble_mesh_cb_t **param_cb**

Callback used to handle message. Initialized by the stack.

struct **esp_ble_mesh_model_cbs_t**

Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t **init_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp_ble_mesh_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t **model_id**

16-bit model identifier

uint16_t **company_id**

16-bit company identifier

uint16_t **model_id**

16-bit model identifier

struct *esp_ble_mesh_model_t*::[anonymous]::[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp_ble_mesh_model_t*::[anonymous] [**anonymous**]

Model ID

uint8_t **element_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8_t **model_idx**

Is the Nth model in the element

uint16_t **flags**

Information about what has changed

esp_ble_mesh_elem_t ***element**

The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const **pub**

Model Publication

uint16_t **keys**[CONFIG_BLE_MESH_MODEL_KEY_COUNT]

AppKey List

uint16_t **groups**[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]

Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t ***op**

Model operation context

esp_ble_mesh_model_cbs_t ***cb**

Model callback structure

void ***user_data**

Model-specific user data

struct **esp_ble_mesh_msg_ctx_t**

Message sending context. This structure is associated with struct *bt_mesh_msg_ctx* in *mesh_access.h*

Public Members

uint16_t **net_idx**

NetKey Index of the subnet through which to send the message.

uint16_t **app_idx**

AppKey Index for message encryption.

uint16_t **addr**

Remote address.

uint16_t **recv_dst**

Destination address of a received message. Not used for sending.

int8_t **recv_rssi**

RSSI of received packet. Not used for sending.

uint8_t **recv_ttl**

Received TTL value. Not used for sending.

uint8_t **send_rel**

Force sending reliably by using segment acknowledgement

uint8_t **send_ttl**

TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t **recv_op**

Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t ***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp_ble_mesh_prov_t**

Provisioning properties & capabilities. This structure is associated with struct `bt_mesh_prov` in `mesh_access.h`

struct **esp_ble_mesh_comp_t**

Node Composition data context. This structure is associated with struct `bt_mesh_comp` in `mesh_access.h`

Public Members

uint16_t **cid**

16-bit SIG-assigned company identifier

uint16_t **pid**

16-bit vendor-assigned product identifier

uint16_t **vid**

16-bit vendor-assigned product version identifier

size_t **element_count**

Element count

esp_ble_mesh_elem_t ***elements**

A sequence of elements

struct **esp_ble_mesh_unprov_dev_add_t**

Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint16_t **oob_info**

Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t **bearer**

Provisioning Bearer

struct **esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]

Device UUID

uint8_t **flag**

BIT0: device address; BIT1: device UUID

struct **esp_ble_mesh_prov_data_info_t**

Information of the provisioner which is going to be updated.

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **flags**

Flags

uint32_t **iv_index**

IV Index

uint8_t **flag**

BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct **esp_ble_mesh_node_t**

Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t **addr**

Node device address

esp_ble_mesh_addr_type_t **addr_type**

Node device address type

uint8_t **dev_uuid**[16]

Device UUID

uint16_t **oob_info**

Node OOB information

uint16_t **unicast_addr**

Node unicast address

uint8_t **element_num**

Node element number

uint16_t **net_idx**

Node NetKey Index

uint8_t **flags**

Node key refresh flag and iv update flag

uint32_t **iv_index**

Node IV Index

uint8_t **dev_key**[16]

Node device key

char **name**[31 + 1]

Node name

uint16_t **comp_length**

Length of Composition Data

uint8_t ***comp_data**

Value of Composition Data

struct **esp_ble_mesh_fast_prov_info_t**

Context of fast provisioning which need to be set.

Public Members

uint16_t **unicast_min**

Minimum unicast address used for fast provisioning

uint16_t **unicast_max**

Maximum unicast address used for fast provisioning

uint16_t **net_idx**

Netkey index used for fast provisioning

uint8_t **flags**

Flags used for fast provisioning

uint32_t **iv_index**

IV Index used for fast provisioning

uint8_t **offset**

Offset of the UUID to be compared

uint8_t **match_len**

Length of the UUID to be compared

uint8_t **match_val**[16]

Value of UUID to be compared

struct **esp_ble_mesh_heartbeat_filter_info_t**

Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t **hb_src**

Heartbeat source address (unicast address)

uint16_t **hb_dst**

Heartbeat destination address (unicast address or group address)

struct **esp_ble_mesh_client_op_pair_t**

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t **cli_op**

The client message opcode

uint32_t **status_op**

The server status opcode corresponding to the client message opcode

struct **esp_ble_mesh_client_t**

Client Model user data context.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the client model. Initialized by the stack.

int **op_pair_size**

Size of the op_pair

const *esp_ble_mesh_client_op_pair_t* ***op_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void ***internal_data**

Pointer to the internal data of client model

uint8_t **msg_role**

Role of the device (Node/Provisioner) that is going to send messages

struct **esp_ble_mesh_client_common_param_t**

Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t **opcode**

Message opcode

esp_ble_mesh_model_t ***model**

Pointer to the client model structure

esp_ble_mesh_msg_ctx_t **ctx**

The context used to send message

int32_t msg_timeout

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role

Role of the device - Node/Provisioner

struct **esp_ble_mesh_state_transition_t**

Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, *ESP_BLE_MESH_SERVER_FLAG_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp_ble_mesh_state_transition_t* sets “set_auto_rsp” to *ESP_BLE_MESH_SERVER_RSP_BY_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool just_started

Indicate if the state transition has just started

uint8_t trans_time

State transition time

uint8_t remain_time

Remaining time of state transition

uint8_t delay

Delay before starting state transition

uint32_t quo_tt

Duration of each divided transition step

uint32_t **counter**

Number of steps which the transition duration is divided

uint32_t **total_duration**

State transition total duration

int64_t **start_timestamp**

Time when the state transition is started

struct k_delayed_work **timer**

Timer used for state transition

struct **esp_ble_mesh_last_msg_info_t**

Parameters of the server model received last same set message.

Public Members

uint8_t **tid**

Transaction number of the last message

uint16_t **src**

Source address of the last message

uint16_t **dst**

Destination address of the last message

int64_t **timestamp**

Time when the last message is received

struct **esp_ble_mesh_server_rsp_ctrl_t**

Parameters of the Server Model response control

Public Members

uint8_t **get_auto_rsp**

BLE Mesh Server Response Option.

- i. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
- ii. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
- iii. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
- iv. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
- v. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
- vi. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;Response control for Client Get messages

uint8_t **set_auto_rsp**

Response control for Client Set messages

uint8_t **status_auto_rsp**

Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL

Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_FEATURE_RELAY**ESP_BLE_MESH_FEATURE_PROXY****ESP_BLE_MESH_FEATURE_FRIEND****ESP_BLE_MESH_FEATURE_LOW_POWER****ESP_BLE_MESH_FEATURE_ALL_SUPPORTED****ESP_BLE_MESH_ADDR_IS_UNICAST** (addr)**ESP_BLE_MESH_ADDR_IS_GROUP** (addr)**ESP_BLE_MESH_ADDR_IS_VIRTUAL** (addr)**ESP_BLE_MESH_ADDR_IS_RFU** (addr)**ESP_BLE_MESH_INVALID_NODE_INDEX****ESP_BLE_MESH_TRANSMIT** (count, int_ms)

Encode transmission count & interval steps.

Note: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Parameters

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

Parameters

- **transmit** –Encoded transmit count & interval value.

Returns Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

Parameters

- **transmit** –Encoded transmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

Parameters

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)

Decode Publish Retransmit count from a given value.

Parameters

- **transmit** –Encoded Publish Retransmit count & interval value.

Returns Retransmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Parameters

- **transmit** –Encoded Publish Retransmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN

Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)

ESP_BLE_MESH_MODEL_OP_2 (b0, b1)

ESP_BLE_MESH_MODEL_OP_3 (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note: This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters

- **_loc** –Location Descriptor.
- **_mods** –Array of SIG models.
- **_vnd_mods** –Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (*_name*, *_msg_len*, *_role*)

Define a model publication context.

Parameters

- **_name** –Variable name given to the context.
- **_msg_len** –Length of the publication message.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (*_opcode*, *_min_len*)

Define a model operation context.

Parameters

- **_opcode** –Message opcode.
- **_min_len** –Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

Type Definitions

`typedef uint8_t esp_ble_mesh_octet16_t[16]`

Define the BLE Mesh octet 8 bytes size

`typedef uint8_t esp_ble_mesh_octet8_t[8]`

Invalid Company ID

`typedef uint32_t esp_ble_mesh_cb_t`

`typedef uint8_t UINT8`

`typedef uint16_t UINT16`

`typedef uint32_t UINT32`

`typedef uint64_t UINT64`

```
typedef UINT8 BT_OCTET32[32]
```

```
typedef uint8_t BD_ADDR[6]
```

```
typedef uint8_t esp_ble_mesh_bd_addr_t[6]
```

```
typedef uint8_t esp_ble_mesh_addr_type_t
```

BLE device address type.

```
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
```

```
typedef uint8_t esp_ble_mesh_dev_add_flag_t
```

```
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
```

`esp_ble_mesh_opcode_config_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_get_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
```

`esp_ble_mesh_opcode_config_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_set_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_status_t
```

`esp_ble_mesh_opcode_config_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

```
typedef uint8_t esp_ble_mesh_cfg_status_t
```

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

```
typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
```

`esp_ble_mesh_opcode_health_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_get_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
```

`esp_ble_mesh_opcode_health_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_set_state` function.

```
typedef uint32_t esp_ble_mesh_health_model_status_t
```

`esp_ble_mesh_health_model_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

```
typedef uint32_t esp_ble_mesh_generic_message_opcode_t
```

`esp_ble_mesh_generic_message_opcode_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by functions `esp_ble_mesh_generic_client_get_state` & `esp_ble_mesh_generic_client_set_state`. Generic OnOff Message Opcode

typedef uint32_t **esp_ble_mesh_sensor_message_opcode_t**

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state.Sensor Message Opcode

typedef uint32_t **esp_ble_mesh_time_scene_message_opcode_t**

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state.Time Message Opcode

typedef uint32_t **esp_ble_mesh_light_message_opcode_t**

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state.Light Lightness Message Opcode

typedef uint32_t **esp_ble_mesh_opcode_t**

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t **esp_ble_mesh_model_status_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

Values:

enumerator **PROXY_FILTER_WHITELIST**

enumerator **PROXY_FILTER_BLACKLIST**

enum **esp_ble_mesh_prov_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_PROV_REGISTER_COMP_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT**

Set the unprovisioned device name completion event

enumerator **ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT**

Enable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT**

Disable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT**

Establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT**

Close a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT**

Generate Node input OOB public key event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT**

Generate Node Output Number event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT**

Generate Node Output String event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_EVT**

Event requiring the user to input a number or string

enumerator **ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT**

Provisioning done event

enumerator **ESP_BLE_MESH_NODE_PROV_RESET_EVT**

Provisioning reset event

enumerator **ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT**

Node set oob public key completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**

Node input number completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**

Node input string completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**

Enable BLE Mesh Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**

Enable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**

Disable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT**

Node add NetKey locally completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**

Node add AppKey locally completion event

enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**

Node bind AppKey to model locally completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**

Provisioner enable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**

Provisioner disable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**

Provisioner receives unprovisioned device beacon event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**

Provisioner read unprovisioned device OOB public key event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**

Provisioner input value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**

Provisioner output value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**

Provisioner establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**

Provisioner close a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**

Provisioner provisioning done event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**

Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
Provisioner start to provision an unprovisioned device completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
Provisioner delete a device from the list, close provisioning link with the device completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
Provisioner set net_idx/flags/iv_index used for provisioning completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
Provisioner set static oob value used for provisioning completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
Provisioner set unicast address of primary element completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
Provisioner read unprovisioned device OOB public key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
Provisioner input number completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
Provisioner input string completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
Provisioner set node name completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
Provisioner add local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
Provisioner update local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Provisioner bind local model with local app key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
Provisioner add local network key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event
- enumerator **ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event
- enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event
- enumerator **ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**
Set fast provisioning action completion event
- enumerator **ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**
Receive Heartbeat message event

enumerator **ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**

Enable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**

Disable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_POLL_COMP_EVT**

Low Power Node send Friend Poll completion event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**

Low Power Node establishes friendship event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**

Low Power Node terminates friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**

Friend Node establishes friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT**

Friend Node terminates friendship event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT**

Proxy Client connect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT**

Proxy Client disconnect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT**

Proxy Client set filter type completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**

Proxy Client add filter address completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**

Proxy Client remove filter address completion event

enumerator **ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model subscribes group address completion event

enumerator **ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model unsubscribes group address completion event

enumerator **ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP_BLE_MESH_PROV_EVT_MAX**

enum **[anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

Values:

enumerator **ESP_BLE_MESH_SERVER_TRANS_TIMER_START**

enumerator **ESP_BLE_MESH_SERVER_FLAG_MAX**

enum **esp_ble_mesh_server_state_type_t**

This enum value is the type of server model states

Values:

enumerator **ESP_BLE_MESH_GENERIC_ONOFF_STATE**

enumerator **ESP_BLE_MESH_GENERIC_LEVEL_STATE**

enumerator **ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE**

enumerator **ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_HUE_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE**

enumerator **ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE**

enumerator **ESP_BLE_MESH_SERVER_MODEL_STATE_MAX**

enum **esp_ble_mesh_model_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_MODEL_OPERATION_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP_BLE_MESH_MODEL_SEND_COMP_EVT**

User-defined models send messages completion event

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT**

User-defined models publish messages completion event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT**

User-defined client models receive publish messages event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT**

Server models update state value completion event

enumerator **ESP_BLE_MESH_MODEL_EVT_MAX**

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*

- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

ESP-BLE-MESH Stack Initialization

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h`

Functions

`esp_err_t esp_ble_mesh_init` (`esp_ble_mesh_prov_t` *prov, `esp_ble_mesh_comp_t` *comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note: After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

Parameters

- **prov** –[in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –[in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_deinit` (`esp_ble_mesh_deinit_param_t` *param)

De-initialize BLE Mesh module.

Note: This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

Parameters **param** –[in] Pointer to the structure of BLE Mesh deinit parameters.

Returns ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h`

Functions

`int32_t esp_ble_mesh_get_model_publish_period` (`esp_ble_mesh_model_t` *model)

Get the model publish period, the unit is ms.

Parameters **model** –[in] Model instance pointer.

Returns Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

`uint16_t esp_ble_mesh_get_primary_element_address` (void)

Get the address of the primary element.

Returns Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group` (*esp_ble_mesh_model_t* *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Parameters

- **model** –[in] Pointer to the model.
- **group_addr** –[in] Group address.

Returns Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

esp_ble_mesh_elem_t *`esp_ble_mesh_find_element` (uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

Parameters **element_addr** –[in] Element address.

Returns Pointer to the element on success, or NULL on failure.

uint8_t `esp_ble_mesh_get_element_count` (void)

Get the number of elements that have been registered.

Returns Number of elements.

esp_ble_mesh_model_t *`esp_ble_mesh_find_vendor_model` (const *esp_ble_mesh_elem_t* *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Parameters

- **element** –[in] Element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier assigned by the Bluetooth SIG.
- **model_id** –[in] A 16-bit vendor-assigned model identifier.

Returns Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

esp_ble_mesh_model_t *`esp_ble_mesh_find_sig_model` (const *esp_ble_mesh_elem_t* *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

Parameters

- **element** –[in] Element to which the model belongs.
- **model_id** –[in] SIG model identifier.

Returns Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const *esp_ble_mesh_comp_t* *`esp_ble_mesh_get_composition_data` (void)

Get the Composition data which has been registered.

Returns Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t `esp_ble_mesh_model_subscribe_group_addr` (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters

- **element_addr** –[in] Unicast address of the element to which the model belongs.

- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The group address to be subscribed.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_unsubscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters

- **element_addr** –[in] Unicast address of the element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The subscribed group address.

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_node_get_local_net_key** (uint16_t net_idx)

This function is called by Node to get the local NetKey.

Parameters **net_idx** –[in] NetKey index.

Returns NetKey on success, or NULL on failure.

const uint8_t ***esp_ble_mesh_node_get_local_app_key** (uint16_t app_idx)

This function is called by Node to get the local AppKey.

Parameters **app_idx** –[in] AppKey index.

Returns AppKey on success, or NULL on failure.

esp_err_t **esp_ble_mesh_node_add_local_net_key** (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

Note: This function can only be called after the device is provisioned.

Parameters

- **net_key** –[in] NetKey to be added.
- **net_idx** –[in] NetKey Index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

Note: The net_idx must be an existing one. This function can only be called after the device is provisioned.

Parameters

- **app_key** –[in] AppKey to be added.
- **net_idx** –[in] NetKey Index.
- **app_idx** –[in] AppKey Index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

Note: If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

Parameters

- **element_addr** –[in] Node local element address
- **company_id** –[in] Node local company id
- **model_id** –[in] Node local model id
- **app_idx** –[in] Node local appkey index

Returns ESP_OK on success or error code otherwise.

Low Power Operation (Updating)

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h](#)

Functions

esp_err_t **esp_ble_mesh_lpn_enable** (void)

Enable BLE Mesh device LPN functionality.

Note: This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_disable** (bool force)

Disable BLE Mesh device LPN functionality.

Parameters **force** –[in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_poll** (void)

LPN tries to poll messages from the Friend Node.

Note: The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

Returns ESP_OK on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h`

Functions

esp_err_t **esp_ble_mesh_register_custom_model_callback** (*esp_ble_mesh_model_cb_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

Note: The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

Parameters `callback` –[in] Pointer to the callback function.

Returns `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_msg_opcode_init** (*uint8_t* *data, *uint32_t* opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

Note: This API is only used to set the opcode of the message.

Parameters

- `data` –[in] Pointer to the message data.
- `opcode` –[in] The message opcode.

Returns `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_init** (*esp_ble_mesh_model_t* *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Note: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t_`) of the client model need to be initialized.

Parameters `model` –[in] BLE Mesh Client model to which the message belongs.

Returns `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_deinit** (*esp_ble_mesh_model_t* *model)

De-initialize the user-defined client model.

Note: This function shall be invoked before `esp_ble_mesh_deinit()` is called.

Parameters `model` –[in] Pointer of the Client model.

Returns `ESP_OK` on success or error code otherwise.

```
esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model,
                                             esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
                                             uint16_t length, uint8_t *data)
```

Send server model messages (such as server model status messages).

Parameters

- **model** –[in] BLE Mesh Server Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of Access Payload (exclude the message opcode) to be sent.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_client_model_send_msg (esp_ble_mesh_model_t *model,
                                             esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
                                             uint16_t length, uint8_t *data, int32_t
                                             msg_timeout, bool need_rsp,
                                             esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

Parameters

- **model** –[in] BLE Mesh Client Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout** –[in] Time to get response to the message (in milliseconds).
- **need_rsp** –[in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device_role** –[in] Role of the device (Node/Provisioner) that sends the message.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_model_publish (esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t
                                     length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

Note: Before calling this function, the user needs to ensure that the model publication message (*esp_ble_mesh_model_pub_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Parameters

- **model** –[in] Mesh (client) Model publishing the message.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** –[in] Role of the device (node/provisioner) publishing the message of the type *esp_ble_mesh_dev_role_t*.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_server_model_update_state (esp_ble_mesh_model_t *model,
                                                  esp_ble_mesh_server_state_type_t type,
                                                  esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note: Currently this API is used to update bound state value, not for all server model states.

Parameters

- **model** –[in] Server model which is going to update the state.
- **type** –[in] Server model state type.
- **value** –[in] Server model state value.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_local_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

Note: All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_node_name** (uint16_t index, const char *name)

This function is called to set the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters

- **index** –[in] Index of the node in the node queue.
- **name** –[in] Name (end by ‘\0’) to be set for the node.

Returns ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_node_name** (uint16_t index)

This function is called to get the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters **index** –[in] Index of the node in the node queue.

Returns Node name on success, or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_node_index** (const char *name)

This function is called to get the node (provisioned device) index.

Parameters **name** –[in] Name of the node (end by ‘\0’).

Returns Node index on success, or an invalid value (0xFFFF) on failure.

esp_err_t **esp_ble_mesh_provisioner_store_node_comp_data** (uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

Parameters

- **unicast_addr** –[in] Element address of the node
- **data** –[in] Pointer of Composition Data
- **length** –[in] Length of Composition Data

Returns ESP_OK on success or error code otherwise.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_uuid** (const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

Parameters **uuid** –[in] Device UUID of the node

Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_addr** (uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

Parameters **unicast_addr** –[in] Unicast address of the node

Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_name** (const char *name)

This function is called to get the provisioned node information with the node name.

Parameters **name** –[in] Name of the node (end by ‘\0’).

Returns Pointer of the node info struct or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_prov_node_count** (void)

This function is called by Provisioner to get provisioned node count.

Returns Number of the provisioned nodes.

const *esp_ble_mesh_node_t* ****esp_ble_mesh_provisioner_get_node_table_entry** (void)

This function is called by Provisioner to get the entry of the node table.

Note: After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t **node)` is NULL. For example: `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { …… } }`

Returns Pointer to the start of the node table.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_uuid** (const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

Parameters **uuid** –[in] Device UUID of the node

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_addr** (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

Parameters **unicast_addr** –[in] Unicast address of the node

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

Note: **app_key:** If set to NULL, app_key will be generated internally. **net_idx:** Should be an existing one. **app_idx:** If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Parameters

- **app_key** –[in] The app key to be set for the local BLE Mesh stack.
- **net_idx** –[in] The network key index.

- **app_idx** –[in] The app key index.
- Returns** ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_app_key** (const uint8_t app_key[16],
uint16_t net_idx, uint16_t
app_idx)

This function is used to update a local AppKey for Provisioner.

Parameters

- **app_key** –[in] Value of the AppKey.
- **net_idx** –[in] Corresponding NetKey Index.
- **app_idx** –[in] The AppKey Index

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_provisioner_get_local_app_key** (uint16_t net_idx, uint16_t
app_idx)

This function is called by Provisioner to get the local app key value.

Parameters

- **net_idx** –[in] Network key index.
- **app_idx** –[in] Application key index.

Returns App key on success, or NULL on failure.

esp_err_t **esp_ble_mesh_provisioner_bind_app_key_to_local_model** (uint16_t element_addr,
uint16_t app_idx,
uint16_t model_id,
uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Parameters

- **element_addr** –[in] Provisioner local element address
- **app_idx** –[in] Provisioner local appkey index
- **model_id** –[in] Provisioner local model id
- **company_id** –[in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_net_key** (const uint8_t net_key[16], uint16_t
net_idx)

This function is called by Provisioner to add local network key.

Note: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Parameters

- **net_key** –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- **net_idx** –[in] The network key index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_net_key** (const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Parameters

- **net_key** –[in] Value of the NetKey.

- **net_idx** –[in] The NetKey Index.

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_provisioner_get_local_net_key** (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Parameters **net_idx** –[in] Network key index.

Returns Network key on success, or NULL on failure.

esp_err_t **esp_ble_mesh_provisioner_recv_heartbeat** (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note: If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Parameters **enable** –[in] Enable or disable receiving heartbeat messages.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_type** (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

Note: 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

- a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
-

Parameters **type** –[in] Heartbeat filter type (acceptlist or rejectlist).

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_info** (uint8_t op,
esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- a. If the operation is “REMOVE” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
 - The filter entry with the same SRC or DST will be removed.
-

Note: 1. If the operation is “ADD” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
 - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
 - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.
-

Parameters

- **op** –[in] Add or REMOVE

- **info** –[in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;
- Returns** ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_direct_erase_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note: This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_index** (uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **index** –[in] Settings index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_uid** (const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **uid** –[in] Settings user id.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_index** (uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.

- When the function is invoked, the Provisioner functionality will be disabled firstly, and:
 - If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
 - If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
- The working process shall be as following:
 - Open settings A
 - Start to provision and control nodes c)
 - Close settings A
 - Open settings B
 - Start to provision and control other nodes f)
 - Close settings B
 - g)
 -

Parameters

- **index** –[in] Settings index.
- **erase** –[in] Indicate if erasing mesh information.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_uid** (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
 - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
 - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
- c. The working process shall be as following:
 - a) Open settings A
 - b) Start to provision and control nodes
 - c) Close settings A
 - d) Open settings B
 - e) Start to provision and control other nodes
 - f) Close settings B
 - g)

Parameters

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Parameters **index** –[in] Settings index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Parameters **uid** –[in] Settings user id.

Returns ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

Parameters **index** –[in] Settings index.

Returns Setting user id on success or NULL on failure.

uint8_t **esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

Parameters **uid** –[in] Settings user id.

Returns Settings index.

uint8_t **esp_ble_mesh_provisioner_get_free_settings_count** (void)

This function is called by Provisioner to get the number of free settings user id.

Returns Number of free settings user id.

```
const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)
```

This function is called to get fast provisioning application key.

Parameters

- **net_idx** –[in] Network key index.
- **app_idx** –[in] Application key index.

Returns Application key on success, or NULL on failure.

Type Definitions

```
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,  
esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

```
esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)
```

Register BLE Mesh provisioning callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

```
bool esp_ble_mesh_node_is_provisioned (void)
```

Check if a device has been provisioned.

Returns TRUE if the device is provisioned, FALSE if the device is unprovisioned.

```
esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers to get the device ready for provisioning.

Note: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Parameters **bearers** –Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Parameters **bearers** –Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32],  
uint8_t private_key[32])
```

Unprovisioned device set own oob public key & private key pair.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Parameters

- **pub_key_x** –[in] Unprovisioned device's Public Key X
- **pub_key_y** –[in] Unprovisioned device's Public Key Y
- **private_key** –[in] Unprovisioned device's Private Key

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_number** (uint32_t number)

Provide provisioning input OOB number.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Parameters **number** –[in] Number input by device.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_string** (const char *string)

Provide provisioning input OOB string.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Parameters **string** –[in] String input by device.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_unprovisioned_device_name** (const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

Note: This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

Parameters **name** –[in] Unprovisioned device name

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_read_oob_pub_key** (uint8_t link_idx, uint8_t pub_key_x[32],
uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device's oob public key.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

Parameters

- **link_idx** –[in] The provisioning link index
- **pub_key_x** –[in] Unprovisioned device's Public Key X
- **pub_key_y** –[in] Unprovisioned device's Public Key Y

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_string** (const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

Parameters

- **string** –[in] String input by Provisioner.
- **link_idx** –[in] The provisioning link index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_number** (uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

This is intended to be called after the *esp_ble_mesh_prov_t* prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

Parameters

- **number** –[in] Number input by Provisioner.
- **link_idx** –[in] The provisioning link index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_enable** (*esp_ble_mesh_prov_bearer_t* bearers)

Enable one or more provisioning bearers.

Note: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

Parameters **bearers** –[in] Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_disable** (*esp_ble_mesh_prov_bearer_t* bearers)

Disable one or more provisioning bearers.

Note: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

Parameters **bearers** –[in] Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_unprov_dev** (*esp_ble_mesh_unprov_dev_add_t* *add_dev, *esp_ble_mesh_dev_add_flag_t* flags)

Add unprovisioned device info to the unprov_dev queue.

Note: : 1. Currently address type only supports public address and static random address.

- If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
- For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
 - In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
- Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function *esp_ble_mesh_register_prov_callback*. And in the callback, the Provisioner can call this API to start provisioning the device.
 - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.

- If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with `ESP_BLE_MESH_PROV_GATT` enabled, and the flags shall be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of `ESP_BLE_MESH_PROV_ADV` and `ESP_BLE_MESH_PROV_GATT` enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with `ADD_DEV_START_PROV_NOW_FLAG` enabled.
 - Note: `ESP_BLE_MESH_PROV_ADV`, `ESP_BLE_MESH_PROV_GATT` and `ADD_DEV_START_PROV_NOW_FLAG` can not be enabled at the same time.
-

Parameters

- **add_dev** –[in] Pointer to a struct containing the device information
- **flags** –[in] Flags indicate several operations on the device information
 - Remove device information from queue after device has been provisioned (BIT0)
 - Start provisioning immediately after device is added to queue (BIT1)
 - Device can be removed if device queue is full (BIT2)

Returns `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_device_with_addr** (const uint8_t uuid[16],
esp_ble_mesh_bd_addr_t addr,
esp_ble_mesh_addr_type_t
addr_type,
esp_ble_mesh_prov_bearer_t
bearer, uint16_t oob_info,
uint16_t unicast_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Note: : 1. Currently address type only supports public address and static random address.

- a. Bearer must be equal to `ESP_BLE_MESH_PROV_ADV` or `ESP_BLE_MESH_PROV_GATT`, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the `ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT` event.
 - b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
 - c. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.
-

Parameters

- **uuid** –[in] Device UUID of the unprovisioned device
- **addr** –[in] Device address of the unprovisioned device
- **addr_type** –[in] Device address type of the unprovisioned device
- **bearer** –[in] Provisioning bearer going to be used by Provisioner
- **oob_info** –[in] OOB info of the unprovisioned device
- **unicast_addr** –[in] Unicast address going to be allocated for the unprovisioned device

Returns Zero on success or (negative) error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_dev** (*esp_ble_mesh_device_delete_t* *del_dev)

Delete device from queue, and reset current provisioning link with the device.

Note: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate

the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters `del_dev` –[in] Pointer to a struct containing the device information.

Returns ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_dev_uuid_match` (const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Parameters

- `match_val` –[in] Value to be compared with the part of the device UUID.
- `match_len` –[in] Length of the compared match value.
- `offset` –[in] Offset of the device UUID to be compared (based on zero).
- `prov_after_match` –[in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

Returns ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_prov_data_info` (*esp_ble_mesh_prov_data_info_t* *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

Parameters `prov_data_info` –[in] Pointer to a struct containing net_idx or flags or iv_index.

Returns ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_static_oob_value` (const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Parameters

- `value` –[in] Pointer to the static oob value.
- `length` –[in] Length of the static oob value.

Returns ESP_OK on success or error code otherwise.

esp_err_t `esp_ble_mesh_provisioner_set_primary_elem_addr` (uint16_t addr)

This function is called by Provisioner to set own Primary element address.

Note: This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the `prov_unicast_addr` value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than

the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Parameters **addr** **–[in]** Unicast address of the Primary element of Provisioner.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_info** (*esp_ble_mesh_fast_prov_info_t* *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

Parameters **fast_prov_info** **–[in]** Pointer to a struct containing unicast address range, net_idx, etc.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_action** (*esp_ble_mesh_fast_prov_action_t* action)

This function is called to start/suspend/exit fast provisioning.

Parameters **action** **–[in]** fast provisioning action (i.e. enter, suspend, exit).

Returns ESP_OK on success or error code otherwise.

Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,  
esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const  
esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,  
esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Param **addr** **[in]** Pointer to the unprovisioned device address.

Param **addr_type** **[in]** Unprovisioned device address type.

Param **adv_type** **[in]** Adv packet type(ADV_IND or ADV_NONCONN_IND).

Param **dev_uuid** **[in]** Unprovisioned device UUID pointer.

Param **oob_info** **[in]** OOB information of the unprovisioned device.

Param **bearer** **[in]** Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

- [components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h](#)

Functions

esp_err_t **esp_ble_mesh_proxy_identity_enable** (void)

Enable advertising with Node Identity.

Note: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_enable** (void)

Enable BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_gatt_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_connect** (*esp_ble_mesh_bd_addr_t* addr,
esp_ble_mesh_addr_type_t addr_type, uint16_t
net_idx)

Proxy Client creates a connection with the Proxy Server.

Parameters

- **addr** –[in] Device address of the Proxy Server.
- **addr_type** –[in] Device address type(public or static random).
- **net_idx** –[in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_disconnect** (uint8_t conn_handle)

Proxy Client terminates a connection with the Proxy Server.

Parameters **conn_handle** –[in] Proxy connection handle.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_set_filter_type** (uint8_t conn_handle, uint16_t net_idx,
esp_ble_mesh_proxy_filter_type_t
filter_type)

Proxy Client sets the filter type of the Proxy Server.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **filter_type** –[in] whitelist or blacklist.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_add_filter_addr** (uint8_t conn_handle, uint16_t net_idx,
uint16_t *addr, uint16_t addr_num)

Proxy Client adds address to the Proxy Server filter list.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_remove_filter_addr** (uint8_t conn_handle, uint16_t
net_idx, uint16_t *addr, uint16_t
addr_num)

Proxy Client removes address from the Proxy Server filter list.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- [components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_config_client_callback** (*esp_ble_mesh_cfg_client_cb_t* callback)

Register BLE Mesh Config Client Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_config_server_callback** (*esp_ble_mesh_cfg_server_cb_t* callback)

Register BLE Mesh Config Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_get_state_t* *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_set_state_t* *set_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_cfg_client_get_state_t**

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures

struct **esp_ble_mesh_cfg_srv**

Configuration Server Model context

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Configuration Server Model

uint8_t **net_transmit**

Network Transmit state

uint8_t **relay**

Relay Mode state

uint8_t **relay_retransmit**

Relay Retransmit state

uint8_t **beacon**

Secure Network Beacon state

uint8_t **gatt_proxy**

GATT Proxy state

uint8_t **friend_state**

Friend state

uint8_t **default_ttl**

Default TTL

struct k_delayed_work **timer**

Heartbeat Publication timer

uint16_t **dst**

Destination address for Heartbeat messages

uint16_t **count**

Number of Heartbeat messages to be sent

Number of Heartbeat messages received

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t **net_idx**

NetKey Index used by Heartbeat Publication

struct *esp_ble_mesh_cfg_srv::*[anonymous] **heartbeat_pub**

Heartbeat Publication

int64_t **expiry**

Timestamp when Heartbeat subscription period is expired

uint16_t **src**

Source address for Heartbeat messages

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

esp_ble_mesh_cb_t **heartbeat_recv_cb**

Optional heartbeat subscription tracking function

struct *esp_ble_mesh_cfg_srv*::[anonymous] **heartbeat_sub**
Heartbeat Subscription

struct **esp_ble_mesh_cfg_composition_data_get_t**
Parameters of Config Composition Data Get.

Public Members

uint8_t **page**
Page number of the Composition Data.

struct **esp_ble_mesh_cfg_model_pub_get_t**
Parameters of Config Model Publication Get.

Public Members

uint16_t **element_addr**
The element address

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_sig_model_sub_get_t**
Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t **element_addr**
The element address

uint16_t **model_id**
The model id

struct **esp_ble_mesh_cfg_vnd_model_sub_get_t**
Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t **element_addr**
The element address

uint16_t **model_id**
The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_app_key_get_t**

Parameters of Config AppKey Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_node_identity_get_t**

Parameters of Config Node Identity Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_sig_model_app_get_t**

Parameters of Config SIG Model App Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

struct **esp_ble_mesh_cfg_vnd_model_app_get_t**

Parameters of Config Vendor Model App Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_get_t**

Parameters of Config Key Refresh Phase Get.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_lpn_polltimeout_get_t**

Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

struct **esp_ble_mesh_cfg_beacon_set_t**

Parameters of Config Beacon Set.

Public Members

uint8_t **beacon**

New Secure Network Beacon state

struct **esp_ble_mesh_cfg_default_ttl_set_t**

Parameters of Config Default TTL Set.

Public Members

uint8_t **ttl**

The default TTL state value

struct **esp_ble_mesh_cfg_friend_set_t**

Parameters of Config Friend Set.

Public Members

uint8_t **friend_state**

The friend state value

struct **esp_ble_mesh_cfg_gatt_proxy_set_t**

Parameters of Config GATT Proxy Set.

Public Members

uint8_t **gatt_proxy**

The GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_set_t**

Parameters of Config Relay Set.

Public Members

uint8_t **relay**

The relay value

uint8_t **relay_retransmit**

The relay retransmit value

struct **esp_ble_mesh_cfg_net_key_add_t**

Parameters of Config NetKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_app_key_add_t**

Parameters of Config AppKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_model_app_bind_t**

Parameters of Config Model App Bind.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_app_idx**

Index of the app key to bind with the model

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_set_t**

Parameters of Config Model Publication Set.

Public Members

uint16_t **element_addr**

The element address

uint16_t **publish_addr**

Value of the publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_overwrite_t**

Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_add_t**

Parameters of Config Model Subscription Virtual Address Add.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_delete_t**

Parameters of Config Model Subscription Virtual Address Delete.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_overwrite_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_va_set_t**
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid[16]**

Value of the Label UUID publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_all_t**
Parameters of Config Model Subscription Delete All.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_net_key_update_t**
Parameters of Config NetKey Update.

Public Members`uint16_t net_idx`

The network key index

`uint8_t net_key[16]`

The network key value

struct `esp_ble_mesh_cfg_net_key_delete_t`

Parameters of Config NetKey Delete.

Public Members`uint16_t net_idx`

The network key index

struct `esp_ble_mesh_cfg_app_key_update_t`

Parameters of Config AppKey Update.

Public Members`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

`uint8_t app_key[16]`

The app key value

struct `esp_ble_mesh_cfg_app_key_delete_t`

Parameters of Config AppKey Delete.

Public Members`uint16_t net_idx`

The network key index

`uint16_t app_idx`

The app key index

struct `esp_ble_mesh_cfg_node_identity_set_t`

Parameters of Config Node Identity Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t identity

New Node Identity state

struct **esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

Public Members**uint16_t element_addr**

The element address

uint16_t model_app_idx

Index of the app key to bind with the model

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t transition

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_net_transmit_set_t**

Parameters of Config Network Transmit Set.

Public Members**uint8_t net_transmit**

Network Transmit State

struct **esp_ble_mesh_cfg_heartbeat_pub_set_t**

Parameters of Config Model Heartbeat Publication Set.

Public Members**uint16_t dst**

Destination address for Heartbeat messages

uint8_t count

Number of Heartbeat messages to be sent

uint8_t period

Period for sending Heartbeat messages

uint8_t ttl

TTL to be used when sending Heartbeat messages

uint16_t feature

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx

NetKey Index

struct **esp_ble_mesh_cfg_heartbeat_sub_set_t**

Parameters of Config Model Heartbeat Subscription Set.

Public Members**uint16_t src**

Source address for Heartbeat messages

uint16_t dst

Destination address for Heartbeat messages

uint8_t period

Period for receiving Heartbeat messages

struct **esp_ble_mesh_cfg_beacon_status_cb_t**

Parameter of Config Beacon Status

Public Members**uint8_t beacon**

Secure Network Beacon state value

struct **esp_ble_mesh_cfg_comp_data_status_cb_t**

Parameters of Config Composition Data Status

Public Members**uint8_t page**

Page number of the Composition Data

struct net_buf_simple ***composition_data**

Pointer to Composition Data for the identified page

struct **esp_ble_mesh_cfg_default_ttl_status_cb_t**

Parameter of Config Default TTL Status

Public Members**uint8_t default_ttl**

Default TTL state value

struct **esp_ble_mesh_cfg_gatt_proxy_status_cb_t**

Parameter of Config GATT Proxy Status

Public Members**uint8_t gatt_proxy**

GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_status_cb_t**

Parameters of Config Relay Status

Public Members**uint8_t relay**

Relay state value

uint8_t retransmit

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp_ble_mesh_cfg_model_pub_status_cb_t**

Parameters of Config Model Publication Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t **publish_addr**

Value of the publish address

uint16_t **app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **ttl**

Default TTL value for the outgoing messages

uint8_t **period**

Period for periodic status publishing

uint8_t **transmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_model_sub_status_cb_t**

Parameters of Config Model Subscription Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **sub_addr**

Value of the address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_net_key_status_cb_t**

Parameters of Config NetKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_app_key_status_cb_t**

Parameters of Config AppKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint16_t **app_idx**

Index of the application key

struct **esp_ble_mesh_cfg_mod_app_status_cb_t**

Parameters of Config Model App Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **app_idx**

Index of the application key

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_friend_status_cb_t**

Parameter of Config Friend Status

Public Members**uint8_t friend_state**

Friend state value

struct **esp_ble_mesh_cfg_hb_pub_status_cb_t**

Parameters of Config Heartbeat Publication Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t dst

Destination address for Heartbeat messages

uint8_t count

Number of Heartbeat messages remaining to be sent

uint8_t period

Period for sending Heartbeat messages

uint8_t ttl

TTL to be used when sending Heartbeat messages

uint16_t features

Features that trigger Heartbeat messages when changed

uint16_t net_idx

Index of the NetKey

struct **esp_ble_mesh_cfg_hb_sub_status_cb_t**

Parameters of Config Heartbeat Subscription Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t src

Source address for Heartbeat messages

uint16_t dst

Destination address for Heartbeat messages

uint8_t period

Remaining Period for processing Heartbeat messages

uint8_t **count**

Number of Heartbeat messages received

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_net_trans_status_cb_t**

Parameters of Config Network Transmit Status

Public Members

uint8_t **net_trans_count**

Number of transmissions for each Network PDU originating from the node

uint8_t **net_trans_step**

Maximum hops when receiving Heartbeat messages

struct **esp_ble_mesh_cfg_model_sub_list_cb_t**

Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct net_buf_simple ***sub_addr**

A block of all addresses from the Subscription List

struct **esp_ble_mesh_cfg_net_key_list_cb_t**

Parameter of Config NetKey List

Public Members

struct net_buf_simple ***net_idx**

A list of NetKey Indexes known to the node

struct **esp_ble_mesh_cfg_app_key_list_cb_t**

Parameters of Config AppKey List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple ***app_idx**

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct **esp_ble_mesh_cfg_node_id_status_cb_t**

Parameters of Config Node Identity Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **identity**

Node Identity state

struct **esp_ble_mesh_cfg_model_app_list_cb_t**

Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct net_buf_simple ***app_idx**

All AppKey indexes bound to the Model

struct **esp_ble_mesh_cfg_kr_phase_status_cb_t**

Parameters of Config Key Refresh Phase Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint8_t **phase**

Key Refresh Phase state

struct **esp_ble_mesh_cfg_lpn_pollto_status_cb_t**

Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t **lpn_addr**

The unicast address of the Low Power node

int32_t **poll_timeout**

The current value of the PollTimeout timer of the Low Power node

struct **esp_ble_mesh_cfg_client_cb_param_t**

Configuration Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t **status_cb**

The config status message callback values

struct **esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

Public Members

uint16_t **element_addr**

Element Address

uint16_t **pub_addr**

Publish Address

uint16_t **app_idx**

AppKey Index

bool **cred_flag**

Friendship Credential Flag

uint8_t **pub_ttl**

Publish TTL

uint8_t **pub_period**

Publish Period

uint8_t **pub_retransmit**

Publish Retransmit

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add

Public Members

uint16_t **element_addr**

Element Address

uint16_t **sub_addr**

Subscription Address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete

Public Members

uint16_t **element_addr**

Element Address

uint16_t **sub_addr**

Subscription Address

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_netkey_add_t**

Parameters of Config NetKey Add

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **net_key**[16]

NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_update_t**

Parameters of Config NetKey Update

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **net_key**[16]

NetKey

struct **esp_ble_mesh_state_change_cfg_netkey_delete_t**

Parameter of Config NetKey Delete

Public Members

uint16_t **net_idx**

NetKey Index

struct **esp_ble_mesh_state_change_cfg_appkey_add_t**

Parameters of Config AppKey Add

Public Members

AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind

Public Members

uint16_t **element_addr**

Element Address

uint16_t **app_idx**

AppKey Index

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_state_change_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set

Public Members

uint16_t **net_idx**

NetKey Index

uint8_t **kr_phase**

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_server_cb_param_t**

Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the server model structure

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received message

esp_ble_mesh_cfg_server_cb_value_t **value**

Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)

Define a new Config Server Model.

Note: The Config Server Model can only be included by a Primary Element.

Parameters

- **srv_data** –Pointer to a unique Config Server Model user_data.

Returns New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)

Define a new Config Client Model.

Note: The Config Client Model can only be included by a Primary Element.

Parameters

- **cli_data** –Pointer to a unique struct *esp_ble_mesh_client_t*.

Returns New Config Client Model instance.

Type Definitions

typedef struct *esp_ble_mesh_cfg_srv* **esp_ble_mesh_cfg_srv_t**

Configuration Server Model context

typedef void (***esp_ble_mesh_cfg_client_cb_t**)(*esp_ble_mesh_cfg_client_cb_event_t* event,
esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

typedef void (***esp_ble_mesh_cfg_server_cb_t**)(*esp_ble_mesh_cfg_server_cb_event_t* event,
esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Param event Event type

Param param Pointer to callback parameter

Enumerations

enum **esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

Values:

enumerator **ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_CFG_CLIENT_EVT_MAX**

enum **esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

Values:

enumerator **ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT**

enumerator **ESP_BLE_MESH_CFG_SERVER_EVT_MAX**

Health Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h`

Functions

esp_err_t **esp_ble_mesh_register_health_client_callback** (*esp_ble_mesh_health_client_cb_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_health_server_callback** (*esp_ble_mesh_health_server_cb_t* callback)

Register BLE Mesh Health Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_get_state_t* *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_health_client_set_state_t* *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_health_server_fault_update** (*esp_ble_mesh_elem_t* *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Parameters **element** –[in] The element to which the Health Server Model belongs.

Returns ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_health_client_get_state_t**

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t **fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union **esp_ble_mesh_health_client_set_state_t**

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the `set_state` parameter in the `esp_ble_mesh_health_client_set_state` function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t **attention_set**

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t **period_set**

For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t **fault_test**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t **fault_clear**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union **esp_ble_mesh_health_client_common_cb_param_t**
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp_ble_mesh_health_current_status_cb_t **current_status**

The health current status value

esp_ble_mesh_health_fault_status_cb_t **fault_status**

The health fault status value

esp_ble_mesh_health_period_status_cb_t **period_status**

The health period status value

esp_ble_mesh_health_attention_status_cb_t **attention_status**

The health attention status value

union **esp_ble_mesh_health_server_cb_param_t**
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.

Public Members

esp_ble_mesh_health_fault_update_comp_cb_t **fault_update_comp**

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

esp_ble_mesh_health_fault_test_cb_t **fault_test**

ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

esp_ble_mesh_health_attention_on_cb_t **attention_on**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

esp_ble_mesh_health_attention_off_cb_t **attention_off**

ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

Structures

struct **esp_ble_mesh_health_srv_cb_t**
ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t **fault_clear**

Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t **fault_test**

Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t **attention_on**

Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t **attention_off**

Health attention off callback. Initialized by the stack.

struct **esp_ble_mesh_health_test_t**

ESP BLE Mesh Health Server test Context

Public Members

uint8_t **id_count**

Number of Health self-test ID

const uint8_t ***test_ids**

Array of Health self-test IDs

uint16_t **company_id**

Company ID used to identify the Health Fault state

uint8_t **prev_test_id**

Current test ID of the health fault test

uint8_t **current_faults**[32]

Array of current faults

uint8_t **registered_faults**[32]

Array of registered faults

struct **esp_ble_mesh_health_srv_t**

ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t **health_cb**

Health callback struct

struct k_delayed_work **attention_timer**

Attention Timer state

bool **attention_timer_start**

Attention Timer start flag

esp_ble_mesh_health_test_t **health_test**

Health Server fault test

struct **esp_ble_mesh_health_fault_get_t**

Parameter of Health Fault Get

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_set_t**

Parameter of Health Attention Set

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_period_set_t**

Parameter of Health Period Set

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_fault_test_t**

Parameter of Health Fault Test

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

uint8_t **test_id**

ID of a specific test to be performed

struct **esp_ble_mesh_health_fault_clear_t**

Parameter of Health Fault Clear

Public Members

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_current_status_cb_t**

Parameters of Health Current Status

Public Members

uint8_t **test_id**

ID of a most recently performed test

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_fault_status_cb_t**

Parameters of Health Fault Status

Public Members

uint8_t **test_id**

ID of a most recently performed test

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_period_status_cb_t**

Parameter of Health Period Status

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_attention_status_cb_t**

Parameter of Health Attention Status

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_client_cb_param_t**

Health Client Model callback parameters

Public Members**int error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t **status_cb**

The health message status callback values

struct **esp_ble_mesh_health_fault_update_comp_cb_t**

Parameter of publishing Health Current Status completion event

Public Members**int error_code**

The result of publishing Health Current Status

esp_ble_mesh_elem_t ***element**

Pointer to the element which contains the Health Server Model

struct **esp_ble_mesh_health_fault_clear_cb_t**

Parameters of Health Fault Clear event

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Health Server Model

uint16_t company_id

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_fault_test_cb_t**

Parameters of Health Fault Test event

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to the Health Server Model

uint8_t test_id

ID of a specific test to be performed

uint16_t company_id

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_on_cb_t**

Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint8_t **time**

Duration of attention timer on (in seconds)

struct **esp_ble_mesh_health_attention_off_cb_t**

Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)

Define a new Health Server Model.

Note: The Health Server Model can only be included by a Primary Element.

Parameters

- **srv** –Pointer to the unique struct *esp_ble_mesh_health_srv_t*.
- **pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

Returns New Health Server Model instance.

ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)

Define a new Health Client Model.

Note: This API needs to be called for each element on which the application needs to have a Health Client Model.

Parameters

- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)

A helper to define a health publication context

Parameters

- **_name** –Name given to the publication context variable.
- **_max** –Maximum number of faults the element can have.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Generic Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h`

Functions

esp_err_t **esp_ble_mesh_register_generic_client_callback** (*esp_ble_mesh_generic_client_cb_t* callback)

Register BLE Mesh Generic Client Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_get_state_t* *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to generic get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_set_state_t* *set_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to generic set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_generic_server_callback** (*esp_ble_mesh_generic_server_cb_t* callback)

Register BLE Mesh Generic Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_gen_onoff_set_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_level_set_t**

Parameters of Generic Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_delta_set_t**

Parameters of Generic Delta Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int32_t **level**

Delta change of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_move_set_t**

Parameters of Generic Move Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **delta_level**

Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_set_t**

Parameters of Generic Power Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **power**

Target value of Generic Power Actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_power_default_set_t**

Parameter of Generic Power Default Set.

Public Members

uint16_t **power**

The value of the Generic Power Default state

struct **esp_ble_mesh_gen_power_range_set_t**

Parameters of Generic Power Range Set.

Public Members

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_loc_global_set_t**

Parameters of Generic Location Global Set.

Public Members

int32_t **global_latitude**

Global Coordinates (Latitude)

int32_t **global_longitude**

Global Coordinates (Longitude)

int16_t **global_altitude**

Global Altitude

struct **esp_ble_mesh_gen_loc_local_set_t**

Parameters of Generic Location Local Set.

Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

struct `esp_ble_mesh_gen_user_property_get_t`
Parameter of Generic User Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

struct `esp_ble_mesh_gen_user_property_set_t`
Parameters of Generic User Property Set.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

struct `net_buf_simple *property_value`
Raw value for the User Property

struct `esp_ble_mesh_gen_admin_property_get_t`
Parameter of Generic Admin Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Admin Property

struct `esp_ble_mesh_gen_admin_property_set_t`
Parameters of Generic Admin Property Set.

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

uint8_t user_access

Enumeration indicating user access

struct net_buf_simple *property_value

Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t

Parameter of Generic Manufacturer Property Get.

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t

Parameters of Generic Manufacturer Property Set.

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t user_access

Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t

Parameter of Generic Client Properties Get.

Public Members**uint16_t property_id**

A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **present_onoff**

Current value of Generic OnOff state

uint8_t **target_onoff**

Target value of Generic OnOff state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_level_status_cb_t**

Parameters of Generic Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **present_level**

Current value of Generic Level state

int16_t **target_level**

Target value of the Generic Level state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_def_trans_time_status_cb_t**

Parameter of Generic Default Transition Time Status.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_status_cb_t**

Parameter of Generic OnPowerUp Status.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_status_cb_t**

Parameters of Generic Power Level Status.

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t present_power

Current value of Generic Power Actual state

uint16_t target_power

Target value of Generic Power Actual state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_power_last_status_cb_t**

Parameter of Generic Power Last Status.

Public Members**uint16_t power**

The value of the Generic Power Last state

struct **esp_ble_mesh_gen_power_default_status_cb_t**

Parameter of Generic Power Default Status.

Public Members**uint16_t power**

The value of the Generic Default Last state

struct **esp_ble_mesh_gen_power_range_status_cb_t**

Parameters of Generic Power Range Status.

Public Members**uint8_t status_code**

Status Code for the request message

uint16_t range_min

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_battery_status_cb_t**

Parameters of Generic Battery Status.

Public Members**uint32_t battery_level**

Value of Generic Battery Level state

uint32_t time_to_discharge

Value of Generic Battery Time to Discharge state

uint32_t time_to_charge

Value of Generic Battery Time to Charge state

uint32_t flags

Value of Generic Battery Flags state

struct **esp_ble_mesh_gen_loc_global_status_cb_t**

Parameters of Generic Location Global Status.

Public Members**int32_t global_latitude**

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

int16_t global_altitude

Global Altitude

struct **esp_ble_mesh_gen_loc_local_status_cb_t**

Parameters of Generic Location Local Status.

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct **esp_ble_mesh_gen_user_properties_status_cb_t**
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple ***property_ids**
Buffer contains a sequence of N User Property IDs

struct **esp_ble_mesh_gen_user_property_status_cb_t**
Parameters of Generic User Property Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID identifying a Generic User Property

uint8_t **user_access**
Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**
Raw value for the User Property (C.1)

struct **esp_ble_mesh_gen_admin_properties_status_cb_t**
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple ***property_ids**
Buffer contains a sequence of N Admin Property IDs

struct **esp_ble_mesh_gen_admin_property_status_cb_t**
Parameters of Generic Admin Property Status.

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID identifying a Generic Admin Property

uint8_t **user_access**
Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the Admin Property (C.1)

struct **esp_ble_mesh_gen_manufacturer_properties_status_cb_t**

Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Manufacturer Property IDs

struct **esp_ble_mesh_gen_manufacturer_property_status_cb_t**

Parameters of Generic Manufacturer Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the Manufacturer Property (C.1)

struct **esp_ble_mesh_gen_client_properties_status_cb_t**

Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Client Property IDs

struct **esp_ble_mesh_generic_client_cb_param_t**

Generic Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_gen_client_status_cb_t **status_cb**

The generic status message callback values

struct **esp_ble_mesh_gen_onoff_state_t**

Parameters of Generic OnOff state

Public Members

uint8_t **onoff**

The present value of the Generic OnOff state

uint8_t **target_onoff**

The target value of the Generic OnOff state

struct **esp_ble_mesh_gen_onoff_srv_t**

User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t **state**

Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_gen_level_state_t**

Parameters of Generic Level state

Public Members

int16_t **level**

The present value of the Generic Level state

int16_t **target_level**

The target value of the Generic Level state

int16_t **last_level**

When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t **last_delta**

The last delta change of the Generic Level state

bool **move_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp_ble_mesh_gen_level_srv_t**

User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_level_state_t **state**

Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_def_trans_time_state_t**

Parameter of Generic Default Transition Time state

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_def_trans_time_srv_t**

User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t **state**

Parameters of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_setup_srv_t**

User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t ***state**

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_state_t**

Parameters of Generic Power Level state

Public Members

uint16_t **power_actual**

The present value of the Generic Power Actual state

uint16_t **target_power_actual**

The target value of the Generic Power Actual state

uint16_t **power_last**

The value of the Generic Power Last state

uint16_t **power_default**

The value of the Generic Power Default state

uint8_t **status_code**

The status code of setting Generic Power Range state

uint16_t **power_range_min**

The minimum value of the Generic Power Range state

uint16_t **power_range_max**

The maximum value of the Generic Power Range state

struct **esp_ble_mesh_gen_power_level_srv_t**

User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_power_level_setup_srv_t**

User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

struct **esp_ble_mesh_gen_battery_state_t**

Parameters of Generic Battery state

Public Members

uint32_t **battery_level**

The value of the Generic Battery Level state

uint32_t **time_to_discharge**

The value of the Generic Battery Time to Discharge state

uint32_t **time_to_charge**

The value of the Generic Battery Time to Charge state

uint32_t **battery_flags**

The value of the Generic Battery Flags state

struct **esp_ble_mesh_gen_battery_srv_t**

User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t **state**

Parameters of the Generic Battery state

struct **esp_ble_mesh_gen_location_state_t**

Parameters of Generic Location state

Public Members

int32_t **global_latitude**

The value of the Global Latitude field

int32_t **global_longitude**

The value of the Global Longitude field

int16_t **global_altitude**

The value of the Global Altitude field

int16_t **local_north**

The value of the Local North field

int16_t **local_east**

The value of the Local East field

int16_t **local_altitude**

The value of the Local Altitude field

uint8_t **floor_number**

The value of the Floor Number field

uint16_t **uncertainty**

The value of the Uncertainty field

struct **esp_ble_mesh_gen_location_srv_t**

User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_gen_location_setup_srv_t**

User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_generic_property_t**

Parameters of Generic Property states

Public Members

uint16_t **id**

The value of User/Admin/Manufacturer Property ID

uint8_t **user_access**

The value of User Access field

uint8_t **admin_access**

The value of Admin Access field

uint8_t **manu_access**

The value of Manufacturer Access field

struct net_buf_simple ***val**

The value of User/Admin/Manufacturer Property

struct **esp_ble_mesh_gen_user_prop_srv_t**

User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic User Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic User Property state

struct **esp_ble_mesh_gen_admin_prop_srv_t**
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Admin Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Admin Property state

struct **esp_ble_mesh_gen_manu_prop_srv_t**
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Manufacturer Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Manufacturer Property state

struct **esp_ble_mesh_gen_client_prop_srv_t**
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **id_count**

Generic Client Property ID count

uint16_t ***property_ids**

Parameters of the Generic Client Property state

struct **esp_ble_mesh_state_change_gen_onoff_set_t**

Parameter of Generic OnOff Set state change event

Public Members

uint8_t **onoff**

The value of Generic OnOff state

struct **esp_ble_mesh_state_change_gen_level_set_t**

Parameter of Generic Level Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_delta_set_t**

Parameter of Generic Delta Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_move_set_t**

Parameter of Generic Move Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t **trans_time**

The value of Generic Default Transition Time state

struct **esp_ble_mesh_state_change_gen_onpowerup_set_t**
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t **onpowerup**
The value of Generic OnPowerUp state

struct **esp_ble_mesh_state_change_gen_power_level_set_t**
Parameter of Generic Power Level Set state change event

Public Members

uint16_t **power**
The value of Generic Power Actual state

struct **esp_ble_mesh_state_change_gen_power_default_set_t**
Parameter of Generic Power Default Set state change event

Public Members

uint16_t **power**
The value of Generic Power Default state

struct **esp_ble_mesh_state_change_gen_power_range_set_t**
Parameters of Generic Power Range Set state change event

Public Members

uint16_t **range_min**
The minimum value of Generic Power Range state

uint16_t **range_max**
The maximum value of Generic Power Range state

struct **esp_ble_mesh_state_change_gen_loc_global_set_t**
Parameters of Generic Location Global Set state change event

Public Members

int32_t **latitude**
The Global Latitude value of Generic Location state

int32_t **longitude**
The Global Longitude value of Generic Location state

`int16_t altitude`

The Global Altitude value of Generic Location state

struct `esp_ble_mesh_state_change_gen_loc_local_set_t`

Parameters of Generic Location Local Set state change event

Public Members

`int16_t north`

The Local North value of Generic Location state

`int16_t east`

The Local East value of Generic Location state

`int16_t altitude`

The Local Altitude value of Generic Location state

`uint8_t floor_number`

The Floor Number value of Generic Location state

`uint16_t uncertainty`

The Uncertainty value of Generic Location state

struct `esp_ble_mesh_state_change_gen_user_property_set_t`

Parameters of Generic User Property Set state change event

Public Members

`uint16_t id`

The property id of Generic User Property state

struct `net_buf_simple *value`

The property value of Generic User Property state

struct `esp_ble_mesh_state_change_gen_admin_property_set_t`

Parameters of Generic Admin Property Set state change event

Public Members

`uint16_t id`

The property id of Generic Admin Property state

`uint8_t access`

The property access of Generic Admin Property state

struct net_buf_simple ***value**

The property value of Generic Admin Property state

struct **esp_ble_mesh_state_change_gen_manu_property_set_t**

Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Manufacturer Property state

uint8_t **access**

The property value of Generic Manufacturer Property state

struct **esp_ble_mesh_server_rcv_gen_user_property_get_t**

Context of the received Generic User Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_server_rcv_gen_admin_property_get_t**

Context of the received Generic Admin Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_server_rcv_gen_manufacturer_property_get_t**

Context of the received Generic Manufacturer Property message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_server_rcv_gen_client_properties_get_t**

Context of the received Generic Client Properties Get message

Public Members

uint16_t **property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_server_rcv_gen_onoff_set_t**
Context of the received Generic OnOff Set message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint8_t **onoff**
Target value of Generic OnOff state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_level_set_t**
Context of the received Generic Level Set message

Public Members

bool **op_en**
Indicate if optional parameters are included

int16_t **level**
Target value of Generic Level state

uint8_t **tid**
Transaction ID

uint8_t **trans_time**
Time to complete state transition (optional)

uint8_t **delay**
Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_delta_set_t**
Context of the received Generic Delta Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int32_t **delta_level**

Delta change of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_move_set_t**

Context of the received Generic Move Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **delta_level**

Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_def_trans_time_set_t**

Context of the received Generic Default Transition Time Set message

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_server_rcv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_server_rcv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_power_default_set_t**

Context of the received Generic Power Default Set message

Public Members**uint16_t power**

The value of the Generic Power Default state

struct **esp_ble_mesh_server_rcv_gen_power_range_set_t**

Context of the received Generic Power Range Set message

Public Members**uint16_t range_min**

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_server_rcv_gen_loc_global_set_t**

Context of the received Generic Location Global Set message

Public Members**int32_t global_latitude**

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

int16_t global_altitude

Global Altitude

struct **esp_ble_mesh_server_rcv_gen_loc_local_set_t**

Context of the received Generic Location Local Set message

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct **esp_ble_mesh_server_rcv_gen_user_property_set_t**

Context of the received Generic User Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**

Raw value for the User Property

struct **esp_ble_mesh_server_rcv_gen_admin_property_set_t**

Context of the received Generic Admin Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_server_rcv_gen_manufacturer_property_set_t**

Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_generic_server_cb_value_t **value**

Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Default Transition Time Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Power OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Power Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)

Define a new Generic Battery Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Battery Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)

Define a new Generic Location Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)

Define a new Generic Property Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

Note: 1. The Generic OnOff Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_onoff_srv_t*.

Returns New Generic OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Level Server Model.

Note: 1. The Generic Level Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_level_srv_t*.

Returns New Generic Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.

Note: 1. The Generic Default Transition Time Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_def_trans_time_srv_t*.

Returns New Generic Default Transition Time Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Server Model.

Note: 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

- a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
 - b. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_srv_t*.

Returns New Generic Power OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Setup Server Model.

Note: 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_setup_srv_t*.

Returns New Generic Power OnOff Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Power Level Server Model.

Note: 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_srv_t*.

Returns New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

Note: 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_setup_srv_t*.

Returns New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)

Define a new Generic Battery Server Model.

Note: 1. The Generic Battery Server Model is a root model.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that is powered by a battery.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_battery_srv_t*.

Returns New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)

Define a new Generic Location Server Model.

Note: 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that knows its location (global or local).
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_srv_t*.

Returns New Generic Location Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

Note: 1. The Generic Location Setup Server model extends the Generic Location Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_setup_srv_t*.

Returns New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note: 1. The Generic User Property Server model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_user_prop_srv_t*.

Returns New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

Note: 1. The Generic Admin Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_admin_prop_srv_t*.

Returns New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

Note: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_manu_prop_srv_t*.

Returns New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note: 1. The Generic Client Property Server model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_client_prop_srv_t*.

Returns New Generic Client Property Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,  
esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,  
esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

Values:

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

```
enum esp_ble_mesh_gen_admin_prop_access_t
```

This enum value is the access value of Generic Admin Property

Values:

enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

Values:

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

Sensor Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback` (`esp_ble_mesh_sensor_client_cb_t` callback)

Register BLE Mesh Sensor Client Model callback.

Parameters `callback` –[in] Pointer to the callback function.

Returns `ESP_OK` on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_get_state_t* *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to sensor get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_set_state_t* *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to sensor set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_sensor_server_callback** (*esp_ble_mesh_sensor_server_cb_t* callback)

Register BLE Mesh Sensor Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

Structures

struct **esp_ble_mesh_sensor_descriptor_get_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_sensor_cadence_get_t**

Parameter of Sensor Cadence Get

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_cadence_set_t**

Parameters of Sensor Cadence Set

Public Members**uint16_t property_id**

Property ID for the sensor

uint8_t fast_cadence_period_divisor

Divisor for the publish period

uint8_t status_trigger_type

The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down

Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up

Delta up value that triggers a status message

uint8_t status_min_interval

Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low

Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high

Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t

Parameter of Sensor Settings Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t

Parameters of Sensor Setting Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

uint16_t sensor_setting_property_id

Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t

Parameters of Sensor Setting Set

Public Members

uint16_t **sensor_property_id**
Property ID identifying a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

struct net_buf_simple ***sensor_setting_raw**
Raw value for the setting

struct **esp_ble_mesh_sensor_get_t**
Parameters of Sensor Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct **esp_ble_mesh_sensor_column_get_t**
Parameters of Sensor Column Get

Public Members

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x**
Raw value identifying a column

struct **esp_ble_mesh_sensor_series_get_t**
Parameters of Sensor Series Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x1**
Raw value identifying a starting column (optional)

struct net_buf_simple ***raw_value_x2**
Raw value identifying an ending column (C.1)

struct **esp_ble_mesh_sensor_descriptor_status_cb_t**
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple ***descriptor**
Sequence of 8-octet sensor descriptors (optional)

struct **esp_ble_mesh_sensor_cadence_status_cb_t**
Parameters of Sensor Cadence Status

Public Members

uint16_t **property_id**
Property for the sensor

struct net_buf_simple ***sensor_cadence_value**
Value of sensor cadence state

struct **esp_ble_mesh_sensor_settings_status_cb_t**
Parameters of Sensor Settings Status

Public Members

uint16_t **sensor_property_id**
Property ID identifying a sensor

struct net_buf_simple ***sensor_setting_property_ids**
A sequence of N sensor setting property IDs (optional)

struct **esp_ble_mesh_sensor_setting_status_cb_t**
Parameters of Sensor Setting Status

Public Members

bool **op_en**
Indicate id optional parameters are included

uint16_t **sensor_property_id**
Property ID identifying a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

uint8_t **sensor_setting_access**
Read/Write access rights for the setting (optional)

struct net_buf_simple ***sensor_setting_raw**
Raw value for the setting

struct **esp_ble_mesh_sensor_status_cb_t**
Parameter of Sensor Status

Public Members

struct net_buf_simple ***marshalled_sensor_data**
Value of sensor data state (optional)

struct **esp_ble_mesh_sensor_column_status_cb_t**
Parameters of Sensor Column Status

Public Members

uint16_t **property_id**
Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_column_value**
Left values of sensor column status

struct **esp_ble_mesh_sensor_series_status_cb_t**
Parameters of Sensor Series Status

Public Members

uint16_t **property_id**
Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_series_value**
Left values of sensor series status

struct **esp_ble_mesh_sensor_client_cb_param_t**
Sensor Client Model callback parameters

Public Members

int **error_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t **status_cb**

The sensor status message callback values

struct **esp_ble_mesh_sensor_descriptor_t**

Parameters of Sensor Descriptor state

Public Members

uint32_t **positive_tolerance**

The value of Sensor Positive Tolerance field

uint32_t **negative_tolerance**

The value of Sensor Negative Tolerance field

uint32_t **sampling_function**

The value of Sensor Sampling Function field

uint8_t **measure_period**

The value of Sensor Measurement Period field

uint8_t **update_interval**

The value of Sensor Update Interval field

struct **esp_ble_mesh_sensor_setting_t**

Parameters of Sensor Setting state

Public Members

uint16_t **property_id**

The value of Sensor Setting Property ID field

uint8_t **access**

The value of Sensor Setting Access field

struct net_buf_simple ***raw**

The value of Sensor Setting Raw field

struct **esp_ble_mesh_sensor_cadence_t**

Parameters of Sensor Cadence state

Public Members

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor field

uint8_t **trigger_type**

The value of Status Trigger Type field

struct net_buf_simple ***trigger_delta_down**

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up field

uint8_t **min_interval**

The value of Status Min Interval field

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low field

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High field

struct **esp_ble_mesh_sensor_data_t**

Parameters of Sensor Data state

Public Members

uint8_t **format**

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length**

The value of the Sensor Data length

struct net_buf_simple ***raw_value**

The value of Sensor Data raw value

struct **esp_ble_mesh_sensor_series_column_t**

Parameters of Sensor Series Column state

Public Members

struct net_buf_simple ***raw_value_x**
The value of Sensor Raw Value X field

struct net_buf_simple ***column_width**
The value of Sensor Column Width field

struct net_buf_simple ***raw_value_y**
The value of Sensor Raw Value Y field

struct **esp_ble_mesh_sensor_state_t**
Parameters of Sensor states

Public Members

uint16_t **sensor_property_id**
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t **descriptor**
Parameters of the Sensor Descriptor state

const uint8_t **setting_count**
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t ***settings**
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t ***cadence**
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”.Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t **sensor_data**
Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t **series_column**
Parameters of the Sensor Series Column state

struct **esp_ble_mesh_sensor_srv_t**
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_sensor_setup_srv_t**

User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_state_change_sensor_cadence_set_t**

Parameters of Sensor Cadence Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor state

uint8_t **trigger_type**

The value of Status Trigger Type state

struct net_buf_simple ***trigger_delta_down**

The value of Status Trigger Delta Down state

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up state

uint8_t **min_interval**

The value of Status Min Interval state

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low state

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High state

struct **esp_ble_mesh_state_change_sensor_setting_set_t**

Parameters of Sensor Setting Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint16_t **setting_property_id**

The value of Sensor Setting Property ID state

struct net_buf_simple ***setting_value**

The value of Sensor Property Value state

struct **esp_ble_mesh_server_rcv_sensor_descriptor_get_t**

Context of the received Sensor Descriptor Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_cadence_get_t**

Context of the received Sensor Cadence Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_settings_get_t**

Context of the received Sensor Settings Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_setting_get_t**
Context of the received Sensor Setting Get message

Public Members

uint16_t **property_id**
Property ID of a sensor

uint16_t **setting_property_id**
Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_server_rcv_sensor_get_t**
Context of the received Sensor Get message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_column_get_t**
Context of the received Sensor Column Get message

Public Members

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x**
Raw value identifying a column

struct **esp_ble_mesh_server_rcv_sensor_series_get_t**
Context of the received Sensor Series Get message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value**
Raw value containing X1 and X2 (optional)

struct **esp_ble_mesh_server_rcv_sensor_cadence_set_t**

Context of the received Sensor Cadence Set message

Public Members

uint16_t **property_id**

Property ID for the sensor

struct net_buf_simple ***cadence**

Value of Sensor Cadence state

struct **esp_ble_mesh_server_rcv_sensor_setting_set_t**

Context of the received Sensor Setting Set message

Public Members

uint16_t **property_id**

Property ID identifying a sensor

uint16_t **setting_property_id**

Setting ID identifying a setting within a sensor

struct net_buf_simple ***setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_server_cb_param_t**

Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t **value**

Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)

Define a new Sensor Client Model.

Note: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Sensor Client Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

Note: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_srv_t*.

Returns New Sensor Server Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

Note: 1. The Sensor Setup Server model extends the Sensor Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_setup_srv_t*.

Returns New Sensor Setup Server Model instance.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID

Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN

Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN

Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE

Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE

Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD

Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL

Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID

Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN

Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN

Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ

Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE

Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN

Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN

Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE

Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX

Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16

Sensor Status Trigger Type - Format Type "uint16"

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A

Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B

Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN

MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN

MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)

Get format of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.

Returns Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)

Get length of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

Returns Length (zero-based) of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)

Get Sensor Property ID of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

Returns Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

Note: 1. The Format field is 0b0 and indicates that Format A is used.

- a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
 - b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
 - c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.
-

Parameters

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

Returns 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

Note: 1. The Format field is 0b1 and indicates Format B is used.

- a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
 - b. The Property ID is a 16-bit bit field representing a Property ID.
 - c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
 - d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID
-

Parameters

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

Returns 3-octet MPID value for sensor data with Format B.

Type Definitions

```
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,  
esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,  
esp_ble_mesh_sensor_server_cb_param_t *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

Values:

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_RMS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_COUNT**

enum **esp_ble_mesh_sensor_server_cb_event_t**

This enum value is the event of Sensor Server Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

Time and Scenes Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

Functions

esp_err_t **esp_ble_mesh_register_time_scene_client_callback** (*esp_ble_mesh_time_scene_client_cb_t* callback)

Register BLE Mesh Time Scene Client Model callback.

Parameters `callback` –[in] Pointer to the callback function.

Returns `ESP_OK` on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_get_state_t
                                                    *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to time scene get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_set_state_t
                                                    *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to time scene set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                           callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Unions

```
union esp_ble_mesh_time_scene_client_get_state_t

Structures

struct **esp_ble_mesh_time_set_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_set_t**

Parameters of Time Zone Set

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_set_t**

Parameters of TAI-UTC Delta Set

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_set_t**

Parameter of Time Role Set

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_store_t**

Parameter of Scene Store

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_scene_recall_t**

Parameters of Scene Recall

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **scene_number**

The number of scenes to be recalled

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_scene_delete_t**

Parameter of Scene Delete

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_status_cb_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_status_cb_t**

Parameters of Time Zone Status

Public Members

uint8_t **time_zone_offset_curr**

Current local time zone offset

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_status_cb_t**

Parameters of TAI-UTC Delta Status

Public Members**uint16_t tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint16_t padding_1

Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new

Upcoming difference between TAI and UTC in seconds

uint16_t padding_2

Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_status_cb_t**

Parameter of Time Role Status

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_status_cb_t**

Parameters of Scene Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t status_code

Status code of the last operation

uint16_t current_scene

Scene Number of the current scene

uint16_t target_scene

Scene Number of the target scene (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_scene_register_status_cb_t**

Parameters of Scene Register Status

Public Members**uint8_t status_code**

Status code for the previous operation

uint16_t current_scene

Scene Number of the current scene

struct net_buf_simple *scenes

A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t

Parameter of Scheduler Status

Public Members**uint16_t schedules**

Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t

Parameters of Scheduler Action Status

Public Members**uint64_t index**

Enumerates (selects) a Schedule Register entry

uint64_t year

Scheduled year for the action

uint64_t month

Scheduled month for the action

uint64_t day

Scheduled day of the month for the action

uint64_t hour

Scheduled hour for the action

uint64_t minute

Scheduled minute for the action

uint64_t second

Scheduled second for the action

uint64_t day_of_week

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_scene_client_cb_param_t**

Time Scene Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t **status_cb**

The scene status message callback values

struct **esp_ble_mesh_time_state_t**

Parameters of Time state

Public Members

uint8_t **tai_seconds**[5]

The value of the TAI Seconds state

uint8_t **subsecond**

The value of the Subsecond field

uint8_t **uncertainty**

The value of the Uncertainty field

uint8_t **time_zone_offset_curr**

The value of the Time Zone Offset Current field

uint8_t **time_zone_offset_new**

The value of the Time Zone Offset New state

uint8_t **tai_zone_change**[5]

The value of the TAI of Zone Chaneg field

uint16_t **time_authority**

The value of the Time Authority bit

uint16_t **tai_utc_delta_curr**

The value of the TAI-UTC Delta Current state

uint16_t **tai_utc_delta_new**

The value of the TAI-UTC Delta New state

uint8_t **tai_delta_change**[5]

The value of the TAI of Delta Change field

struct *esp_ble_mesh_time_state_t*::[anonymous] **time**

Parameters of the Time state

uint8_t **time_role**

The value of the Time Role state

struct **esp_ble_mesh_time_srv_t**

User data of Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_time_setup_srv_t**

User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_scene_register_t**

- a. Scene Store is an operation of storing values of a present state of an element.
- b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t **scene_number**

The value of the Scene Number

uint8_t **scene_type**

The value of the Scene Type

struct net_buf_simple ***scene_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t **scene_count**

The Scenes state's scene count

esp_ble_mesh_scene_register_t ***scenes**

Parameters of the Scenes state

uint16_t **current_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code

The status code of the last scene operation

bool in_progress

Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

struct **esp_ble_mesh_schedule_register_t**

Parameters of Scheduler Register state

Public Members

bool **in_use**

Indicate if the registered schedule is in use

uint64_t **year**

The value of Scheduled year for the action

uint64_t **month**

The value of Scheduled month for the action

uint64_t **day**

The value of Scheduled day of the month for the action

uint64_t **hour**

The value of Scheduled hour for the action

uint64_t **minute**

The value of Scheduled minute for the action

uint64_t **second**

The value of Scheduled second for the action

uint64_t **day_of_week**

The value of Schedule days of the week for the action

uint64_t **action**

The value of Action to be performed at the scheduled time

uint64_t **trans_time**

The value of Transition time for this action

uint16_t **scene_number**

The value of Scene Number to be used for some actions

struct **esp_ble_mesh_scheduler_state_t**

Parameters of Scheduler state

Public Members

const uint8_t **schedule_count**

Scheduler count

esp_ble_mesh_schedule_register_t ***schedules**

Up to 16 scheduled entries

struct **esp_ble_mesh_scheduler_srv_t**

User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_scheduler_setup_srv_t**

User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_state_change_time_set_t**

Parameters of Time Set state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_status_t`

Parameters of Time Status state change event

Public Members

`uint8_t tai_seconds[5]`

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_zone_set_t`

Parameters of Time Zone Set state change event

Public Members

`uint8_t time_zone_offset_new`

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_state_change_tai_utc_delta_set_t**

Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_state_change_time_role_set_t**

Parameter of Time Role Set state change event

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_state_change_scene_store_t**

Parameter of Scene Store state change event

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_state_change_scene_recall_t**

Parameter of Scene Recall state change event

Public Members

uint16_t **scene_number**

The number of scenes to be recalled

struct **esp_ble_mesh_state_change_scene_delete_t**

Parameter of Scene Delete state change event

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_state_change_scheduler_act_set_t**
Parameter of Scheduler Action Set state change event

Public Members

uint64_t **index**
Index of the Schedule Register entry to set

uint64_t **year**
Scheduled year for the action

uint64_t **month**
Scheduled month for the action

uint64_t **day**
Scheduled day of the month for the action

uint64_t **hour**
Scheduled hour for the action

uint64_t **minute**
Scheduled minute for the action

uint64_t **second**
Scheduled second for the action

uint64_t **day_of_week**
Schedule days of the week for the action

uint64_t **action**
Action to be performed at the scheduled time

uint64_t **trans_time**
Transition time for this action

uint16_t **scene_number**
Scene number to be used for some actions

struct **esp_ble_mesh_server_rcv_scheduler_act_get_t**
Context of the received Scheduler Action Get message

Public Members

uint8_t **index**
Index of the Schedule Register entry to get

struct **esp_ble_mesh_server_rcv_time_set_t**
Context of the received Time Set message

Public Members**uint8_t tai_seconds[5]**

The current TAI time in seconds

uint8_t subsecond

The sub-second time in units of 1/256 second

uint8_t uncertainty

The estimated uncertainty in 10-millisecond steps

uint16_t time_authority

0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta

Current difference between TAI and UTC in seconds

uint8_t time_zone_offset

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_server_rcv_time_zone_set_t**

Context of the received Time Zone Set message

Public Members**uint8_t time_zone_offset_new**

Upcoming local time zone offset

uint8_t tai_zone_change[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_server_rcv_tai_utc_delta_set_t**

Context of the received TAI UTC Delta Set message

Public Members**uint16_t tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t padding

Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_server_rcv_time_role_set_t**

Context of the received Time Role Set message

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_server_rcv_scene_store_t**

Context of the received Scene Store message

Public Members**uint16_t scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_server_rcv_scene_recall_t**

Context of the received Scene Recall message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t scene_number

The number of scenes to be recalled

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_scene_delete_t**

Context of the received Scene Delete message

Public Members**uint16_t scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_server_rcv_scheduler_act_set_t**

Context of the received Scheduler Action Set message

Public Members**uint64_t index**

Index of the Schedule Register entry to set

uint64_t year

Scheduled year for the action

uint64_t month

Scheduled month for the action

uint64_t day

Scheduled day of the month for the action

uint64_t hour

Scheduled hour for the action

uint64_t minute

Scheduled minute for the action

uint64_t second

Scheduled second for the action

uint64_t day_of_week

Schedule days of the week for the action

uint64_t action

Action to be performed at the scheduled time

uint64_t trans_time

Transition time for this action

uint16_t scene_number

Scene number to be used for some actions

struct **esp_ble_mesh_server_rcv_time_status_t**

Context of the received Time Status message

Public Members**uint8_t tai_seconds[5]**

The current TAI time in seconds

uint8_t subsecond

The sub-second time in units of 1/256 second

uint8_t uncertainty

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_scene_server_cb_param_t**

Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t **value**

Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)

Define a new Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Time Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)

Define a new Scene Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scene Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Scene Client Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)

Define a new Scheduler Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

Note: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_srv_t*.

Returns New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)

Define a new Time Setup Server Model.

Note: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

- a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
 - b. This model does not support subscribing nor publishing.
-

Parameters

- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_setup_srv_t*.

Returns New Time Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)

Define a new Scene Server Model.

Note: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_srv_t*.

Returns New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)

Define a new Scene Setup Server Model.

Note: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_setup_srv_t*.

Returns New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)

Define a new Scheduler Server Model.

Note: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
 - c. The model requires the Time Server model shall be present on the element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_srv_t*.

Returns New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

Note: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_setup_srv_t*.

Returns New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS

Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE

Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE

Unknown TAI of Delta Change

ESP_BLE_MESH_TAI.UTC_DELTA_MAX_VALUE

Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI.SECONDS_LEN

Length of TAI Seconds

ESP_BLE_MESH_TAI.OF_ZONE_CHANGE_LEN

Length of TAI of Zone Change

ESP_BLE_MESH_TAI.OF_DELTA_CHANGE_LEN

Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER

Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN

Length of the Scene Number

ESP_BLE_MESH_SCHEDULE.YEAR_ANY_YEAR

Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE.DAY_ANY_DAY

Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE.HOUR_ANY_HOUR

Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.HOUR_ONCE_A_DAY

Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE.SEC_ANY_OF_HOUR

Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC_EVERY_15_MIN

Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC_EVERY_20_MIN

Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC_ONCE_AN_HOUR

Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC_ANY_OF_MIN

Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE.SEC_EVERY_15_SEC

Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY_20_SEC

Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC ONCE_AN_MIN

Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF

Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON

Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL

Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION

Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE

Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX

Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE

Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY

Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY

Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET

Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS

Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL

Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND

Scene operation - Scene Not Found

Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_light_client_callback** (*esp_ble_mesh_light_client_cb_t* callback)

Register BLE Mesh Light Client Model callback.

Parameters **callback** –[in] pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_get_state_t* *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer of light get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_set_state_t* *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer of light set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_lighting_server_callback** (*esp_ble_mesh_lighting_server_cb_t* callback)

Register BLE Mesh Lighting Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_light_lightness_set_t**

Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

Parameters of Light Lightness Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lightness_linear_set_t**

Parameters of Light Lightness Linear Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness linear state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lightness_default_set_t**

Parameter of Light Lightness Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_light_lightness_range_set_t**

Parameters of Light Lightness Range Set

Public Members**uint16_t range_min**

Value of range min field of light lightness range state

uint16_t range_max

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_set_t**

Parameters of Light CTL Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_lightness

Target value of light ctl lightness state

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_ctl_temperature_range_set_t`

Parameters of Light CTL Temperature Range Set

Public Members

`uint16_t range_min`

Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`

Value of temperature range max field of light ctl temperature range state

struct `esp_ble_mesh_light_ctl_default_set_t`

Parameters of Light CTL Default Set

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t temperature`

Value of light temperature default state

`int16_t delta_uv`

Value of light delta UV default state

struct `esp_ble_mesh_light_hsl_set_t`

Parameters of Light HSL Set

Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t hsl_lightness`

Target value of light hsl lightness state

uint16_t **hsl_hue**

Target value of light hsl hue state

uint16_t **hsl_saturation**

Target value of light hsl saturation state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_hue_set_t**

Parameters of Light HSL Hue Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_saturation_set_t**

Parameters of Light HSL Saturation Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_hsl_default_set_t`

Parameters of Light HSL Default Set

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_light_hsl_range_set_t`

Parameters of Light HSL Range Set

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_light_xyl_set_t`

Parameters of Light xyL Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xy1_lightness**

The target value of the Light xyL Lightness state

uint16_t **xy1_x**

The target value of the Light xyL x state

uint16_t **xy1_y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_xy1_default_set_t**

Parameters of Light xyL Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xy1_x**

The value of the Light xyL x Default state

uint16_t **xy1_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xy1_range_set_t**

Parameters of Light xyL Range Set

Public Members

uint16_t **xy1_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xy1_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xy1_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xy1_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_set_t**

Parameter of Light LC Mode Set

Public Members

uint8_t **mode**

The target value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_set_t**

Parameter of Light LC OM Set

Public Members

uint8_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_set_t**

Parameters of Light LC Light OnOff Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **light_onoff**

The target value of the Light LC Light OnOff state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lc_property_get_t**

Parameter of Light LC Property Get

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_light_lc_property_set_t**

Parameters of Light LC Property Set

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_lightness_status_cb_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness actual state

uint16_t target_lightness

Target value of light lightness actual state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_linear_status_cb_t**

Parameters of Light Lightness Linear Status

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness linear state

uint16_t **target_lightness**

Target value of light lightness linear state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_last_status_cb_t**

Parameter of Light Lightness Last Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Last state

struct **esp_ble_mesh_light_lightness_default_status_cb_t**

Parameter of Light Lightness Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness default State

struct **esp_ble_mesh_light_lightness_range_status_cb_t**

Parameters of Light Lightness Range Status

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_status_cb_t**

Parameters of Light CTL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_lightness**

Current value of light ctl lightness state

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **target_ctl_lightness**

Target value of light ctl lightness state (optional)

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_status_cb_t**

Parameters of Light CTL Temperature Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **present_ctl_delta_uv**

Current value of light ctl delta UV state

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (optional)

uint16_t **target_ctl_delta_uv**

Target value of light ctl delta UV state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_status_cb_t**

Parameters of Light CTL Temperature Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_status_cb_t**

Parameters of Light CTL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_status_cb_t**

Parameters of Light HSL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness**

Current value of light hsl lightness state

uint16_t **hsl_hue**

Current value of light hsl hue state

uint16_t **hsl_saturation**

Current value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_target_status_cb_t**

Parameters of Light HSL Target Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness_target**

Target value of light hsl lightness state

uint16_t **hsl_hue_target**

Target value of light hsl hue state

uint16_t **hsl_saturation_target**

Target value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_hue_status_cb_t**

Parameters of Light HSL Hue Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_hue**

Current value of light hsl hue state

uint16_t **target_hue**

Target value of light hsl hue state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_saturation_status_cb_t**

Parameters of Light HSL Saturation Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_saturation**

Current value of light hsl saturation state

uint16_t **target_saturation**

Target value of light hsl saturation state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_default_status_cb_t**

Parameters of Light HSL Default Status

Public Members**uint16_t lightness**

Value of light lightness default state

uint16_t hue

Value of light hue default state

uint16_t saturation

Value of light saturation default state

struct **esp_ble_mesh_light_hsl_range_status_cb_t**

Parameters of Light HSL Range Status

Public Members**uint8_t status_code**

Status code for the request message

uint16_t hue_range_min

Value of hue range min field of light hsl hue range state

uint16_t hue_range_max

Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min

Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_light_xyl_status_cb_t**

Parameters of Light xyL Status

Public Members**bool op_en**

Indicate whether optional parameters included

uint16_t xyl_lightness

The present value of the Light xyL Lightness state

uint16_t xyl_x

The present value of the Light xyL x state

uint16_t xyl_y

The present value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_target_status_cb_t**

Parameters of Light xyL Target Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **target_xyl_lightness**

The target value of the Light xyL Lightness state

uint16_t **target_xyl_x**

The target value of the Light xyL x state

uint16_t **target_xyl_y**

The target value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_default_status_cb_t**

Parameters of Light xyL Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xyl_x**

The value of the Light xyL x Default state

uint16_t **xyl_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xyl_range_status_cb_t**

Parameters of Light xyL Range Status

Public Members

uint8_t **status_code**

Status Code for the requesting message

uint16_t **xyL_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xyL_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xyL_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xyL_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_status_cb_t**

Parameter of Light LC Mode Status

Public Members

uint8_t **mode**

The present value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_status_cb_t**

Parameter of Light LC OM Status

Public Members

uint8_t **mode**

The present value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_status_cb_t**

Parameters of Light LC Light OnOff Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **present_light_onoff**

The present value of the Light LC Light OnOff state

uint8_t **target_light_onoff**

The target value of the Light LC Light OnOff state (Optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lc_property_status_cb_t**

Parameters of Light LC Property Status

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_client_cb_param_t**

Lighting Client Model callback parameters

Public Membersint **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_light_client_status_cb_t **status_cb**

The light status message callback values

struct **esp_ble_mesh_light_lightness_state_t**

Parameters of Light Lightness state

Public Membersuint16_t **lightness_linear**

The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**

The target value of Light Lightness Linear state

uint16_t **lightness_actual**

The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**

The target value of Light Lightness Actual state

uint16_t **lightness_last**

The value of Light Lightness Last state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint8_t **status_code**

The status code of setting Light Lightness Range state

uint16_t **lightness_range_min**

The minimum value of Light Lightness Range state

uint16_t **lightness_range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_light_lightness_srv_t**

User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **actual_transition**

Parameters of state transition

esp_ble_mesh_state_transition_t **linear_transition**

Parameters of state transition

int32_t **tt_delta_lightness_actual**

Delta change value of lightness actual state transition

int32_t **tt_delta_lightness_linear**

Delta change value of lightness linear state transition

struct **esp_ble_mesh_light_lightness_setup_srv_t**

User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state

Parameters of the Light Lightness state

struct **esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

Public Members

uint16_t **lightness**

The present value of Light CTL Lightness state

uint16_t **target_lightness**

The target value of Light CTL Lightness state

uint16_t **temperature**

The present value of Light CTL Temperature state

uint16_t **target_temperature**

The target value of Light CTL Temperature state

int16_t **delta_uv**

The present value of Light CTL Delta UV state

int16_t **target_delta_uv**

The target value of Light CTL Delta UV state

uint8_t **status_code**

The statue code of setting Light CTL Temperature Range state

uint16_t **temperature_range_min**

The minimum value of Light CTL Temperature Range state

uint16_t **temperature_range_max**

The maximum value of Light CTL Temperature Range state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **temperature_default**

The value of Light CTL Temperature Default state

int16_t **delta_uv_default**

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_light_ctl_srv_t**

User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_ctl_setup_srv_t**

User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

struct **esp_ble_mesh_light_ctl_temp_srv_t**

User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

Public Members

uint16_t **lightness**

The present value of Light HSL Lightness state

uint16_t **target_lightness**

The target value of Light HSL Lightness state

uint16_t **hue**

The present value of Light HSL Hue state

uint16_t **target_hue**

The target value of Light HSL Hue state

uint16_t **saturation**

The present value of Light HSL Saturation state

uint16_t **target_saturation**

The target value of Light HSL Saturation state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **hue_default**

The value of Light HSL Hue Default state

`uint16_t saturation_default`
The value of Light HSL Saturation Default state

`uint8_t status_code`
The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
The minimum value of Light HSL Saturation state

`uint16_t saturation_range_max`
The maximum value of Light HSL Saturation state

struct `esp_ble_mesh_light_hsl_srv_t`
User data of Light HSL Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

struct `esp_ble_mesh_light_hsl_setup_srv_t`
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

struct **esp_ble_mesh_light_hsl_hue_srv_t**

User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_hue**

Delta change value of hue state transition

struct **esp_ble_mesh_light_hsl_sat_srv_t**

User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_saturation**

Delta change value of saturation state transition

struct **esp_ble_mesh_light_xyL_state_t**

Parameters of Light xyL state

Public Members

uint16_t **lightness**

The present value of Light xyL Lightness state

uint16_t **target_lightness**

The target value of Light xyL Lightness state

uint16_t **x**

The present value of Light xyL x state

uint16_t **target_x**

The target value of Light xyL x state

uint16_t **y**

The present value of Light xyL y state

uint16_t **target_y**

The target value of Light xyL y state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **x_default**

The value of Light xyL x Default state

uint16_t **y_default**

The value of Light xyL y Default state

uint8_t **status_code**

The status code of setting Light xyL x & y Range state

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

uint16_t **x_range_max**

The maximum value of Light xyL x Range state

uint16_t **y_range_min**

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_light_xyl_srv_t**

User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_x**

Delta change value of x state transition

int32_t **tt_delta_y**

Delta change value of y state transition

struct **esp_ble_mesh_light_xyl_setup_srv_t**

User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

struct **esp_ble_mesh_light_lc_state_t**

Parameters of Light LC states

Public Members

uint32_t **mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t **occupancy_mode**

The value of Light LC Occupancy Mode state

uint32_t **light_onoff**

The present value of Light LC Light OnOff state

uint32_t **target_light_onoff**

The target value of Light LC Light OnOff state

uint32_t **occupancy**

The value of Light LC Occupancy state

uint32_t **ambient_luxlevel**

The value of Light LC Ambient LuxLevel state

uint16_t **linear_output**

- Light LC Linear Output = $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct **esp_ble_mesh_light_lc_property_state_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t

Parameters of Light LC state machine

Public Members**uint8_t fade_on**

The value of transition time of Light LC Time Fade On

uint8_t fade

The value of transition time of Light LC Time Fade

uint8_t **fade_standby_auto**

The value of transition time of Light LC Time Fade Standby Auto

uint8_t **fade_standby_manual**

The value of transition time of Light LC Time Fade Standby Manual

struct *esp_ble_mesh_light_lc_state_machine_t*::[anonymous] **trans_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t **state**

The value of Light LC state machine state

struct k_delayed_work **timer**

Timer of Light LC state machine

struct **esp_ble_mesh_light_control_t**

Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t **state**

Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t **prop_state**

Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t **state_machine**

Parameters of Light LC state machine

struct **esp_ble_mesh_light_lc_srv_t**

User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

struct **esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Actual state

struct **esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Linear state

struct **esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

struct **esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event

Public Members**uint16_t range_min**

The minimum value of Light Lightness Range state

uint16_t range_max

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_state_change_light_ctl_set_t**

Parameters of Light CTL state change event

Public Members**uint16_t lightness**

The value of Light CTL Lightness state

uint16_t temperature

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature state change event

Public Members**uint16_t temperature**

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range state change event

Public Members**uint16_t range_min**

The minimum value of Light CTL Temperature Range state

uint16_t range_max

The maximum value of Light CTL Temperature Range state

struct **esp_ble_mesh_state_change_light_ctl_default_set_t**

Parameters of Light CTL Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

uint16_t temperature

The value of Light CTL Temperature Default state

int16_t delta_uv

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_state_change_light_hsl_set_t**

Parameters of Light HSL state change event

Public Members**uint16_t lightness**

The value of Light HSL Lightness state

uint16_t hue

The value of Light HSL Hue state

uint16_t saturation

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_hue_set_t**

Parameter of Light HSL Hue state change event

Public Members**uint16_t hue**

The value of Light HSL Hue state

struct **esp_ble_mesh_state_change_light_hsl_saturation_set_t**

Parameter of Light HSL Saturation state change event

Public Members**uint16_t saturation**

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_default_set_t**

Parameters of Light HSL Default state change event

Public Members**uint16_t lightness**

The value of Light HSL Lightness Default state

uint16_t hue

The value of Light HSL Hue Default state

uint16_t saturation

The value of Light HSL Saturation Default state

struct **esp_ble_mesh_state_change_light_hsl_range_set_t**

Parameters of Light HSL Range state change event

Public Members**uint16_t hue_range_min**

The minimum hue value of Light HSL Range state

uint16_t hue_range_max

The maximum hue value of Light HSL Range state

uint16_t saturation_range_min

The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max

The maximum saturation value of Light HSL Range state

struct **esp_ble_mesh_state_change_light_xyL_set_t**

Parameters of Light xyL state change event

Public Members**uint16_t lightness**

The value of Light xyL Lightness state

uint16_t x

The value of Light xyL x state

uint16_t y

The value of Light xyL y state

struct **esp_ble_mesh_state_change_light_xyL_default_set_t**

Parameters of Light xyL Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

uint16_t **x**

The value of Light xyL x Default state

uint16_t **y**

The value of Light xyL y Default state

struct **esp_ble_mesh_state_change_light_xyl_range_set_t**

Parameters of Light xyL Range state change event

Public Members

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

uint16_t **x_range_max**

The maximum value of Light xyL x Range state

uint16_t **y_range_min**

The minimum value of Light xyL y Range state

uint16_t **y_range_max**

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_state_change_light_lc_mode_set_t**

Parameter of Light LC Mode state change event

Public Members

uint8_t **mode**

The value of Light LC Mode state

struct **esp_ble_mesh_state_change_light_lc_om_set_t**

Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t **mode**

The value of Light LC Occupancy Mode state

struct **esp_ble_mesh_state_change_light_lc_light_onoff_set_t**

Parameter of Light LC Light OnOff state change event

Public Members**uint8_t onoff**

The value of Light LC Light OnOff state

struct **esp_ble_mesh_state_change_light_lc_property_set_t**

Parameters of Light LC Property state change event

Public Members**uint16_t property_id**

The property id of Light LC Property state

struct net_buf_simple ***property_value**

The property value of Light LC Property state

struct **esp_ble_mesh_state_change_sensor_status_t**

Parameters of Sensor Status state change event

Public Members**uint16_t property_id**

The value of Sensor Property ID

uint8_t occupancy

The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay

The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel

The value of Light LC Ambient Luxlevel state

union *esp_ble_mesh_state_change_sensor_status_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp_ble_mesh_server_rcv_light_lc_property_get_t**

Context of the received Light LC Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_server_rcv_light_lightness_set_t**

Context of the received Light Lightness Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light lightness actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_lightness_linear_set_t**

Context of the received Light Lightness Linear Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light lightness linear state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_lightness_default_set_t**

Context of the received Light Lightness Default Set message

Public Members**uint16_t lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_server_rcv_light_lightness_range_set_t**

Context of the received Light Lightness Range Set message

Public Members**uint16_t range_min**

Value of range min field of light lightness range state

uint16_t range_max

Value of range max field of light lightness range state

struct **esp_ble_mesh_server_recv_light_ctl_set_t**

Context of the received Light CTL Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light ctl lightness state

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_ctl_temperature_set_t**

Context of the received Light CTL Temperature Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_ctl_temperature_range_set_t**

Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_server_rcv_light_ctl_default_set_t**

Context of the received Light CTL Default Set message

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_server_rcv_light_hsl_set_t**

Context of the received Light HSL Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light hsl lightness state

uint16_t **hue**

Target value of light hsl hue state

uint16_t **saturation**

Target value of light hsl saturation state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_hsl_hue_set_t**

Context of the received Light HSL Hue Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_hsl_saturation_set_t**

Context of the received Light HSL Saturation Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_default_set_t`

Context of the received Light HSL Default Set message

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_server_rcv_light_hsl_range_set_t`

Context of the received Light HSL Range Set message

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_server_rcv_light_xyl_set_t`

Context of the received Light xyL Set message

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **lightness**

The target value of the Light xyL Lightness state

uint16_t **x**

The target value of the Light xyL x state

uint16_t **y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_xyl_default_set_t**

Context of the received Light xyL Default Set message

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **x**

The value of the Light xyL x Default state

uint16_t **y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_server_rcv_light_xyl_range_set_t**

Context of the received Light xyl Range Set message

Public Members

uint16_t **x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_server_rcv_light_lc_mode_set_t`

Context of the received Light LC Mode Set message

Public Members

`uint8_t mode`

The target value of the Light LC Mode state

struct `esp_ble_mesh_server_rcv_light_lc_om_set_t`

Context of the received Light OM Set message

Public Members

`uint8_t mode`

The target value of the Light LC Occupancy Mode state

struct `esp_ble_mesh_server_rcv_light_lc_light_onoff_set_t`

Context of the received Light LC Light OnOff Set message

Public Members

bool `op_en`

Indicate whether optional parameters included

`uint8_t light_onoff`

The target value of the Light LC Light OnOff state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_lc_property_set_t`

Context of the received Light LC Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_server_recv_sensor_status_t**

Context of the received Sensor Status message

Public Members

struct net_buf_simple ***data**

Value of sensor data state (optional)

struct **esp_ble_mesh_lighting_server_cb_param_t**

Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t **value**

Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)

Define a new Light Lightness Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)

Define a new Light CTL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)

Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)

Define a new Light xyL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light xyL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)

Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_srv_t*.

Returns New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

Note: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_setup_srv_t*.

Returns New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

Note: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_srv_t*.

Returns New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

Note: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_setup_srv_t*.

Returns New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

Note: 1. The Light CTL Temperature Server model extends the Generic Level Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_temp_srv_t*.

Returns New Light CTL Temperature Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)

Define a new Light HSL Server Model.

Note: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- This model shall support model publication and model subscription.
 - The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_srv_t*.

Returns New Light HSL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

Note: 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_setup_srv_t*.

Returns New Light HSL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

Note: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_hue_srv_t*.

Returns New Light HSL Hue Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

Note: 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_sat_srv_t*.

Returns New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)

Define a new Light xyL Server Model.

Note: 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_srv_t*.

Returns New Light xyL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

Note: 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_setup_srv_t*.

Returns New Light xyL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)

Define a new Light LC Server Model.

Note: 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_srv_t*.

Returns New Light LC Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

Note: 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to configure setup parameters for the Light LC Server model.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_setup_srv_t*.

Returns New Light LC Setup Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,  
esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,  
esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

Values:

enumerator **ESP_BLE_MESH_LC_OFF**

enumerator **ESP_BLE_MESH_LC_STANDBY**

enumerator **ESP_BLE_MESH_LC_FADE_ON**

enumerator **ESP_BLE_MESH_LC_RUN**

enumerator **ESP_BLE_MESH_LC_FADE**

enumerator **ESP_BLE_MESH_LC_PROLONG**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_AUTO**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL**

enum **esp_ble_mesh_lighting_server_cb_event_t**

This enum value is the event of Lighting Server Model

Values:

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)

- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C3.
- Combined AP-STA mode (ESP32-C3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples The [wifi](#) directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the [wifi](#) directory of ESP-IDF examples.

In addition, there is a simple [esp-idf-template](#) application to demonstrate a minimal IDF project structure.

API Reference

Header File

- [components/esp_wifi/include/esp_wifi.h](#)

Functions

`esp_err_t esp_wifi_init` (const `wifi_init_config_t` *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

Parameters `config` –pointer to WiFi initialized configuration structure; can point to a temporary variable.

Returns

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

esp_err_t **esp_wifi_deinit** (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_mode** (*wifi_mode_t* mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

Parameters mode –WiFi operating mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_get_mode** (*wifi_mode_t* *mode)

Get current operating mode of WiFi.

Parameters mode –[out] store current WiFi mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_start** (void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_stop** (void)

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- `esp_wifi_set_bandwidth`,
- `esp_wifi_set_protocol`,
- `esp_wifi_set_config` related
- `esp_wifi_set_mode`

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_connect** (void)

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact `WIFI_MODE_STA` or `WIFI_MODE_APSTA` mode

Attention 2. If the ESP32 is connected to an AP, call `esp_wifi_disconnect` to disconnect.

Attention 3. The scanning triggered by `esp_wifi_scan_start()` will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number `ESP_ERR_WIFI_STATE`.

Attention 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the `'failure_retry_cnt'` feature in the `'wifi_sta_config_t'`. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_ERR_WIFI_SSID`: SSID of AP which station connects is invalid

esp_err_t **esp_wifi_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi was not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_FAIL`: other WiFi internal errors

esp_err_t **esp_wifi_clear_fast_connect** (void)

Currently this API is just an stub API.

Returns

- `ESP_OK`: succeed
- others: fail

esp_err_t **esp_wifi_deauth_sta** (uint16_t aid)

deauthenticate all stations or associated id equals to aid

Parameters `aid` –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

esp_err_t **esp_wifi_scan_start** (const *wifi_scan_config_t* *config, bool block)

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in `esp_wifi_scan_get_ap_records`, so generally, call `esp_wifi_scan_get_ap_records` to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Parameters

- **config** –configuration settings for scanning, if set to NULL default settings will be used of which default values are `show_hidden:false`, `scan_type:active`, `scan_time.active.min:0`, `scan_time.active.max:120` miliseconds, `scan_time.passive:360` miliseconds
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by `esp_wifi_start`
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke `esp_wifi_scan_start`
- others: refer to error code in `esp_err.h`

esp_err_t **esp_wifi_scan_stop** (void)

Stop the scan in process.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

esp_err_t **esp_wifi_scan_get_ap_num** (uint16_t *number)

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Parameters **number** –[out] store number of APs found in last scan

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_scan_get_ap_records** (uint16_t *number, *wifi_ap_record_t* *ap_records)

Get AP list found in last scan.

Parameters

- **number** –[inout] As input param, it stores max AP number `ap_records` can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** –*wifi_ap_record_t* array to hold the found APs

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

`esp_err_t esp_wifi_clear_ap_list` (void)

Clear AP list found in last scan.

Attention When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_sta_get_ap_info` (`wifi_ap_record_t` *ap_info)

Get information of AP which the ESP32 station is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

Parameters `ap_info` –the `wifi_ap_record_t` to hold AP information sta can get the connected ap's phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_1r` in the `wifi_ap_record_t` struct. For example, `phy_11b = 1` imply that ap support 802.11b mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

`esp_err_t esp_wifi_set_ps` (`wifi_ps_type_t` type)

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Parameters `type` –power save type

Returns ESP_OK: succeed

`esp_err_t esp_wifi_get_ps` (`wifi_ps_type_t` *type)

Get current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Parameters `type` –[out] store current power save type

Returns ESP_OK: succeed

`esp_err_t esp_wifi_set_protocol` (`wifi_interface_t` ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11AC|WIFI_PROTOCOL_LR)

Attention Support 802.11b or 802.11bg or 802.11bgn or LR mode

Parameters

- `ifx` –interfaces
- `protocol_bitmap` –WiFi protocol bitmap

Returns

- ESP_OK: succeed

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

esp_err_t esp_wifi_get_protocol (*wifi_interface_t* ifx, uint8_t *protocol_bitmap)

Get the current protocol bitmap of the specified interface.

Parameters

- **ifx** –interface
- **protocol_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t esp_wifi_set_bandwidth (*wifi_interface_t* ifx, *wifi_bandwidth_t* bw)

Set the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to configure an interface that is not enabled

Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

Parameters

- **ifx** –interface to be configured
- **bw** –bandwidth

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t esp_wifi_get_bandwidth (*wifi_interface_t* ifx, *wifi_bandwidth_t* *bw)

Get the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to get a interface that is not enable

Parameters

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_set_channel (uint8_t primary, *wifi_second_chan_t* second)

Set primary/secondary channel of ESP32.

Attention 1. This API should be called after esp_wifi_start() and before esp_wifi_stop()

Attention 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

Attention 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

Attention 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

Attention 5. The channel info set by this API will not be stored in NVS. So If you want to remember the channel used before wifi stop, you need to call this API again after wifi start, or you can call `esp_wifi_set_config()` to store the channel info in NVS.

Parameters

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

`esp_err_t esp_wifi_get_channel (uint8_t *primary, wifi_second_chan_t *second)`

Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

Parameters

- **primary** –store current primary channel
- **second** –[out] store current second channel

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_country (const wifi_country_t *country)`

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

Attention 2. The default country is CHINA {`.cc="CN"`, `.schan=1`, `.nchan=13`, `.policy=WIFI_COUNTRY_POLICY_AUTO`}.

Attention 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

Attention 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {`.cc="US"`, `.schan=1`, `.nchan=11`} and the country info of the AP to which the station is connected is {`.cc="JP"`, `.schan=1`, `.nchan=14`} then the country info that will be used is {`.cc="JP"`, `.schan=1`, `.nchan=14`}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {`.cc="US"`, `.schan=1`, `.nchan=11`} in the example.

Attention 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

Attention 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 7. The country configuration is stored into flash.

Attention 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Parameters **country** –the configured country info

Returns

- ESP_OK: succeed

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country** (*wifi_country_t* *country)

get the current country info

Parameters **country** –country info

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_mac** (*wifi_interface_t* ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

Parameters

- **ifx** –interface
- **mac** –the MAC address

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_mac** (*wifi_interface_t* ifx, uint8_t mac[6])

Get mac of specified interface.

Parameters

- **ifx** –interface
- **mac** –[out] store mac of the interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_set_promiscuous_rx_cb** (*wifi_promiscuous_cb_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Parameters **cb** –callback

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_promiscuous** (bool en)

Enable the promiscuous mode.

Parameters **en** –false - disable, true - enable

Returns

- ESP_OK: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_get_promiscuous** (bool *en)

Get the promiscuous mode.

Parameters `en` –[out] store the current status of promiscuous mode

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_set_promiscuous_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable the promiscuous mode packet type filter.

Note: The default filter is to filter all packets except `WIFI_PKT_MISC`

Parameters `filter` –the packet type filtered in promiscuous mode.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_get_promiscuous_filter** (*wifi_promiscuous_filter_t* *filter)

Get the promiscuous filter.

Parameters `filter` –[out] store the current status of promiscuous filter

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_set_promiscuous_ctrl_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable subtype filter of the control packet in promiscuous mode.

Note: The default filter is to filter none control packet.

Parameters `filter` –the subtype of the control packet filtered in promiscuous mode.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_get_promiscuous_ctrl_filter** (*wifi_promiscuous_filter_t* *filter)

Get the subtype filter of the control packet in promiscuous mode.

Parameters `filter` –[out] store the current status of subtype filter of the control packet in promiscuous mode

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_set_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, `bssid_set` needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Attention 4. The configuration will be stored in NVS

Parameters

- **interface** –interface
- **conf** –station or soft-AP configuration

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

esp_err_t esp_wifi_get_config (*wifi_interface_t* interface, *wifi_config_t* *conf)

Get configuration of specified interface.

Parameters

- **interface** –interface
- **conf** –[out] station or soft-AP configuration

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t esp_wifi_ap_get_sta_list (*wifi_sta_list_t* *sta)

Get STAs associated with soft-AP.

Attention SSC only API

Parameters **sta** –[out] station list ap can get the connected sta's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the *wifi_sta_info_t* struct. For example, phy_11b = 1 imply that sta support 802.11b mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)

Get AID of STA connected with soft-AP.

Parameters

- **mac** –STA's mac address
- **aid** –[out] Store the AID corresponding to STA mac

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

esp_err_t **esp_wifi_set_storage** (*wifi_storage_t* storage)

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Parameters *storage* –: storage type

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_vendor_ie** (bool enable, *wifi_vendor_ie_type_t* type, *wifi_vendor_ie_id_t* idx, const void *vnd_ie)

Set 802.11 Vendor-Specific Information Element.

Parameters

- **enable** –If true, specified IE is enabled. If false, specified IE is removed.
- **type** –Information Element type. Determines the frame type to associate with the IE.
- **idx** –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd_ie** –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *vendor_ie_data_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

esp_err_t **esp_wifi_set_vendor_ie_cb** (*esp_vendor_ie_cb_t* cb, void *ctx)

Register Vendor-Specific Information Element monitoring callback.

Parameters

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_max_tx_power** (int8_t power)

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.

Attention 2. The value set by this API will be mapped to the max_tx_power of the structure *wifi_country_t* variable.

Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

Parameters *power* –Maximum WiFi transmitting power.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is out of range

esp_err_t `esp_wifi_get_max_tx_power` (`int8_t *power`)

Get maximum transmitting power after WiFi start.

Parameters `power` –Maximum WiFi transmitting power, unit is 0.25dBm.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t `esp_wifi_set_event_mask` (`uint32_t mask`)

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRCVED`.

Attention 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

Parameters `mask` –WiFi event mask.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t `esp_wifi_get_event_mask` (`uint32_t *mask`)

Get mask of WiFi events.

Parameters `mask` –WiFi event mask.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t `esp_wifi_80211_tx` (`wifi_interface_t ifx`, `const void *buffer`, `int len`, `bool en_sys_seq`)

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Parameters

- `ifx` –interface if the Wi-Fi mode is Station, the `ifx` should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the `ifx` should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the `ifx` should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the `ifx` is wrong, the API returns `ESP_ERR_WIFI_IF`.
- `buffer` –raw ieee80211 buffer
- `len` –the length of raw buffer, the `len` must be `<= 1500 Bytes` and `>= 24 Bytes`
- `en_sys_seq` –indicate whether use the internal sequence number. If `en_sys_seq` is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both `en_sys_seq==true` and `en_sys_seq==false` are fine. However, if the API is called after the Wi-Fi connection has been set up, `en_sys_seq` must be true, otherwise `ESP_ERR_INVALID_ARG` is returned.

Returns

- `ESP_OK`: success

- `ESP_ERR_WIFI_IF`: Invalid interface
- `ESP_ERR_INVALID_ARG`: Invalid parameter
- `ESP_ERR_WIFI_NO_MEM`: out of memory

`esp_err_t esp_wifi_set_csi_rx_cb` (`wifi_csi_cb_t` cb, void *ctx)

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

Parameters

- **cb** –callback
- **ctx** –context argument, passed to callback function

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_csi_config` (const `wifi_csi_config_t` *config)

Set CSI data configuration.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters **config** –configuration

`esp_err_t esp_wifi_set_csi` (bool en)

Enable or disable CSI.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters **en** –true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio` (const `wifi_ant_gpio_config_t` *config)

Set antenna GPIO configuration.

Parameters **config** –Antenna GPIO configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

`esp_err_t esp_wifi_get_ant_gpio` (`wifi_ant_gpio_config_t` *config)

Get current antenna GPIO configuration.

Parameters **config** –Antenna GPIO configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`esp_err_t esp_wifi_set_ant` (const `wifi_ant_config_t` *config)

Set antenna configuration.

Parameters `config` –Antenna configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

`esp_err_t esp_wifi_get_ant` (`wifi_ant_config_t` *config)

Get current antenna configuration.

Parameters `config` –Antenna configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`int64_t esp_wifi_get_tsf_time` (`wifi_interface_t` interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Parameters `interface` –The interface whose `tsf_time` is to be retrieved.

Returns 0 or the TSF time

`esp_err_t esp_wifi_set_inactive_time` (`wifi_interface_t` ifx, `uint16_t` sec)

Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

Parameters

- `ifx` –interface to be configured.
- `sec` –Inactive time. Unit seconds.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument, For Station, if `sec` is less than 3. For SoftAP, if `sec` is less than 10.

`esp_err_t esp_wifi_get_inactive_time` (`wifi_interface_t` ifx, `uint16_t` *sec)

Get inactive time of specified interface.

Parameters

- `ifx` –Interface to be configured.
- `sec` –Inactive time. Unit seconds.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_status_dump** (uint32_t modules)

Dump WiFi statistics.

Parameters *modules* –statistic modules to be dumped

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_set_rssi_threshold** (int32_t rssi)

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

Attention If the user wants to receive another WIFI_EVENT_STA_BSS_RSSI_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

Parameters *rssi* –threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_ftm_initiate_session** (*wifi_ftm_initiator_cfg_t* *cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention 1. Use this API only in Station mode.

Attention 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

Parameters *cfg* –FTM Initiator session configuration

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_end_session** (void)

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_resp_set_offset** (int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

Parameters *offset_cm* –T1 Offset to be added in centimeters

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_config_11b_rate** (*wifi_interface_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Attention 2. Only when really need to disable 11b rate call this API otherwise don't call this.

Parameters

- **ifx** –Interface to be configured.
- **disable** –true means disable 11b rate while false means enable 11b rate.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_set_connectionless_wake_interval** (uint16_t interval)

Set interval for station to wake up periodically at disconnected.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. This configuration would influence nothing until some module configure wake_window

Attention 4. A sensible interval which is not too small is recommended (e.g. 100ms)

Parameters **interval** –how much milliseconds would the chip wake up, from 1 to 65535.

esp_err_t **esp_wifi_force_wakeup_acquire** (void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state(RF opened) to be able to receive packets.

Attention Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

esp_err_t **esp_wifi_force_wakeup_release** (void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state(RF closed) if no more use of radio.

Attention Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

esp_err_t **esp_wifi_set_country_code** (const char *country, bool ieee80211d_enabled)

configure country

Attention 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

Attention 8. The default country is “CN” and `ieee80211d_enabled` is TRUE.

Attention 9. The third octet of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

Parameters

- **country** –the configured country ISO code
- **ieee80211d_enabled** –802.11d is enabled or not

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_get_country_code** (char *country)

get the current country code

Parameters **country** –country code

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_config_80211_tx_rate** (*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Parameters

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_disable_pmf_config** (*wifi_interface_t* ifx)

Disable PMF configuration for specified interface.

Attention This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

Parameters `ifx` –Interface to be configured.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t `esp_wifi_sta_get_aid` (uint16_t *aid)

Get the Association id assigned to STA by AP.

Attention aid = 0 if station is not connected to AP.

Parameters `aid` –[out] store the aid

Returns

- ESP_OK: succeed

esp_err_t `esp_wifi_sta_get_negotiated_phymode` (*wifi_phy_mode_t* *phymode)

Get the negotiated phymode after connection.

Parameters `phymode` –[out] store the negotiated phymode.

Returns

- ESP_OK: succeed

esp_err_t `esp_wifi_sta_get_rssi` (int *rssi)

Get the rssi info after station connected to AP.

Attention This API should be called after station connected to AP.

Parameters `rssi` –store the rssi info received from last beacon.

Returns

- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

Structures

struct `wifi_init_config_t`

WiFi stack configuration parameters passed to `esp_wifi_init` call.

Public Members

system_event_handler_t `event_handler`

WiFi event handler

wifi_osi_funcs_t *`osi_funcs`

WiFi OS functions

wpa_crypto_funcs_t `wpa_crypto_funcs`

WiFi station crypto functions when connect

int `static_rx_buf_num`

WiFi static RX buffer number

int dynamic_rx_buf_num
WiFi dynamic RX buffer number

int tx_buf_type
WiFi TX buffer type

int static_tx_buf_num
WiFi static TX buffer number

int dynamic_tx_buf_num
WiFi dynamic TX buffer number

int rx_mgmt_buf_type
WiFi RX MGMT buffer type

int rx_mgmt_buf_num
WiFi RX MGMT buffer number

int cache_tx_buf_num
WiFi TX cache buffer number

int csi_enable
WiFi channel state information enable flag

int ampdu_rx_enable
WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
WiFi AMPDU TX feature enable flag

int amsdu_tx_enable
WiFi AMSDU TX feature enable flag

int nvs_enable
WiFi NVS flash enable flag

int nano_enable
Nano option for printf/scan family enable flag

int rx_ba_win
WiFi Block Ack RX window size

int wifi_task_core_id
WiFi Task Core ID

int beacon_max_len
WiFi softAP maximum length of the beacon

int **mgmt_sbuf_num**

WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t **feature_caps**

Enables additional WiFi features and capabilities

bool **sta_disconnected_pm**

WiFi Power Management for station at disconnected status

int **espnow_max_encrypt_num**

Maximum encrypt number of peers supported by espnow

int **magic**

WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT

WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED

WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED

WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF

WiFi interface error

ESP_ERR_WIFI_MODE

WiFi mode error

ESP_ERR_WIFI_STATE

WiFi internal state error

ESP_ERR_WIFI_CONN

WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS

WiFi internal NVS module error

ESP_ERR_WIFI_MAC

MAC address is invalid

ESP_ERR_WIFI_SSID

SSID is invalid

ESP_ERR_WIFI_PASSWORD

Password is invalid

ESP_ERR_WIFI_TIMEOUT

Timeout error

ESP_ERR_WIFI_WAKE_FAIL

WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK

The caller would block

ESP_ERR_WIFI_NOT_CONNECT

Station still in disconnect status

ESP_ERR_WIFI_POST

Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE

Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE

Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC

The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW

The WiFi TX is disallowed

ESP_ERR_WIFI_DISCARD

Discard frame

ESP_ERR_WIFI_ROC_IN_PROGRESS

ROC op is in progress

CONFIG_FEATURE_FTM_RESPONDER_BIT

WIFI_INIT_CONFIG_DEFAULT()

Type Definitions

typedef void (***wifi_promiscuous_cb_t**)(void *buf, *wifi_promiscuous_pkt_type_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (*wifi_promiscuous_pkt_t* or *wifi_pkt_rx_ctrl_t*) indicated by 'type' parameter.

Param type promiscuous packet type.

typedef void (***esp_vendor_ie_cb_t**)(void *ctx, *wifi_vendor_ie_type_t* type, const uint8_t sa[6], const *vendor_ie_data_t* *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.

Param vnd_ie Pointer to the vendor specific element data received.

Param rssi Received signal strength indication.

```
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Param ctx context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- `components/esp_wifi/include/esp_wifi_types.h`

Unions

```
union wifi_config_t
```

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

Public Members

wifi_ap_config_t **ap**

configuration of AP

wifi_sta_config_t **sta**

configuration of STA

Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

Public Members

char **cc**[3]

country code string

uint8_t **schan**

start channel

uint8_t **nchan**

total channel number

int8_t **max_tx_power**

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

wifi_country_policy_t **policy**

country policy

struct **wifi_active_scan_time_t**

Range of active scan times per channel.

Public Members

uint32_t **min**

minimum active scan time per channel, units: millisecond

uint32_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_time_t**

Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t **active**

active scan time per channel, units: millisecond.

uint32_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_config_t**

Parameters for an SSID scan.

Public Members

uint8_t ***ssid**

SSID of AP

uint8_t ***bssid**

MAC address of AP

uint8_t **channel**

channel, scan the specific channel

bool **show_hidden**

enable to scan AP whose SSID is hidden

wifi_scan_type_t **scan_type**

scan type, active or passive

wifi_scan_time_t **scan_time**

scan time per channel

uint8_t **home_chan_dwell_time**

time spent at home channel between scanning consecutive channels.

struct **wifi_ap_record_t**

Description of a WiFi AP.

Public Members

uint8_t **bssid**[6]

MAC address of AP

uint8_t **ssid**[33]

SSID of AP

uint8_t **primary**

channel of AP

wifi_second_chan_t **second**

secondary channel of AP

int8_t **rsi**

signal strength of AP. Note that in some rare cases where signal strength is very strong, rsi values can be slightly positive

wifi_auth_mode_t **authmode**

authmode of AP

wifi_cipher_type_t **pairwise_cipher**

pairwise cipher of AP

wifi_cipher_type_t **group_cipher**

group cipher of AP

wifi_ant_t **ant**

antenna used to receive beacon from AP

uint32_t **phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **wps**

bit: 4 flag to identify if WPS is supported or not

uint32_t **ftm_responder**

bit: 5 flag to identify if FTM is supported in responder mode

uint32_t **ftm_initiator**

bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t **reserved**

bit: 7..31 reserved

wifi_country_t **country**

country information of AP

struct **wifi_scan_threshold_t**

Structure describing parameters for a WiFi fast scan.

Public Members

int8_t **rss**

The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t **authmode**

The weakest authmode to accept in the fast scan mode

struct **wifi_pmf_config_t**

Configuration structure for Protected Management Frame

Public Members

bool **capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct **wifi_ap_config_t**

Soft-AP configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]

SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

uint8_t **password**[64]

Password of ESP32 soft-AP.

uint8_t **ssid_len**

Optional length of SSID field.

uint8_t **channel**

Channel of soft-AP

wifi_auth_mode_t **authmode**

Auth mode of soft-AP. Do not support `AUTH_WEP`, `AUTH_WAPI_PSK` and `AUTH_OWE` in soft-AP mode. When the auth mode is set to `WPA2_PSK`, `WPA2_WPA3_PSK` or `WPA3_PSK`, the pairwise cipher will be overwritten with `WIFI_CIPHER_TYPE_CCMP`.

uint8_t **ssid_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**

Max number of stations allowed to connect in

uint16_t **beacon_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t **pairwise_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from `WIFI_CIPHER_TYPE_TKIP`, enum values before that will be considered as invalid and default cipher suites(`TKIP+CCMP`) will be used. Valid cipher suites in softAP mode are `WIFI_CIPHER_TYPE_TKIP`, `WIFI_CIPHER_TYPE_CCMP` and `WIFI_CIPHER_TYPE_TKIP_CCMP`.

bool **ftm_responder**

Enable FTM Responder mode

struct **wifi_sta_config_t**

STA configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]

SSID of target AP.

uint8_t **password**[64]

Password of target AP.

wifi_scan_method_t **scan_method**

do all channel scan or fast scan

bool **bssid_set**

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t **bssid**[6]

MAC address of target AP

uint8_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t **listen_interval**

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t **sort_method**

sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t **threshold**

When scan_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t **pmf_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t **rm_enabled**

Whether Radio Measurements are enabled for the connection

uint32_t **btm_enabled**

Whether BSS Transition Management is enabled for the connection

uint32_t **mbo_enabled**

Whether MBO is enabled for the connection

uint32_t **transition_disable**

Whether to enable transition disable feature

uint32_t **reserved**

Reserved for future feature set

wifi_sae_pwe_method_t **sae_pwe_h2e**

Configuration for SAE PWE derivation method

`uint8_t failure_retry_cnt`

Number of connection retries station will do before moving to next AP. `scan_method` should be set as `WIFI_ALL_CHANNEL_SCAN` to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

struct `wifi_sta_info_t`

Description of STA associated with AP.

Public Members

`uint8_t mac[6]`

mac address

`int8_t rssi`

current average rssi of sta connected

`uint32_t phy_11b`

bit: 0 flag to identify if 11b mode is enabled or not

`uint32_t phy_11g`

bit: 1 flag to identify if 11g mode is enabled or not

`uint32_t phy_11n`

bit: 2 flag to identify if 11n mode is enabled or not

`uint32_t phy_lr`

bit: 3 flag to identify if low rate is enabled or not

`uint32_t is_mesh_child`

bit: 4 flag to identify mesh child

`uint32_t reserved`

bit: 5..31 reserved

struct `wifi_sta_list_t`

List of stations associated with the ESP32 Soft-AP.

Public Members

`wifi_sta_info_t sta[(10)]`

station list

`int num`

number of stations in the list (other entries are invalid)

struct `vendor_ie_data_t`

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t **element_id**

Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8_t **vendor_oui**[3]

Vendor identifier (OUI).

uint8_t **vendor_oui_type**

Vendor-specific OUI type.

uint8_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed **rssi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **__pad0__**

reserved

unsigned **sig_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__**

reserved

unsigned **smoothing**

reserved

unsigned **not_sounding**

reserved

unsigned **__pad3__**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **__pad4__**

reserved

unsigned **ampdu_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad5__**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad6__**

reserved

signed **noise_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **__pad7__**

reserved

unsigned **__pad8__**
reserved

unsigned **__pad9__**
reserved

unsigned **ant**
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **__pad10__**
reserved

unsigned **__pad11__**
reserved

unsigned **__pad12__**
reserved

unsigned **sig_len**
length of packet including Frame Check Sequence(FCS)

unsigned **__pad13__**
reserved

unsigned **rx_state**
state of the packet. 0: no error; others: error numbers which are not public

struct **wifi_promiscuous_pkt_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**
metadata header

uint8_t **payload[0]**
Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct **wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t **filter_mask**
OR of one or more filter values WIFI_PROMIS_FILTER_*

struct **wifi_csi_config_t**

Channel state information(CSI) configuration type.

Public Members

bool **lltf_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc_htltf2_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf_merge_en**

enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool **channel_filter_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi_csi_info_t**

CSI data type.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

received packet radio metadata header of the CSI data

uint8_t **mac**[6]

source MAC address of the CSI data

bool **first_word_invalid**

first four bytes of the CSI data is invalid or not

int8_t ***buf**

buffer of CSI data

uint16_t **len**

length of CSI data

struct **wifi_ant_gpio_t**

WiFi GPIO configuration for antenna selection.

Public Members

uint8_t **gpio_select**

Whether this GPIO is connected to external antenna switch

uint8_t **gpio_num**

The GPIO number that connects to external antenna switch

struct **wifi_ant_gpio_config_t**

WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t **gpio_cfg[4]**

The configurations of GPIOs that connect to external antenna switch

struct **wifi_ant_config_t**

WiFi antenna configuration.

Public Members

wifi_ant_mode_t **rx_ant_mode**

WiFi antenna mode for receiving

wifi_ant_t **rx_ant_default**

Default antenna mode for receiving, it's ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t **tx_ant_mode**

WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t **enabled_ant0**

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t **enabled_ant1**

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct **wifi_action_tx_req_t**

Action Frame Tx Request.

Public Members*wifi_interface_t* **ifx**

WiFi interface to send request to

uint8_t **dest_mac**[6]

Destination MAC address

bool **no_ack**

Indicates no ack required

wifi_action_rx_cb_t **rx_cb**

Rx Callback to receive any response

uint32_t **data_len**

Length of the appended Data

uint8_t **data**[0]

Appended Data payload

struct **wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

Public Membersuint8_t **resp_mac**[6]

MAC address of the FTM Responder

uint8_t **channel**

Primary channel of the FTM Responder

uint8_t **frm_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t **burst_period**Requested time period between consecutive FTM bursts in 100³ s of milliseconds (0 - No pref)struct **wifi_event_sta_scan_done_t**

Argument structure for WIFI_EVENT_SCAN_DONE event

Public Membersuint32_t **status**

status of scanning APs: 0 —success, 1 - failure

uint8_t **number**

number of scan results

`uint8_t scan_id`
scan sequence number, used for block scan

struct `wifi_event_sta_connected_t`
Argument structure for `WIFI_EVENT_STA_CONNECTED` event

Public Members

`uint8_t ssid[32]`
SSID of connected AP

`uint8_t ssid_len`
SSID length of connected AP

`uint8_t bssid[6]`
BSSID of connected AP

`uint8_t channel`
channel of connected AP

`wifi_auth_mode_t authmode`
authentication mode used by AP

struct `wifi_event_sta_disconnected_t`
Argument structure for `WIFI_EVENT_STA_DISCONNECTED` event

Public Members

`uint8_t ssid[32]`
SSID of disconnected AP

`uint8_t ssid_len`
SSID length of disconnected AP

`uint8_t bssid[6]`
BSSID of disconnected AP

`uint8_t reason`
reason of disconnection

`int8_t rssi`
rssi of disconnection

struct `wifi_event_sta_authmode_change_t`
Argument structure for `WIFI_EVENT_STA_AUTHMODE_CHANGE` event

Public Members

wifi_auth_mode_t **old_mode**

the old auth mode of AP

wifi_auth_mode_t **new_mode**

the new auth mode of AP

struct **wifi_event_sta_wps_er_pin_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_sta_wps_er_success_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t **ap_cred_cnt**

Number of AP credentials received

uint8_t **ssid**[32]

SSID of AP

uint8_t **passphrase**[64]

Passphrase for the AP

struct *wifi_event_sta_wps_er_success_t*::[anonymous] **ap_cred**[3]

All AP credentials received from WPS handshake

struct **wifi_event_ap_staconnected_t**

Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station connected to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gives to the station connected to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_stadisconnected_t**

Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station disconnects to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gave to the station disconnects to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_probe_req_rx_t**

Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int **rssi**

Received probe request signal strength

uint8_t **mac**[6]

MAC address of the station which send probe request

struct **wifi_event_bss_rssi_low_t**

Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t **rssi**

RSSI value of bss

struct **wifi_ftm_report_entry_t**

Argument structure for

Public Members

uint8_t **dlog_token**

Dialog Token of the FTM frame

int8_t **rssi**

RSSI of the FTM frame received

uint32_t **rtt**

Round Trip Time in pSec with a peer

uint64_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi_event_ftm_report_t**

Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t **peer_mac**[6]

MAC address of the FTM Peer

wifi_ftm_status_t **status**

Status of the FTM operation

uint32_t **rtt_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t **rtt_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t **dist_est**

Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t ***ftm_report_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8_t **ftm_report_num_entries**

Number of entries in the FTM Report data

struct **wifi_event_action_tx_status_t**

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint32_t **context**

Context to identify the request

uint8_t **da**[6]

Destination MAC address

uint8_t **status**

Status of the operation

struct **wifi_event_roc_done_t**

Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t **context**

Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM

max number of stations which can connect to ESP32C3 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL

filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT

filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL

filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA

filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC

filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU

filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU

filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL

filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL

filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER

filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR

filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA

filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL

filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS

filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS

filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK

filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND

filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK

filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL

mask all WiFi events

WIFI_EVENT_MASK_NONE

mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED

mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN**MAX_PASSPHRASE_LEN****MAX_WPS_AP_CRED****WIFI_STATIS_BUFFER****WIFI_STATIS_RXTX****WIFI_STATIS_HW****WIFI_STATIS_DIAG****WIFI_STATIS_PS****WIFI_STATIS_ALL**

Type Definitions

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure**Param payload** pointer to the Payload following 802.11 Header**Param len** length of the Payload**Param channel** channel number the frame is received on

Enumerations

enum **wifi_mode_t***Values:*enumerator **WIFI_MODE_NULL**

null mode

enumerator **WIFI_MODE_STA**

WiFi station mode

enumerator **WIFI_MODE_AP**

WiFi soft-AP mode

enumerator **WIFI_MODE_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI_MODE_MAX**

enum **wifi_interface_t**

Values:

enumerator **WIFI_IF_STA**

enumerator **WIFI_IF_AP**

enum **wifi_country_policy_t**

Values:

enumerator **WIFI_COUNTRY_POLICY_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI_COUNTRY_POLICY_MANUAL**

Country policy is manual, always use the configured country info

enum **wifi_auth_mode_t**

Values:

enumerator **WIFI_AUTH_OPEN**

authenticate mode : open

enum **wifi_second_chan_t**

Values:

enumerator **WIFI_SECOND_CHAN_NONE**

the channel width is HT20

enumerator **WIFI_SECOND_CHAN_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI_SECOND_CHAN_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi_scan_type_t**

Values:

enumerator **WIFI_SCAN_TYPE_ACTIVE**

active scan

enumerator **WIFI_SCAN_TYPE_PASSIVE**

passive scan

enum **wifi_cipher_type_t**

Values:

enumerator **WIFI_CIPHER_TYPE_NONE**

the cipher type is none

enumerator **WIFI_CIPHER_TYPE_WEP40**

the cipher type is WEP40

enumerator **WIFI_CIPHER_TYPE_WEP104**

the cipher type is WEP104

enumerator **WIFI_CIPHER_TYPE_TKIP**

the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**

the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**

the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**

the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI_CIPHER_TYPE_AES_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI_CIPHER_TYPE_AES_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI_CIPHER_TYPE_UNKNOWN**

the cipher type is unknown

enum **wifi_ant_t**

WiFi antenna.

Values:

enumerator **WIFI_ANT_ANT0**

WiFi antenna 0

enumerator **WIFI_ANT_ANT1**

WiFi antenna 1

enumerator **WIFI_ANT_MAX**

Invalid WiFi antenna

enum **wifi_scan_method_t**

Values:

enumerator **WIFI_FAST_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI_ALL_CHANNEL_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi_sort_method_t**

Values:

enumerator **WIFI_CONNECT_AP_BY_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI_CONNECT_AP_BY_SECURITY**

Sort match AP in scan list by security mode

enum **wifi_ps_type_t**

Values:

enumerator **WIFI_PS_NONE**

No power save

enumerator **WIFI_PS_MIN_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi_sta_config_t](#)

enum **wifi_bandwidth_t**

Values:

enumerator **WIFI_BW_HT20**

enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**

Configuration for SAE PWE derivation

Values:

enumerator **WPA3_SAE_PWE_UNSPECIFIED**

enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**

enumerator **WPA3_SAE_PWE_HASH_TO_ELEMENT**

enumerator **WPA3_SAE_PWE_BOTH**

enum **wifi_storage_t**

Values:

enumerator **WIFI_STORAGE_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI_STORAGE_RAM**

all configuration will only store in the memory

enum **wifi_vendor_ie_type_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

enumerator **WIFI_VND_IE_TYPE_BEACON**

enumerator **WIFI_VND_IE_TYPE_PROBE_REQ**

enumerator **WIFI_VND_IE_TYPE_PROBE_RESP**

enumerator **WIFI_VND_IE_TYPE_ASSOC_REQ**

enumerator **WIFI_VND_IE_TYPE_ASSOC_RESP**

enum **wifi_vendor_ie_id_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

enumerator **WIFI_VND_IE_ID_0**

enumerator **WIFI_VND_IE_ID_1**

enum **wifi_phy_mode_t**

Operation Phymode.

Values:

enumerator **WIFI_PHY_MODE_LR**

PHY mode for Low Rate

enumerator **WIFI_PHY_MODE_11B**

PHY mode for 11b

enumerator **WIFI_PHY_MODE_11G**

PHY mode for 11g

enumerator **WIFI_PHY_MODE_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI_PHY_MODE_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI_PHY_MODE_HE20**

PHY mode for Bandwidth HE20

enum **wifi_promiscuous_pkt_type_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator **WIFI_PKT_MGMT**

Management frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_CTRL**

Control frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_DATA**

Data frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_MISC**

Other type, such as MIMO etc. 'buf' argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

enum **wifi_ant_mode_t**

WiFi antenna mode.

Values:

enumerator **WIFI_ANT_MODE_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI_ANT_MODE_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI_ANT_MODE_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI_ANT_MODE_MAX**

Invalid WiFi enabled antenna

enum **wifi_phy_rate_t**

WiFi PHY rate encodings.

Values:

enumerator **WIFI_PHY_RATE_1M_L**

1 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_L**

2 Mbps with long preamble

enumerator **WIFI_PHY_RATE_5M_L**

5.5 Mbps with long preamble

enumerator **WIFI_PHY_RATE_11M_L**

11 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_S**

2 Mbps with short preamble

enumerator **WIFI_PHY_RATE_5M_S**

5.5 Mbps with short preamble

enumerator **WIFI_PHY_RATE_11M_S**

11 Mbps with short preamble

enumerator **WIFI_PHY_RATE_48M**

48 Mbps

enumerator **WIFI_PHY_RATE_24M**

24 Mbps

enumerator **WIFI_PHY_RATE_12M**

12 Mbps

enumerator **WIFI_PHY_RATE_6M**

6 Mbps

enumerator **WIFI_PHY_RATE_54M**

54 Mbps

enumerator **WIFI_PHY_RATE_36M**

36 Mbps

enumerator **WIFI_PHY_RATE_18M**

18 Mbps

enumerator **WIFI_PHY_RATE_9M**

9 Mbps

enumerator **WIFI_PHY_RATE_MCS0_LGI**

MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_LGI**

MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_LGI**

MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_LGI**

MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_LGI**

MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_LGI**

MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_LGI**

MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_LGI**

MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS0_SGI**

MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_SGI**

MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_SGI**

MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_SGI**

MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_SGI**

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_SGI**

MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_SGI**

MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_SGI**

MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_LORA_250K**

250 Kbps

enumerator **WIFI_PHY_RATE_LORA_500K**

500 Kbps

enumerator **WIFI_PHY_RATE_MAX**

enum **wifi_event_t**

WiFi event declarations

Values:

enumerator **WIFI_EVENT_WIFI_READY**

ESP32 WiFi ready

enumerator **WIFI_EVENT_SCAN_DONE**

ESP32 finish scanning AP

enumerator **WIFI_EVENT_STA_START**

ESP32 station start

enumerator **WIFI_EVENT_STA_STOP**

ESP32 station stop

enumerator **WIFI_EVENT_STA_CONNECTED**

ESP32 station connected to AP

enumerator **WIFI_EVENT_STA_DISCONNECTED**

ESP32 station disconnected from AP

enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**

the auth mode of AP connected by ESP32 station changed

enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**

ESP32 station wps succeeds in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**

ESP32 station wps fails in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**

ESP32 station wps timeout in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PIN**

ESP32 station wps pin code in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**

ESP32 station wps overlap in enrollee mode

enumerator **WIFI_EVENT_AP_START**

ESP32 soft-AP start

enumerator **WIFI_EVENT_AP_STOP**

ESP32 soft-AP stop

enumerator **WIFI_EVENT_AP_STA_CONNECTED**

a station connected to ESP32 soft-AP

enumerator **WIFI_EVENT_AP_STA_DISCONNECTED**

a station disconnected from ESP32 soft-AP

enumerator **WIFI_EVENT_AP_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**

Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**

AP's RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**

Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**

Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**

ESP32 station beacon timeout

enumerator **WIFI_EVENT_MAX**

Invalid WiFi event ID

enum **wifi_event_sta_wps_fail_reason_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

enumerator **WPS_FAIL_REASON_NORMAL**

ESP32 WPS normal fail reason

enumerator **WPS_FAIL_REASON_RECV_M2D**

ESP32 WPS receive M2D frame

enumerator **WPS_FAIL_REASON_MAX**

enum **wifi_ftm_status_t**

FTM operation status types.

Values:

enumerator **FTM_STATUS_SUCCESS**

FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**

Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check [Provisioning API](#).

Application Example Connect ESP32-C3 to target AP using SmartConfig: [wifi/smart_config](#).

API Reference

Header File

- [components/esp_wifi/include/esp_smartconfig.h](#)

Functions

const char ***esp_smartconfig_get_version** (void)

Get the version of SmartConfig.

Returns

- SmartConfig version const char.

esp_err_t **esp_smartconfig_start** (const *smartconfig_start_config_t* *config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.

Attention 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

Parameters **config** –pointer to smartconfig start configure structure

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_esptouch_set_timeout** (uint8_t time_s)

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Parameters **time_s** –range 15s~255s, offset:45s.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_set_type** (*smartconfig_type_t* type)

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

Parameters **type** –Choose from the `smartconfig_type_t`.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_fast_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API `esp_smartconfig_start`.

Attention 2. Fast mode have corresponding APP(phone).

Attention 3. Two mode is compatible.

Parameters **enable** –false-disable(default); true-enable;

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_get_rvd_data** (uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

Parameters

- **rvd_data** –reserved data
- **len** –length of reserved data

Returns

- ESP_OK: succeed
- others: fail

Structures

struct **smartconfig_event_got_ssid_pswd_t**

Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid_set**

whether set MAC address of target AP or not.

uint8_t **bssid**[6]

MAC address of target AP.

smartconfig_type_t **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8_t **cellphone_ip**[4]

IP address of cellphone.

struct **smartconfig_start_config_t**

Configure structure for esp_smartconfig_start

Public Members

bool **enable_log**

Enable smartconfig logs.

bool **esp_touch_v2_enable_crypt**

Enable ESPTouch v2 crypt.

char ***esp_touch_v2_key**

ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations

enum **smartconfig_type_t**

Values:

enumerator **SC_TYPE_ESPTOUCH**

protocol: ESPTouch

enumerator **SC_TYPE_AIRKISS**

protocol: AirKiss

enumerator **SC_TYPE_ESPTOUCH_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC_TYPE_ESPTOUCH_V2**

protocol: ESPTouch v2

enum **smartconfig_event_t**

Smartconfig event declarations

Values:

enumerator **SC_EVENT_SCAN_DONE**

ESP32 station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**

ESP32 station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**

ESP32 station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**

ESP32 station smartconfig has sent ACK to cellphone

ESP-NOW

Overview ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

Add Paired Device Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 10, the default is 6. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in WiFi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Config ESP-NOW Rate Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnow](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW](#) repository.

API Reference

Header File

- `components/esp_wifi/include/esp_now.h`

Functions

`esp_err_t esp_now_init` (void)

Initialize ESPNOW function.

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_INTERNAL` : Internal error

esp_err_t **esp_now_deinit** (void)

De-initialize ESPNOW function.

Returns

- ESP_OK : succeed

esp_err_t **esp_now_get_version** (uint32_t *version)

Get the version of ESPNOW.

Parameters *version* –ESPNOW version

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_register_recv_cb** (*esp_now_recv_cb_t* cb)

Register callback function of receiving ESPNOW data.

Parameters *cb* –callback function of receiving ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_recv_cb** (void)

Unregister callback function of receiving ESPNOW data.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

esp_err_t **esp_now_register_send_cb** (*esp_now_send_cb_t* cb)

Register callback function of sending ESPNOW data.

Parameters *cb* –callback function of sending ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_send_cb** (void)

Unregister callback function of sending ESPNOW data.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

esp_err_t **esp_now_send** (const uint8_t *peer_addr, const uint8_t *data, size_t len)

Send ESPNOW data.

Attention 1. If *peer_addr* is not NULL, send data to the peer whose MAC address matches *peer_addr*

Attention 2. If *peer_addr* is NULL, send data to all of the peers that are added to the peer list

Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN

Attention 4. The buffer pointed to by data argument does not need to be valid after *esp_now_send* returns

Parameters

- **peer_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

`esp_err_t esp_now_add_peer` (const `esp_now_peer_info_t` *peer)

Add a peer to peer list.

Parameters `peer` –peer information

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

`esp_err_t esp_now_del_peer` (const uint8_t *peer_addr)

Delete a peer from peer list.

Parameters `peer_addr` –peer MAC address

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

`esp_err_t esp_now_mod_peer` (const `esp_now_peer_info_t` *peer)

Modify a peer.

Parameters `peer` –peer information

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

`esp_err_t esp_wifi_config_espnw_rate` (`wifi_interface_t` ifx, `wifi_phy_rate_t` rate)

Config ESPNOW rate of specified interface.

Attention 1. This API should be called after `esp_wifi_start()`.

Parameters

- `ifx` –Interface to be configured.
- `rate` –Phy rate to be configured.

Returns

- `ESP_OK`: succeed
- others: failed

`esp_err_t esp_now_get_peer` (const uint8_t *peer_addr, `esp_now_peer_info_t` *peer)

Get a peer whose MAC address matches `peer_addr` from peer list.

Parameters

- `peer_addr` –peer MAC address
- `peer` –peer information

Returns

- `ESP_OK` : succeed

- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

esp_err_t `esp_now_fetch_peer` (bool from_head, *esp_now_peer_info_t* *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Parameters

- `from_head` –fetch from head of list or not
- `peer` –peer information

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

bool `esp_now_is_peer_exist` (const uint8_t *peer_addr)

Peer exists or not.

Parameters `peer_addr` –peer MAC address

Returns

- true : peer exists
- false : peer not exists

esp_err_t `esp_now_get_peer_num` (*esp_now_peer_num_t* *num)

Get the number of peers.

Parameters `num` –number of peers

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

esp_err_t `esp_now_set_pmk` (const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Parameters `pmk` –primary master key

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

esp_err_t `esp_now_set_wake_window` (uint16_t window)

Set esp_now wake window for sta_disconnected power management.

Attention 1. Only when `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work

Attention 2. This configuration only work for station mode and disconnected status

Attention 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked

Attention 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

Attention 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

Parameters `window` –how much microsecond would the chip keep waked each interval, vary from 0 to 65535

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

Structures

struct `esp_now_peer_info`

ESPNOW peer information parameters.

Public Members

uint8_t `peer_addr`[6]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t `lmk`[16]

ESPNOW peer local master key that is used to encrypt data

uint8_t `channel`

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t `ifidx`

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool `encrypt`

ESPNOW data that this peer sends/receives is encrypted or not

void *`priv`

ESPNOW peer private data

struct `esp_now_peer_num`

Number of ESPNOW peers which exist currently.

Public Members

int `total_num`

Total number of ESPNOW peers, maximum value is `ESP_NOW_MAX_TOTAL_PEER_NUM`

int `encrypt_num`

Number of encrypted ESPNOW peers, maximum value is `ESP_NOW_MAX_ENCRYPT_PEER_NUM`

Macros

`ESP_ERR_ESPNOW_BASE`

ESPNOW error number base.

`ESP_ERR_ESPNOW_NOT_INIT`

ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG

Invalid argument

ESP_ERR_ESPNOW_NO_MEM

Out of memory

ESP_ERR_ESPNOW_FULL

ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND

ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL

Internal error

ESP_ERR_ESPNOW_EXIST

ESPNOW peer has existed

ESP_ERR_ESPNOW_IF

Interface error

ESP_NOW_ETH_ALEN

Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN

Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM

Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM

Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN

Maximum length of ESPNOW data which is sent very time

Type Definitionstypedef struct *esp_now_peer_info* **esp_now_peer_info_t**

ESPNOW peer information parameters.

typedef struct *esp_now_peer_num* **esp_now_peer_num_t**

Number of ESPNOW peers which exist currently.

typedef void (***esp_now_recv_cb_t**)(const uint8_t *mac_addr, const uint8_t *data, int data_len)

Callback function of receiving ESPNOW data.

Param mac_addr peer MAC address**Param data** received data**Param data_len** length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

Param mac_addr peer MAC address

Param status status of sending ESPNOW data (succeed or fail)

Enumerations

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

Values:

enumerator **ESP_NOW_SEND_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP_NOW_SEND_FAIL**

Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. [ESP-WIFI-MESH Programming Model](#)
2. [Writing an ESP-WIFI-MESH Application](#)
3. [Self Organized Networking](#)
4. [Application Examples](#)
5. [API Reference](#)

For documentation regarding the ESP-WIFI-MESH protocol, please see the [ESP-WIFI-MESH API Guide](#). For more information about ESP-WIFI-MESH Development Framework, please see [ESP-WIFI-MESH Development Framework](#).

ESP-WIFI-MESH Programming Model

Software Stack The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

System Events An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

Fig. 2: ESP-WIFI-MESH Software Stack

Fig. 3: ESP-WIFI-MESH System Events Delivery

Warning: When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior.** Therefore, user's should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

LwIP & ESP-WIFI-MESH The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
```

(continues on next page)

(continued from previous page)

```
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

Note: ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↳event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. *Initialize Mesh*
2. *Configuring an ESP-WIFI-MESH Network*
3. *Start Mesh*

Initialize Mesh The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↳event_handler, NULL));
```

Configuring an ESP-WIFI-MESH Network ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-WIFI-MESH Network, see mesh_addr_t
Router	Router Configuration, see mesh_router_t
Mesh AP	Mesh AP Configuration, see mesh_ap_cfg_t
Crypto Functions	Crypto Functions for Mesh IE, see mesh_crypto_funcs_t

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```

/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
       strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
       strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

Start Mesh The following code snippet demonstrates how to start ESP-WIFI-MESH.

```

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using [esp_mesh_send\(\)](#) and [esp_mesh_recv\(\)](#).

Self Organized Networking Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in [Building a Network](#))
- Selection of a preferred parent node (see **Parent Node Selection** in [Building a Network](#))
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in [Managing a Network](#))

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.**

toggling Self Organized Networking Self organized networking can be enabled or disabled by the application at runtime by calling the [esp_mesh_set_self_organized\(\)](#) function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> • Nodes already connected to a parent node will remain connected. • Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect ()</code> to restart.
	Y	<ul style="list-style-type: none"> • A root node already connected to router will stay connected. • A root node disconnected from router will need to call <code>esp_mesh_connect ()</code> to reconnect.
Y	N	<ul style="list-style-type: none"> • Nodes without a parent node will automatically select a preferred parent and connect. • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.
	Y	<ul style="list-style-type: none"> • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.

The following code snippet demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
```

(continues on next page)

```

...
//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();

```

Calling Wi-Fi API There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.

```

//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router

```

Application Examples ESP-IDF contains these ESP-WIFI-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- [components/esp_wifi/include/esp_mesh.h](#)

Functions***esp_err_t* esp_mesh_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.**Returns**

- ESP_OK
- ESP_FAIL

***esp_err_t* esp_mesh_deinit** (void)

Mesh de-initialization.

- Release resources and stop the mesh

Returns

- ESP_OK
- ESP_FAIL

***esp_err_t* esp_mesh_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.**Returns**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

***esp_err_t* esp_mesh_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_send** (const *mesh_addr_t* *to, const *mesh_data_t* *data, int flag, const *mesh_opt_t* opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

Parameters

- **to** –[in] the address of the final destination of the packet
 - If the packet is to the root, set this parameter to NULL.
 - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
 - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
 - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
 - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
 - Speed up the route search
 - * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
 - * If the packet is to an internal device, MESH_DATA_P2P should be set.
 - * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
 - * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
 - Specify whether this API is block or non-block, block by default
 - * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
 - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_rcv_toDS().
Generally, we suggest esp_mesh_rcv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_rcv_toDS() which avoids unnecessary memory copy.
- **opt** –[in] options
 - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
 - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** –[in] option count
 - Currently, this API only takes one option, so opt_count is only supported to be 1.

Returns

- ESP_OK

- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

esp_err_t **esp_mesh_send_block_time** (uint32_t time_ms)

Set blocking time of esp_mesh_send()

Attention This API shall be called before mesh is started.

Parameters *time_ms* –[in] blocking time of esp_mesh_send(), unit:ms

Returns

- ESP_OK

esp_err_t **esp_mesh_recv** (*mesh_addr_t* *from, *mesh_data_t* *data, int timeout_ms, int *flag, *mesh_opt_t* opt[], int opt_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

Parameters

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
 - Field proto is the data protocol in use. Should follow it to parse the received data.
 - Field tos is the transmission tos (type of service) in use.
- **timeout_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[out] bitmap for data received
 - MESH_DATA_FROMDS represents data from external IP network
 - MESH_DATA_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
 - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count** –[in] option count desired to receive
 - Currently, this API only takes one option, so opt_count is only supported to be 1.

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

esp_err_t **esp_mesh_recv_toDS** (*mesh_addr_t* *from, *mesh_addr_t* *to, *mesh_data_t* *data, int timeout_ms, int *flag, *mesh_opt_t* opt[], int opt_count)

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_rcv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_rcv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be `MESH_DATA_TODS`.

Attention This API is only called by the root.

Parameters

- **from** –[**out**] the address of the original source of the packet
- **to** –[**out**] the address contains remote IP address and port (IPv4:PORT)
- **data** –[**out**] pointer to the received packet
 - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** –[**in**] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[**out**] bitmap for data received
 - `MESH_DATA_TODS` represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[**out**] options desired to receive
- **opt_count** –[**in**] option count desired to receive

Returns

- `ESP_OK`
- `ESP_ERR_MESH_ARGUMENT`
- `ESP_ERR_MESH_NOT_START`
- `ESP_ERR_MESH_TIMEOUT`
- `ESP_ERR_MESH_DISCARD`
- `ESP_ERR_MESH_RECV_RELEASE`

esp_err_t `esp_mesh_set_config` (const *mesh_cfg_t* *config)

Set mesh stack configuration.

- Use `MESH_INIT_CONFIG_DEFAULT()` to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

Parameters `config` –[in] pointer to mesh stack configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t `esp_mesh_get_config` (*mesh_cfg_t* *config)

Get mesh stack configuration.

Parameters `config` –[out] pointer to mesh stack configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_router` (const *mesh_router_t* *router)

Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Parameters `router` –[in] pointer to router configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_get_router` (*mesh_router_t* *router)

Get router configuration.

Parameters `router` –[out] pointer to router configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_id` (const *mesh_addr_t* *id)

Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

Parameters `id` –[in] pointer to mesh network ID

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

esp_err_t `esp_mesh_get_id` (*mesh_addr_t* *id)

Get mesh network ID.

Parameters `id` –[out] pointer to mesh network ID

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_type` (*mesh_type_t* type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Parameters `type` –[in] device type

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

mesh_type_t `esp_mesh_get_type` (void)

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Returns mesh type

esp_err_t `esp_mesh_set_max_layer` (int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Parameters `max_layer` –[in] max layer value

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

int `esp_mesh_get_max_layer` (void)

Get max layer value.

Returns max layer value

esp_err_t `esp_mesh_set_ap_password` (const uint8_t *pwd, int len)

Set mesh softAP password.

Attention This API shall be called before mesh is started.

Parameters

- `pwd` –[in] pointer to the password
- `len` –[in] password length

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_set_ap_authmode** (*wifi_auth_mode_t* authmode)

Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

Parameters **authmode** –[in] authentication mode

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

wifi_auth_mode_t **esp_mesh_get_ap_authmode** (void)

Get mesh softAP authentication mode.

Returns authentication mode

esp_err_t **esp_mesh_set_ap_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

Parameters **connections** –[in] the number of max connections

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

int **esp_mesh_get_ap_connections** (void)

Get mesh max connection configuration.

Returns the number of mesh max connections

int **esp_mesh_get_non_mesh_connections** (void)

Get non-mesh max connection configuration.

Returns the number of non-mesh max connections

int **esp_mesh_get_layer** (void)

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Returns layer value

esp_err_t **esp_mesh_get_parent_bssid** (*mesh_addr_t* *bssid)

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Parameters **bssid** –[out] pointer to parent BSSID

Returns

- ESP_OK
- ESP_FAIL

bool **esp_mesh_is_root** (void)

Return whether the device is the root node of the network.

Returns true/false

esp_err_t **esp_mesh_set_self_organized** (bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

Attention This API is used to dynamically modify whether to enable the self organizing.

Parameters

- **enable** –[in] enable or disable self-organized networking
- **select_parent** –[in] Only valid when self-organized networking is enabled.
 - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

Returns

- ESP_OK
- ESP_FAIL

bool **esp_mesh_get_self_organized** (void)

Return whether enable self-organized networking or not.

Returns true/false

esp_err_t **esp_mesh_waive_root** (const *mesh_vote_t* *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Parameters

- **vote** –[in] vote configuration
 - If this parameter is set NULL, the vote will perform the default 15 times.
 - Field percentage threshold is 0.9 by default.
 - Field `is_rc_specified` shall be false.
 - Field `attempts` shall be at least 15 times.

- **reason** `–[in]` only accept `MESH_VOTE_REASON_ROOT_INITIATED` for now

Returns

- `ESP_OK`
- `ESP_ERR_MESH_QUEUE_FULL`
- `ESP_ERR_MESH_DISCARD`
- `ESP_FAIL`

esp_err_t **esp_mesh_set_vote_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Parameters **percentage** `–[in]` vote percentage threshold

Returns

- `ESP_OK`
- `ESP_FAIL`

float **esp_mesh_get_vote_percentage** (void)

Get vote percentage threshold for approval of being a root.

Returns percentage threshold

esp_err_t **esp_mesh_set_ap_assoc_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Parameters **seconds** `–[in]` the expired time

Returns

- `ESP_OK`
- `ESP_FAIL`

int **esp_mesh_get_ap_assoc_expire** (void)

Get mesh softAP associate expired time.

Returns seconds

int **esp_mesh_get_total_node_num** (void)

Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Returns total number of devices (including the root)

int **esp_mesh_get_routing_table_size** (void)

Get the number of devices in this device's sub-network (including self)

Returns the number of devices over this device's sub-network (including self)

esp_err_t **esp_mesh_get_routing_table** (*mesh_addr_t* *mac, int len, int *size)

Get routing table of this device's sub-network (including itself)

Parameters

- **mac** –[out] pointer to routing table
- **len** –[in] routing table size(in bytes)
- **size** –[out] pointer to the number of devices in routing table (including itself)

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_post_toDS_state** (bool reachable)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

Parameters **reachable** –[in] this state represents whether the root is able to access external IP network

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_tx_pending** (*mesh_tx_pending_t* *pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Parameters **pending** –[out] pointer to the TX pending

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_rx_pending** (*mesh_rx_pending_t* *pending)

Return the number of packets available in the queue waiting to be received by applications.

Parameters **pending** –[out] pointer to the RX pending

Returns

- ESP_OK
- ESP_FAIL

int **esp_mesh_available_txupQ_num** (const *mesh_addr_t* *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

Parameters

- **addr** –[in] self address or an associate children address
- **xseqno_in** –[out] sequence number of the last received packet from the specified address

Returns the number of upQ for a certain address

esp_err_t **esp_mesh_set_xon_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: $wnd = xon_qsize / (2 * max_connection + 1)$. However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

Attention This API shall be called before mesh is started.

Parameters **qsize** –[in] default:32 (min:16)

Returns

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_xon_qsize** (void)

Get queue size.

Returns the number of queue

esp_err_t **esp_mesh_allow_root_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

Parameters **allowed** –[in] allow or not

Returns

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

bool **esp_mesh_is_root_conflicts_allowed** (void)

Check whether allow more than one root to exist in one network.

Returns true/false

esp_err_t **esp_mesh_set_group_id** (const *mesh_addr_t* *addr, int num)

Set group ID addresses.

Parameters

- **addr** –[in] pointer to new group ID addresses
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_delete_group_id** (const *mesh_addr_t* *addr, int num)

Delete group ID addresses.

Parameters

- **addr** –[in] pointer to deleted group ID address
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_group_num** (void)

Get the number of group ID addresses.

Returns the number of group ID addresses

esp_err_t **esp_mesh_get_group_list** (*mesh_addr_t* *addr, int num)

Get group ID addresses.

Parameters

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

bool **esp_mesh_is_my_group** (const *mesh_addr_t* *addr)

Check whether the specified group address is my group.

Returns true/false

esp_err_t **esp_mesh_set_capacity_num** (int num)

Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

Parameters **num** *–[in]* mesh network capacity

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_capacity_num** (void)

Get mesh network capacity.

Returns mesh network capacity

esp_err_t **esp_mesh_set_ie_crypto_funcs** (const mesh_crypto_funcs_t *crypto_funcs)

Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

Parameters **crypto_funcs** *–[in]* crypto functions for mesh IE

- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

Returns

- ESP_OK

esp_err_t **esp_mesh_set_ie_crypto_key** (const char *key, int len)

Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Parameters

- **key** *–[in]* ASCII crypto key
- **len** *–[in]* length in bytes, range:8~64

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_get_ie_crypto_key** (char *key, int len)

Get mesh IE crypto key.

Parameters

- **key** *–[out]* ASCII crypto key
- **len** *–[in]* length in bytes, range:8~64

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_set_root_healing_delay** (int delay_ms)

Set delay time before starting root healing.

Parameters **delay_ms** *–[in]* delay time in milliseconds

Returns

- ESP_OK

int **esp_mesh_get_root_healing_delay** (void)

Get delay time before network starts root healing.

Returns delay time in milliseconds

esp_err_t **esp_mesh_fix_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters **enable** –[in] enable or not

Returns

- ESP_OK

bool **esp_mesh_is_root_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Returns true/false

esp_err_t **esp_mesh_set_parent** (const *wifi_config_t* *parent, const *mesh_addr_t* *parent_mesh_id, *mesh_type_t* my_type, int my_layer)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Parameters

- **parent** –[in] parent configuration, the SSID and the channel of the parent are mandatory.
 - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** –[in] parent mesh ID,
 - If this value is not set, the original mesh ID is used.
- **my_type** –[in] mesh type
 - MESH_STA is not supported.
 - If the parent set for the device is the same as the router in the network configuration, then **my_type** shall set MESH_ROOT and **my_layer** shall set MESH_ROOT_LAYER.
- **my_layer** –[in] mesh layer
 - **my_layer** of the device may change after joining the network.
 - If **my_type** is set MESH_NODE, **my_layer** shall be greater than MESH_ROOT_LAYER.
 - If **my_type** is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

Returns

- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

esp_err_t **esp_mesh_scan_get_ap_ie_len** (int *len)

Get mesh networking IE length of one AP.

Parameters **len** –[out] mesh networking IE length

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_scan_get_ap_record** (*wifi_ap_record_t* *ap_record, void *buffer)

Get AP record.

Attention Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual_networking” example.

Parameters

- **ap_record** –[out] pointer to one AP record
- **buffer** –[out] pointer to the mesh networking IE of this AP

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Returns

- ESP_OK

esp_err_t **esp_mesh_get_subnet_nodes_num** (const *mesh_addr_t* *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

Parameters

- **child_mac** –[in] an associated child address of this device
- **nodes_num** –[out] pointer to the number of nodes in the subnet of a specific child

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_get_subnet_nodes_list** (const *mesh_addr_t* *child_mac, *mesh_addr_t* *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

Parameters

- **child_mac** –[in] an associated child address of this device
- **nodes** –[out] pointer to nodes in the subnet of a specific child
- **nodes_num** –[in] the number of nodes in the subnet of a specific child

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_disconnect** (void)

Disconnect from current parent.

Returns

- ESP_OK

esp_err_t **esp_mesh_connect** (void)

Connect to current parent.

Returns

- ESP_OK

esp_err_t **esp_mesh_flush_scan_result** (void)

Flush scan result.

Returns

- ESP_OK

esp_err_t **esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

Parameters

- **new_bssid** –[in] the new router BSSID if the router changes
- **csa_newchan** –[in] the new channel number to which the whole network is moving
- **csa_count** –[in] channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

Returns

- ESP_OK

esp_err_t **esp_mesh_get_router_bssid** (uint8_t *router_bssid)

Get the router BSSID.

Parameters **router_bssid** –[out] pointer to the router BSSID

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG

int64_t **esp_mesh_get_tsf_time** (void)

Get the TSF time.

Returns the TSF time

esp_err_t **esp_mesh_set_topology** (*esp_mesh_topology_t* topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Parameters **topo** –[in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_mesh_topology_t **esp_mesh_get_topology** (void)

Get mesh topology.

Returns MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_disable_ps** (void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool **esp_mesh_is_ps_enabled** (void)

Check whether the mesh Power Save function is enabled.

Returns true/false

bool **esp_mesh_is_device_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

esp_err_t **esp_mesh_set_active_duty_cycle** (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters

- **dev_duty** –[in] device duty cycle
- **dev_duty_type** –[in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_active_duty_cycle** (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Parameters

- **dev_duty** –[out] device duty cycle

- **dev_duty_type** *–[out]* device PS duty cycle type

Returns

- ESP_OK

esp_err_t **esp_mesh_set_network_duty_cycle** (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Parameters

- **nwk_duty** *–[in]* network duty cycle
- **duration_mins** *–[in]* duration (unit: minutes)
- **applied_rule** *–[in]* only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_network_duty_cycle** (int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

Parameters

- **nwk_duty** *–[out]* current network duty cycle
- **duration_mins** *–[out]* the duration of current nwk_duty
- **dev_duty_type** *–[out]* if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- **applied_rule** *–[out]* MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns

- ESP_OK

int **esp_mesh_get_running_active_duty_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns the running active duty cycle

esp_err_t **esp_mesh_ps_duty_signaling** (int fwd_times)

Duty signaling.

Parameters **fwd_times** –[in] the times of forwarding duty signaling packets

Returns

- ESP_OK

Unions

union **mesh_addr_t**

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t **addr**[6]

mac address

mip_t **mip**

mip address

union **mesh_event_info_t**

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t **channel_switch**

channel switch

mesh_event_child_connected_t **child_connected**

child connected

mesh_event_child_disconnected_t **child_disconnected**

child disconnected

mesh_event_routing_table_change_t **routing_table**

routing table change

mesh_event_connected_t **connected**

parent connected

mesh_event_disconnected_t **disconnected**

parent disconnected

mesh_event_no_parent_found_t **no_parent**

no parent found

mesh_event_layer_change_t **layer_change**

layer change

mesh_event_toDS_state_t **toDS_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t **vote_started**

vote started

mesh_event_root_address_t **root_addr**

root address

mesh_event_root_switch_req_t **switch_req**

root switch request

mesh_event_root_conflict_t **root_conflict**

other powerful root

mesh_event_root_fixed_t **root_fixed**

fixed root

mesh_event_scan_done_t **scan_done**

scan done

mesh_event_network_state_t **network_state**

network state, such as whether current mesh network has a root.

mesh_event_find_network_t **find_network**

network found that can join

mesh_event_router_switch_t **router_switch**

new router information

mesh_event_ps_duty_t **ps_duty**

PS duty information

union **mesh_rc_config_t**

#include <esp_mesh.h> Vote address configuration.

Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t **rc_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

Structures

struct **mip_t**

IP address and port.

Public Members

ip4_addr_t **ip4**

IP address

uint16_t **port**

port

struct **mesh_event_channel_switch_t**

Channel switch information.

Public Members

uint8_t **channel**

new channel

struct **mesh_event_connected_t**

Parent connected information.

Public Members

wifi_event_sta_connected_t **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16_t **self_layer**

layer

uint8_t **duty**

parent duty

struct **mesh_event_no_parent_found_t**

No parent found information.

Public Members

int **scan_times**

scan times being through

struct **mesh_event_layer_change_t**

Layer change information.

Public Members

uint16_t **new_layer**

new layer

struct **mesh_event_vote_started_t**

vote started information

Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

mesh_addr_t **rc_addr**

root address specified by users via API `esp_mesh_waive_root()`

struct **mesh_event_find_network_t**

find a mesh network that this device can join

Public Members

uint8_t **channel**

channel number of the new found network

uint8_t **router_bssid[6]**

router BSSID

struct **mesh_event_root_switch_req_t**

Root switch request information.

Public Members**int reason**root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`***mesh_addr_t* rc_addr**

the address of root switch requester

struct **mesh_event_root_conflict_t**

Other powerful root address.

Public Members**int8_t rssi**

rssi with router

uint16_t capacity

the number of devices in current network

uint8_t addr[6]

other powerful root address

struct **mesh_event_routing_table_change_t**

Routing table change.

Public Members**uint16_t rt_size_new**

the new value

uint16_t rt_size_change

the changed value

struct **mesh_event_root_fixed_t**

Root fixed.

Public Members**bool is_fixed**

status

struct **mesh_event_scan_done_t**

Scan done event information.

Public Members

uint8_t **number**

the number of APs scanned

struct **mesh_event_network_state_t**

Network state information.

Public Members

bool **is_rootless**

whether current mesh network has a root

struct **mesh_event_ps_duty_t**

PS duty information.

Public Members

uint8_t **duty**

parent or child duty

mesh_event_child_connected_t **child_connected**

child info

struct **mesh_opt_t**

Mesh option.

Public Members

uint8_t **type**

option type

uint16_t **len**

option length

uint8_t ***val**

option value

struct **mesh_data_t**

Mesh data for esp_mesh_send() and esp_mesh_rcv()

Public Members

uint8_t ***data**

data

`uint16_t size`

data size

`mesh_proto_t proto`

data protocol

`mesh_tos_t tos`

data type of service

struct `mesh_router_t`

Router configuration.

Public Members

`uint8_t ssid[32]`

SSID

`uint8_t ssid_len`

length of SSID

`uint8_t bssid[6]`

BSSID, if this value is specified, users should also specify “allow_router_switch” .

`uint8_t password[64]`

password

bool `allow_router_switch`

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (`mesh_attempts_t`) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct `mesh_ap_cfg_t`

Mesh softAP configuration.

Public Members

`uint8_t password[64]`

mesh softAP password

`uint8_t max_connection`

max number of stations allowed to connect in, default 6, max 10 = `max_connection` + `non-mesh_max_connection`max mesh connections

`uint8_t nonmesh_max_connection`

max non-mesh connections

struct **mesh_cfg_t**

Mesh initialization configuration.

Public Members

uint8_t **channel**

channel, the mesh network on

bool **allow_channel_switch**

if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t **mesh_id**

mesh network identification

mesh_router_t **router**

router configuration

mesh_ap_cfg_t **mesh_ap**

mesh softAP configuration

const mesh_crypto_funcs_t ***crypto_funcs**

crypto functions

struct **mesh_vote_t**

Vote.

Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is_rc_specified**

if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t **config**

vote address configuration

struct **mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int **to_parent**

to parent queue

int **to_parent_p2p**
to parent (P2P) queue

int **to_child**
to child queue

int **to_child_p2p**
to child (P2P) queue

int **mgmt**
management queue

int **broadcast**
broadcast and multicast queue

struct **mesh_rx_pending_t**
The number of packets available in the queue waiting to be received by applications.

Public Members

int **toDS**
to external DS

int **toSelf**
to self

Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn't started

ESP_ERR_MESH_NOT_INIT
mesh isn't initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn't configured

ESP_ERR_MESH_NOT_START

mesh isn't started

ESP_ERR_MESH_NOT_SUPPORT

not supported yet

ESP_ERR_MESH_NOT_ALLOWED

operation is not allowed

ESP_ERR_MESH_NO_MEMORY

out of memory

ESP_ERR_MESH_ARGUMENT

illegal argument

ESP_ERR_MESH_EXCEED_MTU

packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT

timeout

ESP_ERR_MESH_DISCONNECTED

disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL

queue fail

ESP_ERR_MESH_QUEUE_FULL

queue full

ESP_ERR_MESH_NO_PARENT_FOUND

no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND

no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL

no option found

ESP_ERR_MESH_OPTION_UNKNOWN

unknown option

ESP_ERR_MESH_XON_NO_WINDOW

no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE

low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_rcv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_rcv()

data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for esp_mesh_send() and esp_mesh_rcv()

data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR

return a remote IP address; used with `esp_mesh_send()` and `esp_mesh_recv()`

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS

Flag of mesh networking IE.

vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE

no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND

root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED

fixed root

MESH_PS_DEVICE_DUTY_REQUEST

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND

requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**MESH_INIT_CONFIG_DEFAULT ()****Type Definitions**

```
typedef mesh_addr_t mesh_event_root_address_t
```

Root address.

```
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
```

Parent disconnected information.

```
typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
```

Child connected information.

```
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
```

Child disconnected information.

```
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
```

New router information.

Enumerations

enum **mesh_event_id_t**

Enumerated list of mesh event id.

Values:

enumerator **MESH_EVENT_STARTED**

mesh is started

enumerator **MESH_EVENT_STOPPED**

mesh is stopped

enumerator **MESH_EVENT_CHANNEL_SWITCH**

channel switch

enumerator **MESH_EVENT_CHILD_CONNECTED**

a child is connected on softAP interface

enumerator **MESH_EVENT_CHILD_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH_EVENT_ROUTING_TABLE_ADD**

routing table is changed by adding newly joined children

enumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**

routing table is changed by removing leave children

enumerator **MESH_EVENT_PARENT_CONNECTED**

parent is connected on station interface

enumerator **MESH_EVENT_PARENT_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH_EVENT_NO_PARENT_FOUND**

no parent found

enumerator **MESH_EVENT_LAYER_CHANGE**

layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator **MESH_EVENT_VOTE_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**

the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**

Device type.

Values:

enumerator **MESH_IDLE**

hasn't joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability

enumerator **MESH_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**

Protocol of transmitted application data.

Values:

enumerator **MESH_PROTO_BIN**

binary

enumerator **MESH_PROTO_HTTP**

HTTP protocol

enumerator **MESH_PROTO_JSON**

JSON format

enumerator **MESH_PROTO_MQTT**

MQTT protocol

enumerator **MESH_PROTO_AP**

IP network mesh communication of node's AP interface

enumerator **MESH_PROTO_STA**

IP network mesh communication of node's STA interface

enum **mesh_tos_t**

For reliable transmission, mesh stack provides three type of services.

Values:

enumerator **MESH_TOS_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH_TOS_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH_TOS_DEF**

no retransmission on mesh stack

enum **mesh_vote_reason_t**

Vote reason.

Values:

enumerator **MESH_VOTE_REASON_ROOT_INITIATED**

vote is initiated by the root

enumerator **MESH_VOTE_REASON_CHILD_INITIATED**

vote is initiated by children

enum **mesh_disconnect_reason_t**

Mesh disconnect reason code.

Values:

enumerator **MESH_REASON_CYCLIC**

cyclic is detected

enumerator **MESH_REASON_PARENT_IDLE**

parent is idle

enumerator **MESH_REASON_LEAF**

the connected device is changed to a leaf

enumerator **MESH_REASON_DIFF_ID**

in different mesh ID

enumerator **MESH_REASON_ROOTS**

root conflict is detected

enumerator **MESH_REASON_PARENT_STOPPED**

parent has stopped the mesh

enumerator **MESH_REASON_SCAN_FAIL**

scan fail

enumerator **MESH_REASON_IE_UNKNOWN**

unknown IE

enumerator **MESH_REASON_WAIVE_ROOT**

waive root

enumerator **MESH_REASON_PARENT_WORSE**

parent with very poor RSSI

enumerator **MESH_REASON_EMPTY_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH_REASON_PARENT_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp_mesh_topology_t**

Mesh topology.

Values:

enumerator **MESH_TOPO_TREE**

tree topology

enumerator **MESH_TOPO_CHAIN**

chain topology

enum **mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

Values:

enumerator **MESH_TODS_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH_TODS_REACHABLE**

the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32-C3 using a supported smartphone: [wifi/wifi_easy_connect/dpp-enrollee](#).

API Reference

Header File

- `components/wpa_supplicant/esp_supplicant/include/esp_dpp.h`

Functions

`esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)`

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

Parameters `evt_cb` –Callback function to receive DPP related events

void `esp_supp_dpp_deinit` (void)

De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

`esp_err_t esp_supp_dpp_bootstrap_gen` (const char *chan_list, `esp_supp_dpp_bootstrap_t` type, const char *key, const char *info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Parameters

- `chan_list` –List of channels device will be available on for listening
- `type` –Bootstrap method type, only QR Code method is supported for now.
- `key` –(Optional) Private Key used to generate a Bootstrapping Public Key
- `info` –(Optional) Ancilliary Device Information like Serial Number

Returns

- `ESP_OK`: Success
- `ESP_FAIL`: Failure

`esp_err_t esp_supp_dpp_start_listen` (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel from Channel List for a pre-defined wait time.

Returns

- `ESP_OK`: Success
- `ESP_FAIL`: Generic Failure
- `ESP_ERR_INVALID_STATE`: ROC attempted before WiFi is started
- `ESP_ERR_NO_MEM`: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

`ESP_ERR_DPP_FAILURE`

Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE

DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR

Encountered invalid DPP Attribute

Type Definitionstypedef enum *dpp_bootstrap_type* **esp_supp_dpp_bootstrap_t**

Types of Bootstrap Methods for DPP.

typedef void (***esp_supp_dpp_event_cb_t**)(*esp_supp_dpp_event_t* evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

Param evt DPP event ID**Param data** Event data payload**Enumerations**enum **dpp_bootstrap_type**

Types of Bootstrap Methods for DPP.

*Values:*enumerator **DPP_BOOTSTRAP_QR_CODE**

QR Code Method

enumerator **DPP_BOOTSTRAP_PKEX**

Proof of Knowledge Method

enumerator **DPP_BOOTSTRAP_NFC_URI**

NFC URI record Method

enum **esp_supp_dpp_event_t**

Types of Callback Events received from DPP Supplicant.

*Values:*enumerator **ESP_SUPP_DPP_URI_READY**

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.Code examples for ESP-WIFI-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

2.2.2 Ethernet

Ethernet

Overview ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc control of Ethernet driver*

Basic Ethernet Concepts Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

Fig. 4: Ethernet Data Frame Format

Preamble and Start-of-Frame Delimiter The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

Destination Address The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

Source Address The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

Type / Length The type/length field is a 2-byte field, if the value in this field is ≤ 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is ≥ 1536 , it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

Payload The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

Padding and FCS The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and

CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

Note: Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They're not supported in ESP-IDF.

Configure MAC and PHY Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `rx_task_stack_size` and `rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

Create MAC and PHY Instance Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC
↪configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY
↪configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY
↪address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO
↪used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
```

(continues on next page)

```

spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_
↪handle));
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

```

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. *esp_eth_mac_new_dm9051* and *esp_eth_phy_new_dm9051*). This is because we don't have other choices but the integrated PHY.
- We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to *SPI Master*.
- The SPI device configuration (i.e. *spi_device_interface_config_t*) can be different for other Ethernet modules. Please check out your module's spec and the examples in esp-idf.

Install Driver To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in *esp_eth_config_t*:

- *mac*: instance that created from MAC generator (e.g. *esp_eth_mac_new_esp32()*).
- *phy*: instance that created from PHY generator (e.g. *esp_eth_phy_new_ip101()*).
- *check_link_period_ms*: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- *stack_input*: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function *esp_eth_update_input_path()* after driver installation.
- *on_lowlevel_init_done* and *on_lowlevel_deinit_done*: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro *ETH_DEFAULT_CONFIG*.

```

esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↪configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the_
↪handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver

```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```

/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that running in
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↳// register Ethernet event handler (to deal with user specific stuffs when event
↳like link up/down happened)

```

Start Ethernet Driver After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

Connect Driver to TCP/IP Stack Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can't obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to [LwIP](#).

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to [Network Interface](#).

```

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)

```

(continues on next page)

(continued from previous page)

```

{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

```

Warning: It is recommended to fully initialize the Ethernet driver and network interface prior registering user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user's handlers.

Misc control of Ethernet driver The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
↳addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

Flow control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with

the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by invoking `esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, true)`;: One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Example

- Ethernet basic example: [ethernet/basic](#).
- Ethernet iperf example: [ethernet/iperf](#).
- Ethernet to Wi-Fi AP “router” : [ethernet/eth2ap](#).
- Most of protocol examples should also work for Ethernet: [protocols](#).

API Reference

Header File

- `components/esp_eth/include/esp_eth.h`

Functions

`esp_err_t esp_eth_driver_install` (const `esp_eth_config_t` *config, `esp_eth_handle_t` *out_hdl)

Install Ethernet driver.

Parameters

- **config** –[in] configuration of the Ethernet driver
- **out_hdl** –[out] handle of Ethernet driver

Returns

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_driver_uninstall` (`esp_eth_handle_t` hdl)

Uninstall Ethernet driver.

Note: It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_start** (*esp_eth_handle_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

Note: This API will start driver state machine and internal software timer (for checking link status).

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- **ESP_OK**: start esp_eth driver successfully
- **ESP_ERR_INVALID_ARG**: start esp_eth driver failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: start esp_eth driver failed because driver has started already
- **ESP_FAIL**: start esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_stop** (*esp_eth_handle_t* hdl)

Stop Ethernet driver.

Note: This function does the oppsite operation of `esp_eth_start`.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- **ESP_OK**: stop esp_eth driver successfully
- **ESP_ERR_INVALID_ARG**: stop esp_eth driver failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: stop esp_eth driver failed because driver has not started yet
- **ESP_FAIL**: stop esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_update_input_path** (*esp_eth_handle_t* hdl, *esp_err_t* (*stack_input)(*esp_eth_handle_t* hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note: After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **stack_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

Returns

- **ESP_OK**: update input path successfully
- **ESP_ERR_INVALID_ARG**: update input path failed because of some invalid argument
- **ESP_FAIL**: update input path failed because some other error occurred

esp_err_t **esp_eth_transmit** (*esp_eth_handle_t* hdl, void *buf, size_t length)

General Transmit.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

Returns

- **ESP_OK**: transmit frame buffer successfully

- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)`

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

Note: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Note: This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn't support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **buf** –[out] buffer to preserve the received packet
- **length** –[out] length of the received packet

Returns

- `ESP_OK`: receive frame buffer successfully
- `ESP_ERR_INVALID_ARG`: receive frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_SIZE`: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- `ESP_FAIL`: receive frame buffer failed because some other error occurred

`esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)`

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **cmd** –[in] IO control command
- **data** –[inout] address of data for `set` command or address where to store the data when used with `get` command

Returns

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred

esp_err_t **esp_eth_increase_reference** (*esp_eth_handle_t* hdl)

Increase Ethernet driver reference.

Note: Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

esp_err_t **esp_eth_decrease_reference** (*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Structures

struct **esp_eth_config_t**

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t ***mac**

Ethernet MAC object.

esp_eth_phy_t ***phy**

Ethernet PHY object.

uint32_t **check_link_period_ms**

Period time of checking Ethernet link status.

esp_err_t (***stack_input**)(*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

Param eth_handle [in] handle of Ethernet driver

Param buffer [in] frame buffer that will get input to upper stack

Param length [in] length of the frame buffer

Return

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

esp_err_t (***on_lowlevel_init_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC' s SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Macros

ETH_DEFAULT_CONFIG (emac, ephy)

Default configuration for Ethernet driver.

Type Definitions

typedef void ***esp_eth_handle_t**

Handle of Ethernet driver.

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

esp_err_t **esp_eth_detect_phy_addr** (*esp_eth_mediator_t* *eth, int *detected_addr)

Detect PHY address.

Parameters

- **eth** **[in]** mediator of Ethernet driver
- **detected_addr** **[out]** a valid address after detection

Returns

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Structures

struct **esp_eth_mediator_s**

Ethernet mediator.

Public Members

esp_err_t (***phy_reg_read**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param eth **[in]** mediator of Ethernet driver

Param phy_addr **[in]** PHY Chip address (0~31)

Param phy_reg **[in]** PHY register index code

Param reg_value **[out]** PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

esp_err_t (***phy_reg_write**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param eth **[in]** mediator of Ethernet driver

Param phy_addr **[in]** PHY Chip address (0~31)

Param phy_reg **[in]** PHY register index code

Param reg_value **[in]** PHY register value

Return

- ESP_OK: write PHY register successfully

- **ESP_FAIL**: write PHY register failed because some error occurred

esp_err_t (***stack_input**)(*esp_eth_mediator_t* *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.

Param eth [in] mediator of Ethernet driver

Param buffer [in] packet buffer

Param length [in] length of the packet

Return

- **ESP_OK**: deliver packet to upper stack successfully
- **ESP_FAIL**: deliver packet failed because some error occurred

esp_err_t (***on_state_changed**)(*esp_eth_mediator_t* *eth, *esp_eth_state_t* state, void *args)

Callback on Ethernet state changed.

Param eth [in] mediator of Ethernet driver

Param state [in] new state

Param args [in] optional argument for the new state

Return

- **ESP_OK**: process the new state successfully
- **ESP_FAIL**: process the new state failed because some error occurred

Macros

ETH_MAX_PAYLOAD_LEN

Maximum Ethernet payload size.

ETH_MIN_PAYLOAD_LEN

Minimum Ethernet payload size.

ETH_HEADER_LEN

Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

ETH_VLAN_TAG_LEN

Optional 802.1q VLAN Tag length.

ETH_JUMBO_FRAME_PAYLOAD_LEN

Jumbo frame payload size.

ETH_MAX_PACKET_SIZE

Maximum frame size (1522 Bytes)

ETH_MIN_PACKET_SIZE

Minimum frame size (64 Bytes)

Type Definitions

typedef struct *esp_eth_mediator_s* **esp_eth_mediator_t**

Ethernet mediator.

Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

Values:

enumerator **ETH_STATE_LLINIT**

Lowlevel init done

enumerator **ETH_STATE_DEINIT**

Deinit done

enumerator **ETH_STATE_LINK**

Link status changed

enumerator **ETH_STATE_SPEED**

Speed updated

enumerator **ETH_STATE_DUPLEX**

Duplex updated

enumerator **ETH_STATE_PAUSE**

Pause ability updated

enum **esp_eth_io_cmd_t**

Command list for ioctl API.

Values:

enumerator **ETH_CMD_G_MAC_ADDR**

Get MAC address

enumerator **ETH_CMD_S_MAC_ADDR**

Set MAC address

enumerator **ETH_CMD_G_PHY_ADDR**

Get PHY address

enumerator **ETH_CMD_S_PHY_ADDR**

Set PHY address

enumerator **ETH_CMD_G_SPEED**

Get Speed

enumerator **ETH_CMD_S_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**

Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**

Get Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**

Set PHY loopback

enum **eth_event_t**

Ethernet event declarations.

Values:

enumerator **ETHERNET_EVENT_START**

Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**

Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**

Ethernet lost a valid link

Header File

- [components/esp_eth/include/esp_eth_mac.h](#)

Unions

union **eth_mac_clock_config_t**

#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

Public Members

struct *eth_mac_clock_config_t*::[anonymous] **mii**

EMAC MII Clock Configuration

emac_rmii_clock_mode_t **clock_mode**

RMII Clock Mode Configuration

emac_rmii_clock_gpio_t **clock_gpio**

RMII Clock GPIO Configuration

struct *eth_mac_clock_config_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

Structures

struct **esp_eth_mac_s**

Ethernet MAC.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_mac_t* *mac, *esp_eth_mediator_t* *eth)

Set mediator for Ethernet MAC.

Param mac [in] Ethernet MAC instance

Param eth [in] Ethernet mediator

Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (***init**)(*esp_eth_mac_t* *mac)

Initialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (***deinit**)(*esp_eth_mac_t* *mac)

Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

esp_err_t (***start**)(*esp_eth_mac_t* *mac)

Start Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (***stop**)(*esp_eth_mac_t* *mac)

Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

esp_err_t (***transmit**)(*esp_eth_mac_t* *mac, *uint8_t* *buf, *uint32_t* length)

Transmit packet from Ethernet MAC.

Param mac [in] Ethernet MAC instance

Param buf [in] packet buffer to transmit

Param length [in] length of packet

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***receive**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

Note: Memory of buf is allocated in the Layer2, make sure it get free after process.

Note: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Param mac [in] Ethernet MAC instance

Param buf [out] packet buffer which will preserve the received frame

Param length [out] length of the received packet

Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

esp_err_t (***read_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (***set_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Param mac [in] Ethernet MAC instance

Param addr [in] MAC address

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (***get_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Param mac [in] Ethernet MAC instance

Param addr [out] MAC address

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (***set_speed**)(*esp_eth_mac_t* *mac, eth_speed_t speed)

Set speed of MAC.

Param mac [in] Ethernet MAC instance

Param speed [in] MAC speed

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (***set_duplex**)(*esp_eth_mac_t* *mac, eth_duplex_t duplex)

Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance

Param duplex [in] MAC duplex

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (***set_link**)(*esp_eth_mac_t* *mac, eth_link_t link)

Set link status of MAC.

Param mac [in] Ethernet MAC instance

Param link [in] Link status

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

esp_err_t (***set_promiscuous**)(*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (***enable_flow_ctrl**)(*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable flow control; set false to disable flow control

Return

- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

esp_err_t (**set_peer_pause_ability**)(*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Param mac [in] Ethernet MAC instance

Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

Return

- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (**del**)(*esp_eth_mac_t* *mac)

Free memory of Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth_mac_config_t**

Configuration of Ethernet MAC object.

Public Members

uint32_t **sw_reset_timeout_ms**

Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**

Stack size of the receive task

uint32_t **rx_task_prio**

Priority of the receive task

int **smi_mdc_gpio_num**

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **smi_mdio_gpio_num**

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32_t **flags**

Flags that specify extra capability for mac driver

eth_data_interface_t **interface**

EMAC Data interface to PHY (MII/RMII)

eth_mac_clock_config_t **clock_config**

EMAC Interface clock configuration

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE

MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE

Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()

Default configuration for Ethernet MAC object.

Type Definitions

typedef struct *esp_eth_mac_s* **esp_eth_mac_t**

Ethernet MAC.

Enumerations

enum **emac_rmii_clock_mode_t**

RMII Clock Mode Options.

Values:

enumerator **EMAC_CLK_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**

RMII Clock GPIO number Options.

Values:

enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

Note: ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

Note: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with

EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File

- [components/esp_eth/include/esp_eth_phy.h](#)

Functions

esp_eth_phy_t ***esp_eth_phy_new_ip101** (const *eth_phy_config_t* *config)

Create a PHY instance of IP101.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_rt18201** (const *eth_phy_config_t* *config)

Create a PHY instance of RTL8201.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_lan87xx** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN87xx.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

static inline *esp_eth_phy_t* ***esp_eth_phy_new_lan8720** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN8720.

Note: For ESP-IDF backwards compatibility reasons. In all other cases, use `esp_eth_phy_new_lan87xx` instead.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_dp83848** (const *eth_phy_config_t* *config)

Create a PHY instance of DP83848.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz8041** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ8041.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz8081** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ8081.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct **esp_eth_phy_s**

Ethernet PHY.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)

Set mediator for PHY.

Param *phy* [in] Ethernet PHY instance

Param *mediator* [in] mediator of Ethernet driver

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

esp_err_t (***reset**)(*esp_eth_phy_t* *phy)

Software Reset Ethernet PHY.

Param *phy* [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***reset_hw**)(*esp_eth_phy_t* *phy)

Hardware Reset Ethernet PHY.

Note: Hardware reset is mostly done by pull down and up PHY' s nRST pin

Param *phy* [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***init**)(*esp_eth_phy_t* *phy)

Initialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

esp_err_t (***deinit**)(*esp_eth_phy_t* *phy)

Deinitialize Ethernet PHY.

Param phyL [in] Ethernet PHY instance

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

esp_err_t (***negotiate**)(*esp_eth_phy_t* *phy)

Start auto negotiation.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred

esp_err_t (***get_link**)(*esp_eth_phy_t* *phy)

Get Ethernet PHY link status.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (***pwrctrl**)(*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

Param phy [in] Ethernet PHY instance

Param enable [in] set true to power on Ethernet PHY; ser false to power off Ethernet PHY

Return

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (***set_addr**)(*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [in] PHY chip address

Return

- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (***get_addr**)(*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [out] PHY chip address

Return

- ESP_OK: get Ethernet PHY address successfully

- `ESP_ERR_INVALID_ARG`: get Ethernet PHY address failed because of invalid argument

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)`

Advertise pause function supported by MAC layer.

Param phy [in] Ethernet PHY instance

Param addr [out] Pause ability

Return

- `ESP_OK`: Advertise pause ability successfully
- `ESP_ERR_INVALID_ARG`: Advertise pause ability failed because of invalid argument

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)`

Param phy [in] Ethernet PHY instance

Param enable [in] enables or disables PHY loopback

Return

- `ESP_OK`: configures PHY instance loopback function successfully
- `ESP_FAIL`: PHY instance loopback configuration failed because some error occurred

`esp_err_t (*del)(esp_eth_phy_t *phy)`

Free memory of Ethernet PHY instance.

Param phy [in] Ethernet PHY instance

Return

- `ESP_OK`: free PHY instance successfully
- `ESP_FAIL`: free PHY instance failed because some error occurred

struct **eth_phy_config_t**

Ethernet PHY configuration.

Public Members

int32_t **phy_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG ()

Default configuration for Ethernet PHY object.

Type Definitions

typedef struct *esp_eth_phy_s* **esp_eth_phy_t**
Ethernet PHY.

Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`

Functions

esp_eth_netif_glue_handle_t **esp_eth_new_netif_glue** (*esp_eth_handle_t* eth_hdl)
Create a netif glue for Ethernet driver.

Note: netif glue is used to attach io driver to TCP/IP netif

Parameters **eth_hdl** –Ethernet driver handle
Returns glue object, which inherits `esp_netif_driver_base_t`

esp_err_t **esp_eth_del_netif_glue** (*esp_eth_netif_glue_handle_t* eth_netif_glue)
Delete netif glue of Ethernet driver.

Parameters **eth_netif_glue** –netif glue
Returns -ESP_OK: delete netif glue successfully

esp_err_t **esp_eth_set_default_handlers** (void *esp_netif)
Register default IP layer handlers for Ethernet.

Note: : Ethernet handle might not yet properly initialized when setting up these default handlers

Warning: : This function is deprecated and is kept here only for compatibility reasons. Registration of default IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use multiple Ethernet instances at a time.

Parameters **esp_netif** –[in] esp network interface handle created for Ethernet driver
Returns

- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp_event handler

esp_err_t **esp_eth_clear_default_handlers** (void *esp_netif)
Unregister default IP layer handlers for Ethernet.

Warning: : This function is deprecated and is kept here only for compatibility reasons. Unregistration of default IP layer handlers for Ethernet is now handled automatically if not registered by calling `esp_eth_set_default_handlers`.

Parameters **esp_netif** –[in] esp network interface handle created for Ethernet driver
Returns

- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp_event handler

Type Definitions

typedef struct esp_eth_netif_glue_t ***esp_eth_netif_glue_handle_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

2.2.3 Thread

Thread

Introduction [Thread](#) is a IP-based mesh networking protocol. It' s based on the 802.15.4 physical and MAC layer.

Application Examples The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot_cli](#).
- The Thread border router [openthread/ot_br](#).
- The Thread radio co-processor [openthread/ot_rcp](#).

API Reference For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- [components/openthread/include/esp_openthread.h](#)

Functions

esp_err_t **esp_openthread_init** (const *esp_openthread_platform_config_t* *init_config)

Initializes the full OpenThread stack.

Note: The OpenThread instance will also be initialized in this function.

Parameters **init_config** -[in] The initialization configuration.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

esp_err_t **esp_openthread_launch_mainloop** (void)

Launches the OpenThread main loop.

Note: This function will not return unless error happens when running the OpenThread stack.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t **esp_openthread_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance ***esp_openthread_get_instance** (void)

This function acquires the underlying OpenThread instance.

Note: This function can be called on other tasks without lock.

Returns The OpenThread instance pointer

Header File

- [components/openthread/include/esp_openthread_types.h](#)

Structures

struct **esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**

The write file descriptors

fd_set **error_fds**

The error file descriptors

int **max_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp_openthread_uart_config_t**

The uart port config for OpenThread.

Public Members

uart_port_t **port**

UART port number

uart_config_t **uart_config**

UART configuration, see [uart_config_t](#) docs

int **rx_pin**
UART RX pin

int **tx_pin**
UART TX pin

struct **esp_openthread_radio_config_t**
The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**
The radio mode

esp_openthread_uart_config_t **radio_uart_config**
The uart configuration to RCP

struct **esp_openthread_host_connection_config_t**
The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**
The host connection mode

esp_openthread_uart_config_t **host_uart_config**
The uart configuration to host

struct **esp_openthread_port_config_t**
The OpenThread port specific configuration.

Public Members

const char ***storage_partition_name**
The partition for storing OpenThread dataset

uint8_t **netif_queue_size**
The packet queue size for the network interface

uint8_t **task_queue_size**
The task queue size

struct **esp_openthread_platform_config_t**
The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t **radio_config**

The radio configuration

esp_openthread_host_connection_config_t **host_config**

The host connection configuration

esp_openthread_port_config_t **port_config**

The port configuration

Enumerations

enum **esp_openthread_event_t**

OpenThread event declarations.

Values:

enumerator **OPENTHREAD_EVENT_START**

OpenThread stack start

enumerator **OPENTHREAD_EVENT_STOP**

OpenThread stack stop

enumerator **OPENTHREAD_EVENT_IF_UP**

OpenThread network interface up

enumerator **OPENTHREAD_EVENT_IF_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD_EVENT_GOT_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD_EVENT_LOST_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

enum **esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**

Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**

Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**

CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

Header File

- [components/openthread/include/esp_openthread_lock.h](#)

Functions

esp_err_t **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire** (TickType_t block_ticks)

This functions acquires the OpenThread API lock.

Note: Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Parameters **block_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.

Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

Header File

- [components/openthread/include/esp_openthread_netif_glue.h](#)

Functions

void ***esp_openthread_netif_glue_init** (const *esp_openthread_platform_config_t* *config)

This function initializes the OpenThread network interface glue.

Parameters **config** –[in] The platform configuration.

Returns

- glue pointer on success
- NULL on failure

void **esp_openthread_netif_glue_deinit** (void)

This function deinitializes the OpenThread network interface glue.

esp_netif_t ***esp_openthread_get_netif** (void)

This function acquires the OpenThread netif.

Returns The OpenThread netif or NULL if not initialized.

Header File

- [components/openthread/include/esp_openthread_border_router.h](#)

Functions

esp_err_t **esp_openthread_border_router_init** (*esp_netif_t* *backbone_netif)

Initializes the border router features of OpenThread.

Note: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Parameters **backbone_netif** –[in] The backbone network interface (WiFi or ethernet)

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FIAL on other failures

esp_err_t **esp_openthread_border_router_deinit** (void)

Deinitializes the border router features of OpenThread.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FIAL on other failures

esp_netif_t ***esp_openthread_get_backbone_netif** (void)

Gets the backbone interface of OpenThread border router.

Returns The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the [openthread](#) directory of ESP-IDF examples.

2.2.4 IP Network Layer

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.

- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the *TCP/IP Adapter Migration Guide* section in case existing applications to be ported to use the esp-netif API instead.

ESP-NETIF architecture

Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- ***** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

- A) Initialization code
- 1) Initializes IO driver
 - 2) Creates a new instance of ESP-NETIF and configure with

- ESP-NETIF specific options (flags, behaviour, name)
 - Network stack options (netif init and input functions, not publicly available)
 - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
 - 4) Configures event handlers
 - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
 - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
 - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
 - Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
 - Used for network interface lifecycle management
 - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
 - Set interface up or down
 - DHCP server and client API
 - DNS API
- 6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

ESP-NETIF programmer' s manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- `components/esp_netif/include/esp_netif.h`

Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

Note: This function should be called exactly once from application code, when the application starts up.

Returns

- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization is not supported yet

Returns

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t` *`esp_netif_config`)

Creates an instance of new esp-netif object based on provided config.

Parameters `esp_netif_config` –[in] pointer esp-netif configuration

Returns

- pointer to esp-netif object on success
- NULL otherwise

void `esp_netif_destroy` (`esp_netif_t` *`esp_netif`)

Destroys the esp_netif object.

Parameters `esp_netif` –[in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config` (`esp_netif_t` *`esp_netif`, const `esp_netif_driver_ifconfig_t` *`driver_config`)

Configures driver related options of esp_netif object.

Parameters

- `esp_netif` –[inout] pointer to the object to be configured
- `driver_config` –[in] pointer esp-netif io driver related configuration

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

esp_err_t **esp_netif_attach** (esp_netif_t *esp_netif, esp_netif_io_driver_handle driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

Parameters

- **esp_netif** –[inout] pointer to esp_netif object to be attached
- **driver_handle** –[in] pointer to the driver handle

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's post_attach callback failed

esp_err_t **esp_netif_receive** (esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Received data
- **len** –[in] Length of the data frame
- **eb** –[in] Pointer to internal buffer (used in Wi-Fi driver)

Returns

- ESP_OK

void **esp_netif_action_start** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_stop** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_connected** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver connected event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_disconnected** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_got_ip** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)
Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_add_ip6_address** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_remove_ip6_address** (void *esp_netif, *esp_event_base_t* base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

esp_err_t **esp_netif_set_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **mac** –[in] Desired mac address for the related network interface

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_get_mac** (esp_netif_t *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **mac** –[out] Resultant mac address for the related network interface

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_set_hostname** (esp_netif_t *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **hostname** –[in] New hostname for the interface. Maximum length 32 bytes.

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

esp_err_t **esp_netif_get_hostname** (esp_netif_t *esp_netif, const char **hostname)

Get interface hostname.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **hostname** –[out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

bool **esp_netif_is_netif_up** (esp_netif_t *esp_netif)

Test if supplied interface is up or down.

Parameters

esp_netif –[in]

- true - Interface is up
- false - Interface is down

esp_err_t **esp_netif_get_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_old_ip_info** (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_set_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

Note: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] IP information to set on the specified interface

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

esp_err_t **esp_netif_set_old_ip_info** (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] Store the old IP information for the specified interface

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

int **esp_netif_get_netif_impl_index** (esp_netif_t *esp_netif)

Get net interface index from network stack implementation.

Note: This index could be used in `setsockopt()` to bind socket with multicast interface

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns implementation specific index of interface represented with supplied esp_netif

esp_err_t **esp_netif_get_netif_impl_name** (esp_netif_t *esp_netif, char *name)

Get net interface name from network stack implementation.

Note: This name could be used in `setsockopt()` to bind socket with appropriate interface

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **name** –[out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_dhcps_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **opt_op** –[in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt_val** –[inout] Pointer to the option parameter.
- **opt_len** –[in] Length of the option parameter.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **opt_op** –[in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt_val** –[inout] Pointer to the option parameter.
- **opt_len** –[in] Length of the option parameter.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_start** (esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

Note: The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

- ESP_ERR_ESP_NETIF_DHCP_START_FAILED

esp_err_t **esp_netif_dhcpc_stop** (esp_netif_t *esp_netif)

Stop DHCP client (only if enabled in interface object)

Note: Calling action_netif_stop() will also stop the DHCP Client if it is running.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcpc_get_status** (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP client status.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of DHCP client will be returned in this argument.

Returns

- ESP_OK

esp_err_t **esp_netif_dhcps_get_status** (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)

Get DHCP Server status.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of the DHCP server will be returned in this argument.

Returns

- ESP_OK

esp_err_t **esp_netif_dhcps_start** (esp_netif_t *esp_netif)

Start DHCP server (only if enabled in interface object)

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcps_stop** (esp_netif_t *esp_netif)

Stop DHCP server (only if enabled in interface object)

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_set_dns_info** (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type `ESP_NETIF_DNS_MAIN`.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

Parameters

- **esp_netif** `–[in]` Handle to esp-netif instance
- **type** `–[in]` Type of DNS Server to set: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- **dns** `–[in]` DNS Server address to set

Returns

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

esp_err_t **esp_netif_get_dns_info** (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp_netif_set_dns_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Parameters

- **esp_netif** `–[in]` Handle to esp-netif instance
- **type** `–[in]` Type of DNS Server to get: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- **dns** `–[out]` DNS Server result is written here on success

Returns

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

esp_err_t **esp_netif_create_ip6_linklocal** (esp_netif_t *esp_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a `SYSTEM_EVENT_GOT_IP6` event will be sent.

Parameters **esp_netif** `–[in]` Handle to esp-netif instance

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

esp_err_t **esp_netif_get_ip6_linklocal** (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Parameters

- **esp_netif** `–[in]` Handle to esp-netif instance
- **if_ip6** `–[out]` IPv6 information will be returned in this argument if successful.

Returns

- `ESP_OK`

- **ESP_FAIL** If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t **esp_netif_get_ip6_global** (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Parameters

- **esp_netif** **–[in]** Handle to esp-netif instance
- **if_ip6** **–[out]** IPv6 information will be returned in this argument if successful.

Returns

- **ESP_OK**
- **ESP_FAIL** If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp_netif_get_all_ip6** (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])

Get all IPv6 addresses of the specified interface.

Parameters

- **esp_netif** **–[in]** Handle to esp-netif instance
- **if_ip6** **–[out]** Array of IPv6 addresses will be copied to the argument

Returns number of returned IPv6 addresses

void **esp_netif_set_ip4_addr** (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)

Sets IPv4 address to the specified octets.

Parameters

- **addr** **–[out]** IP address to be set
- **a** **–**the first octet (127 for IP 127.0.0.1)
- **b** **–**
- **c** **–**
- **d** **–**

char ***esp_ip4addr_ntoa** (const esp_ip4_addr_t *addr, char *buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

Parameters

- **addr** **–**ip address in network order to convert
- **buf** **–**target buffer where the string is stored
- **buflen** **–**length of buf

Returns either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t **esp_ip4addr_aton** (const char *addr)

Ascii internet address interpretation routine The value returned is in network order.

Parameters **addr** **–**IP address in ascii representation (e.g. “127.0.0.1”)

Returns ip address in network order

esp_err_t **esp_netif_str_to_ip4** (const char *src, esp_ip4_addr_t *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Parameters

- **src** **–[in]** IPv4 address in ascii representation (e.g. “127.0.0.1”)
- **dst** **–[out]** Address of the target esp_ip4_addr_t structure to receive converted address

Returns

- **ESP_OK** on success
- **ESP_FAIL** if conversion failed
- **ESP_ERR_INVALID_ARG** if invalid parameter is passed into

`esp_err_t esp_netif_str_to_ip6` (const char *src, esp_ip6_addr_t *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”)

Parameters

- **src** **–[in]** IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001”)
- **dst** **–[out]** Address of the target esp_ip6_addr_t structure to receive converted address

Returns

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle **esp_netif_get_io_driver** (esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns opaque pointer of related IO driver

esp_netif_t ***esp_netif_get_handle_from_ifkey** (const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

Parameters **if_key** **–**Textual description of network interface

Returns Handle to esp-netif instance

esp_netif_flags_t **esp_netif_get_flags** (esp_netif_t *esp_netif)

Returns configured flags for this interface.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns Configuration flags

const char ***esp_netif_get_ifkey** (esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns Textual description of related interface

const char ***esp_netif_get_desc** (esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns Enumerated type of this interface, such as station, AP, ethernet

int **esp_netif_get_route_prio** (esp_netif_t *esp_netif)

Returns configured routing priority number.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns Integer representing the instance’ s route-prio, or -1 if invalid paramters

int32_t **esp_netif_get_event_id** (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

Parameters

- **esp_netif** **–[in]** Handle to esp-netif instance
- **event_type** **–**(either get or lost IP)

Returns specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

esp_netif_t ***esp_netif_next** (esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Parameters **esp_netif** **–[in]** Handle to esp-netif instance

Returns First netif from the list if supplied parameter is NULL, next one otherwise

size_t **esp_netif_get_nr_of_ifs** (void)

Returns number of registered esp_netif objects.

Returns Number of esp_netifs

void **esp_netif_netstack_buf_ref** (void *netstack_buf)

increase the reference counter of net stack buffer

Parameters **netstack_buf** –[in] the net stack buffer

void **esp_netif_netstack_buf_free** (void *netstack_buf)

free the netstack buffer

Parameters **netstack_buf** –[in] the net stack buffer

esp_err_t **esp_netif_tcpip_exec** (*esp_netif_callback_fn* fn, void *ctx)

Utility to execute the supplied callback in TCP/IP context.

Parameters

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

Returns The error code (*esp_err_t*) returned by the callback

Macros

`_ESP_NETIF_SUPPRESS_LEGACY_WARNING_`

Type Definitions

typedef *esp_err_t* (***esp_netif_callback_fn**)(void *ctx)

TCPIP thread safe callback used with *esp_netif_tcpip_exec()*

WiFi default API reference

Header File

- [components/esp_wifi/include/esp_wifi_default.h](#)

Functions

esp_err_t **esp_netif_attach_wifi_station** (esp_netif_t *esp_netif)

Attaches wifi station interface to supplied netif.

Parameters **esp_netif** –instance to attach the wifi station to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_netif_attach_wifi_ap** (esp_netif_t *esp_netif)

Attaches wifi soft AP interface to supplied netif.

Parameters **esp_netif** –instance to attach the wifi AP to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_wifi_set_default_wifi_sta_handlers** (void)

Sets default wifi event handlers for STA interface.

Returns

- ESP_OK on success, error returned from *esp_event_handler_register* if failed

esp_err_t **esp_wifi_set_default_wifi_ap_handlers** (void)

Sets default wifi event handlers for AP interface.

Returns

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t **esp_wifi_clear_default_wifi_driver_and_handlers** (void *esp_netif)

Clears default wifi event handlers for supplied network interface.

Parameters *esp_netif* –instance of corresponding if object

Returns

- ESP_OK on success, error returned from esp_event_handler_register if failed

esp_netif_t ***esp_netif_create_default_wifi_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

esp_netif_t ***esp_netif_create_default_wifi_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

Note: The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

Returns pointer to esp-netif instance

void **esp_netif_destroy_default_wifi** (void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_...() API.

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

Parameters *esp_netif* –[in] object to detach from WiFi and destroy

esp_netif_t ***esp_netif_create_wifi** (*wifi_interface_t* wifi_if, *esp_netif_inherent_config_t* *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Parameters

- *wifi_if* –[in] type of wifi interface
- *esp_netif_config* –[in] inherent esp-netif configuration pointer

Returns pointer to esp-netif instance

esp_err_t **esp_netif_create_default_wifi_mesh_netifs** (*esp_netif_t* **p_netif_sta, *esp_netif_t* **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Parameters

- `p_netif_sta` –[out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` –[out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success

TCP/IP Adapter Migration Guide

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from `tcpip_adapter` API to its successor *ESP-NETIF*.

Updating network connection code

Network stack initialization Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the *ESP-NETIF* initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

Network interface creation TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the *ESP-NETIF* to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta()`; or `esp_netif_create_default_wifi_ap()`; after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)

Replacing other `tcpip_adapter` API All the `tcpip_adapter` functions have their `esp-netif` counter-part. Please refer to the `esp_netif.h` grouped into these sections:

- [Setters/Getters](#)
- [DHCP](#)
- [DNS](#)
- [IP address](#)

Default event handlers Event handlers are moved from `tcpip_adapter` to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of `esp-netif` specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```
ESP_LOGI(TAG, "got ip:" IPSTR "\n", IP2STR(&event->ip_info.ip));
```

Instead of

```
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since `ip4addr_ntoa()` is a LwIP API, the esp-netif provides `esp_ip4addr_ntoa()` as a replacement, but the above method is generally preferred.

IP addresses It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * [esp-netif IP address definitions](#)

Next steps Additional step in porting an application to fully benefit from the *ESP-NETIF* is to disable the `tcpip_adapter` compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible `tcpip_adapter` interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

Default handlers I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File

- [components/esp_netif/include/esp_netif_net_stack.h](#)

Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl` (void *dev)

Returns esp-netif handle.

Parameters `dev` –[in] opaque ptr to network interface of specific TCP/IP stack

Returns handle to related esp-netif instance

`void *esp_netif_get_netif_impl` (esp_netif_t *esp_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Parameters `esp_netif` –[in] Handle to esp-netif instance

Returns handle to related network stack netif handle

`esp_err_t esp_netif_transmit` (esp_netif_t *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame

Returns ESP_OK on success, an error passed from the I/O driver otherwise

`esp_err_t esp_netif_transmit_wrap` (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame
- **netstack_buf** –[in] net stack buffer

Returns ESP_OK on success, an error passed from the I/O driver otherwise

void `esp_netif_free_rx_buffer` (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the [TCP/IP Adapter Migration Guide](#) to update existing IDF applications.

2.2.5 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

2.3 Peripherals API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32-C3 integrates 2 SAR ([Successive Approximation Register](#)) ADCs, supporting a total of 6 measurement channels (analog enabled pins).

These channels are supported:

ADC1:

- 5 channels: GPIO0 - GPIO4

ADC2:

- 1 channels: GPIO5

ADC Attenuation

Vref is the reference voltage used internally by ESP32-C3 ADCs for measuring the input voltage. The ESP32-C3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

Attenuation	Measurable input voltage range
ADC_ATTEN_DB_0	0 mV ~ 750 mV
ADC_ATTEN_DB_2_5	0 mV ~ 1050 mV
ADC_ATTEN_DB_6	0 mV ~ 1300 mV
ADC_ATTEN_DB_12	0 mV ~ 2500 mV

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-C3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`
- `adc_digi_read_bytes()`

To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, see ADC Attenuation .
Dmax	Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See [ADC Calibration](#).

ADC Limitations

Note:

- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.
- A specific ADC module can only work under one operating mode at any one time, either Continuous Read Mode or Single Read Mode.
- For continuous (DMA) read mode, the ADC sampling frequency (the `sample_freq_hz` member of `adc_digi_config_t`) should be within `SOC_ADC_SAMPLE_FREQ_THRES_LOW` and `SOC_ADC_SAMPLE_FREQ_THRES_HIGH`.
- ADC2 oneshot mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in *ESP32C3 Errata* <https://www.espressif.com/sites/default/files/documentation/esp32-c3_errata_en.pdf>. For compatibility, you can enable `CONFIG_ADC_ONESHOT_FORCE_USE_ADC2_ON_C3` to force use ADC2.

- ADC2 continuous (DMA) mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in *ESP32C3 Errata* <https://www.espressif.com/sites/default/files/documentation/esp32-c3_errata_en.pdf>. For compatibility, you can enable `CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3` to force use ADC2.
-

Driver Usage

Each ADC unit supports two work modes, ADC single read mode and ADC continuous (DMA) mode. ADC single read mode is suitable for low-frequency sampling operations. ADC continuous (DMA) read mode is suitable for high-frequency continuous sampling actions.

Note: ADC readings from a pin not connected to any signal are random.

ADC Continuous (DMA) Read mode To use the ADC continuous read mode driver, execute the following steps:

1. Initialize the ADC driver by calling the function `adc_digi_initialize()`.
2. Initialize the ADC controller by calling the function `adc_digi_controller_config()`.
3. Start the ADC continuous reading by calling the function `adc_digi_start()`.
4. After starting the ADC, you can get the ADC reading result by calling the function `adc_digi_read_bytes()`. Before stopping the ADC (by calling `adc_digi_stop()`), the driver will keep converting the analog data to digital data.
5. Stop the ADC reading by calling the function `adc_digi_stop()`.
6. Deinitialize the ADC driver by calling the function `adc_digi_deinitialize()`.

The code example for using ADC continuous (DMA) read mode can be found in the [peripherals/adc/dma_read](#) directory of ESP-IDF examples.

Note: See [ADC Limitations](#) for the limitation of using ADC continuous (DMA) read mode.

ADC Single Read mode The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in [peripherals/adc/single_read](#) directory of ESP-IDF examples.

Note: See [ADC Limitations](#) for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32-C3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

ADC Calibration

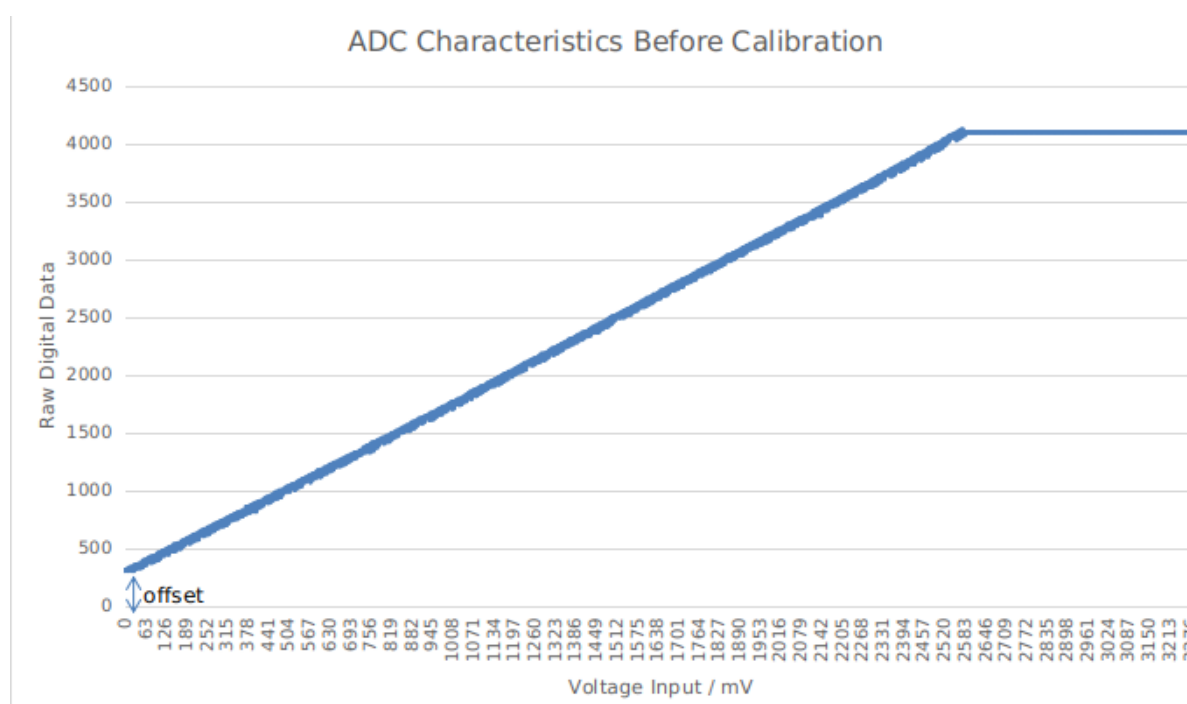

ESP32-C3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

Hardware Calibration Based on series of comparisons with the reference voltage, ESP32-C3 ADC determines each bit of the output digital result. Per design the ESP32-C3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:

1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC Vin-Dout characteristics. ADC characteristics is generally a function: $f(x) = A * x + B$, where B is the offset.

An uncalibrated ADC characteristics is as follows:

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

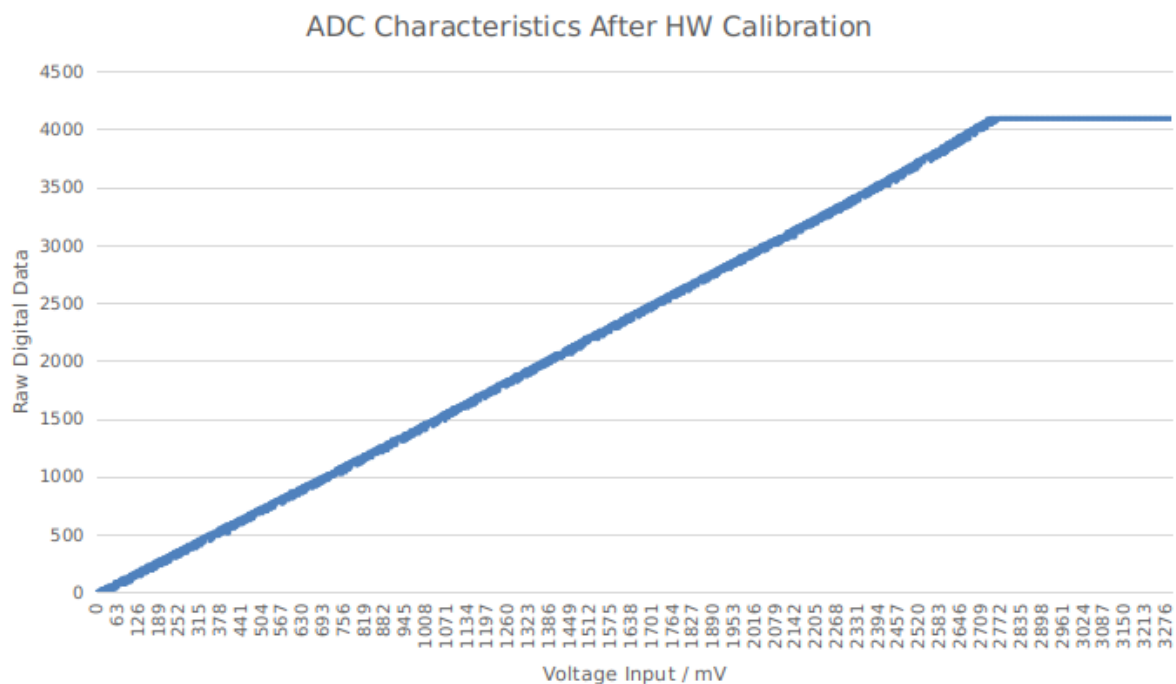

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see [ADC Conversion](#).

Software Calibration To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via `esp_adc_cal_check_efuse()`.
2. Calculate the ADC calibration characteristics via `esp_adc_cal_characterize()`. The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation.
3. Get the actual voltage value via `esp_adc_cal_raw_to_voltage()`.

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in [peripherals/adc/single_read](#) directory of ESP-IDF examples.

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. `ADC1_CHANNEL_0_GPIO_NUM` is the GPIO number of ADC1 channel 0.
2. `ADC1_GPIOn_CHANNEL` is the ADC1 channel number of GPIO n.

API Reference

This reference covers three components:

- [ADC driver](#)
- [ADC Calibration](#)
- [GPIO Lookup Macros](#)

ADC driver

Header File

- [components/driver/include/driver/adc.h](#)

Functions

void **adc_power_on** (void)

Enable ADC power.

Deprecated:

Use `adc_power_acquire` and `adc_power_release` instead.

void **adc_power_off** (void)

Power off SAR ADC.

Deprecated:

Use `adc_power_acquire` and `adc_power_release` instead. This function will force power down for ADC. This function is deprecated because forcing power ADC power off may disrupt operation of other components which may be using the ADC.

void **adc_power_acquire** (void)

Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.

void **adc_power_release** (void)

Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

esp_err_t **adc1_pad_get_io_num** (*adc1_channel_t* channel, *gpio_num_t* *gpio_num)

Get the GPIO number of a specific ADC1 channel.

Parameters

- **channel** –Channel to get the GPIO number
- **gpio_num** –output buffer to hold the GPIO number

Returns

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

esp_err_t **adc1_config_channel_atten** (*adc1_channel_t* channel, *adc_atten_t* atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050
	6	0 ~ 1300
	11	0 ~ 2500

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Note: For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

Note: This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

Parameters

- **channel** –ADC1 channel to configure
- **atten** –Attenuation level

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **adc1_config_width** (*adc_bits_width_t* width_bit)

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

Parameters **width_bit** –Bit capture width for ADC1

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

int **adc1_get_raw** (*adc1_channel_t* channel)

Take an ADC1 reading from a single channel.

Note: ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Note: Call `adc1_config_width()` before the first time this function is called.

Note: For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

Parameters **channel** –ADC1 channel to read

Returns

- -1: Parameter error
- Other: ADC1 channel reading.

esp_err_t **adc2_pad_get_io_num** (*adc2_channel_t* channel, *gpio_num_t* *gpio_num)

Get the GPIO number of a specific ADC2 channel.

Parameters

- **channel** –Channel to get the GPIO number
- **gpio_num** –output buffer to hold the GPIO number

Returns

- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

esp_err_t **adc2_config_channel_atten** (*adc2_channel_t* channel, *adc_atten_t* atten)

Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

SoC	attenuation (dB)	suggested range (mV)
ESP32	0	100 ~ 950
	2.5	100 ~ 1250
	6	150 ~ 1750
	11	150 ~ 2450
ESP32-S2	0	0 ~ 750
	2.5	0 ~ 1050

(continues on next page)

(continued from previous page)

	6	0 ~ 1300	
+-----+-----+			
	11	0 ~ 2500	
+-----+-----+			

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

Note: This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

Note: For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

Parameters

- **channel** –ADC2 channel to configure
- **atten** –Attenuation level

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **adc2_get_raw**(*adc2_channel_t* channel, *adc_bits_width_t* width_bit, int *raw_out)

Take an ADC2 reading on a single channel.

Note: ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Note: ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with `ESP_ERR_TIMEOUT`.

Note: ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

Parameters

- **channel** –ADC2 channel to read
- **width_bit** –Bit capture width for ADC2
- **raw_out** –the variable to hold the output data.

Returns

- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

esp_err_t **adc_vref_to_gpio** (*adc_unit_t* adc_unit, *gpio_num_t* gpio)

Output ADC1 or ADC2' s reference voltage to *adc2_channe_t*' s IO.

This function routes the internal reference voltage of ADCn to one of ADC2' s channels. This reference voltage can then be manually measured for calibration purposes.

Note: ESP32 only supports output of ADC2' s internal reference voltage.

Parameters

- **adc_unit** –[in] ADC unit index
- **gpio** –[in] GPIO number (Only ADC2' s channels IO are supported)

Returns

- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

esp_err_t **adc2_vref_to_gpio** (*gpio_num_t* gpio)

Output ADC2 reference voltage to *adc2_channe_t*' s IO.

This function routes the internal reference voltage of ADCn to one of ADC2' s channels. This reference voltage can then be manually measured for calibration purposes.

Deprecated:

Use `adc_vref_to_gpio` instead.

Parameters **gpio** –[in] GPIO number (ADC2' s channels are supported)

Returns

- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

esp_err_t **adc_digi_initialize** (const *adc_digi_init_config_t* *init_config)

Initialize the Digital ADC.

Parameters **init_config** –Pointer to Digital ADC initialization config. Refer to `adc_digi_init_config_t`.

Returns

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

esp_err_t **adc_digi_read_bytes** (*uint8_t* *buf, *uint32_t* length_max, *uint32_t* *out_length, *uint32_t* timeout_ms)

Read bytes from Digital ADC through DMA.

Parameters

- **buf** –[out] Buffer to read from ADC.
- **length_max** –[in] Expected length of data read from the ADC.
- **out_length** –[out] Real length of data read from the ADC via this API.
- **timeout_ms** –[in] Time to wait for data via this API, in millisecond.

Returns

- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

esp_err_t **adc_digi_start** (void)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

Returns

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_digi_stop** (void)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

Returns

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_digi_deinitialize** (void)

Deinitialize the Digital ADC.

Returns

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_digi_controller_configure** (const *adc_digi_configuration_t* *config)

Setting the digital controller.

Parameters **config** –Pointer to digital controller paramter. Refer to *adc_digi_config_t*.

Returns

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

esp_err_t **adc_digi_filter_reset** (*adc_digi_filter_idx_t* idx)

Reset adc digital controller filter.

Parameters **idx** –Filter index.

Returns

- ESP_OK Success

esp_err_t **adc_digi_filter_set_config** (*adc_digi_filter_idx_t* idx, *adc_digi_filter_t* *config)

Set adc digital controller filter configuration.

Note: For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

Parameters

- **idx** –Filter index.
- **config** –See *adc_digi_filter_t*.

Returns

- ESP_OK Success

esp_err_t **adc_digi_filter_get_config** (*adc_digi_filter_idx_t* idx, *adc_digi_filter_t* *config)

Get adc digital controller filter configuration.

Note: For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

Parameters

- **idx** –Filter index.
- **config** –See *adc_digi_filter_t*.

Returns

- ESP_OK Success

esp_err_t **adc_digi_filter_enable** (*adc_digi_filter_idx_t* idx, bool enable)

Enable/disable adc digital controller filter. Filtering the ADC data to obtain smooth data at higher sampling rates.

Note: For ESP32S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

Parameters

- **idx** –Filter index.
- **enable** –Enable/Disable filter.

Returns

- ESP_OK Success

esp_err_t **adc_digi_monitor_set_config** (*adc_digi_monitor_idx_t* idx, *adc_digi_monitor_t* *config)

Config monitor of adc digital controller.

Note: For ESP32S2, The monitor will monitor all the enabled channel data of the each ADC unit at the same time.

Parameters

- **idx** –Monitor index.
- **config** –See *adc_digi_monitor_t*.

Returns

- ESP_OK Success

esp_err_t **adc_digi_monitor_enable** (*adc_digi_monitor_idx_t* idx, bool enable)

Enable/disable monitor of adc digital controller.

Note: For ESP32S2, The monitor will monitor all the enabled channel data of the each ADC unit at the same time.

Parameters

- **idx** –Monitor index.
- **enable** –True or false enable monitor.

Returns

- ESP_OK Success

Structures

struct **adc_digi_init_config_s**

ADC DMA driver configuration.

Public Members

uint32_t **max_store_buf_size**

Max length of the converted data that driver can store before they are processed.

uint32_t **conv_num_each_intr**

Bytes of data that can be converted in 1 interrupt.

uint32_t **adc1_chan_mask**

Channel list of ADC1 to be initialized.

uint32_t **adc2_chan_mask**

Channel list of ADC2 to be initialized.

struct **adc_digi_configuration_t**

ADC digital controller settings.

Public Members

bool **conv_limit_en**

To limit ADC conversion times. Conversion stops after finishing `conv_limit_num` times conversion.

uint32_t **conv_limit_num**

Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t **pattern_num**

Number of ADC channels that will be used.

[*adc_digi_pattern_config_t*](#) ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz $F_s = F_d / \text{interval} / 2$ F_s : sampling frequency; F_d : digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

[*adc_digi_convert_mode_t*](#) **conv_mode**

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

[*adc_digi_output_format_t*](#) **format**

ADC DMA conversion output format, see `adc_digi_output_format_t`.

Macros

ADC_ATTEN_0db

ADC rtc controller attenuation option.

Note: This definitions are only for being back-compatible

ADC_ATTEN_2_5db

ADC_ATTEN_6db

ADC_ATTEN_11db

ADC_WIDTH_BIT_DEFAULT

The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by `SOC_ADC_MAX_BITWIDTH` defined in `soc_caps.h`.

ADC_WIDTH_9Bit**ADC_WIDTH_10Bit****ADC_WIDTH_11Bit****ADC_WIDTH_12Bit****ADC_MAX_DELAY**

Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

Type Definitions

typedef struct *adc_digi_init_config_s* **adc_digi_init_config_t**
ADC DMA driver configuration.

Enumerations

enum **adc1_channel_t**

Values:

enumerator **ADC1_CHANNEL_0**

ADC1 channel 0 is GPIO0

enumerator **ADC1_CHANNEL_1**

ADC1 channel 1 is GPIO1

enumerator **ADC1_CHANNEL_2**

ADC1 channel 2 is GPIO2

enumerator **ADC1_CHANNEL_3**

ADC1 channel 3 is GPIO3

enumerator **ADC1_CHANNEL_4**

ADC1 channel 4 is GPIO4

enumerator **ADC1_CHANNEL_MAX**

enum **adc2_channel_t**

Values:

enumerator **ADC2_CHANNEL_0**

ADC2 channel 0 is GPIO5

enumerator **ADC2_CHANNEL_MAX**

enum **adc_i2s_encode_t**

ADC digital controller encode option.

Deprecated:

The ESP32-S2 doesn't use I2S DMA. Call `adc_digi_output_format_t` instead.

Values:

enumerator **ADC_ENCODE_12BIT**

ADC to DMA data format, , [15:12]-channel [11:0]-12 bits ADC data

enumerator **ADC_ENCODE_11BIT**

ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

enumerator **ADC_ENCODE_MAX**

Header File

- [components/hal/include/hal/adc_types.h](#)

Structures

struct **adc_digi_pattern_config_t**

ADC digital controller pattern configuration.

Public Members

uint8_t **atten**

Attenuation of this ADC channel.

uint8_t **channel**

ADC channel.

uint8_t **unit**

ADC unit.

uint8_t **bit_width**

ADC output bit width.

struct **adc_digi_output_data_t**

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t **data**

ADC real output data info. Resolution: 12 bit.

uint32_t **reserved12**

Reserved12.

uint32_t **channel**

ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t **unit**

ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t **reserved17_31**

Reserved17.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit. ADC_DIGI_FORMAT_11BIT

uint32_t **val**

Raw data value

struct **adc_arbiter_t**

ADC arbiter work mode and priority setting.

Note: ESP32-S2: Only ADC2 support arbiter.

Public Members

adc_arbiter_mode_t **mode**

Refer to *adc_arbiter_mode_t*. Note: only support ADC2.

uint8_t **rtc_pri**

RTC controller priority. Range: 0 ~ 2.

uint8_t **dig_pri**

Digital controller priority. Range: 0 ~ 2.

uint8_t **pwdet_pri**

Wi-Fi controller priority. Range: 0 ~ 2.

struct **adc_digi_filter_t**

ADC digital controller (DMA mode) filter configuration.

Note: For ESP32-S2, The filter object of the ADC is fixed.

Note: For ESP32-S2, The filter object is always all enabled channels.

Public Members

adc_unit_t **adc_unit**

Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t **channel**

Set adc channel number for filter. For ESP32-S2, it' s always ADC_CHANNEL_MAX

adc_digi_filter_mode_t **mode**

Set adc filter mode for filter. See *adc_digi_filter_mode_t*.

struct **adc_digi_monitor_t**

ADC digital controller (DMA mode) monitor configuration.

Note: For ESP32-S2, The monitor object of the ADC is fixed.

Note: For ESP32-S2, The monitor object is always all enabled channels.

Public Members

adc_unit_t **adc_unit**

Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t **channel**

Set adc channel number for monitor. For ESP32-S2, it' s always ADC_CHANNEL_MAX

adc_digi_monitor_mode_t **mode**

Set adc monitor mode. See *adc_digi_monitor_mode_t*.

uint32_t **h_threshold**

Set monitor threshold of adc digital controller.

uint32_t **l_threshold**

Set monitor threshold of adc digital controller.

Macros

ADC_ARBITER_CONFIG_DEFAULT ()

ADC arbiter default configuration.

Note: ESP32S2: Only ADC2 supports (needs) an arbiter.

Enumerations

enum **adc_unit_t**

ADC unit enumeration.

Note: For ADC digital controller (DMA mode), ESP32 doesn't support `ADC_UNIT_2`, `ADC_UNIT_BOTH`, `ADC_UNIT_ALTER`.

Values:

enumerator **ADC_UNIT_1**

SAR ADC 1.

enumerator **ADC_UNIT_2**

SAR ADC 2.

enumerator **ADC_UNIT_BOTH**

SAR ADC 1 and 2.

enumerator **ADC_UNIT_ALTER**

SAR ADC 1 and 2 alternative mode.

enumerator **ADC_UNIT_MAX**

enum **adc_channel_t**

ADC channels handle. See `adc1_channel_t`, `adc2_channel_t`.

Note: For ESP32 ADC1, don't use `ADC_CHANNEL_8`, `ADC_CHANNEL_9`. See `adc1_channel_t`.

Values:

enumerator **ADC_CHANNEL_0**

ADC channel

enumerator **ADC_CHANNEL_1**

ADC channel

enumerator **ADC_CHANNEL_2**

ADC channel

enumerator **ADC_CHANNEL_3**

ADC channel

enumerator **ADC_CHANNEL_4**

ADC channel

enumerator **ADC_CHANNEL_5**

ADC channel

enumerator **ADC_CHANNEL_6**

ADC channel

enumerator **ADC_CHANNEL_7**

ADC channel

enumerator **ADC_CHANNEL_8**

ADC channel

enumerator **ADC_CHANNEL_9**

ADC channel

enumerator **ADC_CHANNEL_MAX**

enum **adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC. See `adc1_config_channel_atten`.

Values:

enumerator **ADC_ATTEN_DB_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC_ATTEN_DB_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC_ATTEN_DB_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC_ATTEN_DB_11**

This is deprecated, it behaves the same as `ADC_ATTEN_DB_12`

enumerator **ADC_ATTEN_MAX**

enum **adc_bits_width_t**

ADC resolution setting option.

Note: Only used in single read mode

Values:

enumerator **ADC_WIDTH_BIT_12**

ADC capture width is 12Bit.

enumerator **ADC_WIDTH_MAX**

enum **adc_digi_convert_mode_t**

ADC digital controller (DMA mode) work mode.

Values:

enumerator **ADC_CONV_SINGLE_UNIT_1**

Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**

Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2

enumerator **ADC_CONV_UNIT_MAX**

enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_FORMAT_12BIT**

ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data ([adc_digi_output_data_t](#)). Note: For single convert mode.

enumerator **ADC_DIGI_FORMAT_11BIT**

ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data ([adc_digi_output_data_t](#)). Note: For multi or alter convert mode.

enumerator **ADC_DIGI_FORMAT_MAX**

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See [adc_digi_output_data_t.type1](#)

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See [adc_digi_output_data_t.type2](#)

enum **adc_arbiter_mode_t**

ADC arbiter work mode option.

Note: ESP32-S2: Only ADC2 support arbiter.

Values:

enumerator **ADC_ARB_MODE_SHIELD**

Force shield arbiter, Select the highest priority controller to work.

enumerator **ADC_ARB_MODE_FIX**

Fixed priority switch controller mode.

enumerator **ADC_ARB_MODE_LOOP**

Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

enum **adc_digi_filter_idx_t**

ADC digital controller (DMA mode) filter index options.

Note: For ESP32-S2, The filter object of the ADC is fixed.

Values:

enumerator **ADC_DIGI_FILTER_IDX0**

The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

enumerator **ADC_DIGI_FILTER_IDX1**

The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

enumerator **ADC_DIGI_FILTER_IDX_MAX**

enum **adc_digi_filter_mode_t**

ADC digital controller (DMA mode) filter type options. Expression: $\text{filter_data} = (k-1)/k * \text{last_data} + \text{new_data} / k$.

Values:

enumerator **ADC_DIGI_FILTER_DIS**

Disable filter

enumerator **ADC_DIGI_FILTER_IIR_2**

The filter mode is first-order IIR filter. The coefficient is 2.

enumerator **ADC_DIGI_FILTER_IIR_4**

The filter mode is first-order IIR filter. The coefficient is 4.

enumerator **ADC_DIGI_FILTER_IIR_8**

The filter mode is first-order IIR filter. The coefficient is 8.

enumerator **ADC_DIGI_FILTER_IIR_16**

The filter mode is first-order IIR filter. The coefficient is 16.

enumerator **ADC_DIGI_FILTER_IIR_64**

The filter mode is first-order IIR filter. The coefficient is 64.

enumerator **ADC_DIGI_FILTER_IIR_MAX**

enum **adc_digi_monitor_idx_t**

ADC digital controller (DMA mode) monitor index options.

Note: For ESP32-S2, The monitor object of the ADC is fixed.

Values:

enumerator **ADC_DIGI_MONITOR_IDX0**

The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.

enumerator **ADC_DIGI_MONITOR_IDX1**

The monitor index 1. For ESP32-S2, It can only be used to monitor all enabled channels of ADC2 unit at the same time.

enumerator **ADC_DIGI_MONITOR_IDX_MAX**

enum **adc_digi_monitor_mode_t**

Set monitor mode of adc digital controller. **MONITOR_HIGH**: If **ADC_OUT** > threshold, Generates monitor interrupt. **MONITOR_LOW**: If **ADC_OUT** < threshold, Generates monitor interrupt.

Values:

enumerator **ADC_DIGI_MONITOR_DIS**

Disable monitor.

enumerator **ADC_DIGI_MONITOR_EN**

If **ADC_OUT** < threshold, Generates monitor interrupt. If **ADC_OUT** > threshold, Generates monitor interrupt.

enumerator **ADC_DIGI_MONITOR_MAX**

enum **adc_i2s_source_t**

ESP32 ADC DMA source selection.

Deprecated:

Not applicable on ESP32-S2 because ESP32-S2 doesn't use I2S DMA.

Values:

enumerator **ADC_I2S_DATA_SRC_IO_SIG**

I2S data from GPIO matrix signal

enumerator **ADC_I2S_DATA_SRC_ADC**

I2S data from ADC

enumerator **ADC_I2S_DATA_SRC_MAX**

ADC Calibration

Header File

- `components/esp_adc_cal/include/esp_adc_cal.h`

Functions

`esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)`

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note: in ESP32S2, only `ESP_ADC_CAL_VAL_EFUSE_TP` is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Parameters `value_type` –Type of calibration value (`ESP_ADC_CAL_VAL_EFUSE_VREF` or `ESP_ADC_CAL_VAL_EFUSE_TP`)

Returns

- `ESP_OK`: The calibration mode is supported in eFuse
- `ESP_ERR_NOT_SUPPORTED`: Error, eFuse values are not burned
- `ESP_ERR_INVALID_ARG`: Error, invalid argument (`ESP_ADC_CAL_VAL_DEFAULT_VREF`)

`esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)`

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of $[y = \text{coeff_a} * x + \text{coeff_b}]$. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

Note: For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using `menuconfig`. For ESP32s2, only Two Point values calibration and only `ADC_WIDTH_BIT_13` is supported. The parameter `default_vref` is unused.

Parameters

- `adc_num` –[in] ADC to characterize (`ADC_UNIT_1` or `ADC_UNIT_2`)
- `atten` –[in] Attenuation to characterize
- `bit_width` –[in] Bit width configuration of ADC
- `default_vref` –[in] Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- `chars` –[out] Pointer to empty structure used to store ADC characteristics

Returns

- `ESP_ADC_CAL_VAL_EFUSE_VREF`: eFuse Vref used for characterization
- `ESP_ADC_CAL_VAL_EFUSE_TP`: Two Point value used for characterization (only in Linear Mode)
- `ESP_ADC_CAL_VAL_DEFAULT_VREF`: Default Vref used for characterization

`uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)`

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC' s characteristics.

Note: Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

Parameters

- **adc_reading** –[in] ADC reading
- **chars** –[in] Pointer to initialized structure containing ADC characteristics

Returns Voltage in mV

`esp_err_t esp_adc_cal_get_voltage` (`adc_channel_t` channel, const `esp_adc_cal_characteristics_t` *chars, `uint32_t` *voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

Note: The Characteristics structure must be initialized before this function is called (call `esp_adc_cal_characterize()`)

Parameters

- **channel** –[in] ADC Channel to read
- **chars** –[in] Pointer to initialized ADC characteristics structure
- **voltage** –[out] Pointer to store converted voltage

Returns

- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Structures

struct `esp_adc_cal_characteristics_t`

Structure storing characteristics of an ADC.

Note: Call `esp_adc_cal_characterize()` to initialize the structure

Public Members

`adc_unit_t` **adc_num**

ADC number

`adc_atten_t` **atten**

ADC attenuation

`adc_bits_width_t` **bit_width**

ADC bit width

`uint32_t` **coeff_a**

Gradient of ADC-Voltage curve

uint32_t **coeff_b**

Offset of ADC-Voltage curve

uint32_t **vref**

Vref used by lookup table

const uint32_t ***low_curve**

Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t ***high_curve**

Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t **version**

ADC Calibration

Enumerations

enum **esp_adc_cal_value_t**

Type of calibration value used in characterization.

Values:

enumerator **ESP_ADC_CAL_VAL_EFUSE_VREF**

Characterization based on reference voltage stored in eFuse

enumerator **ESP_ADC_CAL_VAL_EFUSE_TP**

Characterization based on Two Point values stored in eFuse

enumerator **ESP_ADC_CAL_VAL_DEFAULT_VREF**

Characterization based on default reference voltage

enumerator **ESP_ADC_CAL_VAL_EFUSE_TP_FIT**

Characterization based on Two Point values and fitting curve coefficients stored in eFuse

enumerator **ESP_ADC_CAL_VAL_MAX**

enumerator **ESP_ADC_CAL_VAL_NOT_SUPPORTED**

2.3.2 General Purpose Timer

Introduction

The ESP32-C3 chip contains two hardware timer groups. Each group has one general-purpose hardware timer(s). They are all 54-bit generic timers based on 16-bit pre-scalers and 54-bit up / down counters which are capable of being auto-reloaded.

Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- *Timer Initialization* - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- *Timer Control* - describes how to read a timer's value, pause or start a timer, and change how it operates.
- *Alarms* - shows how to set and use alarms.
- *Interrupts* - explains how to use interrupt callbacks.

Timer Initialization The two ESP32-C3 timer groups, with one timer(s) in each, provide the total of two individual timers for use. An ESP32-C3 timer group should be identified using *timer_group_t*. An individual timer in a group should be identified with *timer_idx_t*.

First of all, the timer should be initialized by calling the function *timer_init()* and passing a structure *timer_config_t* to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Clock Source:** Select the clock source, which together with the **Divider** define the resolution of the working timer.
- **Divider:** Sets how quickly the timer's counter is “ticking”. The setting `divider` is used as a divisor of the clock source that by default is APB_CLK running at 80 MHz. For more information of APB_CLK frequency, please check *ESP32-C3 Technical Reference Manual > Reset and Clock [PDF]* chapter for more details.
- **Mode:** Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable:** If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable:** Can be set using `alarm_en`.
- **Auto Reload:** Sets if the counter should `auto_reload` the initial counter value on the timer's alarm or continue incrementing or decrementing.

To get the current values of the timer's settings, use the function `timer_get_config()`.

Timer Control Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to `true`, or call `timer_start()`. You can specify the timer's initial counter value by calling `timer_set_counter_value()`. To check the timer's current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section *Timer Initialization*.

You can also reconfigure the timer by using dedicated functions to change individual settings:

Setting	Dedicated Function	Description
Divider	<code>timer_set_divider()</code>	Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.
Mode	<code>timer_set_counter_dir()</code>	Set if the counter should be incrementing or decrementing
Auto Reload	<code>timer_set_auto_reload()</code>	Set if the initial counter value should be reloaded on the timer's alarm

Alarms To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section *Interrupts* on how to configure interrupts.
- When `auto_reload` is enabled, the timer's counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

Note:

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
 - Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.
-

To check the specified alarm value, call `timer_get_alarm_value()`.

Interrupts Registration of an interrupt callback for a specific timer can be done by calling `timer_isr_callback_add()` and passing in the group ID, timer ID, callback handler and user data. The callback handler will be invoked in ISR context, so user shouldn't put any blocking API in the callback

function. The benefit of using interrupt callback instead of preprocessing interrupt from scratch is, you don't have to deal with interrupt status check and clean stuffs, they are all addressed before the callback got run in driver's default interrupt handler.

For more information on how to use interrupts, please see the application example below.

Application Example

The 54-bit hardware timer example: [peripherals/timer_group](#).

API Reference

Header File

- [components/driver/include/driver/timer.h](#)

Functions

esp_err_t **timer_get_counter_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t *timer_val)

Read the counter value of hardware timer.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **timer_val** –Pointer to accept timer counter value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_get_counter_time_sec** (*timer_group_t* group_num, *timer_idx_t* timer_num, double *time)

Read the counter value of hardware timer, in unit of a given scale.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **time** –Pointer, type of double*, to accept timer counter value, in seconds.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_counter_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t load_val)

Set counter value to hardware timer.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **load_val** –Counter value to write to the hardware timer.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_start** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Start the counter of hardware timer.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_pause** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Pause the counter of hardware timer.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_counter_mode** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_count_dir_t* counter_dir)

Set counting mode for hardware timer.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir** –Counting direction of timer, count-up or count-down

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_auto_reload** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_autoreload_t* reload)

Enable or disable counter reload function when alarm event occurs.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **reload** –Counter reload mode.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_divider** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint32_t divider)

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **divider** –Timer clock divider value. The divider's range is from 2 to 65536.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t alarm_value)

Set timer alarm value.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value** –A 64-bit value to set the alarm value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_get_alarm_value** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t *alarm_value)

Get timer alarm value.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value** –Pointer of A 64-bit value to accept the alarm value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_set_alarm** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_alarm_t* alarm_en)

Enable or disable generation of timer alarm events.

Parameters

- **group_num** –Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_en** –To enable or disable timer alarm function.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_callback_add** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_isr_t* isr_handler, void *arg, int intr_alloc_flags)

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Note: This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call timer_isr_register(...) to register ISR.

Parameters

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group
- **isr_handler** –Interrupt handler function, it is a callback function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_callback_remove** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Remove ISR handle callback for the corresponding timer.

Parameters

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_isr_register** (*timer_group_t* group_num, *timer_idx_t* timer_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *timer_isr_handle_t* *handle)

Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the `intr_alloc_flags` value `ESP_INTR_FLAG_IRAM` is set, the handler function must be declared with `IRAM_ATTR` attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

Note: If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(..)` before your handling, and call `timer_spinlock_give(...)` after your handling.

Parameters

- **group_num** –Timer group number
- **timer_num** –Timer index of timer group
- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (`ORred`) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **timer_init** (*timer_group_t* group_num, *timer_idx_t* timer_num, const *timer_config_t* *config)

Initializes and configure the timer.

Parameters

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer to timer initialization parameters.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **timer_deinit** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Deinitializes the timer.

Parameters

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **timer_get_config** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_config_t* *config)

Get timer configure value.

Parameters

- **group_num** –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`
- **timer_num** –Timer index, 0 for `hw_timer[0]` & 1 for `hw_timer[1]`
- **config** –Pointer of struct to accept timer parameters.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **timer_group_intr_enable** (*timer_group_t* group_num, *timer_intr_t* intr_mask)

Enable timer group interrupt, by enable mask.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask** –Timer interrupt enable mask.
 - TIMER_INTR_T0: t0 interrupt
 - TIMER_INTR_T1: t1 interrupt
 - TIMER_INTR_WDT: watchdog interrupt

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_group_intr_disable** (*timer_group_t* group_num, *timer_intr_t* intr_mask)

Disable timer group interrupt, by disable mask.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask** –Timer interrupt disable mask.
 - TIMER_INTR_T0: t0 interrupt
 - TIMER_INTR_T1: t1 interrupt
 - TIMER_INTR_WDT: watchdog interrupt

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_enable_intr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Enable timer interrupt.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **timer_disable_intr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Disable timer interrupt.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

void **timer_group_intr_clr_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Clear timer interrupt status, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

void **timer_group_clr_intr_status_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Clear timer interrupt status, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

void **timer_group_enable_alarm_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Enable alarm interrupt, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

uint64_t **timer_group_get_counter_value_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Get the current counter value, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.

Returns

- Counter value

void **timer_group_set_alarm_value_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num, uint64_t alarm_val)

Set the alarm threshold for the timer, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.
- **alarm_val** –Alarm threshold.

void **timer_group_set_counter_enable_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num, *timer_start_t* counter_en)

Enable/disable a counter, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index.
- **counter_en** –Enable/disable.

timer_intr_t **timer_group_intr_get_in_isr** (*timer_group_t* group_num)

Get the masked interrupt status, just used in ISR.

Parameters **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Returns

- Interrupt status

uint32_t **timer_group_get_intr_status_in_isr** (*timer_group_t* group_num)

Get interrupt status, just used in ISR.

Parameters **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Returns

- Interrupt status

void **timer_group_clr_intr_sta_in_isr** (*timer_group_t* group_num, *timer_intr_t* intr_mask)

Clear the masked interrupt status, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask** –Masked interrupt.

bool **timer_group_get_auto_reload_in_isr** (*timer_group_t* group_num, *timer_idx_t* timer_num)

Get auto reload enable status, just used in ISR.

Parameters

- **group_num** –Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num** –Timer index

Returns

- True Auto reload enabled
- False Auto reload disabled

esp_err_t **timer_spinlock_take** (*timer_group_t* group_num)

Take timer spinlock to enter critical protect.

Note: Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

Parameters `group_num` –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **timer_spinlock_give** (*timer_group_t* group_num)

Give timer spinlock to exit critical protect.

Note: Deprecated, the recommended way is to use ISR callbacks instead, see `timer_group_example_main`

Parameters `group_num` –Timer group number, 0 for `TIMERG0` or 1 for `TIMERG1`

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Macros

TIMER_BASE_CLK

Frequency of the clock on the input of the timer groups

Type Definitions

typedef bool (***timer_isr_t**)(void*)

Interrupt handle callback function. User need to retrun a bool value in callback.

Note: If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

Return

- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

typedef *intr_handle_t* **timer_isr_handle_t**

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

Header File

- [components/hal/include/hal/timer_types.h](#)

Structures

struct **timer_config_t**

Data structure with timer' s configuration settings.

Public Members

timer_alarm_t **alarm_en**

Timer alarm enable

timer_start_t **counter_en**

Counter enable

timer_intr_mode_t **intr_type**

Interrupt mode

timer_count_dir_t **counter_dir**

Counter direction

timer_autoreload_t **auto_reload**

Timer auto-reload

uint32_t **divider**

Counter clock divider. The divider's range is from 2 to 65536.

timer_src_clk_t **clk_src**

Use XTAL as source clock.

Enumerations

enum **timer_group_t**

Selects a Timer-Group out of 2 available groups.

Values:

enumerator **TIMER_GROUP_0**

Hw timer group 0

enumerator **TIMER_GROUP_1**

Hw timer group 1

enumerator **TIMER_GROUP_MAX**

enum **timer_idx_t**

Select a hardware timer from timer groups.

Values:

enumerator **TIMER_0**

Select timer0 of GROUPx

enumerator **TIMER_MAX**

enum **timer_count_dir_t**

Decides the direction of counter.

Values:

enumerator **TIMER_COUNT_DOWN**

Descending Count from cnt.hightcnt.low

enumerator **TIMER_COUNT_UP**

Ascending Count from Zero

enumerator **TIMER_COUNT_MAX**

enum **timer_start_t**

Decides whether timer is on or paused.

Values:

enumerator **TIMER_PAUSE**

Pause timer counter

enumerator **TIMER_START**

Start timer counter

enum **timer_intr_t**

Interrupt types of the timer.

Values:

enumerator **TIMER_INTR_TO**

interrupt of timer 0

enumerator **TIMER_INTR_WDT**

interrupt of watchdog

enumerator **TIMER_INTR_NONE**

enum **timer_alarm_t**

Decides whether to enable alarm mode.

Values:

enumerator **TIMER_ALARM_DIS**

Disable timer alarm

enumerator **TIMER_ALARM_EN**

Enable timer alarm

enumerator **TIMER_ALARM_MAX**

enum **timer_intr_mode_t**

Select interrupt type if running in alarm mode.

Values:

enumerator **TIMER_INTR_LEVEL**

Interrupt mode: level mode

enumerator **TIMER_INTR_MAX**

enum **timer_autoreload_t**

Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

enumerator **TIMER_AUTORELOAD_DIS**

Disable auto-reload: hardware will not load counter value after an alarm event

enumerator **TIMER_AUTORELOAD_EN**

Enable auto-reload: hardware will load counter value after an alarm event

enumerator **TIMER_AUTORELOAD_MAX**

enum **timer_src_clk_t**

Select timer source clock.

Values:

enumerator **TIMER_SRC_CLK_APB**

Select APB as the source clock

enumerator **TIMER_SRC_CLK_XTAL**

Select XTAL as the source clock

2.3.3 GPIO & RTC GPIO

Overview

The ESP32-C3 chip features 22 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF]. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	Comment
GPIO0	ADC1_CH0	RTC
GPIO1	ADC1_CH1	RTC
GPIO2	ADC1_CH2	Strapping pin; RTC
GPIO3	ADC1_CH3	RTC
GPIO4	ADC1_CH4	RTC
GPIO5	ADC2_CH0	RTC
GPIO6		
GPIO7		
GPIO8		Strapping pin
GPIO9		Strapping pin
GPIO10		
GPIO11		
GPIO12		SPI0/1
GPIO13		SPI0/1
GPIO14		SPI0/1
GPIO15		SPI0/1
GPIO16		SPI0/1
GPIO17		SPI0/1
GPIO18		USB-JTAG
GPIO19		USB-JTAG
GPIO20		
GPIO21		

Note:

- Strapping pin: GPIO2, GPIO8 and GPIO9 are strapping pins. For more information, please refer to [ESP32-C3 datasheet](#).
- SPI0/1: GPIO12-17 are usually used for SPI flash and PSRAM and not recommended for other uses.
- USB-JTAG: GPIO 18 and 19 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
- RTC: GPIO0-5 can be used when in deep sleep.

Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic_gpio](#).

API Reference - Normal GPIO**Header File**

- [components/driver/include/driver/gpio.h](#)

Functions

`esp_err_t gpio_config` (const `gpio_config_t` *pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

Parameters `pGPIOConfig` –Pointer to GPIO configure struct

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_reset_pin** (*gpio_num_t* gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Parameters **gpio_num** –GPIO number.

Returns Always return ESP_OK.

esp_err_t **gpio_set_intr_type** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

GPIO set interrupt trigger type.

Parameters

- **gpio_num** –GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type** –Interrupt type, select from gpio_int_type_t

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_enable** (*gpio_num_t* gpio_num)

Enable GPIO module interrupt signal.

Note: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Parameters **gpio_num** –GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_disable** (*gpio_num_t* gpio_num)

Disable GPIO module interrupt signal.

Parameters **gpio_num** –GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_level** (*gpio_num_t* gpio_num, uint32_t level)

GPIO set output level.

Parameters

- **gpio_num** –GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level** –Output level. 0: low ; 1: high

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

int **gpio_get_level** (*gpio_num_t* gpio_num)

GPIO get input level.

Warning: If the pad is not configured for input (or input and output) the returned value is always 0.

Parameters **gpio_num** –GPIO number. If you want to get the logic level of e.g. pin GPIO16, **gpio_num** should be **GPIO_NUM_16** (16);

Returns

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

esp_err_t **gpio_set_direction** (*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction.

Configure GPIO direction,such as output_only,input_only,output_and_input

Parameters

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, **gpio_num** should be **GPIO_NUM_16** (16);
- **mode** –GPIO direction

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** GPIO error

esp_err_t **gpio_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, **gpio_num** should be **GPIO_NUM_16** (16);
- **pull** –GPIO pull up/down mode.

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** : Parameter error

esp_err_t **gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_intr_type_t* intr_type)

Enable GPIO wake-up function.

Parameters

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only **GPIO_INTR_LOW_LEVEL** or **GPIO_INTR_HIGH_LEVEL** can be used.

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

esp_err_t **gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO wake-up function.

Parameters **gpio_num** –GPIO number

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

***esp_err_t* gpio_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

Parameters

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- `ESP_OK` Success ;
- `ESP_ERR_INVALID_ARG` GPIO error
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags

***esp_err_t* gpio_pullup_en** (*gpio_num_t* gpio_num)

Enable pull-up on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp_err_t* gpio_pullup_dis** (*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp_err_t* gpiopulldown_en** (*gpio_num_t* gpio_num)

Enable pull-down on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp_err_t* gpiopulldown_dis** (*gpio_num_t* gpio_num)

Disable pull-down on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp_err_t* gpio_install_isr_service** (int intr_alloc_flags)

Install the driver's GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

Parameters `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

Returns

- `ESP_OK` Success

- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_INVALID_ARG` GPIO error

void **gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add** (*gpio_num_t* gpio_num, *gpio_isr_t* isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Parameters

- **gpio_num** –GPIO number
- **isr_handler** –ISR handler function for the corresponding GPIO number.
- **args** –parameter for ISR handler.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **gpio_isr_handler_remove** (*gpio_num_t* gpio_num)

Remove ISR handler for the corresponding GPIO pin.

Parameters **gpio_num** –GPIO number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **gpio_set_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set GPIO pad drive capability.

Parameters

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **gpio_get_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* *strength)

Get GPIO pad drive capability.

Parameters

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **gpio_hold_en** (*gpio_num_t* gpio_num)

Enable gpio pad hold function.

When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified (including input enable, output enable,

output value, function, and drive strength values). It can be used to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: input read value can still reflect the changes of the input signal.

The state of the digital gpio cannot be held during Deep-sleep, and it will resume to hold at its default pin state when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Parameters `gpio_num` –GPIO number, only support output-capable GPIOs

Returns

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

esp_err_t `gpio_hold_dis` (*gpio_num_t* gpio_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

Parameters `gpio_num` –GPIO number, only support output-capable GPIOs

Returns

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

void `gpio_deep_sleep_hold_en` (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void `gpio_deep_sleep_hold_dis` (void)

Disable all digital gpio pads hold function during Deep-sleep.

void `gpio_iomux_in` (uint32_t gpio_num, uint32_t signal_idx)

Set pad input to a peripheral signal through the IOMUX.

Parameters

- `gpio_num` –GPIO number of the pad.
- `signal_idx` –Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void `gpio_iomux_out` (uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- `gpio_num` –gpio_num GPIO number of the pad.
- `func` –The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- `oen_inv` –True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_force_hold_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

Warning: This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

esp_err_t **gpio_force_unhold_all** (void)

Force unhold all digital and rtc gpio pads.

esp_err_t **gpio_sleep_sel_en** (*gpio_num_t* gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters `gpio_num` –GPIO number of the pad.

Returns

- ESP_OK Success

esp_err_t **gpio_sleep_sel_dis** (*gpio_num_t* gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters `gpio_num` –GPIO number of the pad.

Returns

- ESP_OK Success

esp_err_t **gpio_sleep_set_direction** (*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

Parameters

- `gpio_num` –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` –GPIO direction

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_sleep_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters

- `gpio_num` –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` –GPIO pull up/down mode.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_deep_sleep_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO deep-sleep wake-up function.

Note: Called by the SDK. User shouldn't call this directly in the APP.

Parameters

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_deep_sleep_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO deep-sleep wake-up function.

Parameters **gpio_num** –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Macros

GPIO_PIN_COUNT

GPIO_IS_VALID_GPIO (gpio_num)

Check whether it is a valid GPIO number.

GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)

Check whether it can be a valid GPIO number of output mode.

GPIO_IS_VALID_DIGITAL_IO_PAD (gpio_num)

Check whether it can be a valid digital I/O pad.

GPIO_IS_DEEP_SLEEP_WAKEUP_VALID_GPIO (gpio_num)

enumerator `GPIO_DRIVE_CAP_3`

Pad drive capability: strongest

enumerator `GPIO_DRIVE_CAP_MAX`

2.3.4 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’ s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’ s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’ s impossible to control GPIOA.

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
 - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
 - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

Note: `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that input to bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that output from bundle	<code>dedic_gpio_bundle_read_in()</code>

Note: The functions above just wrap the customized instructions defined for ESP32-C3, for the details of those instructions, please refer to [ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix \(GPIO, IO_MUX\)](#) [PDF].

Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:

CPU Arch	Set bits of GPIO	Clear bits of GPIO	Remarks
Xtensa	set_bit_gpio_out imm[7:0]	clr_bit_gpio_out imm[7:0]	immediate value width depends on the number of dedicated GPIO channels
RISC-V	csrrsi rd, csr, imm[4:0]	csrrci rd, csr, imm[4:0]	can only control the lowest 4 GPIO channels

For details of supported dedicated GPIO instructions, please refer to *ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF]. The supported dedicated CPU instructions are also wrapped inside *soc/cpu_ll.h* as helper inline functions.

Note: Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

Application Example

Matrix keyboard example based on dedicated GPIO: [peripherals/gpio/matrix_keyboard](#).

API Reference

Header File

- [components/driver/include/driver/dedic_gpio.h](#)

Functions

esp_err_t **dedic_gpio_get_out_mask** (*dedic_gpio_bundle_handle_t* bundle, uint32_t *mask)

Get allocated channel mask.

Note: Each bundle should have at least one mask (in or/and out), based on bundle configuration.

Note: With the returned mask, user can directly invoke LL function like “cpu_ll_write_dedic_gpio_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** –[out] Returned mask value for on specific direction (in or out)

Returns

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

esp_err_t **dedic_gpio_get_in_mask** (*dedic_gpio_bundle_handle_t* bundle, uint32_t *mask)

esp_err_t **dedic_gpio_new_bundle** (const *dedic_gpio_bundle_config_t* *config, *dedic_gpio_bundle_handle_t* *ret_bundle)

Create GPIO bundle and return the handle.

Note: One has to enable at least input or output mode in “config” parameter.

Parameters

- **config** –[in] Configuration of GPIO bundle
- **ret_bundle** –[out] Returned handle of the new created GPIO bundle

Returns

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

esp_err_t **dedic_gpio_del_bundle** (*dedic_gpio_bundle_handle_t* bundle)

Destory GPIO bundle.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

Returns

- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

void **dedic_gpio_bundle_write** (*dedic_gpio_bundle_handle_t* bundle, uint32_t mask, uint32_t value)

Write value to GPIO bundle.

Note: The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** –[in] Mask of the GPIOs to be written in the given bundle
- **value** –[in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_out** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that output from the given GPIO bundle.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

Returns Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_in** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that input to the given GPIO bundle.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

Returns Value that input to the GPIO bundle, low bit represents low member in the bundle

Structures

struct **dedic_gpio_bundle_config_t**

Type of Dedicated GPIO bundle configuration.

Public Members

const int ***gpio_array**

Array of GPIO numbers, `gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num`

size_t **array_size**

Number of GPIOs in `gpio_array`

unsigned int **in_en**

Enable input

unsigned int **in_invert**

Invert input signal

unsigned int **out_en**

Enable output

unsigned int **out_invert**

Invert output signal

struct *dedic_gpio_bundle_config_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct *dedic_gpio_bundle_t* ***dedic_gpio_bundle_handle_t**

Type of Dedicated GPIO bundle.

2.3.5 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.

- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on the ESP32-C3

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

eFuse Keys for HMAC Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.

HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit by `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)`. This will permanently disable JTAG unless the correct key value is provided by software.

JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp32c3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
    ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
    key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32c3/esp_hmac.h`

Functions

`esp_err_t esp_hmac_calculate` (*hmac_key_id_t* key_id, const void *message, size_t message_len, uint8_t *hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message_len*. SHA256 is used for the calculation (fixed on ESP32S2).

Note: Uses the HMAC peripheral in “upstream” mode.

Parameters

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message_len** –message length return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** –[out] the hmac result; the buffer behind the provided pointer must be 32 bytes long

Returns

- ESP_OK, if the calculation was successful,
- ESP_FAIL, if the hmac calculation failed

`esp_err_t esp_hmac_jtag_enable` (*hmac_key_id_t* key_id, const uint8_t *token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

Parameters

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

Returns

- ESP_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

`esp_err_t esp_hmac_jtag_disable` (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable()` API.

Returns

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

enum **hmac_key_id_t**

The possible efuse keys for the HMAC peripheral

Values:

enumerator **HMAC_KEY0**

enumerator **HMAC_KEY1**

enumerator **HMAC_KEY2**

enumerator **HMAC_KEY3**

enumerator **HMAC_KEY4**

enumerator **HMAC_KEY5**

enumerator **HMAC_KEY_MAX**

2.3.6 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,

2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the python script `configure_ds.py`. More details about the `configure_ds.py` script can be found at [mqtt example README](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. *Non Volatile Storage* can be used to store the encrypted private key parameters in flash. The script `configure_ds.py` creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-C3. The application then needs to read the DS data from NVS, which can be done with the function `esp_read_ds_data_from_nvs` in file `ssl_mutual_auth/main/app_main.c`

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through *ESP-MQTT*) to connect to broker `test.mosquitto.org` using `ssl` transport with mutual authentication. The `ssl` part is internally performed with *ESP-TLS*. See [example README](#) for more details.

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32c3/esp_ds.h`

Functions

esp_err_t **esp_ds_sign** (const void *message, const *esp_ds_data_t* *data, *hmac_key_id_t* key_id, void *signature)

Sign the message with a hardware key from specific key slot.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

Note: This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

Parameters

- **message** –the message to be signed; its length is determined by `data->rsa_length`
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** –the destination of the signature, should be $(data->rsa_length + 1)*4$ bytes long

Returns

- ESP_OK if successful, the signature was written to the parameter `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTODS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTODS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

esp_err_t **esp_ds_start_sign** (const void *message, const *esp_ds_data_t* *data, *hmac_key_id_t* key_id, *esp_ds_context_t* **esp_ds_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

Note: This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

Parameters

- **message** –the message to be signed; its length is determined by `data->rsa_length`
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx** –the context object which is needed for finishing the signing process later

Returns

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTODS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTODS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp_ds_is_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

Note: Only valid if `esp_ds_start_sign()` was called before.

esp_err_t **esp_ds_finish_sign** (void *signature, *esp_ds_context_t* *esp_ds_ctx)

Finish the signing process.

Parameters

- **signature** –the destination of the signature, should be $(data->rsa_length + 1)*4$ bytes long
- **esp_ds_ctx** –the context object retrieved by `esp_ds_start_sign()`

Returns

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

esp_err_t **esp_ds_encrypt_params** (*esp_ds_data_t* *data, const void *iv, const *esp_ds_p_data_t* *p_data, const void *key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

Parameters

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- **iv** –Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Returns

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `p_data->rsa_length` is too long

Structures

struct **esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

***esp_digital_signature_length_t* rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 3072).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

Note: In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

uint32_t **iv**[128 / 32]

IV value used to encrypt 'c'

uint8_t **c**[(((3072 * 3 + 256 + 32 + 32 + 64) / 8))]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp_ds_p_data_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

Public Members

uint32_t **Y**[3072 / 32]

RSA exponent.

uint32_t **M**[3072 / 32]

RSA modulus.

uint32_t **Rb**[3072 / 32]

RSA r inverse operand.

uint32_t **M_prime**

RSA M prime operand.

uint32_t **length**

RSA length in words (32 bit)

Macros

ESP32C3_ERR_HW_CRYPT0_DS_HMAC_FAIL

HMAC peripheral problem

ESP32C3_ERR_HW_CRYPT0_DS_INVALID_KEY

given HMAC key isn't correct, HMAC peripheral problem

ESP32C3_ERR_HW_CRYPTODS_INVALID_DIGEST

message digest check failed, result is invalid

ESP32C3_ERR_HW_CRYPTODS_INVALID_PADDING

padding check failed, but result is produced anyway and can be read

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN

ESP_DS_SIGNATURE_MAX_BIT_LEN

ESP_DS_SIGNATURE_MD_BIT_LEN

ESP_DS_SIGNATURE_M_PRIME_BIT_LEN

ESP_DS_SIGNATURE_L_BIT_LEN

ESP_DS_SIGNATURE_PADDING_BIT_LEN

ESP_DS_C_LEN

Type Definitions

```
typedef struct esp_ds_context esp_ds_context_t
```

```
typedef struct esp_digital_signature_data esp_ds_data_t
```

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

```
enum esp_digital_signature_length_t
```

Values:

enumerator **ESP_DS_RSA_1024**

enumerator **ESP_DS_RSA_2048**

enumerator **ESP_DS_RSA_3072**

2.3.7 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C3 has only one I2C controller (also referred to as port) which is responsible for handling communications on I2C bus. The I2C controller can operate as master or slave.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
 - a) *Communication as Master* - handle communications (master)
 - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver*- release resources used by the I2C driver when communication ends

Configuration To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - slave or master from `i2c_mode_t`
- Configure **communication pins**
 - Assign GPIO pins for SDA and SCL signals
 - Set whether to enable ESP32-C3's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
 - Whether to enable **10 bit address mode**
 - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↪project
```

(continues on next page)

(continued from previous page)

```

        .scl_pullup_en = GPIO_PULLUP_ENABLE,
        .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your_
↪project
        // .clk_flags = 0, //!< Optional, you can use I2C_SCLK_SRC_FLAG_*_
↪flags to choose i2c source clock here. */
};

```

Configuration example (slave):

```

int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO, // select GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO, // select GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR, // address of your project
};

```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

Source Clock Configuration **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

Note: A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

Table 1: Characteristics of ESP32-C3 clock sources

Clock name	MAX freq for SCL	Clock capabilities
XTAL	2 MHz	/
RTC	1 MHz	<code>I2C_SCLK_SRC_FLAG_AWARE_DFS</code> , <code>I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</code>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock's baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C3, reading technical reference manual before using it.

Note: The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

Note: The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

Install Driver After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

Communication as Master After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

ESP32-C3's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

Master Write The example below shows how to build a command link for an I2C master to send n bytes to a slave.

Fig. 5: I2C command link - master write example

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.
Then, populate it with the series of data to be sent to the slave:
 - a) **Start bit** - `i2c_master_start()`
 - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
 - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
 - d) **Stop bit** - `i2c_master_stop()`
 Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

Master Read The example below shows how to build a command link for an I2C master to read n bytes from a slave.

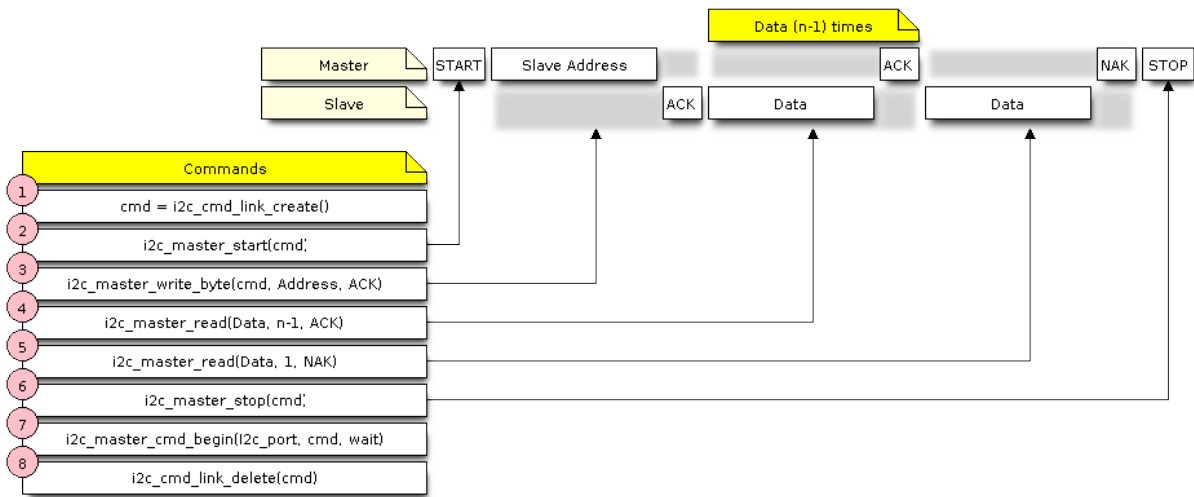

Fig. 6: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

Indicating Write or Read After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave's address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

Communication as Slave After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
- `i2c_slave_write_buffer()`
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

Interrupt Handling During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to *ESP32-C3 Technical Reference Manual > I2C Controller (I2C) > Interrupts* [PDF] for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

Customized Configuration As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

Table 2: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of start signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of stop signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

Note: ESP32-C3's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see [TI Application Note](#)

Error Handling The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file [driver/i2c.c](#) and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

Delete Driver When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C master and slave example: [peripherals/i2c](#).

API Reference

Header File

- [components/driver/include/driver/i2c.h](#)

Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

Note: In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

Parameters

- **i2c_num** – I2C port number
- **mode** – I2C mode (either master or slave)
- **slv_rx_buf_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

esp_err_t **i2c_driver_delete** (*i2c_port_t* i2c_num)

Delete I2C driver.

Note: This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

Parameters **i2c_num** –I2C port to delete

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_param_config** (*i2c_port_t* i2c_num, const *i2c_config_t* *i2c_conf)

Configure an I2C bus with the given configuration.

Parameters

- **i2c_num** –I2C port to configure
- **i2c_conf** –Pointer to the I2C configuration

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_reset_tx_fifo** (*i2c_port_t* i2c_num)

reset I2C tx hardware fifo

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_reset_rx_fifo** (*i2c_port_t* i2c_num)

reset I2C rx fifo

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_isr_register** (*i2c_port_t* i2c_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *intr_handle_t* *handle)

Register an I2C ISR handler.

Parameters

- **i2c_num** –I2C port number to attach handler to
- **fn** –ISR handler function
- **arg** –Parameter for the ISR handler
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** –Handle return from esp_intr_alloc.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_isr_free** (*intr_handle_t* handle)

Delete and free I2C ISR handle.

Parameters **handle** –Handle of isr to delete.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_pin** (*i2c_port_t* i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, *i2c_mode_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

Parameters

- **i2c_num** –I2C port number
- **sda_io_num** –GPIO number for I2C SDA signal
- **scl_io_num** –GPIO number for I2C SCL signal
- **sda_pullup_en** –Enable the internal pullup for SDA pin
- **scl_pullup_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_master_write_to_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_read_from_device** (*i2c_port_t* i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_write_read_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device’s 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

i2c_cmd_handle_t **i2c_cmd_link_create_static** (uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

Note: It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

Parameters

- **buffer** –Buffer to use for commands allocations
- **size** –Size in bytes of the buffer

Returns Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

i2c_cmd_handle_t **i2c_cmd_link_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Returns Handle to the I2C command link

void **i2c_cmd_link_delete_static** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

Parameters **cmd_handle** –I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c_cmd_link_delete** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list.

Parameters **cmd_handle** –I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t **i2c_master_start** (*i2c_cmd_handle_t* cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Parameters **cmd_handle** –I2C commands list

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small

- `ESP_FAIL` No more memory left on the heap

esp_err_t `i2c_master_write_byte` (*i2c_cmd_handle_t* cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Byte to send on the port
- **ack_en** –Enable ACK signal

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

esp_err_t `i2c_master_write` (*i2c_cmd_handle_t* cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data_len** –Length, in bytes, of the data buffer
- **ack_en** –Enable ACK signal

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

esp_err_t `i2c_master_read_byte` (*i2c_cmd_handle_t* cmd_handle, uint8_t *data, *i2c_ack_type_t* ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

esp_err_t `i2c_master_read` (*i2c_cmd_handle_t* cmd_handle, uint8_t *data, size_t data_len, *i2c_ack_type_t* ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data_len** –Size, in bytes, of the `data` buffer
- **ack** –ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_stop** (*i2c_cmd_handle_t* cmd_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Parameters `cmd_handle` –I2C commands list

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_cmd_begin** (*i2c_port_t* i2c_num, *i2c_cmd_handle_t* cmd_handle, TickType_t ticks_to_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

Parameters

- `i2c_num` –I2C port number
- `cmd_handle` –I2C commands list
- `ticks_to_wait` –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

int **i2c_slave_write_buffer** (*i2c_port_t* i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

Note: This function shall only be called in I2C slave mode.

Parameters

- `i2c_num` –I2C port number
- `data` –Bytes to write into internal buffer
- `size` –Size, in bytes, of `data` buffer
- `ticks_to_wait` –Maximum ticks to wait.

Returns

- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

int **i2c_slave_read_buffer** (*i2c_port_t* i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the `data` user buffer.

Note: This function shall only be called in I2C slave mode.

Parameters

- **i2c_num** –I2C port number
- **data** –Buffer to fill with ringbuffer' s bytes
- **max_size** –Maximum bytes to read
- **ticks_to_wait** –Maximum waiting ticks

Returns

- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

esp_err_t **i2c_set_period** (*i2c_port_t* i2c_num, int high_period, int low_period)

Set I2C master clock period.

Parameters

- **i2c_num** –I2C port number
- **high_period** –Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** –Clock cycle number during SCL is low level, low_period is a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_period** (*i2c_port_t* i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

Parameters

- **i2c_num** –I2C port number
- **high_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_enable** (*i2c_port_t* i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note: Enable filter will slow down the SCL clock.

Parameters

- **i2c_num** –I2C port number to filter
- **cyc_num** –the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_disable** (*i2c_port_t* i2c_num)

Disable filter on I2C bus.

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_start_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master start signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_start_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master start signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time
- **hold_time** –pointer to get hold time

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_stop_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master stop signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_stop_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time.
- **hold_time** –pointer to get hold time.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_timing** (*i2c_port_t* i2c_num, int sample_time, int hold_time)

set I2C data signal timing

Parameters

- **i2c_num** –I2C port number
- **sample_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- **hold_time** –clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_timing** (*i2c_port_t* i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

Parameters

- **i2c_num** –I2C port number
- **sample_time** –pointer to get sample time
- **hold_time** –pointer to get hold time

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_timeout** (*i2c_port_t* i2c_num, int timeout)

set I2C timeout value

Parameters

- **i2c_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_timeout** (*i2c_port_t* i2c_num, int *timeout)

get I2C timeout value

Parameters

- **i2c_num** –I2C port number
- **timeout** –pointer to get timeout value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* tx_trans_mode, *i2c_trans_mode_t* rx_trans_mode)

set I2C data transfer mode

Parameters

- **i2c_num** –I2C port number
- **tx_trans_mode** –I2C sending data mode
- **rx_trans_mode** –I2C receiving data mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* *tx_trans_mode, *i2c_trans_mode_t* *rx_trans_mode)

get I2C data transfer mode

Parameters

- **i2c_num** –I2C port number
- **tx_trans_mode** –pointer to get I2C sending data mode
- **rx_trans_mode** –pointer to get I2C receiving data mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **i2c_config_t**

I2C initialization parameters.

Public Members

i2c_mode_t **mode**

I2C mode

int **sda_io_num**

GPIO number for I2C sda signal

int **scl_io_num**

GPIO number for I2C scl signal

bool **sda_pullup_en**

Internal GPIO pull mode for I2C sda signal

bool **scl_pullup_en**

Internal GPIO pull mode for I2C scl signal

uint32_t **clk_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c_config_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8_t **addr_10bit_en**

I2C 10bit address mode enable for slave mode

uint16_t **slave_addr**

I2C address for slave mode

uint32_t **maximum_speed**

I2C expected clock speed from SCL.

struct *i2c_config_t*::[anonymous]::[anonymous] **slave**

I2C slave config

uint32_t **clk_flags**

Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros

I2C_APB_CLK_FREQ

I2C source clock is APB clock, 80MHz

I2C_NUM_MAX

I2C port max

I2C_NUM_0

I2C port 0

I2C_SCLK_SRC_FLAG_FOR_NOMAL

Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_DFS

For REF tick clock, it won't change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP

For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

Type Definitions

```
typedef void *i2c_cmd_handle_t
    I2C command handle
```

Header File

- [components/hal/include/hal/i2c_types.h](#)

Macros**I2C_CLK_FREQ_MAX**

Use the highest speed that is available for the clock source picked by `clk_flags`.

Type Definitions

```
typedef int i2c_port_t
    I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```

Enumerations

```
enum i2c_mode_t
```

Values:

```
enumerator I2C_MODE_SLAVE
    I2C slave mode
```

```
enumerator I2C_MODE_MASTER
    I2C master mode
```

enumerator **I2C_MODE_MAX**

enum **i2c_rw_t**

Values:

enumerator **I2C_MASTER_WRITE**

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

enum **i2c_sclk_t**

I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

Values:

enumerator **I2C_SCLK_DEFAULT**

I2C source clock not selected

enumerator **I2C_SCLK_XTAL**

I2C source clock from XTAL, 40M

enumerator **I2C_SCLK_RTC**

I2C source clock from 8M RTC, 8M

enumerator **I2C_SCLK_MAX**

2.3.8 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-C3 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

Functional Overview

Installing the Driver Install the I2S driver by calling the function `:cpp:func`i2s_driver_install`` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `:cpp:func`i2s_driver_install`` returns `ESP_OK`, it means I2S has started.

Configuration example:

```

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);

```

Setting Communication Pins Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `cpp:func`i2s_set_pin`` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

Note: MCK only takes effect in `I2S_MODE_MASTER` mode.

```

static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);

```

Running I2S Communication To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```

i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_
↪write, 100);

```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```

i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read,
↪100);

```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func`i2s_driver_install`` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

Application Example

A code example for the I2S driver can be found in the directory [peripherals/i2s](#).

In addition, there is a short configuration examples for the I2S driver.

I2S configuration Example for general usage.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

I2S on ESP32-C3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculate automatically. Also you can set a particular total channel number for it, but it shouldn't be smaller than the largest channel you use.

If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_msk` is enabled, these inactive channels will be skipped.

```
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number
```

(continues on next page)

```

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_MULTIPLE,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

...
/* You can reset parameters by calling 'i2s_set_clk'
 *
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_
->ACTIVE_CH1); // set clock
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

```

Application Notes

How to Prevent Data Lost For the applications that need a high frequency sample rate, sometimes the massive throughput of receiving data may cause data lost. Users can receive data lost event by registering an event queue handler to the driver during installation:

```

QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);

```

You will receive `I2S_EVENT_RX_Q_OVF` event when there are data lost.

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happened, the interval should be the bigger the better, it can help to reduce the interrupt times, i.e., `dma_buf_len` should be as big as possible while the DMA buffer size won't exceed its maximum value 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_buf_len / sample_rate
dma_buffer_size = dma_buf_len * slot_num * data_bit_width / 8 <= 4092

```

2. Determine the `dma_buf_count`. The `dma_buf_count` is decided by the max time of `i2s_read` polling cycle, all the received data are supposed to be stored between two `i2s_read`. This cycle can be measured by a timer or an outputting gpio signal. The relationship is:

```
dma_buf_count > polling_cycle / interrupt_interval
```

- Determine the receiving buffer size. The receiving buffer that offered by user in `i2s_read` should be able to take all the data in all dma buffers, that means it should be bigger than the total size of all the dma buffers:

```
recv_buffer_size > dma_buf_count * dma_buffer_size
```

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10ms
```

Then the parameters `dma_buf_len`, `dma_buf_count` and `recv_buf_size` can be calculated according to the given known values:

```
dma_buf_len * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_buf_len <= 511
interrupt_interval = dma_buf_len / sample_rate = 511 / 144000 = 0.003549 s = 3.549ms
dma_buf_count > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818) = 3
recv_buffer_size > dma_buf_count * dma_buffer_size = 3 * 4092 = 12276 bytes
```

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive `I2S_EVENT_RX_Q_OVF` event when there are data lost.

API Reference

Header File

- `components/driver/include/driver/i2s.h`

Functions

`esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)`

Set I2S pin number.

Inside the pin configuration structure, set `I2S_PIN_NO_CHANGE` for any pin where the current configuration should not be changed.

Note: The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

Note: if `*pin` is set as `NULL`, this function will initialize both of the built-in DAC channels by default. if you don't want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

Parameters

- `i2s_num` – I2S port number

- **pin** –I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

esp_err_t **i2s_set_pdm_tx_up_sample** (*i2s_port_t* i2s_num, const *i2s_pdm_tx_upsample_cfg_t* *upsample_cfg)

Set TX PDM mode up-sample rate.

Note: If you have set PDM mode while calling ‘i2s_driver_install’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration

Parameters

- **i2s_num** –I2S port number
- **upsample_cfg** –Set I2S PDM up-sample rate configuration

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

esp_err_t **i2s_driver_install** (*i2s_port_t* i2s_num, const *i2s_config_t* *i2s_config, int queue_size, void *i2s_queue)

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters

- **i2s_num** –I2S port number
- **i2s_config** –I2S configurations - see *i2s_config_t* struct
- **queue_size** –I2S event queue size/depth.
- **i2s_queue** –I2S event queue handle, if set NULL, driver will not use an event queue.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

esp_err_t **i2s_driver_uninstall** (*i2s_port_t* i2s_num)

Uninstall I2S driver.

Parameters **i2s_num** –I2S port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

esp_err_t **i2s_write** (*i2s_port_t* i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)

Write data to I2S DMA transmit buffer.

Parameters

- **i2s_num** –I2S port number
- **src** –Source address to write from
- **size** –Size of data in bytes
- **bytes_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.

- **ticks_to_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_write_expand** (*i2s_port_t* i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see *i2s_config_t*).

Parameters

- **i2s_num** –I2S port number
- **src** –Source address to write from
- **size** –Size of data in bytes
- **src_bits** –Source audio bit
- **aim_bits** –Bit wanted, no more than 32, and must be greater than **src_bits**
- **bytes_written** –[out] Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks_to_wait** –TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_read** (*i2s_port_t* i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)

Read data from I2S DMA receive buffer.

Note: If the built-in ADC mode is enabled, we should call *i2s_adc_enable* and *i2s_adc_disable* around the whole reading process, to prevent the data getting corrupted.

Parameters

- **i2s_num** –I2S port number
- **dest** –Destination address to read into
- **size** –Size of data in bytes
- **bytes_read** –[out] Number of bytes read, if timeout, bytes read will be less than the size passed in.
- **ticks_to_wait** –RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_set_sample_rates** (*i2s_port_t* i2s_num, uint32_t rate)

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and *i2s_config_t* configuration parameters (number of channels, *bits_per_sample*).

```
bit_clock = rate * (number of channels) * bits_per_sample
```

Parameters

- **i2s_num** –I2S port number
- **rate** –I2S sample rate (ex: 8000, 44100…)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

esp_err_t **i2s_stop** (*i2s_port_t* i2s_num)

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

Parameters **i2s_num** –I2S port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_start** (*i2s_port_t* i2s_num)

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

Parameters **i2s_num** –I2S port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_zero_dma_buffer** (*i2s_port_t* i2s_num)

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Parameters **i2s_num** –I2S port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_pcm_config** (*i2s_port_t* i2s_num, const *i2s_pcm_cfg_t* *pcm_cfg)

Configure I2S a/u-law decompress or compress.

Note: This function should be called after i2s driver installed Only take effective when the i2s ‘communication_format’ is set to ‘I2S_COMM_FORMAT_STAND_PCM_SHORT’ or ‘I2S_COMM_FORMAT_STAND_PCM_LONG’

Parameters

- **i2s_num** –I2S port number
- **pcm_cfg** –including mode selection and a/u-law decompress or compress configuration paramater

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2s_set_clk** (*i2s_port_t* i2s_num, uint32_t rate, uint32_t bits_cfg, *i2s_channel_t* ch)

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

- a. stop i2s;
- b. calculate mclk, bck, bck_factor
- c. malloc dma buffer;
- d. start i2s

Parameters

- **i2s_num** –I2S port number
- **rate** –I2S sample rate (ex: 8000, 44100…)
- **bits_cfg** –I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’) high 16bits =0 means same as the bits per sample.
- **ch** –I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

float **i2s_get_clk** (*i2s_port_t* i2s_num)

get clock set on particular port number.

Parameters **i2s_num** –I2S port number

Returns

- actual clock set by i2s driver

Structures

struct **i2s_pcm_cfg_t**

I2S PCM configuration.

Public Members

i2s_pcm_compress_t **pcm_type**

I2S PCM a/u-law decompress or compress type

struct **i2s_pdm_tx_upsample_cfg_t**

I2S PDM up-sample rate configuration.

Note: TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate If the pdm receiver do not care the pdm serial clock, it' s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.

Public Members

int **sample_rate**

I2S PDM sample rate

int **fp**

I2S PDM TX upsampling paramater. Normally it should be set to 960

int **fs**

I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency $F_{pdm} = 128 * \text{sample_rate}$, when it is set to $\text{sample_rate} / 100$, F_{pdm} will be fixed to $128 * 48000$

struct **i2s_pin_config_t**

I2S pin number for `i2s_set_pin`.

Public Members

int **mck_io_num**

MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int **bck_io_num**

BCK in out pin

int **ws_io_num**

WS in out pin

int **data_out_num**

DATA out pin

int **data_in_num**

DATA in pin

struct **i2s_driver_config_t**

I2S driver configuration parameters.

Public Members

i2s_mode_t **mode**

I2S work mode

uint32_t **sample_rate**

I2S sample rate

i2s_bits_per_sample_t **bits_per_sample**

I2S sample bits in one channel

i2s_channel_fmt_t **channel_format**

I2S channel format.

i2s_comm_format_t **communication_format**

I2S communication format

int **intr_alloc_flags**

Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info

int dma_buf_count

The total number of DMA buffers to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, 'dma_desc_num' can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to 'i2s_read' and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

int dma_buf_len

Number of frames in a DMA buffer. A frame means the data of all channels in a WS cycle. The $\text{real_dma_buf_size} = \text{dma_buf_len} * \text{chan_num} * \text{bits_per_chan} / 8$. For example, if two channels in stereo mode (i.e., 'channel_format' is set to 'I2S_CHANNEL_FMT_RIGHT_LEFT') are active, and each channel transfers 32 bits (i.e., 'bits_per_sample' is set to 'I2S_BITS_PER_CHAN_32BIT'), then the total number of bytes of a frame is 'channel_format' * 'bits_per_sample' = 2 * 32 / 8 = 8 bytes. We assume that the current 'dma_buf_len' is 100, then the real length of the DMA buffer is 8 * 100 = 800 bytes. Note that the length of an internal real DMA buffer shouldn't be greater than 4092.

bool use_apll

I2S using APLL as main I2S clock, enable it to get accurate clock

bool tx_desc_auto_clear

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int fixed_mclk

I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won't take effect

***i2s_mclk_multiple_t* mclk_multiple**

The multiple of I2S master clock(MCLK) to sample rate

***i2s_bits_per_chan_t* bits_per_chan**

I2S total bits in one channel, only take effect when larger than 'bits_per_sample', default '0' means equal to 'bits_per_sample'

***i2s_channel_t* chan_mask**

I2S active channel bit mask, set value in `i2s_channel_t` to enable specific channel, the bit map of active channel can not exceed (0x1<<total_chan).

uint32_t total_chan

I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

bool left_align

Set to enable left alignment

bool big_edin

Set to enable big edin

bool bit_order_msb

Set to enable msb order

bool **skip_msk**

Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

struct **i2s_event_t**

Event structure used in I2S event queue.

Public Members

i2s_event_type_t **type**

I2S event type

size_t **size**

I2S data size for I2S_DATA event

Macros

I2S_PIN_NO_CHANGE

Use in *i2s_pin_config_t* for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG (rate)

Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

typedef *i2s_driver_config_t* **i2s_config_t**

typedef *intr_handle_t* **i2s_isr_handle_t**

Enumerations

enum **i2s_port_t**

I2S port number, the max port number is (I2S_NUM_MAX -1).

Values:

enumerator **I2S_NUM_0**

I2S port 0

enumerator **I2S_NUM_MAX**

I2S port max

enum **i2s_event_type_t**

I2S event queue types.

Values:

enumerator **I2S_EVENT_DMA_ERROR**

enumerator **I2S_EVENT_TX_DONE**

I2S DMA finish sent 1 buffer

enumerator **I2S_EVENT_RX_DONE**
I2S DMA finish received 1 buffer

enumerator **I2S_EVENT_TX_Q_OVF**
I2S DMA sent queue overflow

enumerator **I2S_EVENT_RX_Q_OVF**
I2S DMA receive queue overflow

enumerator **I2S_EVENT_MAX**
I2S event max index

Header File

- [components/hal/include/hal/i2s_types.h](#)

Enumerations

enum **i2s_bits_per_sample_t**

I2S bit width per sample.

Values:

enumerator **I2S_BITS_PER_SAMPLE_8BIT**
data bit-width: 8

enumerator **I2S_BITS_PER_SAMPLE_16BIT**
data bit-width: 16

enumerator **I2S_BITS_PER_SAMPLE_24BIT**
data bit-width: 24

enumerator **I2S_BITS_PER_SAMPLE_32BIT**
data bit-width: 32

enum **i2s_bits_per_chan_t**

I2S bit width per chan.

Values:

enumerator **I2S_BITS_PER_CHAN_DEFAULT**
channel bit-width equals to data bit-width

enumerator **I2S_BITS_PER_CHAN_8BIT**
channel bit-width: 8

enumerator **I2S_BITS_PER_CHAN_16BIT**
channel bit-width: 16

enumerator **I2S_BITS_PER_CHAN_24BIT**
channel bit-width: 24

enumerator **I2S_BITS_PER_CHAN_32BIT**

channel bit-width: 32

enum **i2s_channel_t**

I2S channel.

Values:

enumerator **I2S_CHANNEL_MONO**

I2S channel (mono), one channel activated. In this mode, you only need to send one channel data but the fifo will copy same data for the other unactivated channels automatically, then both channels will transmit same data.

enumerator **I2S_CHANNEL_STEREO**

I2S channel (stereo), two (or more) channels activated. In this mode, these channels will transmit different data.

enumerator **I2S_TDM_ACTIVE_CH0**

I2S channel 0 activated

enumerator **I2S_TDM_ACTIVE_CH1**

I2S channel 1 activated

enumerator **I2S_TDM_ACTIVE_CH2**

I2S channel 2 activated

enumerator **I2S_TDM_ACTIVE_CH3**

I2S channel 3 activated

enumerator **I2S_TDM_ACTIVE_CH4**

I2S channel 4 activated

enumerator **I2S_TDM_ACTIVE_CH5**

I2S channel 5 activated

enumerator **I2S_TDM_ACTIVE_CH6**

I2S channel 6 activated

enumerator **I2S_TDM_ACTIVE_CH7**

I2S channel 7 activated

enumerator **I2S_TDM_ACTIVE_CH8**

I2S channel 8 activated

enumerator **I2S_TDM_ACTIVE_CH9**

I2S channel 9 activated

enumerator **I2S_TDM_ACTIVE_CH10**

I2S channel 10 activated

enumerator **I2S_TDM_ACTIVE_CH11**

I2S channel 11 activated

enumerator **I2S_TDM_ACTIVE_CH12**

I2S channel 12 activated

enumerator **I2S_TDM_ACTIVE_CH13**

I2S channel 13 activated

enumerator **I2S_TDM_ACTIVE_CH14**

I2S channel 14 activated

enumerator **I2S_TDM_ACTIVE_CH15**

I2S channel 15 activated

enum **i2s_comm_format_t**

I2S communication standard format.

Values:

enumerator **I2S_COMM_FORMAT_STAND_I2S**

I2S communication I2S Philips standard, data launch at second BCK

enumerator **I2S_COMM_FORMAT_STAND_MSB**

I2S communication MSB alignment standard, data launch at first BCK

enumerator **I2S_COMM_FORMAT_STAND_PCM_SHORT**

PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

enumerator **I2S_COMM_FORMAT_STAND_PCM_LONG**

PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

enumerator **I2S_COMM_FORMAT_STAND_MAX**

standard max

enumerator **I2S_COMM_FORMAT_I2S**

I2S communication format I2S, correspond to **I2S_COMM_FORMAT_STAND_I2S**

enumerator **I2S_COMM_FORMAT_I2S_MSB**

I2S format MSB, (**I2S_COMM_FORMAT_I2S** || **I2S_COMM_FORMAT_I2S_MSB**) correspond to **I2S_COMM_FORMAT_STAND_I2S**

enumerator **I2S_COMM_FORMAT_I2S_LSB**

I2S format LSB, (**I2S_COMM_FORMAT_I2S** || **I2S_COMM_FORMAT_I2S_LSB**) correspond to **I2S_COMM_FORMAT_STAND_MSB**

enumerator **I2S_COMM_FORMAT_PCM**

I2S communication format PCM, correspond to **I2S_COMM_FORMAT_STAND_PCM_SHORT**

enumerator **I2S_COMM_FORMAT_PCM_SHORT**

PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

enumerator **I2S_COMM_FORMAT_PCM_LONG**

PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum **i2s_channel_fmt_t**

I2S channel format type.

Values:

enumerator **I2S_CHANNEL_FMT_RIGHT_LEFT**

Separated left and right channel

enumerator **I2S_CHANNEL_FMT_ALL_RIGHT**

Load right channel data in both two channels

enumerator **I2S_CHANNEL_FMT_ALL_LEFT**

Load left channel data in both two channels

enumerator **I2S_CHANNEL_FMT_ONLY_RIGHT**

Only load data in right channel (mono mode)

enumerator **I2S_CHANNEL_FMT_ONLY_LEFT**

Only load data in left channel (mono mode)

enumerator **I2S_CHANNEL_FMT_MULTIPLE**

More than two channels are used

enum **i2s_mode_t**

I2S Mode.

Values:

enumerator **I2S_MODE_MASTER**

Master mode

enumerator **I2S_MODE_SLAVE**

Slave mode

enumerator **I2S_MODE_TX**

TX mode

enumerator **I2S_MODE_RX**

RX mode

enumerator **I2S_MODE_PDM**

I2S PDM mode

enum **i2s_clock_src_t**

I2S source clock.

Values:

enumerator **I2S_CLK_D2CLK**

Clock from PLL_D2_CLK(160M)

enum **i2s_mclk_multiple_t**

The multiple of mclk to sample rate.

Values:

enumerator **I2S_MCLK_MULTIPLE_DEFAULT**

Default value. $mclk = sample_rate * 256$

enumerator **I2S_MCLK_MULTIPLE_128**

$mclk = sample_rate * 128$

enumerator **I2S_MCLK_MULTIPLE_256**

$mclk = sample_rate * 256$

enumerator **I2S_MCLK_MULTIPLE_384**

$mclk = sample_rate * 384$

enum **i2s_pcm_compress_t**

A/U-law decompress or compress configuration.

Values:

enumerator **I2S_PCM_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**

A-law decompress

enumerator **I2S_PCM_A_COMPRESS**

A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**

U-law decompress

enumerator **I2S_PCM_U_COMPRESS**

U-law compress

enum **i2s_pdm_sig_scale_t**

Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**

I2S TX PDM sigmadelta signal scaling: /2

enumerator `I2S_PDM_SIG_SCALING_MUL_1`

I2S TX PDM sigmadelta signal scaling: x1

enumerator `I2S_PDM_SIG_SCALING_MUL_2`

I2S TX PDM sigmadelta signal scaling: x2

enumerator `I2S_PDM_SIG_SCALING_MUL_4`

I2S TX PDM sigmadelta signal scaling: x4

2.3.9 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: [peripherals/lcd](#):

- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)

Enumerations

enum `lcd_clock_source_t`

LCD clock source.

Note: User should select the clock source based on the real requirement:

LCD clock source	Features	Power Management
LCD_CLK_SRC_PLL160M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_PLL240M	High resolution	ESP_PM_APB_FREQ_MAX lock
LCD_CLK_SRC_APLL	Configurable resolution	ESP_PM_NO_LIGHT_SLEEP lock
LCD_CLK_SRC_XTAL	Medium resolution	No PM lock

Values:

enumerator **LCD_CLK_SRC_PLL160M**
Select PLL160M as the source clock

enumerator **LCD_CLK_SRC_PLL240M**
Select PLL240M as the source clock

enumerator **LCD_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **LCD_CLK_SRC_XTAL**
Select XTAL as the source clock

enum **lcd_color_space_t**

LCD color space.

Values:

enumerator **LCD_COLOR_SPACE_RGB**
Color space: RGB

enumerator **LCD_COLOR_SPACE_YUV**
Color space: YUV

enum **lcd_color_range_t**

LCD color range.

Values:

enumerator **LCD_COLOR_RANGE_LIMIT**
Limited color range

enumerator **LCD_COLOR_RANGE_FULL**
Full color range

enum **lcd_yuv_sample_t**

YUV sampling method.

Values:

enumerator **LCD_YUV_SAMPLE_422**
YUV 4:2:2 sampling

enumerator **LCD_YUV_SAMPLE_420**

YUV 4:2:0 sampling

enumerator **LCD_YUV_SAMPLE_411**

YUV 4:1:1 sampling

enum **lcd_yuv_conv_std_t**

The standard used for conversion between RGB and YUV.

Values:

enumerator **LCD_YUV_CONV_STD_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD_YUV_CONV_STD_BT709**

YUV<->RGB conversion standard: BT.709

Header File

Type Definitions

typedef struct esp_lcd_panel_io_t ***esp_lcd_panel_io_handle_t**

Type of LCD panel IO handle

typedef struct esp_lcd_panel_t ***esp_lcd_panel_handle_t**

Type of LCD panel handle

Enumerations

enum **esp_lcd_color_space_t**

LCD color space type definition.

Values:

enumerator **ESP_LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **ESP_LCD_COLOR_SPACE_BGR**

Color space: BGR

enumerator **ESP_LCD_COLOR_SPACE_MONOCHROME**

Color space: monochrome

Functions

esp_err_t **esp_lcd_panel_io_rx_param** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **–[in]** The specific LCD command, set to -1 if no command needed
- **param** **–[out]** Buffer for the command data
- **param_size** **–[in]** Size of `param` buffer

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

esp_err_t **esp_lcd_panel_io_tx_param** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **–[in]** The specific LCD command, set to -1 if no command needed
- **param** **–[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** **–[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **esp_lcd_panel_io_tx_color** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

Note: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

Parameters

- **io** **–[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

- **lcd_cmd** –[in] The specific LCD command, set to -1 if no command needed
- **color** –[in] Buffer that holds the RGB color data
- **color_size** –[in] Size of `color` in memory, in bytes

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_del** (*esp_lcd_panel_io_handle_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

Parameters **io** –[in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_register_event_callbacks** (*esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_io_callbacks_t* *cbs, void *user_ctx)

Register LCD panel IO callbacks.

Parameters

- **io** –[in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** –[in] structure with all LCD panel IO callbacks
- **user_ctx** –[in] User private data, passed directly to callback's `user_ctx`

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_spi** (*esp_lcd_spi_bus_handle_t* bus, const *esp_lcd_panel_io_spi_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for SPI interface.

Parameters

- **bus** –[in] SPI bus handle
- **io_config** –[in] IO configuration, for SPI interface
- **ret_io** –[out] Returned IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_i2c** (*esp_lcd_i2c_bus_handle_t* bus, const *esp_lcd_panel_io_i2c_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for I2C interface.

Parameters

- **bus** –[in] I2C bus handle
- **io_config** –[in] IO configuration, for I2C interface
- **ret_io** –[out] Returned IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_io_event_data_t**

Type of LCD panel IO event data.

struct **esp_lcd_panel_io_callbacks_t**

Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

struct **esp_lcd_panel_io_spi_config_t**

Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**

GPIO used for CS line

int **dc_gpio_num**

GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int **spi_mode**

Traditional SPI mode (0~3)

unsigned int **pclk_hz**

Frequency of pixel clock

size_t **trans_queue_depth**

Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_as_cmd_phase**

D/C line value is encoded into SPI transaction command phase

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **lsb_first**

transmit LSB bit first

struct *esp_lcd_panel_io_spi_config_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**

Panel IO configuration structure, for I2C interface.

Public Members

uint32_t **dev_addr**

I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to *on_color_trans_done*'s *user_ctx*

size_t **control_phase_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**

Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**

If this flag is enabled, the control phase isn't used

struct *esp_lcd_panel_io_i2c_config_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

Type Definitions

typedef void ***esp_lcd_spi_bus_handle_t**

Type of LCD SPI bus handle

```
typedef void *esp_lcd_i2c_bus_handle_t
```

Type of LCD I2C bus handle

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,  
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Param panel_io [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

Param edata [in] Panel IO event data, fed by driver

Param user_ctx [in] User data, passed from `esp_lcd_panel_io_XXX_config_t`

Return Whether a high priority task has been waken up by this function

Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

Functions

```
esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
```

Reset LCD panel.

Note: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

Parameters panel **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
```

Initialize LCD panel.

Note: Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

Parameters panel **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)
```

Deinitialize the LCD panel.

Parameters panel **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end,  
int y_end, const void *color_data)
```

Draw bitmap on LCD panel.

Parameters

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** **-[in]** Start index on x-axis (x_start included)
- **y_start** **-[in]** Start index on y-axis (y_start included)
- **x_end** **-[in]** End index on x-axis (x_end not included)
- **y_end** **-[in]** End index on y-axis (y_end not included)
- **color_data** **-[in]** RGB color data that will be dumped to the specific window range

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_mirror** (*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

Note: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

Parameters

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** **-[in]** Whether the panel will be mirrored about the x axis
- **mirror_y** **-[in]** Whether the panel will be mirrored about the y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_swap_xy** (*esp_lcd_panel_handle_t* panel, bool swap_axes)

Swap/Exchange x and y axis.

Note: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

Parameters

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** **-[in]** Whether to swap the x and y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_set_gap** (*esp_lcd_panel_handle_t* panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Parameters

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** **-[in]** Extra gap on x axis, in pixels
- **y_gap** **-[in]** Extra gap on y axis, in pixels

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_invert_color** (*esp_lcd_panel_handle_t* panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

Parameters

- **panel** *–[in]* LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** *–[in]* Whether to invert the color data

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_disp_on_off** (*esp_lcd_panel_handle_t* panel, bool on_off)

Turn on or off the display.

Parameters

- **panel** *–[in]* LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** *–[in]* True to turns on display, False to turns off display

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_off** (*esp_lcd_panel_handle_t* panel, bool off)

Turn off the display.

Deprecated:

This function has similar functionality to `esp_lcd_panel_disp_on_off`.

Parameters

- **panel** *–[in]* LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** *–[in]* Whether to turn off the screen

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

Functions

esp_err_t **esp_lcd_new_panel_st7789** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model ST7789.

Parameters

- **io** *–[in]* LCD panel IO handle
- **panel_dev_config** *–[in]* general panel device configuration
- **ret_panel** *–[out]* Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_nt35510** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model NT35510.

Parameters

- **io** –[in] LCD panel IO handle
- **panel_dev_config** –[in] general panel device configuration
- **ret_panel** –[out] Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_ssd1306** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model SSD1306.

Parameters

- **io** –[in] LCD panel IO handle
- **panel_dev_config** –[in] general panel device configuration
- **ret_panel** –[out] Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_dev_config_t**

Configuration structure for panel device.

Public Members

int **reset_gpio_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

esp_lcd_color_space_t **color_space**

Set the color space used by the LCD panel

unsigned int **bits_per_pixel**

Color depth, in bpp

unsigned int **reset_active_high**

Setting this if the panel reset is high level active

struct *esp_lcd_panel_dev_config_t*::[anonymous] **flags**

LCD panel config flags

void ***vendor_config**

vendor specific configuration, optional, left as NULL if not used

2.3.10 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C3 only supports configuring channels in “low speed” mode.

1. *Timer Configuration* by specifying the PWM signal’s frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 7: Key Settings of LED PWM Controller’s API

Timer Configuration Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

Channel Configuration When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

Note: All the timers and channels in the ESP32-C3's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

Change PWM Duty Cycle Using Software To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to $(2 ** \text{duty_resolution})$. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~ 0.1%.

Warning: On ESP32-C3, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to $(2 ** \text{duty_resolution})$. Otherwise, the internal duty counter in the hardware will overflow and be messed up.

Change PWM Duty Cycle using Hardware The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked

by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

Change PWM Frequency The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

More Control Over PWM There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

Use Interrupts When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ($2^{13} = 8192$ discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the *ESP32-C3 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc_fade](#).

The LEDC basic example: [peripherals/ledc/ledc_basic](#).

API Reference

Header File

- [components/driver/include/driver/ledc.h](#)

Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Parameters `ledc_conf` –Pointer of LEDC channel configure struct

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Parameters `timer_conf` –Pointer of LEDC timer configure struct

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

`esp_err_t ledc_update_duty` (`ledc_mode_t` speed_mode, `ledc_channel_t` channel)

LEDC update channel parameters.

Note: Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **ledc_set_pin** (int gpio_num, *ledc_mode_t* speed_mode, *ledc_channel_t* ledc_channel)

Set LEDC output gpio.

Deprecated:

This function is redundant, please use `ledc_channel_config` to set gpio pins.

Parameters

- **gpio_num** –The LEDC output gpio
- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **idle_level** –Set output idle level after LEDC stops.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from `ledc_timer_t`
- **freq_hz** –Set the LEDC frequency

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **ledc_get_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num)

LEDC get channel frequency (Hz)

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from `ledc_timer_t`

Returns

- 0 error
- Others Current LEDC frequency

esp_err_t **ledc_set_duty_with_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int `ledc_get_hpoint` (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t `ledc_set_duty` (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *uint32_t* duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_get_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

esp_err_t **ledc_set_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, *ledc_duty_direction_t* fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_direction** –Set the direction of the gradient
- **step_num** –Set the number of the gradient
- **duty_cycle_num** –Set how many LEDC tick each time the gradient lasts
- **duty_scale** –Set gradient change amplitude

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *ledc_isr_handle_t* *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Parameters

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source

esp_err_t **ledc_timer_set** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel, uint32_t clock_divider, uint32_t duty_resolution, *ledc_clk_src_t* clk_src)

Configure LEDC settings.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** –Resolution of duty setting in number of bits. The range is [1, SOC_LEDC_TIMER_BIT_WIDTH]
- **clk_src** –Select LEDC source clock.

Returns

- (-1) Parameter error
- Other Current LEDC duty

esp_err_t **ledc_timer_rst** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Reset LEDC timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_pause** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_resume** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_bind_channel_timer** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **timer_sel** –LEDC timer index (0-3), select from *ledc_timer_t*

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_set_fade_with_step** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every `cycle_num` cycles

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t `ledc_set_fade_with_time` (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_fade_func_install** (int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

Parameters *intr_alloc_flags* –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

void **ledc_fade_func_uninstall** (void)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

Note: Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade_mode** –Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized or fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

esp_err_t **ledc_set_duty_and_update** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once, before calling this function.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).
- **fade_mode** –choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

Note: Call `ledc_fade_func_install()` once before calling this function.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles
- **fade_mode** –choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **cbs** –Group of LEDC callback functions
- **user_arg** –user registered data for the callback function

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

Structures

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for *ledc_channel_config* function.

Public Members

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - 7)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - 3)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2**duty_resolution)-1]

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc_channel_config_t*::[anonymous] **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC Timer timer for ledc_timer_config function.

Public Members

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_timer_bit_t **duty_resolution**

LEDC channel duty resolution

ledc_timer_bit_t **bit_num**

Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

ledc_timer_t **timer_num**

The timer source of channel (0 - 3)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

ledc_clk_cfg_t **clk_cfg**

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

struct **ledc_cb_param_t**

LEDC callback parameter.

Public Members

ledc_cb_event_t **event**

Event name

uint32_t **speed_mode**

Speed mode of the LEDC channel group

uint32_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

struct **ledc_cbs_t**

Group of supported LEDC callbacks.

Note: The callbacks are all running under ISR environment

Public Members

ledc_cb_t **fade_cb**

LEDC fade_end callback function

Macros

LEDC_APB_CLK_HZ

LEDC_REF_CLK_HZ

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef *intr_handle_t* **ledc_isr_handle_t**

typedef bool (***ledc_cb_t**)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter

Param user_arg User registered data

Return Whether a high priority task has been waken up by this function

Enumerations

enum **ledc_cb_event_t**

LEDC callback event type.

Values:

enumerator **LEDC_FADE_END_EVT**

LEDC fade end event

Header File

- `components/hal/include/hal/ledc_types.h`

Enumerations

enum **ledc_mode_t**

Values:

enumerator **LEDC_LOW_SPEED_MODE**

LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**

LEDC speed limit

enum **ledc_intr_type_t**

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

Values:

enumerator **LEDC_SLOW_CLK_RTC8M**

LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC_SLOW_CLK_XTAL**

LEDC low speed timer clock source XTAL clock

enum **ledc_clk_cfg_t**

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

enumerator **LEDC_AUTO_CLK**

The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**

LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**

LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC_USE_XTAL_CLK**

LEDC timer select XTAL clock as source clock

enum **ledc_clk_src_t**

Values:

enumerator **LEDC_APB_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**

Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**

LEDC channel 1

enumerator **LEDC_CHANNEL_2**

LEDC channel 2

enumerator **LEDC_CHANNEL_3**

LEDC channel 3

enumerator **LEDC_CHANNEL_4**

LEDC channel 4

enumerator **LEDC_CHANNEL_5**

LEDC channel 5

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.3.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT's transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

Fig. 8: RMT Transmitter Overview

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. *Configure Driver*
2. *Transmit Data or Receive Data*
3. *Change Operation Parameters*
4. *Use Interrupts*

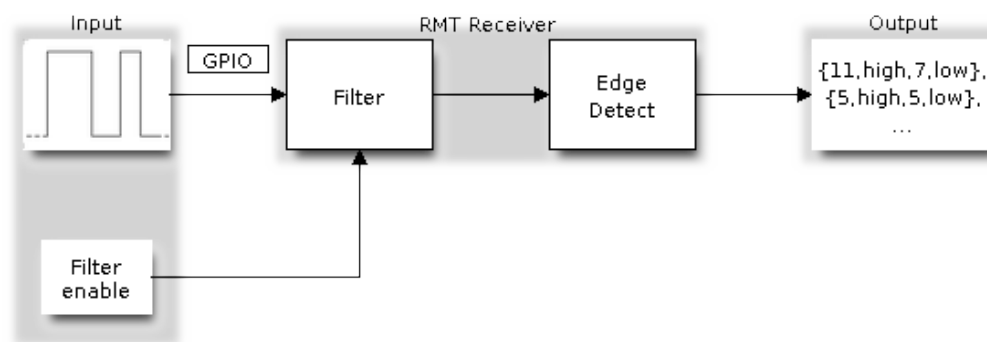

Fig. 9: RMT Receiver Overview

The RMT has four channels numbered from zero to three. The first half (i.e. Channel 0 ~ 1) channels can only be configured for transmitting, and the other half (i.e. Channel 2 ~ 3) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT **operation mode** - whether this channel is used to transmit or receive data, selected by setting a **rmt_mode** members to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting **gpio_num**.
- How many **memory blocks** will be used by the channel, set with **mem_block_num**.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
 - When **RMT_CHANNEL_FLAGS_AWARE_DFS** is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See [power_management](#) for more information.
 - When **RMT_CHANNEL_FLAGS_INVERT_SIG** is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk_div** to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT_CHANNEL_FLAGS_AWARE_DFS** is set in **flags**, RMT source clock is changed to REF_TICK or XTAL.

Note: The period of a square wave after the clock divider is called a ‘tick’ . The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’ .

There are also couple of specific parameters that should be set up depending if selected channel is configured in [Transmit Mode](#) or [Receive Mode](#):

Transmit Mode When configuring channel in transmit mode, set **tx_config** and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - **loop_en**
- Enable the RMT carrier signal - **carrier_en**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT output, when the carrier is applied - **carrier_level**
- Enable the RMT output if idle - **idle_output_en**
- Set the signal level on the RMT output if idle - **idle_level**
- Specify maximum number of transmissions in a loop - **loop_count**

Receive Mode In receive mode, set **rx_config** and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - **filter_en**
- A threshold of the filter, set in the number of ticks - **filter_ticks_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle_threshold**. The receiver will ignore pulses longer than this setting.
- Enable the RMT carrier demodulation - **carrier_rm**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT input, where the carrier is modulated to - **carrier_level**

Finalize Configuration Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0 , then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in [Use Interrupts](#).

Now, depending on how the channel is configured, we are ready to either [Transmit Data](#) or [Receive Data](#). This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

For a simple example how to define a block of items see [peripherals/rmt/morse_code](#).

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 192 x 32-bits of internal RAM shared between all four channels.

Fig. 10: Structure of RMT items (L - signal level)

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what's inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`

- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn't support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP`. - `rmt_enable_tx_loop_autostop()`

Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT's memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32c3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can de-register it by calling a function `rmt_isr_deregister()`.

Warning: `rmt_isr_register()` is provided as a public API by mistake. It's not recommended to use it directly. Even if you have registered a customized ISR handler with that, you still don't have the context of the RMT driver object. The driver has registered a dedicated ISR handler called `rmt_driver_isr_default` within `rmt_driver_install()`.

If you want to get a notification at some specific event (for example, "transaction done"), you can register callback functions like `rmt_register_tx_end_callback()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

- Using RMT to send morse code: [peripherals/rmt/morse_code](#).
- Using RMT to drive RGB LED strip: [peripherals/rmt/led_strip](#).
- NEC remote control TX and RX example: [peripherals/rmt/ir_protocols](#).
- Musical buzzer example: [peripherals/rmt/musical_buzzer](#).

API Reference

Header File

- `components/driver/include/driver/rmt.h`

Functions

esp_err_t `rmt_set_clk_div`(*rmt_channel_t* channel, uint8_t div_cnt)

Set RMT clock divider, channel clock is divided from source clock.

Parameters

- **channel** –RMT channel
- **div_cnt** –RMT counter clock divider

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_get_clk_div`(*rmt_channel_t* channel, uint8_t *div_cnt)

Get RMT clock divider, channel clock is divided from source clock.

Parameters

- **channel** –RMT channel
- **div_cnt** –pointer to accept RMT counter divider

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_set_rx_idle_thresh`(*rmt_channel_t* channel, uint16_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thres` channel clock cycles, the receive process is finished.

Parameters

- **channel** –RMT channel
- **thresh** –RMT RX idle threshold

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_get_rx_idle_thresh`(*rmt_channel_t* channel, uint16_t *thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than `idle_thres` channel clock cycles, the receive process is finished.

Parameters

- **channel** –RMT channel
- **thresh** –pointer to accept RMT RX idle threshold value

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_set_mem_block_num`(*rmt_channel_t* channel, uint8_t rmt_mem_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel `n`. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel `n` is `start_addr_CHn` to `end_addr_CHn`, which are defined by: Memory block start address is `RMT_CHANNEL_MEM(n)` (in `soc/rmt_reg.h`), that is, `start_addr_chn = RMT base`

address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

Note: If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Parameters

- **channel** –RMT channel
- **rmt_mem_num** –RMT RX memory block number, one block has 64 * 32 bits.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_mem_block_num** (*rmt_channel_t* channel, uint8_t *rmt_mem_num)

Get RMT memory block number.

Parameters

- **channel** –RMT channel
- **rmt_mem_num** –Pointer to accept RMT RX memory block number

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_carrier** (*rmt_channel_t* channel, bool carrier_en, uint16_t high_level, uint16_t low_level, *rmt_carrier_level_t* carrier_level)

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

Parameters

- **channel** –RMT channel
- **carrier_en** –Whether to enable output carrier.
- **high_level** –High level duration of carrier
- **low_level** –Low level duration of carrier.
- **carrier_level** –Configure the way carrier wave is modulated for channel.
 - 1' b1:transmit on low output level
 - 1' b0:transmit on high output level

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_mem_pd** (*rmt_channel_t* channel, bool pd_en)

Set RMT memory in low power mode.

Reduce power consumed by memory. 1:memory is in low power state.

Parameters

- **channel** –RMT channel
- **pd_en** –RMT memory low power enable.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_mem_pd** (*rmt_channel_t* channel, bool *pd_en)

Get RMT memory low power mode.

Parameters

- **channel** –RMT channel

- **pd_en** –Pointer to accept RMT memory low power mode.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_start** (*rmt_channel_t* channel, bool tx_idx_rst)

Set RMT start sending data from memory.

Parameters

- **channel** –RMT channel
- **tx_idx_rst** –Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_stop** (*rmt_channel_t* channel)

Set RMT stop sending.

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_start** (*rmt_channel_t* channel, bool rx_idx_rst)

Set RMT start receiving data.

Parameters

- **channel** –RMT channel
- **rx_idx_rst** –Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_stop** (*rmt_channel_t* channel)

Set RMT stop receiving data.

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_tx_memory_reset** (*rmt_channel_t* channel)

Reset RMT TX memory.

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_rx_memory_reset** (*rmt_channel_t* channel)

Reset RMT RX memory.

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_memory_owner** (*rmt_channel_t* channel, *rmt_mem_owner_t* owner)

Set RMT memory owner.

Note: Setting memroy is only valid for RX channel.

Parameters

- **channel** –RMT channel
- **owner** –To set when the transmitter or receiver can process the memory of channel.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_memory_owner** (*rmt_channel_t* channel, *rmt_mem_owner_t* *owner)

Get RMT memory owner.

Parameters

- **channel** –RMT channel
- **owner** –Pointer to get memory owner.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_loop_mode** (*rmt_channel_t* channel, bool loop_en)

Set RMT tx loop mode.

Parameters

- **channel** –RMT channel
- **loop_en** –Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_tx_loop_mode** (*rmt_channel_t* channel, bool *loop_en)

Get RMT tx loop mode.

Parameters

- **channel** –RMT channel
- **loop_en** –Pointer to accept RMT transmitter loop sending mode.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_rx_filter** (*rmt_channel_t* channel, bool rx_filter_en, uint8_t thresh)

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Parameters

- **channel** –RMT channel
- **rx_filter_en** –To enable RMT receiver filter.
- **thresh** –Threshold of pulse width for receiver.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_source_clk** (*rmt_channel_t* channel, *rmt_source_clk_t* base_clk)

Set RMT source clock.

RMT module has two clock sources:

- a. APB clock which is 80Mhz

- b. REF tick clock, which would be 1Mhz (not supported in this version).

Parameters

- **channel** –RMT channel
- **base_clk** –To choose source clock for RMT module.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_source_clk** (*rmt_channel_t* channel, *rmt_source_clk_t* *src_clk)

Get RMT source clock.

RMT module has two clock sources:

- APB clock which is 80Mhz
- REF tick clock, which would be 1Mhz (not supported in this version).

Parameters

- **channel** –RMT channel
- **src_clk** –Pointer to accept source clock for RMT module.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_idle_level** (*rmt_channel_t* channel, bool idle_out_en, *rmt_idle_level_t* level)

Set RMT idle output level for transmitter.

Parameters

- **channel** –RMT channel
- **idle_out_en** –To enable idle level output.
- **level** –To set the output signal' s level for channel in idle state.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_idle_level** (*rmt_channel_t* channel, bool *idle_out_en, *rmt_idle_level_t* *level)

Get RMT idle output level for transmitter.

Parameters

- **channel** –RMT channel
- **idle_out_en** –Pointer to accept value of enable idle.
- **level** –Pointer to accept value of output signal' s level in idle state for specified channel.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_get_status** (*rmt_channel_t* channel, uint32_t *status)

Get RMT status.

Parameters

- **channel** –RMT channel
- **status** –Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in *rmt_reg.h* for more details of each field.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_rx_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT RX interrupt enable.

Parameters

- **channel** –RMT channel
- **en** –enable or disable RX interrupt.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_err_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT RX error interrupt enable.

Parameters

- **channel** –RMT channel
- **en** –enable or disable RX err interrupt.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_intr_en** (*rmt_channel_t* channel, bool en)

Set RMT TX interrupt enable.

Parameters

- **channel** –RMT channel
- **en** –enable or disable TX interrupt.

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_thr_intr_en** (*rmt_channel_t* channel, bool en, uint16_t evt_thresh)

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

Parameters

- **channel** –RMT channel
- **en** –enable or disable TX event interrupt.
- **evt_thresh** –RMT event interrupt threshold value

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_gpio** (*rmt_channel_t* channel, *rmt_mode_t* mode, *gpio_num_t* gpio_num, bool invert_signal)

Configure the GPIO used by RMT channel.

Parameters

- **channel** –RMT channel
- **mode** –RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- **gpio_num** –GPIO number, which is connected with certain RMT signal
- **invert_signal** –Invert RMT signal physically by GPIO matrix

Returns

- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

esp_err_t **rmt_config** (const *rmt_config_t* *rmt_param)

Configure RMT parameters.

Parameters **rmt_param** –RMT parameter struct**Returns**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *rmt_isr_handle_t* *handle)

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

Note: If you already called `rmt_driver_install` to use system RMT driver, please do not register ISR handler again.

Parameters

- **fn** –Interrupt handler function.
- **arg** –Parameter for the handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –If non-zero, a handle to later clean up the ISR gets stored here.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.
- `ESP_FAIL` System driver installed, can not register ISR handler for RMT

esp_err_t `rmt_isr_deregister` (*rmt_isr_handle_t* handle)

Deregister previously registered RMT interrupt handler.

Parameters **handle** –Handle obtained from `rmt_isr_register`

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Handle invalid

esp_err_t `rmt_fill_tx_items` (*rmt_channel_t* channel, const *rmt_item32_t* *item, *uint16_t* item_num, *uint16_t* mem_offset)

Fill memory data of channel with given RMT items.

Parameters

- **channel** –RMT channel
- **item** –Pointer of items.
- **item_num** –RMT sending items number.
- **mem_offset** –Index offset of memory.

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_driver_install` (*rmt_channel_t* channel, *size_t* rx_buf_size, *int* intr_alloc_flags)

Initialize RMT driver.

Parameters

- **channel** –RMT channel
- **rx_buf_size** –Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- **intr_alloc_flags** –Flags for the RMT driver interrupt handler. Pass 0 for default flags. See `esp_intr_alloc.h` for details. If `ESP_INTR_FLAG_IRAM` is used, please do not use the memory allocated from psram when calling `rmt_write_items`.

Returns

- `ESP_ERR_INVALID_STATE` Driver is already installed, call `rmt_driver_uninstall` first.
- `ESP_ERR_NO_MEM` Memory allocation failure
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t `rmt_driver_uninstall` (*rmt_channel_t* channel)

Uninstall RMT driver.

Parameters **channel** –RMT channel

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **rmt_get_channel_status** (*rmt_channel_status_result_t* *channel_status)

Get the current status of eight channels.

Note: Do not call this function if it is possible that `rmt_driver_uninstall` will be called at the same time.

Parameters `channel_status` –[out] store the current status of each channel

Returns

- `ESP_ERR_INVALID_ARG` Parameter is NULL
- `ESP_OK` Success

esp_err_t **rmt_get_counter_clock** (*rmt_channel_t* channel, *uint32_t* *clock_hz)

Get speed of channel's internal counter clock.

Parameters

- `channel` –RMT channel
- `clock_hz` –[out] counter clock speed, in hz

Returns

- `ESP_ERR_INVALID_ARG` Parameter is NULL
- `ESP_OK` Success

esp_err_t **rmt_write_items** (*rmt_channel_t* channel, *const rmt_item32_t* *rmt_item, *int* item_num, *bool* wait_tx_done)

RMT send waveform from `rmt_item` array.

This API allows user to send waveform with any length.

Note: This function will not copy data, instead, it will point to the original items, and send the waveform items. If `wait_tx_done` is set to true, this function will block and will not return until all items have been sent out. If `wait_tx_done` is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Parameters

- `channel` –RMT channel
- `rmt_item` –head point of RMT items array. If `ESP_INTR_FLAG_IRAM` is used, please do not use the memory allocated from psram when calling `rmt_write_items`.
- `item_num` –RMT data item number.
- `wait_tx_done` –
 - If set 1, it will block the task and wait for sending done.
 - If set 0, it will not wait and return immediately.

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **rmt_wait_tx_done** (*rmt_channel_t* channel, *TickType_t* wait_time)

Wait RMT TX finished.

Parameters

- `channel` –RMT channel
- `wait_time` –Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with `ESP_ERR_TIMEOUT` if TX is busy (polling).

Returns

- `ESP_OK` RMT Tx done successfully
- `ESP_ERR_TIMEOUT` Exceeded the 'wait_time' given
- `ESP_ERR_INVALID_ARG` Parameter error

- `ESP_FAIL` Driver not installed

esp_err_t **rmt_get_ringbuf_handle** (*rmt_channel_t* channel, *RingbufHandle_t* *buf_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Parameters

- **channel** –RMT channel
- **buf_handle** –Pointer to buffer handle to accept RX ringbuffer handle.

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **rmt_translator_init** (*rmt_channel_t* channel, *sample_to_rmt_t* fn)

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Parameters

- **channel** –RMT channel .
- **fn** –Point to the data conversion function.

Returns

- `ESP_FAIL` Init fail.
- `ESP_OK` Init success.

esp_err_t **rmt_translator_set_context** (*rmt_channel_t* channel, void *context)

Set user context for the translator of specific channel.

Parameters

- **channel** –RMT channel number
- **context** –User context

Returns

- `ESP_FAIL` Set context fail
- `ESP_OK` Set context success

esp_err_t **rmt_translator_get_context** (const size_t *item_num, void **context)

Get the user context set by ‘rmt_translator_set_context’ .

Note: This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

Parameters

- **item_num** –Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
- **context** –Returned User context

Returns

- `ESP_FAIL` Get context fail
- `ESP_OK` Get context success

esp_err_t **rmt_write_sample** (*rmt_channel_t* channel, const uint8_t *src, size_t src_size, bool wait_tx_done)

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

Parameters

- **channel** –RMT channel .
- **src** –Pointer to the raw data.
- **src_size** –The size of the raw data.
- **wait_tx_done** –Set true to wait all data send done.

Returns

- `ESP_FAIL` Send fail

- ESP_OK Send success

rmt_tx_end_callback_t **rmt_register_tx_end_callback** (*rmt_tx_end_fn_t* function, void *arg)

Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

Note: Requires `rmt_driver_install` to install the default ISR handler.

Parameters

- **function** –Function to be called from the default interrupt handler or NULL.
- **arg** –Argument which will be provided to the callback when it is called.

Returns the previous callback settings (members will be set to NULL if there was none)

esp_err_t **rmt_set_rx_thr_intr_en** (*rmt_channel_t* channel, bool en, uint16_t evt_thresh)

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

Parameters

- **channel** –RMT channel
- **en** –enable or disable RX event interrupt.
- **evt_thresh** –RMT event interrupt threshold value

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_add_channel_to_group** (*rmt_channel_t* channel)

Add channel into a synchronous group (channels in the same group can start transaction simultaneously)

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_remove_channel_from_group** (*rmt_channel_t* channel)

Remove channel out of a group.

Parameters **channel** –RMT channel

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_set_tx_loop_count** (*rmt_channel_t* channel, uint32_t count)

Set loop count threshold value for RMT TX channel.

When tx loop count reaches this value, an ISR callback will notify user

Parameters

- **channel** –RMT channel
- **count** –loop count, 1 ~ 1023

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **rmt_enable_tx_loop_autostop** (*rmt_channel_t* channel, bool en)

Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

- When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold

- When disabled, the RMT transmission continue indefinitely until halted by the users

Note: The auto-stop feature is implemented in hardware on particular targets (i.e. those with `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP` defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

Parameters

- **channel** –RMT channel
- **en** –enable bit

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **rmt_memory_rw_rst** (*rmt_channel_t* channel)

Reset RMT TX/RX memory index.

Parameters **channel** –RMT channel

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

void **rmt_set_intr_enable_mask** (uint32_t mask)

Set mask value to RMT interrupt enable register.

Parameters **mask** –Bit mask to set to the register

void **rmt_clr_intr_enable_mask** (uint32_t mask)

Clear mask value to RMT interrupt enable register.

Parameters **mask** –Bit mask to clear the register

esp_err_t **rmt_set_pin** (*rmt_channel_t* channel, *rmt_mode_t* mode, *gpio_num_t* gpio_num)

Set RMT pin.

Parameters

- **channel** –RMT channel
- **mode** –TX or RX mode for RMT
- **gpio_num** –GPIO number to transmit or receive the signal.

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

Structures

struct **rmt_tx_config_t**

Data struct of RMT TX configure parameters.

Public Members

uint32_t **carrier_freq_hz**

RMT carrier frequency

rmt_carrier_level_t **carrier_level**

Level of the RMT output, when the carrier is applied

rmt_idle_level_t **idle_level**

RMT idle level

uint8_t **carrier_duty_percent**

RMT carrier duty (%)

uint32_t **loop_count**

Maximum loop count

bool **carrier_en**

RMT carrier enable

bool **loop_en**

Enable sending RMT items in a loop

bool **idle_output_en**

RMT idle level output enable

struct **rmt_rx_config_t**

Data struct of RMT RX configure parameters.

Public Members

uint16_t **idle_threshold**

RMT RX idle threshold

uint8_t **filter_ticks_thresh**

RMT filter tick number

bool **filter_en**

RMT receiver filter enable

bool **rm_carrier**

RMT receiver remove carrier enable

uint32_t **carrier_freq_hz**

RMT carrier frequency

uint8_t **carrier_duty_percent**

RMT carrier duty (%)

rmt_carrier_level_t **carrier_level**

The level to remove the carrier

struct **rmt_config_t**

Data struct of RMT configure parameters.

Public Members

rmt_mode_t **rmt_mode**

RMT mode: transmitter or receiver

rmt_channel_t **channel**

RMT channel

gpio_num_t **gpio_num**

RMT GPIO number

uint8_t **clk_div**

RMT channel counter divider

uint8_t **mem_block_num**

RMT memory block number

uint32_t **flags**

RMT channel extra configurations, OR'ed with RMT_CHANNEL_FLAGS_[*]

rmt_tx_config_t **tx_config**

RMT TX parameter

rmt_rx_config_t **rx_config**

RMT RX parameter

struct **rmt_tx_end_callback_t**

Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t **function**

Function which is called on RMT TX end

void ***arg**

Optional argument passed to function

Macros

RMT_CHANNEL_FLAGS_AWARE_DFS

Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG

Invert RMT signal

RMT_MEM_ITEM_NUM

Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)

Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)

Default configuration for RX channel.

Type Definitions

typedef *intr_handle_t* **rmt_isr_handle_t**

RMT interrupt handle.

typedef void (***rmt_tx_end_fn_t**)(*rmt_channel_t* channel, void *arg)

Type of RMT Tx End callback function.

typedef void (***sample_to_rmt_t**)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)

User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

This function may be called from an ISR, so, the code should be short and efficient.

Note: In fact, item_num should be a multiple of translated_size, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be $item_num = translated_size * 8$.

Param src Pointer to the buffer storing the raw data that needs to be converted to rmt format.

Param dest [out] Pointer to the buffer storing the rmt format data.

Param src_size The raw data size.

Param wanted_num The number of rmt format data that wanted to get.

Param translated_size [out] The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.

Param item_num [out] The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. it should return 0 if no data was converted.

Header File

- [components/hal/include/hal/rmt_types.h](#)

Structures

struct **rmt_channel_status_result_t**

Data struct of RMT channel status.

Public Members

rmt_channel_status_t **status**[*RMT_CHANNEL_MAX*]

Store the current status of each channel

Enumerations

enum **rmt_channel_t**

RMT channel ID.

Values:

enumerator **RMT_CHANNEL_0**

RMT channel number 0

enumerator **RMT_CHANNEL_1**

RMT channel number 1

enumerator **RMT_CHANNEL_2**

RMT channel number 2

enumerator **RMT_CHANNEL_3**

RMT channel number 3

enumerator **RMT_CHANNEL_MAX**

Number of RMT channels

enum **rmt_mem_owner_t**

RMT Internal Memory Owner.

Values:

enumerator **RMT_MEM_OWNER_TX**

RMT RX mode, RMT transmitter owns the memory block

enumerator **RMT_MEM_OWNER_RX**

RMT RX mode, RMT receiver owns the memory block

enumerator **RMT_MEM_OWNER_MAX**

enum **rmt_source_clk_t**

Clock Source of RMT Channel.

Values:

enumerator **RMT_BASECLK_APB**

RMT source clock is APB CLK, 80Mhz by default

enumerator **RMT_BASECLK_XTAL**

RMT source clock is XTAL clock, 40Mhz by default

enumerator **RMT_BASECLK_MAX**

enum **rmt_data_mode_t**

RMT Data Mode.

Note: We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:

enumerator **RMT_DATA_MODE_FIFO**

enumerator **RMT_DATA_MODE_MEM**

enumerator **RMT_DATA_MODE_MAX**

enum **rmt_mode_t**

RMT Channel Working Mode (TX or RX)

Values:

enumerator **RMT_MODE_TX**

RMT TX mode

enumerator **RMT_MODE_RX**

RMT RX mode

enumerator **RMT_MODE_MAX**

enum **rmt_idle_level_t**

RMT Idle Level.

Values:

enumerator **RMT_IDLE_LEVEL_LOW**

RMT TX idle level: low Level

enumerator **RMT_IDLE_LEVEL_HIGH**

RMT TX idle level: high Level

enumerator **RMT_IDLE_LEVEL_MAX**

enum **rmt_carrier_level_t**

RMT Carrier Level.

Values:

enumerator **RMT_CARRIER_LEVEL_LOW**

RMT carrier wave is modulated for low Level output

enumerator **RMT_CARRIER_LEVEL_HIGH**

RMT carrier wave is modulated for high Level output

enumerator **RMT_CARRIER_LEVEL_MAX**

enum **rmt_channel_status_t**

RMT Channel Status.

Values:

enumerator **RMT_CHANNEL_UNINIT**

RMT channel uninitialized

enumerator **RMT_CHANNEL_IDLE**

RMT channel status idle

enumerator **RMT_CHANNEL_BUSY**

RMT channel status busy

2.3.12 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi_dev_handle_t* spi_handle returned when attaching the device to an SPI bus by calling *sdspi_host_init_device*. The bus should be already initialized before (by *spi_bus_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro *SDSPI_DEVICE_CONFIG_DEFAULT* to initialize a structure *sdmmc_slot_config_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use *SDSPI_HOST_DEFAULT* macro to initialize a *sdmmc_host_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device spi_handle just returned from *sdspi_host_init_device*. Call *sdmmc_card_init* with the *sdmmc_host_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- *sdspi_host_init()*
- *sdspi_host_init_device()*
- *sdspi_host_remove_device()*
- *sdspi_host_deinit()*

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the *sdmmc_host_t* structure. For more details, see *the SD/SDIO/MMC Driver*.

Note: SD over SPI does not support speeds above *SDMMC_FREQ_DEFAULT* due to the limitations of the SPI driver.

API Reference

Header File

- `components/driver/include/driver/sdspi_host.h`

Functions

esp_err_t **sdspi_host_init** (void)

Initialize SD SPI driver.

Note: This function is not thread safe

Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

esp_err_t **sdspi_host_init_device** (const *sdspi_device_config_t* *dev_config, *sdspi_dev_handle_t* *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

Note: This function is not thread safe

Note: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

Note: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Parameters

- **dev_config** – pointer to device configuration structure
- **out_handle** – Output of the handle to the sdspi device.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `sdspi_host_init_device` has invalid arguments
- `ESP_ERR_NO_MEM` if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

esp_err_t **sdspi_host_remove_device** (*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

Parameters **handle** – Handle of the SD SPI device

Returns Always `ESP_OK`

esp_err_t **sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

Parameters

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

Returns

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

esp_err_t **sdspi_host_set_card_clk** (*sdspi_dev_handle_t* host, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note: This function is not thread safe

Parameters

- **host** –Handle of the sdspi device
- **freq_khz** –card clock frequency, in kHz

Returns

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdspi_host_deinit** (void)

Release resources allocated using sdspi_host_init.

Note: This function is not thread safe

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t **sdspi_host_io_int_enable** (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

Parameters **handle** –Handle of the sdspi device

Returns

- ESP_OK on success

esp_err_t **sdspi_host_io_int_wait** (*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

Parameters

- **handle** –Handle of the sdspi device
- **timeout_ticks** –Ticks to wait before timeout.

Returns

- ESP_OK on success

esp_err_t **sdspi_host_init_slot** (int slot, const *sdspi_slot_config_t* *slot_config)

Initialize SD SPI driver for the specific SPI controller.

Deprecated:

Use sdspi_host_init_device instead.

Note: This function is not thread safe

Note: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Parameters

- `slot` –SPI controller to use (SPI2_HOST or SPI3_HOST)
- `slot_config` –pointer to slot configuration structure

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_init_slot` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

Structures

struct `sdspi_device_config_t`

Extra configuration for SD SPI device.

Public Members

spi_host_device_t `host_id`

SPI host to use, SPIx_HOST (see `spi_types.h`).

gpio_num_t `gpio_cs`

GPIO number of CS signal.

gpio_num_t `gpio_cd`

GPIO number of card detect signal.

gpio_num_t `gpio_wp`

GPIO number of write protect signal.

gpio_num_t `gpio_int`

GPIO number of interrupt line (input) for SDIO card.

struct `sdspi_slot_config_t`

Extra configuration for SPI host.

Deprecated:

Use `sdspi_device_config_t` and corresponding `sdspi_host_init_device()` instead.

Public Members

gpio_num_t `gpio_cs`

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

gpio_num_t **gpio_miso**

GPIO number of MISO signal.

gpio_num_t **gpio_mosi**

GPIO number of MOSI signal.

gpio_num_t **gpio_sck**

GPIO number of SCK signal.

int **dma_channel**

DMA channel to be used by SPI driver (1 or 2).

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT ()

Default *sdmmc_host_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT ()

Macro defining default configuration of SD SPI device.

SDSPI_SLOT_CONFIG_DEFAULT ()

Macro defining default configuration of SPI host

Type Definitions

typedef int **sdspi_dev_handle_t**

Handle representing an SD SPI device.

2.3.13 Sigma-delta Modulation

Introduction

ESP32-C3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

Functionality Overview

There are 4 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the 'duty' input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal's duty will be about 50%, see description of `sigmadelta_set_duty()`.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Fig. 11: Sallen-Key Low Pass Filter

Application Example

Sigma-delta Modulation example: [peripherals/sigmadelta](#).

API Reference

Header File

- [components/driver/include/driver/sigmadelta.h](#)

Functions

esp_err_t **sigmadelta_config** (const *sigmadelta_config_t* *config)

Configure Sigma-delta channel.

Parameters **config** –Pointer of Sigma-delta channel configuration struct

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_duty** (*sigmadelta_channel_t* channel, int8_t duty)

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty, If you add a capacitor between the output pin and ground, the average output voltage will be $V_{dc} = VDDIO / 256 * duty + VDDIO/2$, where VDDIO is the power supply voltage.

Parameters

- **channel** –Sigma-delta channel number
- **duty** –Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_prescale** (*sigmadelta_channel_t* channel, uint8_t prescale)

Set Sigma-delta channel's clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

Parameters

- **channel** –Sigma-delta channel number
- **prescale** –The divider of source clock, ranges from 0 to 255

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **sigmadelta_set_pin** (*sigmadelta_channel_t* channel, *gpio_num_t* gpio_num)

Set Sigma-delta signal output pin.

Parameters

- **channel** –Sigma-delta channel number
- **gpio_num** –GPIO number of output pin.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Header File

- [components/hal/include/hal/sigmadelta_types.h](#)

Structures

struct **sigmadelta_config_t**

Sigma-delta configure struct.

Public Members

sigmadelta_channel_t **channel**

Sigma-delta channel number

int8_t **sigmadelta_duty**

Sigma-delta duty, duty ranges from -128 to 127.

uint8_t **sigmadelta_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

uint8_t **sigmadelta_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

enum **sigmadelta_port_t**

SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

Values:

enumerator **SIGMADELTA_PORT_0**

SIGMADELTA port 0

enumerator **SIGMADELTA_PORT_MAX**

SIGMADELTA port max

enum **sigmadelta_channel_t**

Sigma-delta channel list.

Values:

enumerator **SIGMADELTA_CHANNEL_0**

Sigma-delta channel 0

enumerator **SIGMADELTA_CHANNEL_1**

Sigma-delta channel 1

enumerator **SIGMADELTA_CHANNEL_2**

Sigma-delta channel 2

enumerator **SIGMADELTA_CHANNEL_3**

Sigma-delta channel 3

enumerator **SIGMADELTA_CHANNEL_MAX**

Sigma-delta channel max

2.3.14 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3's SPI peripherals while they function as masters.

Overview of ESP32-C3's SPI peripherals

ESP32-C3 integrates 3 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
De-vice	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device' s individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
As- ser- tion	The action of activating a line.
De- asser- tion	The action of returning the line back to inactive (back to idle) status.
Trans- ac- tion	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch- edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch- edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

Warning: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using [xSemaphoreCreateMutex](#).

SPI Features

SPI Master

SPI Bus Lock To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it's meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Dummy	This phase is configurable and is used to meet the timing requirements.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

Interrupt Transactions Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

Transaction Line Mode Supported line modes for ESP32-C3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOM-MON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOM-MON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR	

Command and Address Phases During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of `base` as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

Note: Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
 - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
 - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte

from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 μ s.
- Interrupt Transaction via CPU: 27 μ s.
- Polling Transaction via DMA: 10 μ s.
- Polling Transaction via CPU: 9 μ s.

SPI Clock Frequency Transferring each byte takes eight times the clock period $8/f_{spi}$.

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select [CONFIG_SPI_MASTER_IN_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz]$ [us] for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG_SPI_MASTER_ISR_IN_IRAM](#) and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi_master/hd_eeprom](#) directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- [components/hal/include/hal/spi_types.h](#)

Structures

```
struct spi_line_mode_t
```

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

Functions

esp_err_t **spi_bus_initialize** (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host_id** –SPI peripheral that controls this bus
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan** – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting SPI_DMA_DISABLED limits the size of transactions.
 - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
 - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

Returns

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_free** (*spi_host_device_t* host_id)

Free a SPI bus.

Warning: In order for this to succeed, all devices have to be removed first.

Parameters **host_id** –SPI peripheral to free

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn't been initialized before, or not all devices on the bus are freed
- ESP_OK on success

Structures

struct **spi_bus_config_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi_bus_config_t* referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int **mosi_io_num**

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int **data0_io_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso_io_num**

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int **data1_io_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk_io_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp_io_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2_io_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd_io_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3_io_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4_io_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

int **intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters

- **DATA** –Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA** –Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS**Type Definitions**

typedef *spi_common_dma_t* **spi_dma_chan_t**

Enumerations

enum **spi_common_dma_t**

SPI DMA channels.

Values:

enumerator **SPI_DMA_DISABLED**

Do not enable DMA for SPI.

enumerator **SPI_DMA_CH_AUTO**

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master**Header File**

- [components/driver/include/driver/spi_master.h](#)

Functions

esp_err_t **spi_bus_add_device** (*spi_host_device_t* host_id, const *spi_device_interface_config_t* *dev_config, *spi_device_handle_t* *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note: While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Parameters

- **host_id** –SPI peripheral to allocate device on
- **dev_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn't have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_remove_device** (*spi_device_handle_t* handle)

Remove a device from the SPI bus.

Parameters *handle* –Device handle to free

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by *spi_device_get_trans_result*.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using *spi_host_add_dev*
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use portMAX_DELAY to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (*spi_device_acquire_bus*() should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_get_trans_result** (*spi_device_handle_t* handle, *spi_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by *spi_device_queue_trans*.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Parameters

- **handle** –Device handle obtained using *spi_host_add_dev*
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by *spi_device_get_trans_result*.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use portMAX_DELAY to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

esp_err_t **spi_device_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **spi_device_polling_start** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

esp_err_t **spi_device_polling_end** (*spi_device_handle_t* handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

esp_err_t **spi_device_polling_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

`esp_err_t spi_device_acquire_bus (spi_device_handle_t device, TickType_t wait)`

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

Note: The function will wait until all the existing transactions have been sent.

Parameters

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

Returns

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

`void spi_device_release_bus (spi_device_handle_t dev)`

Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters **dev** –The device to release the bus.

`int spi_cal_clock (int fapb, int hz, int duty_cycle, uint32_t *reg_o)`

Calculate the working frequency that is most close to desired frequency, and also the register value.

Deprecated:

The app shouldn't care about the register. Call `spi_get_actual_clock` instead.

Parameters

- **fapb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock
- **reg_o** –Output of value to be set in clock register, or `NULL` if not needed.

Returns Actual working frequency that most fit.

`int spi_get_actual_clock (int fapb, int hz, int duty_cycle)`

Calculate the working frequency that is most close to desired frequency.

Parameters

- **fapb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock

Returns Actual working frequency that most fit.

```
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

Note: If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters

- `gpio_is_used` – True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns` – Input delay from SCLK launch edge to MISO data valid.
- `eff_clk` – Effective clock frequency (in Hz) from `spi_cal_clock`.
- `dummy_o` – Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o` – Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

```
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Parameters

- `gpio_is_used` – True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns` – Input delay from SCLK launch edge to MISO data valid.

Returns Frequency limit of current configurations.

```
esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)
```

Get max length (in bytes) of one transaction.

Parameters

- `host_id` – SPI peripheral
- `max_bytes` – [out] Max length of one transaction, in bytes

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

Structures

```
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

```
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

```
uint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

int input_delay_ns

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

int spics_io_num

CS GPIO pin for this device, or -1 if not used.

uint32_t flags

Bitwise OR of `SPI_DEVICE_*` flags.

int queue_size

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction_cb_t* pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction_cb_t* post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct spi_transaction_t

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members**uint32_t flags**

Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length

Total data length, in bits.

size_t rxlength

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void *user

User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz). 8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK**SPI_TRANS_MODE_DIO**

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the `command_bits` in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_ADDR

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_DUMMY

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

```
typedef struct spi_transaction_t spi_transaction_t
```

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.3.15 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C3's SPI peripherals while they function as slaves.

Overview of ESP32-C3's SPI peripherals

ESP32-C3 integrates one general purpose SPI controller which can be used as slave node driven by an off-chip SPI master. The controller is called SPI2 and has an independent signal bus with the same name.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
• MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
• MOSI	Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.
• SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
• CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
• QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
• QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
• Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

Note: A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

Speed and Timing Considerations

Transaction Interval The ESP32-C3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi_slave](#).

SCLK Frequency Requirements The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

Application Example

The code example for Device/Host communication can be found in the [peripherals/spi_slave](#) directory of ESP-IDF examples.

API Reference

Header File

- [components/driver/include/driver/spi_slave.h](#)

Functions

esp_err_t **spi_slave_initialize** (*spi_host_device_t* host, const *spi_bus_config_t* *bus_config, const *spi_slave_interface_config_t* *slave_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus as a slave interface.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host** –SPI peripheral to use as a SPI slave interface
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **slave_config** –Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting SPI_DMA_DISABLED limits the size of transactions.
 - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
 - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

Returns

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel

- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

Parameters *host* –SPI peripheral to free

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

esp_err_t **spi_slave_queue_trans** (*spi_host_device_t* host, const *spi_slave_transaction_t* **trans_desc*, TickType_t *ticks_to_wait*)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Parameters

- **host** –SPI peripheral that is acting as a slave
- **trans_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there' s room in the queue; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **spi_slave_get_trans_result** (*spi_host_device_t* host, *spi_slave_transaction_t* ***trans_desc*, TickType_t *ticks_to_wait*)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –[out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** –Ticks to wait until there' s a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **spi_slave_transmit** (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc*, TickType_t *ticks_to_wait*)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn' t been finalized using `spi_slave_get_trans_result`.

Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of `SPI_SLAVE_*` flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

[*slave_transaction_cb_t post_setup_cb*](#)

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

[*slave_transaction_cb_t post_trans_cb*](#)

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi_slave_transaction_t**

This structure describes one SPI transaction

Public Members

`size_t length`

Total data length, in bits.

`size_t trans_len`

Transaction data length, in bits.

`const void *tx_buffer`

Pointer to transmit buffer, or NULL for no MOSI phase.

`void *rx_buffer`

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

`void *user`

User-defined variable. Can be used to store eg transaction ID.

Macros

`SPI_SLAVE_TXBIT_LSBFIRST`

Transmit command/address/data LSB first instead of the default MSB first.

`SPI_SLAVE_RXBIT_LSBFIRST`

Receive data LSB first instead of the default MSB first.

`SPI_SLAVE_BIT_LSBFIRST`

Transmit and receive LSB first.

Type Definitions

`typedef struct spi_slave_transaction_t spi_slave_transaction_t`

`typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)`

2.3.16 Temperature Sensor

Overview

The ESP32-C3 has a built-in temperature sensor used to measure the chip's internal temperature, and hard to measure the environmental temperature accurately. Being built-in means that the temperature sensor should work on any ESP32-C3 regardless of what board the chip is embedded in. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a temperature offset DAC.

The conversion relationship is the first columns of the table below. Among them, Offset = 0 is the default measurement option, and other values are extended measurement options.

Offset	Measurement Range (°C)	Measurement Error (°C)
-2	50 ~ 125	< 3
-1	20 ~ 100	< 2
0	-10 ~ 80	< 1
1	-30 ~ 50	< 2
2	-40 ~ 20	< 3

Driver Usage

1. Initialize the temperature sensor by calling the function `temp_sensor_set_config()` and pass to it a `temp_sensor_config_t` structure. The `temp_sensor_config_t` structure should contain all the required parameters. See the example below.

```
temp_sensor_config_t temp_sensor = {
    .dac_offset = TSENS_DAC_L2,
    .clk_div = 6,
};
temp_sensor_set_config(temp_sensor);
```

1. Start the temperature sensor by calling `temp_sensor_start()`, and then the sensor will start to measure the temperature.
2. To get the current temperature, you can take the example below as a reference, and the temperatures you get are in Celsius.

```
float tsens_out;
temp_sensor_read_celsius(&tsens_out);
```

1. To stop the temperature sensor, please call `temp_sensor_stop()`.

Note: To realize dynamic reconfiguration, you need to stop the sensor first with `temp_sensor_stop()`, then set the new configuration with `temp_sensor_set_config()`, and then re-start the sensor with `temp_sensor_start()`.

Application Example

For examples of the temperature sensor, please refer to [peripherals/temp_sensor](#).

API Reference - Normal Temp Sensor

Header File

- `components/driver/esp32c3/include/driver/temp_sensor.h`

Functions

`esp_err_t temp_sensor_set_config(temp_sensor_config_t tsens)`

Set parameter of temperature sensor.

Parameters `tsens` –

Returns

- ESP_OK Success

`esp_err_t temp_sensor_get_config(temp_sensor_config_t *tsens)`

Get parameter of temperature sensor.

Parameters `tsens` –

Returns

- ESP_OK Success

`esp_err_t temp_sensor_start(void)`

Start temperature sensor measure.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is started already.

esp_err_t **temp_sensor_stop** (void)

Stop temperature sensor measure.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is stopped already.

esp_err_t **temp_sensor_read_raw** (uint32_t *tsens_out)

Read temperature sensor raw data.

Parameters *tsens_out* –Pointer to raw data, Range: 0 ~ 255

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG *tsens_out* is NULL
- ESP_ERR_INVALID_STATE temperature sensor dont start

esp_err_t **temp_sensor_read_celsius** (float *celsius)

Read temperature sensor data that is converted to degrees Celsius.

Note: Should not be called from interrupt.

Parameters *celsius* –The measure output value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG ARG is NULL.
- ESP_ERR_INVALID_STATE The ambient temperature is out of range.

Structures

struct **tsens_dac_offset_t**

tsens dac offset, internal use only

Public Members

int **index**

temperature dac offset index

int **offset**

temperature dac offset

int **set_val**

temperature dac set value

int **range_min**

temperature current range minimum

int **range_max**

temperature current range maximum

int **error_max**

temperature current range error

struct **temp_sensor_config_t**

Configuration for temperature sensor reading.

Public Members

temp_sensor_dac_offset_t **dac_offset**

The temperature measurement range is configured with a built-in temperature offset DAC.

uint8_t **clk_div**

Default: 6

Macros

TSENS_ADC_FACTOR

TSENS_DAC_FACTOR

TSENS_SYS_OFFSET

TSENS_CONFIG_DEFAULT ()

Enumerations

enum **temp_sensor_dac_offset_t**

Values:

enumerator **TSENS_DAC_L0**

offset = -2, measure range: 50°C ~ 125°C, error < 3°C.

enumerator **TSENS_DAC_L1**

offset = -1, measure range: 20°C ~ 100°C, error < 2°C.

enumerator **TSENS_DAC_L2**

offset = 0, measure range: -10°C ~ 80°C, error < 1°C.

enumerator **TSENS_DAC_L3**

offset = 1, measure range: -30°C ~ 50°C, error < 2°C.

enumerator **TSENS_DAC_L4**

offset = 2, measure range: -40°C ~ 20°C, error < 3°C.

enumerator **TSENS_DAC_MAX**

enumerator **TSENS_DAC_DEFAULT**

2.3.17 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. *TWAI Protocol Summary*
2. *Signals Lines and Transceiver*
3. *Driver Configuration*
4. *Driver Operation*
5. *Examples*

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3's GPIO pads.

Fig. 12: Signal lines of the TWAI controller

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock (APB Clock).

Note: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 3: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

Note: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

Note: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

Note: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-C3, the `brp` can be **any even number from 2 to 16384**.

Fig. 13: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

Note: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`
- `TWAI_TIMING_CONFIG_1KBITS()`

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 14: Bit layout of single filter mode (Right side MSBit)

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 15: Bit layout of dual filter mode (Right side MSBit)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 16: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter \geq 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States **Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"

...
```

(continues on next page)

(continued from previous page)

```

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

```

(continues on next page)

(continued from previous page)

```

}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

Multiple ID Filter Configuration The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai_network](#).

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai_alert_and_recovery](#).

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai_self_test](#).

API Reference

Header File

Structures

struct **twai_message_t**

Structure to store a TWAI message.

Note: The flags member is deprecated

Public Members

uint32_t **extd**

Extended Frame Format (29bit ID)

uint32_t **rtr**

Message is a Remote Frame

uint32_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32_t **dlc_non_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t **reserved**

Reserved bits

uint32_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32_t **identifier**

11 or 29 bit identifier

uint8_t **data_length_code**

Data length code

uint8_t **data**[8]

Data bytes (not relevant in RTR frame)

struct **twai_timing_config_t**

Structure for bit timing configuration of the TWAI driver.

Note: Macro initializers are available for this structure

Public Members

uint32_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note: Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Enumerationsenum **twai_mode_t**

TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Functions

esp_err_t twai_driver_install (const *twai_general_config_t* *g_config, const *twai_timing_config_t* *t_config, const *twai_filter_config_t* *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note: Macro initializers are available for the configuration structures (see documentation)

Note: To reinstall the TWAI driver, call `twai_driver_uninstall()` first

Parameters

- **g_config** –[in] General configuration structure
- **t_config** –[in] Timing configuration structure
- **f_config** –[in] Filter configuration structure

Returns

- **ESP_OK**: Successfully installed TWAI driver
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_NO_MEM**: Insufficient memory
- **ESP_ERR_INVALID_STATE**: Driver is already installed

esp_err_t **twai_driver_uninstall** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning: The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Returns

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t **twai_start** (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Returns

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t **twai_stop** (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Returns

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t **twai_transmit** (const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note: This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Parameters

- **message** –[in] Message to transmit
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block on the TX queue

Returns

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

esp_err_t twai_receive (*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning: The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters

- **message** –[out] Received message
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block on RX queue

Returns

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

Note: Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Parameters

- **alerts** –[out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block for alert

Returns

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Parameters

- **alerts_enabled** –[in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** –[out] Bit field of currently raised alerts. Set to NULL if unused

Returns

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_initiate_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Returns

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t **twai_get_status_info** (*twai_status_info_t* *status_info)

Get current status information of the TWAI driver.

Parameters *status_info* –[out] Status information

Returns

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_transmit_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

Note: The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

Note: The receive queue is automatically cleared when `twai_start()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

struct **twai_general_config_t**

Structure for general configuration of the TWAI driver.

Note: Macro initializers are available for this structure

Public Members

twai_mode_t mode

Mode of TWAI controller

gpio_num_t tx_io

Transmit GPIO number

gpio_num_t rx_io

Receive GPIO number

gpio_num_t clkout_io

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t tx_queue_len

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t rx_queue_len

Number of messages RX queue can hold

uint32_t alerts_enabled

Bit field of alerts to enable (see documentation)

uint32_t clkout_divider

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t

Structure to store status information of TWAI driver.

Public Members

twai_state_t state

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx

Number of messages queued for transmission or awaiting transmission completion

uint32_t **msgs_to_rx**

Number of messages in RX queue waiting to be read

uint32_t **tx_error_counter**

Current value of Transmit Error Counter

uint32_t **rx_error_counter**

Current value of Receive Error Counter

uint32_t **tx_failed_count**

Number of messages that failed transmissions

uint32_t **rx_missed_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t **rx_overrun_count**

Number of messages that were lost due to a RX FIFO overrun

uint32_t **arb_lost_count**

Number of instances arbitration was lost

uint32_t **bus_error_count**

Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED

Marks GPIO as unused in TWAI configuration

Enumerations

enum **twai_state_t**

TWAI driver states.

Values:

enumerator **TWAI_STATE_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI_STATE_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI_STATE_BUS_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI_STATE_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

2.3.18 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C3 chip has two UART controllers (UART0 and UART1), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32-C3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-C3's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Setting Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart_echo](#).

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 4: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

Driver Installation Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

Transmitting After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-C3 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling

`uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
 - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
 - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
 - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
 - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
 - Disable the interrupt using `uart_disable_pattern_det_intr()`

Macros The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

Note: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-C3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]*. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C3's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted

datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section [Interface Connection Options](#)). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the \sim RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

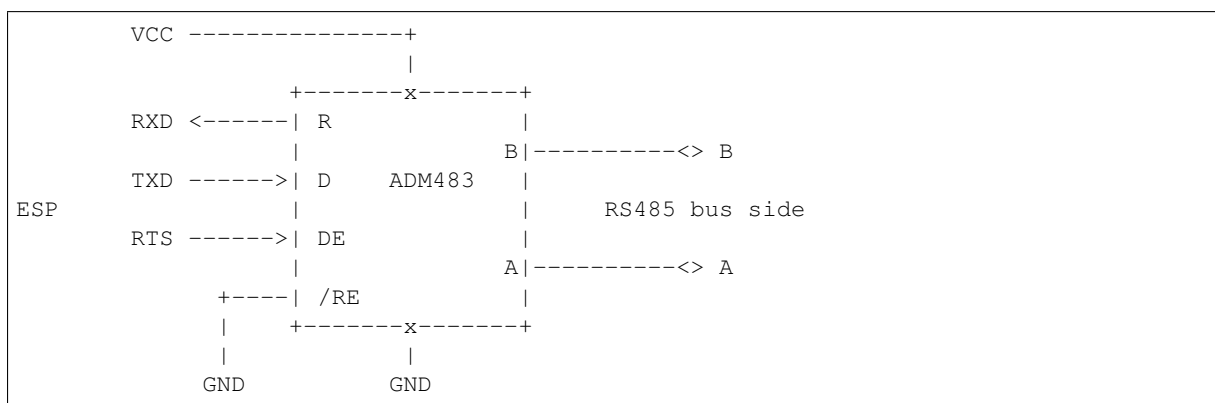

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32-C3's RS485 interface connection.

Note:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

Circuit A: Collision Detection Circuit

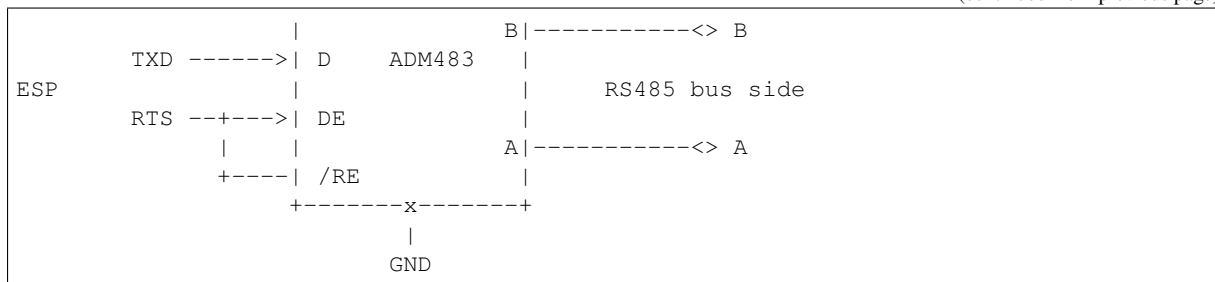

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

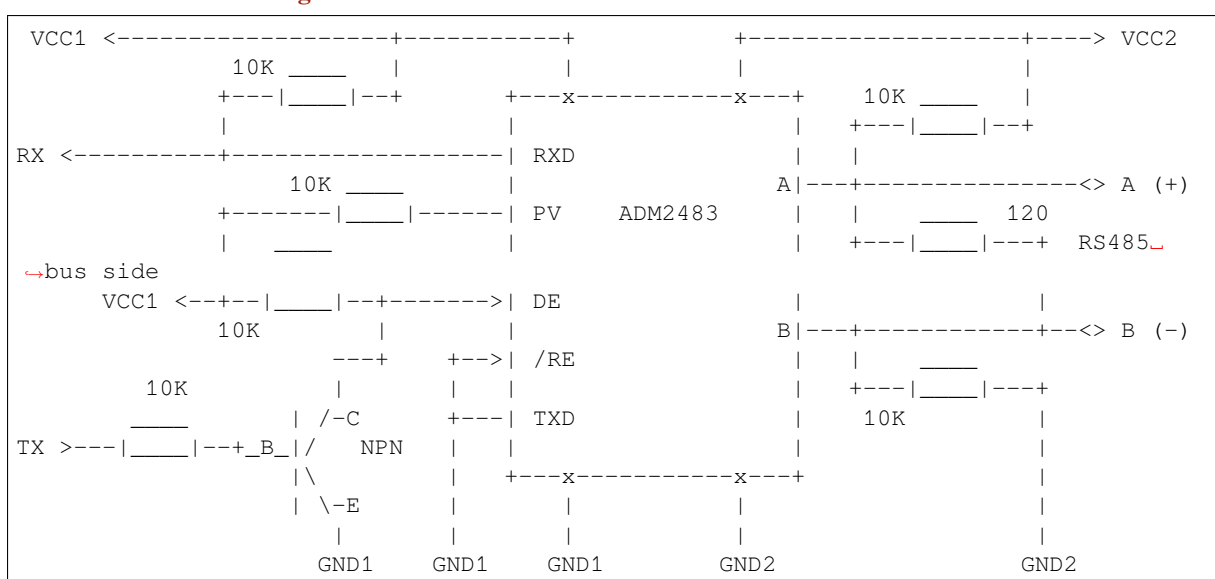

(continues on next page)

(continued from previous page)

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
peripherals/uart/uart_echo	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
peripherals/uart/uart_events	Reporting various communication events, using pattern detection interrupts.
peripherals/uart/uart_async_rxtxtasks	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
peripherals/uart/uart_select	Using synchronous I/O multiplexing for UART file descriptors.
peripherals/uart/uart_echo_rs485	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to peripherals/uart/uart_echo but allows communication through an RS485 interface chip connected to ESP32-C3 pins.
peripherals/uart/nmea0183_parser	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

API Reference

Header File

- [components/driver/include/driver/uart.h](#)

Functions

esp_err_t **uart_driver_install** (*uart_port_t* uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, *QueueHandle_t* *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

Note: Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** –UART RX ring buffer size.
- **tx_buffer_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** –UART event queue size/depth.
- **uart_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_driver_delete** (*uart_port_t* uart_num)

Uninstall UART driver.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

`bool uart_is_driver_installed(uart_port_t uart_num)`

Checks whether the driver is installed or not.

Parameters `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- true driver is installed
- false driver is not installed

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`

Set UART data bits.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` –UART data bits

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`

Get the UART data bit configuration.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` –Pointer to accept value of UART data bits.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`

Set UART stop bits.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` –UART stop bits

Returns

- ESP_OK Success
- ESP_FAIL Fail

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`

Get the UART stop bit configuration.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` –Pointer to accept value of UART stop bits.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

`esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)`

Set UART parity mode.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode` –the enum of uart parity configuration

Returns

- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)`

Get the UART parity mode configuration.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

- **parity_mode** –Pointer to accept value of UART parity mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_set_baudrate** (*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –UART baud rate.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_baudrate** (*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse** (*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **inverse_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Hardware flow control mode
- **rx_thresh** –Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl** (*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

Parameters

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable** –switch on or off
- **rx_thresh_xon** –low water mark
- **rx_thresh_xoff** –high water mark

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Option for different flow control mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status** (*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** –Bit mask of the interrupt status to be cleared.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask** (*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** –Bit mask of the enable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask** (*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** –Bit mask of the disable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr** (*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr** (*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr** (*uart_port_t* uart_num)

Disable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

Parameters **uart_num** –UART port number

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr** (*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_isr_register** (*uart_port_t* uart_num, void (*fn)(void*), void *arg, int intr_alloc_flags, *uart_isr_handle_t* *handle)

Register UART interrupt handler (ISR).

Note: UART ISR handler will be attached to the same CPU core that this function is running on.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **fn** –Interrupt handler function.
- **arg** –parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_isr_free** (*uart_port_t* uart_num)

Free UART interrupt handler registered by `uart_isr_register`. Must be called on the same core as `uart_isr_register` was called.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin** (*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

Note: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0' s default TX pin and GPIO3 is UART0' s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

- **tx_io_num** –UART TX pin GPIO number.
- **rx_io_num** –UART RX pin GPIO number.
- **rts_io_num** –UART RTS pin GPIO number.
- **cts_io_num** –UART CTS pin GPIO number.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_rts** (*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

Note: UART must be configured with hardware flow control disabled.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_dtr** (*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_tx_idle_num** (*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_param_config** (*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** –UART parameter settings

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config** (*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** –UART interrupt settings

Returns

- ESP_OK Success

- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done** (*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** –Timeout, count in RTOS ticks

Returns

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars** (*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note: This function should only be used when UART TX buffer is not enabled.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes** (*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break** (*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver' s parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send
- **brk_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes** (*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks_to_wait** –sTimeout, count in RTOS ticks

Returns

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

esp_err_t **uart_flush** (*uart_port_t* uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input** (*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

Note: In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len** (*uart_port_t* uart_num, size_t *size)

UART get RX ring buffer cached data length.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of `size_t` to accept cached data length

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size** (*uart_port_t* uart_num, size_t *size)

UART get TX ring buffer free space size.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of `size_t` to accept the free space size

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr** (*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr** (*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

Parameters

- **uart_num** –UART port number.
- **pattern_chr** –character of the pattern.
- **chr_num** –number of the character, 8bit value.
- **chr_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart_pattern_get_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

esp_err_t `uart_pattern_queue_reset` (*uart_port_t* uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t `uart_set_mode` (*uart_port_t* uart_num, *uart_mode_t* mode)

UART set communication mode.

Note: This function must be executed after `uart_driver_install()`, when the driver object is initialized.

Parameters

- `uart_num` –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` –UART UART mode to set

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t `uart_set_rx_full_threshold` (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

Note: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Parameters

- `uart_num` –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold` –Threshold value above which RX fifo full interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t `uart_set_tx_empty_threshold` (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

Parameters

- `uart_num` –UART_NUM_0, UART_NUM_1 or UART_NUM_2

- **threshold** –Threshold value below which TX fifo empty interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout** (*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

Parameters

- **uart_num** –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag** (*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Parameters

- **uart_num** –Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** –Pointer to variable of type bool to return collision flag.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 010001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in *uart_config_t* to true.

Note: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Parameters

- **uart_num** –UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

Returns

- ESP_OK on success

- `ESP_ERR_INVALID_ARG` if `uart_num` is incorrect or `wakeup_threshold` is outside of `[3, 0x3ff]` range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* `uart_num`, `int *out_wakeup_threshold`)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Parameters

- `uart_num` –UART number, the max port number is `(UART_NUM_MAX -1)`.
- `out_wakeup_threshold` –[out] output, set to the current value of wakeup threshold for the given UART.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `out_wakeup_threshold` is `NULL`

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* `uart_num`)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

Parameters `uart_num` –UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* `uart_num`, `bool loop_back_en`)

Configure TX signal loop back to RX module, just for the test usage.

•

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

Parameters

- `uart_num` –UART number
- `loop_back_en` –Set ture to enable the loop back function, else set it false.

`void` **uart_set_always_rx_timeout** (*uart_port_t* `uart_num`, `bool always_rx_timeout_en`)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- `uart_num` –UART number
- `always_rx_timeout_en` –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

`uint32_t intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

Public Members

`uart_event_type_t` type

UART event type

`size_t` size

UART data size for `UART_DATA` event

bool `timeout_flag`

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

`UART_NUM_0`

UART port 0

`UART_NUM_1`

UART port 1

`UART_NUM_MAX`

UART port max

`UART_PIN_NO_CHANGE`

`UART_FIFO_LEN`

Length of the UART HW FIFO.

`UART_BITRATE_MAX`

Maximum configurable bitrate.

Type Definitions

```
typedef intr_handle_t uart_isr_handle_t
```

Enumerations

```
enum uart_event_type_t
```

UART event types used in the ring buffer.

Values:

enumerator **UART_DATA**

UART data event

enumerator **UART_BREAK**

UART break event

enumerator **UART_BUFFER_FULL**

UART RX buffer full event

enumerator **UART_FIFO_OVF**

UART FIFO overflow event

enumerator **UART_FRAME_ERR**

UART RX frame error event

enumerator **UART_PARITY_ERR**

UART RX parity event

enumerator **UART_DATA_BREAK**

UART TX data and break event

enumerator **UART_PATTERN_DET**

UART pattern detected

enumerator **UART_WAKEUP**

UART wakeup event

enumerator **UART_EVENT_MAX**

UART event max index

Header File

- [components/hal/include/hal/uart_types.h](#)

Structures

```
struct uart_at_cmd_t
```

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members**uint8_t cmd_char**

UART AT cmd char

uint8_t char_num

AT cmd char repeat number

uint32_t gap_tout

gap time(in baud-rate) between AT cmd char

uint32_t pre_idle

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members**uint8_t xon_char**

Xon flow control char

uint8_t xoff_char

Xoff flow control char

uint8_t xon_thrd

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct **uart_config_t**

UART configuration parameters for uart_param_config function.

Public Members**int baud_rate**

UART baud rate

uart_word_length_t **data_bits**

UART byte size

uart_parity_t **parity**

UART parity mode

uart_stop_bits_t **stop_bits**

UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**

UART HW flow control mode (cts/rts)

uint8_t **rx_flow_ctrl_thresh**

UART HW RTS threshold

uart_sclk_t **source_clk**

UART source clock selection

bool **use_ref_tick**

Deprecated method to select ref tick clock source, set `source_clk` field instead

Type Definitions

typedef int **uart_port_t**

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

Enumerations

enum **uart_mode_t**

UART mode selection.

Values:

enumerator **UART_MODE_UART**

mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**

mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits

enumerator **UART_DATA_8_BITS**

word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**

UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**

stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**

stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**

stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**

UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**

Disable UART parity

enumerator **UART_PARITY_EVEN**

Enable UART even parity

enumerator **UART_PARITY_ODD**

Enable UART odd parity

enum **uart_hw_flowcontrol_t**

UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**

disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**
enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**
enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**
enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**
Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**
inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**
inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**
inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**
inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**
inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**
inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**
inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**
inverse the UART dtr signal

enum **uart_sclk_t**

UART source clock.

Values:

enumerator **UART_SCLK_APB**
UART source clock from APB

enumerator **UART_SCLK_RTC**

UART source clock from RTC

enumerator **UART_SCLK_XTAL**

UART source clock from XTAL

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

Note: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- [components/soc/esp32c3/include/soc/uart_channel.h](#)

Macros

`UART_GPIO21_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO20_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_TXD_GPIO21_DIRECT_CHANNEL`

`UART_RXD_GPIO20_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

2.4 Application Protocols

2.4.1 ASIO port

Overview

Asio is a cross-platform C++ library, see <https://think-async.com>. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at <https://think-async.com/Asio/Documentation>. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

Supported features ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio [protocols/asio](#):

- [protocols/asio/udp_echo_server](#)
- [protocols/asio/tcp_echo_server](#)
- [protocols/asio/asio_chat](#)
- [protocols/asio/ssl_client_server](#)

Please refer to the specific example README.md for details

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tcp, default port 8883
- [protocols/mqtt/ssl_psk](#): MQTT over tcp using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support `mqtt`, `mqtt`s, `ws`, `wss` schemes
- MQTT over TCP samples:
 - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
 - `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:
 - `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
 - `mqtt://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
 - `mqtt://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over Websocket samples:
 - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
 - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.

- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

Last Will and Testament MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

Other Configuration Parameters

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from `menuconfig`
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

Change settings in Project Configuration Menu The settings for MQTT can be found using `idf.py menuconfig`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` *config)

Creates mqtt client handle based on the configuration.

Parameters `config` –mqtt configuration structure

Returns `mqtt_client_handle` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char *uri)

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

Parameters

- `client` –mqtt client handle
- `uri` –

Returns `ESP_FAIL` if URI parse error, `ESP_OK` on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts mqtt client with already created client handle.

Parameters `client` –mqtt client handle

Returns `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` on other error

`esp_err_t esp_mqtt_client_reconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force reconnection upon a specific event.

Parameters `client` –mqtt client handle

Returns `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

`esp_err_t esp_mqtt_client_disconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force disconnection from the broker.

Parameters `client` –mqtt client handle

Returns `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization

esp_err_t **esp_mqtt_client_stop** (*esp_mqtt_client_handle_t* client)

Stops mqtt client tasks.

- Notes:
- Cannot be called from the mqtt event handler

Parameters **client** –mqtt client handle

Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

int **esp_mqtt_client_subscribe** (*esp_mqtt_client_handle_t* client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Parameters

- **client** –mqtt client handle
- **topic** –
- **qos** –

Returns message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to *esp_mqtt_client_subscribe* for details

Parameters

- **client** –mqtt client handle
- **topic** –

Returns message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_publish** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to *esp_mqtt_client_subscribe* for details

Parameters

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag

Returns message_id of the publish message (for QoS 0 message_id will always be zero) on success.
-1 on failure.

int **esp_mqtt_client_enqueue** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Parameters

- **client** –mqtt client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –qos of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

Returns message_id if queued successfully, -1 otherwise

esp_err_t **esp_mqtt_client_destroy** (*esp_mqtt_client_handle_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

Parameters **client** –mqtt client handle

Returns ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_set_config** (*esp_mqtt_client_handle_t* client, const *esp_mqtt_client_config_t* *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

Parameters

- **client** –mqtt client handle
- **config** –mqtt configuration structure

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

esp_err_t **esp_mqtt_client_register_event** (*esp_mqtt_client_handle_t* client, *esp_mqtt_event_id_t* event, *esp_event_handler_t* event_handler, void *event_handler_arg)

Registers mqtt event.

Parameters

- **client** –mqtt client handle
- **event** –event type
- **event_handler** –handler callback
- **event_handler_arg** –handlers context

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

int **esp_mqtt_client_get_outbox_size** (*esp_mqtt_client_handle_t* client)

Get outbox size.

Parameters **client** –mqtt client handle

Returns outbox size 0 on wrong initialization

Structures

struct **esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from tcp_transport/esp-tls | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from MQTT broker on connection |

Public Members

esp_err_t **esp_tls_last_esp_err**

last `esp_err` code reported from esp-tls component

int **esp_tls_stack_err**

tls specific error code reported from underlying tls stack

int **esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t **error_type**

error type referring to the source of the error

esp_mqtt_connect_return_code_t **connect_return_code**

connection refused error code reported from MQTT broker on connection

int **esp_transport_sock_errno**

errno from the underlying socket

struct **esp_mqtt_event_t**

MQTT event configuration structure

Public Members

esp_mqtt_event_id_t **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

void ***user_context**

User context passed from MQTT client config

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT message id of message

int **session_present**

MQTT session_present flag for connection event

[*esp_mqtt_error_codes_t*](#) ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

qos of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

struct **esp_mqtt_client_config_t**

MQTT client configuration structure

Public Members

[*mqtt_event_callback_t*](#) **event_handle**

handle for MQTT events as a callback in legacy mode

[*esp_event_loop_handle_t*](#) **event_loop_handle**

handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

bool set_null_client_id
Selects a NULL client id

const char *client_id
Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

int **task_prio**

MQTT task priority, default is 5, can be changed in `make menuconfig`

int **task_stack**

MQTT task stack size, default is 6144 bytes, can be changed in `make menuconfig`

int **buffer_size**

size of MQTT send/receive buffer, default is 1024 (only receive buffer size if `out_buffer_size` defined)

const char ***cert_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

size_t **cert_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char ***client_cert_pem**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size_t **client_cert_len**

Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

const char ***client_key_pem**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size_t **client_key_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

esp_mqtt_transport_t **transport**

overrides URI transport

int **refresh_connection_after_ms**

Refresh connection after this value (in milliseconds)

const struct *psk_key_hint* ***psk_hint_key**

Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool **use_global_ca_store**

Use a global `ca_store` for all the connections in which this bool is set.

esp_err_t (***crt_bundle_attach**)(void *conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int **reconnect_timeout_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

const char ****alpn_protos**

NULL-terminated list of supported application protocols to be used for ALPN

const char ***clientkey_password**

Client key decryption password string

int **clientkey_password_len**

String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

int **out_buffer_size**

size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as `buffer_size`

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool **use_secure_element**

enable secure element for enabling SSL connection

void ***ds_data**

carrier of handle for digital signature parameters

int **network_timeout_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool **disable_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

const char ***path**

Path in the URI

int **message_retransmit_timeout**

timeout for retransmit of failed packet

Macros

MQTT_ERROR_TYPE_ESP_TLS

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
```

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from MQTT broker on connection

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```

Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

Values:

enumerator **MQTT_EVENT_ANY**

enumerator **MQTT_EVENT_ERROR**

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

enumerator **MQTT_EVENT_CONNECTED**

connected event, additional context: `session_present` flag

enumerator **MQTT_EVENT_DISCONNECTED**

disconnected event

enumerator **MQTT_EVENT_SUBSCRIBED**

subscribed event, additional context:

- `msg_id` message id

- data pointer to the received data
- data_len length of the data for this event

enumerator **MQTT_EVENT_UNSUBSCRIBED**

unsubscribed event

enumerator **MQTT_EVENT_PUBLISHED**

published event, additional context: msg_id

enumerator **MQTT_EVENT_DATA**

data event, additional context:

- msg_id message id
- topic pointer to the received topic
- topic_len length of the topic
- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos qos level of the message
- dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**

The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

enum **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**

Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

enum **esp_mqtt_transport_t**

Values:

enumerator **MQTT_TRANSPORT_UNKNOWN**

enumerator **MQTT_TRANSPORT_OVER_TCP**

MQTT over TCP, using scheme: `mqtt`

enumerator **MQTT_TRANSPORT_OVER_SSL**

MQTT over SSL, using scheme: `mqttssl`

enumerator **MQTT_TRANSPORT_OVER_WS**

MQTT over Websocket, using scheme: `ws`

enumerator **MQTT_TRANSPORT_OVER_WSS**

MQTT over Websocket Secure, using scheme: `wss`

enum **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

Values:

enumerator **MQTT_PROTOCOL_UNDEFINED**

enumerator **MQTT_PROTOCOL_V_3_1**

enumerator **MQTT_PROTOCOL_V_3_1_1**

2.4.3 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).

Tree structure for ESP-TLS component

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
 - `cacert_buf` - pointer to the buffer which contains the CA cert.
 - `cacert_bytes` - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.*

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

Note: *These values are subject to change with change in configuration options and version of respective libraries.*

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such

as how to calculate private key parameters can be found in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in *Digital Signature*.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

Note: When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert_buf*) and the DS params (*ds_data*) are required and the client key (*clientkey_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File

- [components/esp-tls/esp_tls.h](#)

Functions

esp_tls_t ***esp_tls_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

Returns *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

esp_tls_t ***esp_tls_conn_new** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp_tls_conn_new_sync* (and its asynchronous version *esp_tls_conn_new_async*)

Parameters

- **hostname** **–[in]** Hostname of the host.
- **hostlen** **–[in]** Length of hostname.
- **port** **–[in]** Port number of the host.
- **cfg** **–[in]** TLS configuration as *esp_tls_cfg_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp_tls_cfg_t*. At a minimum, this structure should be zero-initialized.

Returns pointer to *esp_tls_t*, or NULL if connection couldn't be opened.

int **esp_tls_conn_new_sync** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

`esp_tls_t *esp_tls_conn_http_new` (const char *url, const `esp_tls_cfg_t` *cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘`esp_tls_cfg_t`’. At a minimum, this structure should be zero-initialized.

Returns pointer to `esp_tls_t`, or NULL if connection couldn’t be opened.

int `esp_tls_conn_new_async` (const char *hostname, int hostlen, int port, const `esp_tls_cfg_t` *cfg, `esp_tls_t` *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int `esp_tls_conn_http_new_async` (const char *url, const `esp_tls_cfg_t` *cfg, `esp_tls_t` *tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as `esp_tls_cfg_t`.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

static inline ssize_t **esp_tls_conn_write** (*esp_tls_t* *tls, const void *data, size_t datalen)

Write from buffer 'data' into specified tls connection.

Parameters

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

Returns

- ≥ 0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- < 0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

static inline ssize_t **esp_tls_conn_read** (*esp_tls_t* *tls, void *data, size_t datalen)

Read from specified tls connection into the buffer 'data' .

Parameters

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

Returns

- > 0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- < 0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

void **esp_tls_conn_delete** (*esp_tls_t* *tls)

Compatible version of `esp_tls_conn_destroy()` to close the TLS/SSL connection.

Note: This API will be removed in IDFv5.0

Parameters **tls** –[in] pointer to esp-tls as esp-tls handle.

int **esp_tls_conn_destroy** (*esp_tls_t* *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new()` or `esp_tls_conn_http_new()` APIs.

Parameters **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns - 0 on success

- -1 if socket error or an invalid argument

ssize_t **esp_tls_get_bytes_avail** (*esp_tls_t* *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls' `mbedtls_ssl_get_bytes_avail()` API.

Parameters **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns

- -1 in case of invalid arg
- bytes available in the application data record read buffer

esp_err_t **esp_tls_get_conn_sockfd** (*esp_tls_t* *tls, int *sockfd)

Returns the connection socket file descriptor from *esp_tls* session.

Parameters

- **tls** –[in] handle to *esp_tls* context
- **sockfd** –[out] int pointer to sockfd value.

Returns - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

esp_err_t **esp_tls_init_global_ca_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

Returns

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t **esp_tls_set_global_ca_store** (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

Parameters

- **cacert_pem_buf** –[in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** –[in] Length of the buffer.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_tls_free_global_ca_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t **esp_tls_get_and_clear_last_error** (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in *esp_tls* with detailed mbedtls related error codes. The error information is cleared internally upon return.

Parameters

- **h** –[in] esp-tls error handle.
- **esp_tls_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- **esp_tls_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

Returns

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

esp_err_t **esp_tls_get_and_clear_error_type** (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in *esp_tls* of a specific type The error information is cleared internally upon return.

Parameters

- **h** –[in] esp-tls error handle.

- **err_type** –[in] specific error type
- **error_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

Returns

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

mbedtls_x509_crt ***esp_tls_get_global_ca_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than *esp_tls*.

Note: Modifying the pointer might cause a failure in verifying the certificates.

Returns

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t **esp_tls_plain_tcp_connect** (const char *host, int hostlen, int port, const *esp_tls_cfg_t* *cfg, esp_tls_error_handle_t error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Parameters

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] ESP-TLS configuration as esp_tls_cfg_t.
- **error_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –[out] Socket descriptor if successfully connected on TCP layer

Returns ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct **psk_key_hint**

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t ***key**

key in PSK authentication mode in binary format

const size_t **key_size**

length of the key

const char ***hint**

hint in PSK authentication mode in string format

struct **tls_keep_alive_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time (second)

int **keep_alive_interval**

Keep-alive interval time (second)

int **keep_alive_count**

Keep-alive packet retry send count

struct **esp_tls_cfg**

ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls support This buffer should be NULL terminated in case of PEM

const unsigned char ***cacert_pem_buf**

CA certificate buffer legacy name

unsigned int **cacert_bytes**

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char ***clientcert_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **non_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**

Enable this option to use secure element or atec608a chip (Integrated with ESP32-WROOM-32SE)

int **timeout_ms**

Network timeout in milliseconds

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**

Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void ***ds_data**

Pointer for digital signature peripheral context

bool **is_plain_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

struct **esp_tls**

ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context **ssl**

TLS/SSL context

mbedtls_entropy_context **entropy**

mbedTLS entropy context structure

mbedtls_ctr_drbg_context **ctr_drbg**

mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config **conf**

TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context **server_fd**

mbedTLS wrapper type for sockets

mbedtls_x509_cert **cacert**

Container for the X.509 CA certificate

mbedtls_x509_crt ***cacert_ptr**

Pointer to the cacert being used.

mbedtls_x509_crt **clientcert**

Container for the X.509 client certificate

mbedtls_pk_context **clientkey**

Container for the private key of the client certificate

int **sockfd**

Underlying socket file descriptor.

ssize_t (***read**)(struct *esp_tls* *tls, char *data, size_t datalen)

Callback function for reading data from TLS/SSL connection.

ssize_t (***write**)(struct *esp_tls* *tls, const char *data, size_t datalen)

Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t **conn_state**

ESP-TLS Connection state

fd_set **rset**

read file descriptors

fd_set **wset**

write file descriptors

bool **is_tls**

indicates connection type (TLS or NON-TLS)

esp_tls_role_t **role**

esp-tls role

- ESP_TLS_CLIENT
- ESP_TLS_SERVER

esp_tls_error_handle_t **error_handle**

handle to error descriptor

Type Definitions

typedef enum *esp_tls_conn_state* **esp_tls_conn_state_t**

ESP-TLS Connection State.

typedef enum *esp_tls_role* **esp_tls_role_t**

typedef struct *psk_key_hint* **psk_hint_key_t**

ESP-TLS preshared key and hint structure.

```
typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
```

esp-tls client session ticket ctx

Keep alive parameters structure

```
typedef struct esp_tls_cfg esp_tls_cfg_t
```

ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

```
typedef struct esp_tls esp_tls_t
```

ESP-TLS Connection Handle.

Enumerations

```
enum esp_tls_conn_state
```

ESP-TLS Connection State.

Values:

enumerator **ESP_TLS_INIT**

enumerator **ESP_TLS_CONNECTING**

enumerator **ESP_TLS_HANDSHAKE**

enumerator **ESP_TLS_FAIL**

enumerator **ESP_TLS_DONE**

```
enum esp_tls_role
```

Values:

enumerator **ESP_TLS_CLIENT**

enumerator **ESP_TLS_SERVER**

2.4.4 OpenSSL-APIs

Note: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in [openssl](#) directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter Introduction

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

Chapter 1. SSL Context Method Create

1.1 const SSL_METHOD* SSLv3_client_method (void)

Arguments:

none

Return:

SSLV3.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 const SSL_METHOD* TLSv1_client_method (void)

Arguments:

none

Return:

TLSV1.0 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```

1.3 const SSL_METHOD* TLSv1_1_client_method (void)**Arguments:**

none

Return:

TLSV1.1 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ...
}
```

1.4 const SSL_METHOD* TLSv1_2_client_method (void)**Arguments:**

none

Return:

TLSV1.2 version SSL context client method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.5 const SSL_METHOD* TLS_client_method (void)**Arguments:**

none

Return:

TLSV1.2 version SSL context client method point

Description:

create the default SSL context method, it's always to be TLSV1.2

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

1.6 const SSL_METHOD* SSLv3_server_method (void)

Arguments:

none

Return:

SSLV3.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

1.7 const SSL_METHOD* TLSv1_server_method (void)

Arguments:

none

Return:

TLSV1.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```

1.8 const SSL_METHOD* TLSv1_1_server_method (void)

Arguments:

none

Return:

TLSV1.1 version SSL context server method point

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}
```

1.9 const SSL_METHOD* TLSv1_2_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the target SSL context method
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

1.10 const SSL_METHOD* TLS_server_method (void)**Arguments:**

```
none
```

Return:

```
TLSV1.2 version SSL context server method point
```

Description:

```
create the default SSL context method, it's always to be TLSV1.2
```

Example:

```
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

Chapter 2. SSL Context Function**2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)**

Arguments:

```
method - the SSL context method point
```

Return:

```
context point
```

Description:

```
create a SSL context
```

Example:

```
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)**Arguments:**

```
ctx - the SSL context point
```

Return:

```
none
```

Description:

```
free a SSL context
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;
    ... ..
    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version (SSL_CTX * ctx, const SSL_METHOD * meth)**Arguments:**

```
ctx - SSL context point
meth - SSL method point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set the SSL context version
```

Example:

```
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;

    ... ..

    SSL_CTX_set_ssl_version(ctx, meth);
}
```

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX * ctx)

Arguments:

ctx - SSL context point

Return:

SSL context method

Description:

get the SSL context method

Example:

```
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;

    ... ..

    method = SSL_CTX_get_ssl_method(ctx);
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:

ctx - SSL context point

Return:

SSL method

Description:

create a SSL

Example:

```
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;

    ... ..
}
```

(continues on next page)

(continued from previous page)

```
    ssl = SSL_new(ctx);  
}
```

3.2 void SSL_free (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
none
```

Description:

```
free SSL
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    ... ..  
    SSL_free(ssl);  
}
```

3.3 int SSL_do_handshake (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK  
0 : failed, connect is close by remote  
-1 : a error catch
```

Description:

```
perform the SSL handshake
```

Example:

```
void example(void)  
{  
    SSL *ssl;  
    int ret;  
    ... ..  
    ret = SSL_do_handshake(ssl);  
}
```

3.4 int SSL_connect (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
connect to the remote SSL server
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_connect(ssl);
}
```

3.5 int SSL_accept (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
accept the remote connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_accept(ssl);
}
```

3.6 int SSL_shutdown (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed, connect is close by remote
-1 : a error catch
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_shutdown(ssl);
}
```

3.7 int SSL_clear (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
shutdown the connection
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)**Arguments:**

```
ssl    - point
buffer - data buffer point
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch
```

Description:

```
read data from remote
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_read(ssl, buf, len);
}
```

3.9 int SSL_write (SSL * ssl, const void * buffer, int len)

Arguments:

```
ssl    - SSL point
buffer - data buffer point
len    - data length
```

Return:

```
> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch
```

Description:

```
send the data to remote
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ..

    ret = SSL_write(ssl, buf, len);
}
```

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL context
```

Description:

```
get SSL context of the SSL
```

Example:

```
void example(void)
{
```

(continues on next page)

(continued from previous page)

```
SSL *ssl;
SSL_CTX *ctx;

... ..

ctx = SSL_get_SSL_CTX(ssl);
}
```

3.11 int SSL_get_shutdown (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
get SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    int mode;

    ... ..

    mode = SSL_get_SSL_CTX(ssl);
}
```

3.12 void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

```
ssl - SSL point
```

Return:

```
shutdown mode
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    int mode = 0;

    ... ..

    SSL_set_shutdown(ssl, mode);
}
```

3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL method
```

Description:

```
set SSL shutdown mode
```

Example:

```
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..

    method = SSL_get_ssl_method(ssl);
}
```

3.14 int SSL_set_ssl_method(SSL * ssl, const SSL_METHOD * method)**Arguments:**

```
ssl - SSL point
meth - SSL method point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set the SSL method
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;

    ... ..

    ret = SSL_set_ssl_method(ssl, method);
}
```

3.15 int SSL_pending(const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
data bytes
```

Description:

```
get received data bytes
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
1 : Yes
0 : No
```

Description:

```
check if data is received
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;

    ... ..

    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
>= 0 : socket id
< 0 : a error catch
```

Description:

```
get the socket of the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
```

(continues on next page)

(continued from previous page)

```
... ..  
ret = SSL_get_fd(ssl);  
}
```

3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
>= 0 : socket id  
< 0 : a error catch
```

Description:

```
get the read only socket of the SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_rfd(ssl);  
}
```

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
>= 0 : socket id  
< 0 : a error catch
```

Description:

```
get the write only socket of the SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
  
    ... ..  
  
    ret = SSL_get_wfd(ssl);  
}
```

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set socket to SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_fd(ssl, socket);  
}
```

3.21 int SSL_set_rfd(SSL * ssl, int fd)**Arguments:**

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK  
0 : failed
```

Description:

```
set read only socket to SSL
```

Example:

```
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    int socket;  
  
    ... ..  
  
    ret = SSL_set_rfd(ssl, socket);  
}
```

3.22 int SSL_set_wfd(SSL * ssl, int fd)**Arguments:**

```
ssl - SSL point  
fd - socket id
```

Return:

```
1 : OK
0 : failed
```

Description:

```
set write only socket to SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;

    ... ..

    ret = SSL_set_wfd(ssl, socket);
}
```

3.23 int SSL_version (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL version
```

Description:

```
get SSL version
```

Example:

```
void example(void)
{
    int version;
    SSL *ssl;

    ... ..

    version = SSL_version(ssl);
}
```

3.24 const char* SSL_get_version (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL version string
```

Description:

```
get the SSL current version string
```

Example:

```
void example(void)
{
    char *version;
    SSL *ssl;

    ... ..

    version = SSL_get_version(ssl);
}
```

3.25 OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
SSL state
```

Description:

```
get the SSL state
```

Example:

```
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;

    ... ..

    state = SSL_get_state(ssl);
}
```

3.26 const char* SSL_alert_desc_string (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value string
```

Description:

```
get alert description string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string(val);
}
```

3.27 const char* SSL_alert_desc_string_long (int value)

Arguments:

```
value - SSL description
```

Return:

```
alert value long string
```

Description:

```
get alert description long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_desc_string_long(val);
}
```

3.28 const char* SSL_alert_type_string (int value)**Arguments:**

```
value - SSL type description
```

Return:

```
alert type string
```

Description:

```
get alert type string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string(val);
}
```

3.29 const char* SSL_alert_type_string_long (int value)**Arguments:**

```
value - SSL type description
```

Return:

```
alert type long string
```

Description:

```
get alert type long string
```

Example:

```
void example(void)
{
    int val;
    char *str;

    ... ..

    str = SSL_alert_type_string_long(val);
}
```

3.30 const char* SSL_rstate_string (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_rstate_string(ssl);
}
```

3.31 const char* SSL_rstate_string_long (SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string where SSL is reading
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..
```

(continues on next page)

(continued from previous page)

```
    str = SSL_rstate_string_long(ssl);
}
```

3.32 const char* SSL_state_string (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state string
```

Description:

```
get the state string
```

Example:

```
void example(void)
{
    SSL *ssl;
    const char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

3.33 char* SSL_state_string_long (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
state long string
```

Description:

```
get the state long string
```

Example:

```
void example(void)
{
    SSL *ssl;
    char *str;

    ... ..

    str = SSL_state_string(ssl);
}
```

3.34 int SSL_get_error (const SSL * ssl, int ret_code)

Arguments:

```
ssl      - SSL point
ret_code - SSL return code
```

Return:

```
SSL error number
```

Description:

```
get SSL error code
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;
    int err;

    ... ..

    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
specific statement
```

Description:

```
get the SSL specific statement
```

Example:

```
void example(void)
{
    SSL *ssl;
    int state;

    ... ..

    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want nothing
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want(ssl);
}
```

3.37 int SSL_want_read(const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want to read
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want_read(ssl);
}
```

3.38 int SSL_want_write(const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
0 : false
1 : true
```

Description:

```
check if SSL want to write
```

Example:

```
void example(void)
{
    SSL *ssl;
    int ret;

    ... ..

    ret = SSL_want_write(ssl);
}
```

Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:

```
cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes
```

Return:

```
X509 certification object point
```

Description:

```
load a character certification context into system context. If '*cert' is
pointed to the certification, then load certification into it. Or create a new X509
certification object
```

Example:

```
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ..

    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:

```
ssl - SSL point
x - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL
```

Example:

```
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;
    ... ..

    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)

Arguments:

```
ctx - SSL context point
x   - CA certification point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
add CA client certification into the SSL context
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;

    ... ..

    ret = SSL_add_client_CA(SSL_CTX_add_client_CA(ctx, new));
}
```

4.4 X509* SSL_get_certificate (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
SSL certification point
```

Description:

```
get the SSL certification point
```

Example:

```
void example(void)
{
    SSL *ssl;
    X509 *cert;

    ... ..

    cert = SSL_get_certificate(ssl);
}
```

4.5 long SSL_get_verify_result (const SSL * ssl)**Arguments:**

```
ssl - SSL point
```

Return:

```
the result of verifying
```

Description:

```
get the verifying result of the SSL certification
```

Example:

```
void example(void)
{
    SSL *ssl;
    long ret;

    ... ..

    ret = SSL_get_verify_result(ssl);
}
```

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)**Arguments:**

```
ctx - the SSL context point
pkey - certification object point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the certification into the SSL_CTX or SSL object
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;

    ... ..

    ret = SSL_CTX_use_certificate(ctx, new);
}
```

4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)**Arguments:**

```
ctx - SSL context point
len - certification length
d - data point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the ASN1 certification into SSL context
```

Example:

```

void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;

    ... ..

    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}

```

4.8 int SSL_CTX_use_PrivateKey(SSL_CTX * ctx, EVP_PKEY * pkey)

Arguments:

```

ctx - SSL context point
pkey - private key object point

```

Return:

```

1 : OK
0 : failed

```

Description:

```

load the private key into the context object

```

Example:

```

void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;

    ... ..

    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}

```

4.9 int SSL_CTX_use_PrivateKey_ASN1(int pk, SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

```

ctx - SSL context point
d   - data point
len - private key length

```

Return:

```

1 : OK
0 : failed

```

Description:

```

load the ASN1 private key into SSL context

```

Example:

```

void example(void)
{

```

(continues on next page)

(continued from previous page)

```
int ret;
int pk;
SSL_CTX *ctx;
const unsigned char *buf;
long len;

... ..

ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

```
ctx - SSL context point
d   - data point
len - private key length
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load the RSA ASN1 private key into SSL context
```

Example:

```
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)

Arguments:

```
ssl - SSL point
len - data bytes
d   - data point
```

Return:

```
1 : OK
0 : failed
```

Description:

```
load certification into the SSL
```

Example:

```

void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;

    ... ..

    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}

```

4.12 X509* SSL_get_peer_certificate (const SSL * ssl)

Arguments:

```
ssl - SSL point
```

Return:

```
peer certification
```

Description:

```
get peer certification
```

Example:

```

void example(void)
{
    SSL *ssl;
    X509 *peer;

    ... ..

    peer = SSL_get_peer_certificate(ssl);
}

```

2.4.5 ESP HTTP Client

Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- `esp_http_client_init()`: To use the HTTP client, the first thing we must do is create an `esp_http_client` by pass into this function with the `esp_http_client_config_t` configurations. Which configuration values we do not define, the library will use default.
- `esp_http_client_perform()`: The `esp_http_client` argument created from the init function is needed. This function performs all operations of the `esp_http_client`, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the `event_handle` (defined by `esp_http_client_config_t`). This function performs its job and blocks the current task until it' s done
- `esp_http_client_cleanup()`: After completing our `esp_http_client`' s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client

Application Example

```

esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }

            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
            break;
        case HTTP_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
            break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);

if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
        esp_http_client_get_status_code(client),
        esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);

```

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example

```

esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);

esp_http_client_cleanup(client);

```

HTTPS

The HTTP client supports SSL connections using **mbedtls**, with the **url** configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via [CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS](#) (enabled by default).

Note: By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert_pem` in `esp_http_client_config_t`

HTTPS example

```

static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}

```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. the HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always to called first to get the handle. Perform that functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read

- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader Check the example function `http_perform_as_stream_reader` at [protocols/esp_http_client](#).

HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of `config` entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the `UNAUTHORIZED` header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp_http_client](#).

API Reference

Header File

- [components/esp_http_client/include/esp_http_client.h](#)

Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` *config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

Parameters `config` –[in] The configurations, see `http_client_config_t`

Returns

- `esp_http_client_handle_t`
- NULL if any errors

esp_err_t esp_http_client_perform (*esp_http_client_handle_t* client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of *esp_http_client_config_t* must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

Note: You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

Parameters `client` –The `esp_http_client` handle

Returns

- ESP_OK on successful
- ESP_FAIL on error

esp_err_t esp_http_client_set_url (*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Parameters

- `client` –[in] The `esp_http_client` handle
- `url` –[in] The url

Returns

- ESP_OK
- ESP_FAIL

esp_err_t esp_http_client_set_post_field (*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Parameters

- `client` –[in] The `esp_http_client` handle
- `data` –[in] post data pointer
- `len` –[in] post length

Returns

- ESP_OK
- ESP_FAIL

int esp_http_client_get_post_field (*esp_http_client_handle_t* client, char **data)

Get current post field information.

Parameters

- `client` –[in] The client
- `data` –[out] Point to post data pointer

Returns Size of post data

esp_err_t esp_http_client_set_header (*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

Parameters

- **client** –[in] The `esp_http_client` handle
- **key** –[in] The header key
- **value** –[in] The header value

Returns

- `ESP_OK`
- `ESP_FAIL`

esp_err_t `esp_http_client_get_header` (*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Parameters

- **client** –[in] The `esp_http_client` handle
- **key** –[in] The header key
- **value** –[out] The header value

Returns

- `ESP_OK`
- `ESP_FAIL`

esp_err_t `esp_http_client_get_username` (*esp_http_client_handle_t* client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Parameters

- **client** –[in] The `esp_http_client` handle
- **value** –[out] The username value

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`

esp_err_t `esp_http_client_set_username` (*esp_http_client_handle_t* client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Parameters

- **client** –[in] The `esp_http_client` handle
- **username** –[in] The username value

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`

esp_err_t `esp_http_client_get_password` (*esp_http_client_handle_t* client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Parameters

- **client** –[in] The `esp_http_client` handle
- **value** –[out] The password value

Returns

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`

esp_err_t `esp_http_client_set_password` (*esp_http_client_handle_t* client, const char *password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Parameters

- **client** –[in] The esp_http_client handle
- **password** –[in] The password value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_auth_type** (*esp_http_client_handle_t* client, *esp_http_client_auth_type_t* auth_type)

Set http request auth_type.

Parameters

- **client** –[in] The esp_http_client handle
- **auth_type** –[in] The esp_http_client auth type

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

int **esp_http_client_get_errno** (*esp_http_client_handle_t* client)

Get HTTP client session errno.

Parameters **client** –[in] The esp_http_client handle

Returns

- (-1) if invalid argument
- errno

esp_err_t **esp_http_client_set_method** (*esp_http_client_handle_t* client, *esp_http_client_method_t* method)

Set http request method.

Parameters

- **client** –[in] The esp_http_client handle
- **method** –[in] The method

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_timeout_ms** (*esp_http_client_handle_t* client, int timeout_ms)

Set http request timeout.

Parameters

- **client** –[in] The esp_http_client handle
- **timeout_ms** –[in] The timeout value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_delete_header** (*esp_http_client_handle_t* client, const char *key)

Delete http request header.

Parameters

- **client** –[in] The esp_http_client handle
- **key** –[in] The key

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_open** (*esp_http_client_handle_t* client, int write_len)

This function will be open the connection, write all header strings and return.

Parameters

- **client** –[in] The esp_http_client handle
- **write_len** –[in] HTTP Content length need to write to the server

Returns

- ESP_OK
- ESP_FAIL

int **esp_http_client_write** (*esp_http_client_handle_t* client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

Parameters

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

Returns

- (-1) if any errors
- Length of data written

int **esp_http_client_fetch_headers** (*esp_http_client_handle_t* client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

Parameters **client** –[in] The esp_http_client handle

Returns

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

bool **esp_http_client_is_chunked_response** (*esp_http_client_handle_t* client)

Check response data is chunked.

Parameters **client** –[in] The esp_http_client handle

Returns true or false

int **esp_http_client_read** (*esp_http_client_handle_t* client, char *buffer, int len)

Read data from http stream.

Parameters

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] The length

Returns

- (-1) if any errors
- Length of data was read

int **esp_http_client_get_status_code** (*esp_http_client_handle_t* client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Parameters **client** –[in] The esp_http_client handle

Returns Status code

int **esp_http_client_get_content_length** (*esp_http_client_handle_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Parameters **client** –[in] The esp_http_client handle

Returns

- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t **esp_http_client_close** (*esp_http_client_handle_t* client)

Close http connection, still kept all http request resources.

Parameters **client** –[in] The esp_http_client handle

Returns

- ESP_OK

- ESP_FAIL

esp_err_t **esp_http_client_cleanup** (*esp_http_client_handle_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

Parameters **client** –[in] The `esp_http_client` handle

Returns

- ESP_OK
- ESP_FAIL

esp_http_client_transport_t **esp_http_client_get_transport_type** (*esp_http_client_handle_t* client)

Get transport type.

Parameters **client** –[in] The `esp_http_client` handle

Returns

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

esp_err_t **esp_http_client_set_redirection** (*esp_http_client_handle_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Parameters **client** –[in] The `esp_http_client` handle

Returns

- ESP_OK
- ESP_FAIL

void **esp_http_client_add_auth** (*esp_http_client_handle_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters **client** –[in] The `esp_http_client` handle

bool **esp_http_client_is_complete_data_received** (*esp_http_client_handle_t* client)

Checks if entire data in the response has been read without any error.

Parameters **client** –[in] The `esp_http_client` handle

Returns

- true
- false

int **esp_http_client_read_response** (*esp_http_client_handle_t* client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

Parameters

- **client** –[in] The `esp_http_client` handle
- **buffer** –The buffer
- **len** –[in] The buffer length

Returns

- Length of data was read

esp_err_t **esp_http_client_flush_response** (*esp_http_client_handle_t* client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

Parameters

- **client** –[in] The `esp_http_client` handle
- **len** –Length of data discarded

Returns

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t **esp_http_client_get_url** (*esp_http_client_handle_t* client, char *url, const int len)

Get URL from client.

Parameters

- **client** –[in] The `esp_http_client` handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_chunk_length** (*esp_http_client_handle_t* client, int *len)

Get Chunk-Length from client.

Parameters

- **client** –[in] The `esp_http_client` handle
- **len** –[out] Variable to store length

Returns

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct **esp_http_client_event**

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

`esp_http_client_handle_t` context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header value

struct **esp_http_client_config_t**

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

esp_http_client_auth_type_t **auth_type**

Http authentication type, see *esp_http_client_auth_type_t*

const char ***path**

HTTP Path, if not set, default is /

const char ***query**

HTTP query

const char ***cert_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size_t **client_cert_len**

Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char ***client_key_pem**

SSL client key, PEM format as string, if the server requires to verify client

size_t **client_key_len**

Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char ***client_key_password**

Client key decryption password string

size_t **client_key_password_len**

String length of the password pointed to by client_key_password

const char ***user_agent**

The User Agent string to send with HTTP requests

esp_http_client_method_t **method**

HTTP Method

int **timeout_ms**

Network timeout in milliseconds

bool **disable_auto_redirect**

Disable HTTP automatic redirects

int **max_redirection_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**

HTTP Event Handle

esp_http_client_transport_t **transport_type**

HTTP transport type, see esp_http_client_transport_t

int **buffer_size**

HTTP receive buffer size

int **buffer_size_tx**

HTTP transmit buffer size

void ***user_data**

HTTP user_data context

bool **is_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE

Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT

The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT

Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA

Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER

Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT

There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING

HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN

Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED

Read FIN from peer and the connection closed

Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

Values:

enumerator **HTTP_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_EVENT_ON_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP_EVENT_HEADERS_SENT**

After sending all the headers to the server

enumerator **HTTP_EVENT_HEADER_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

enumerator **HTTP_EVENT_ON_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**

The connection has been disconnected

enum **esp_http_client_transport_t**

HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**

Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**

Transport over ssl

enum **esp_http_client_method_t**

HTTP method.

Values:

enumerator **HTTP_METHOD_GET**

HTTP GET Method

enumerator **HTTP_METHOD_POST**

HTTP POST Method

enumerator **HTTP_METHOD_PUT**

HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**

HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**

HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**

HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**

HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**

HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**

HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**

HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**

HTTP Authentication type.

Values:

enumerator **HTTP_AUTH_TYPE_NONE**

No authentication

enumerator **HTTP_AUTH_TYPE_BASIC**

HTTP Basic authentication

enumerator **HTTP_AUTH_TYPE_DIGEST**

HTTP Digest authentication

enum **HttpStatus_Code**

Enum for the HTTP status codes.

Values:

enumerator **HttpStatus_Ok**

enumerator **HttpStatus_MultipleChoices**

enumerator **HttpStatus_MovedPermanently**

enumerator **HttpStatus_Found**

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

2.4.6 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C3. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri` name, `method` type (eg. `HTTPD_GET/HTTPD_POST/HTTPD_PUT` etc.), `function` pointer of type `esp_err_t *handler` (`httpd_req_t *req`) and `user_ctx` pointer to user context data.

Application Example

```
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}
```

(continues on next page)

(continued from previous page)

```

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {

```

(continues on next page)

(continued from previous page)

```

        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

```

Simple HTTP server example Check HTTP server example under [protocols/http_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↪data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↪context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http_server/persistent_sockets](#).

WebSocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see [CONFIG_HTTPD_WS_SUPPORT](#). Please check the example under [protocols/http_server/ws_echo_server](#)

API Reference

Header File

- [components/esp_http_server/include/esp_http_server.h](#)

Functions

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` *uri_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters

- **handle** `–[in]` handle to HTTPD server instance
- **uri_handler** `–[in]` pointer to handler that needs to be registered

Returns

- `ESP_OK` : On successfully registering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_HANDLERS_FULL` : If no slots left for new handler

- `ESP_ERR_HTTPD_HANDLER_EXISTS` : If handler with same URI and method is already registered

esp_err_t `httpd_unregister_uri_handler` (*httpd_handle_t* handle, const char *uri, *httpd_method_t* method)

Unregister a URI handler.

Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string
- **method** –[in] HTTP method

Returns

- `ESP_OK` : On successfully deregistering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : Handler with specified URI and method not found

esp_err_t `httpd_unregister_uri` (*httpd_handle_t* handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

Returns

- `ESP_OK` : On successfully deregistering all such handlers
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : No handler registered with specified uri string

esp_err_t `httpd_sess_set_recv_override` (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv_func** –[in] The receive function to be set for this session

Returns

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t `httpd_sess_set_send_override` (*httpd_handle_t* hd, int sockfd, *httpd_send_func_t* send_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle

- **sockfd** –[in] Session socket FD
- **send_func** –[in] The send function to be set for this session

Returns

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_pending_override** (*httpd_handle_t* hd, int sockfd, *httpd_pending_func_t* pending_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending_func** –[in] The receive function to be set for this session

Returns

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

int **httpd_req_to_sockfd** (*httpd_req_t* *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

Note: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

Parameters **r** –[in] The request whose socket descriptor should be found

Returns

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd_req_recv** (*httpd_req_t* *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf_len** –[in] Length of the buffer

Returns

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK_ERR_INVALID : Invalid arguments
- HTTPD SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t **httpd_req_get_hdr_value_len** (*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it' s value.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

Returns

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp_err_t **httpd_req_get_hdr_value_str** (*httpd_req_t* *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once *httpd_resp_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
 - Use *httpd_req_get_hdr_value_len()* to know the right buffer length
-

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val_size** –[in] Size of the user buffer “val”

Returns

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

`size_t httpd_req_get_url_query_len (httpd_req_t *r)`

Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

Parameters `r` –[in] The request being responded to

Returns

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

`esp_err_t httpd_req_get_url_query_str (httpd_req_t *r, char *buf, size_t buf_len)`

Get Query string from the request URL.

Note:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
 - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
 - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
-

Parameters

- `r` –[in] The request being responded to
- `buf` –[out] Pointer to the buffer into which the query string will be copied (if found)
- `buf_len` –[in] Length of output buffer

Returns

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

`esp_err_t httpd_query_key_value (const char *qry, const char *key, char *val, size_t val_size)`

Helper function to get a URL query tag from a query string of the type `param1=val1¶m2=val2`.

Note:

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
 - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
-

Parameters

- `qry` –[in] Pointer to query string
- `key` –[in] The key to be searched in the query string
- `val` –[out] Pointer to the buffer into which the value will be copied if the key is found

- **val_size** –[in] Size of the user buffer “val”

Returns

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Parameters

- **req** –[in] Pointer to the HTTP request
- **cookie_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

Returns

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

bool **httpd_uri_match_wildcard** (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Parameters

- **uri_template** –[in] URI template (pattern)
- **uri_to_match** –[in] URI to be matched
- **match_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

esp_err_t **httpd_resp_send** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, the request has been responded to.
 - No additional data can then be sent for the request.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf_len** –[in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

esp_err_t **httpd_resp_send_chunk** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf_len** –[in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

Returns

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline *esp_err_t* **httpd_resp_sendstr** (*httpd_req_t* *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline *esp_err_t* **httpd_resp_sendstr_chunk** (*httpd_req_t* *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_set_status** (*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the status string is valid till send function is called.
-

Parameters

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

Returns

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_type** (*httpd_req_t* *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the type string is valid till send function is called.
-

Parameters

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

Returns

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_hdr** (*httpd_req_t* *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- The header isn't sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of *max_resp_headers* in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

Returns

- ESP_OK : On successfully appending new header
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_send_err** (*httpd_req_t* *req, *httpd_err_code_t* error, const char *msg)

For sending out error code in response to HTTP request.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Parameters

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_404** (*httpd_req_t* *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters `r` –[in] The request being responded to

Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_408` (`httpd_req_t` *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters `r` –[in] The request being responded to

Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_500` (`httpd_req_t` *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters `r` –[in] The request being responded to

Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

int **httpd_send** (*httpd_req_t* *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : *httpd_resp_send()*, *httpd_resp_send_chunk()*

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the fully constructed packet is to be read
- **buf_len** –[in] Length of the buffer

Returns

- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int **httpd_socket_send** (*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by *httpd_sess_set_send_override()*.

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Parameters

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf_len** –[in] data size
- **flags** –[in] flags for the send() function

Returns

- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int **httpd_socket_recv** (*httpd_handle_t* hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by *httpd_sess_set_recv_override()*.

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Parameters

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf_len** –[in] data size
- **flags** –[in] flags for the send() function

Returns

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK_ERR_INVALID : Invalid arguments
- HTTPD SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

esp_err_t **httpd_register_err_handler** (*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd_err_code_t*. See prototype *httpd_err_handler_func_t* above for details.

Parameters

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

Returns

- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

esp_err_t **httpd_start** (*httpd_handle_t* *handle, const *httpd_config_t* *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

Parameters

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

Returns

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

esp_err_t **httpd_stop** (*httpd_handle_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Parameters **handle** –[in] Handle to server returned by `httpd_start`

Returns

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

esp_err_t **httpd_queue_work** (*httpd_handle_t* handle, *httpd_work_fn_t* work, void *arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

Note: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **work** –[in] Pointer to the function to be executed in the HTTPD's context
- **arg** –[in] Pointer to the arguments that should be passed to this function

Returns

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

void ***httpd_sess_get_ctx** (*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`

- **sockfd** –[in] The socket descriptor for which the context should be extracted.

Returns

- **void*** : Pointer to the context associated with this session
- **NULL** : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free_fn** –[in] Function that should be called to free the context

void ***httpd_sess_get_transport_ctx** (*httpd_handle_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:

`httpd_sess_get_ctx()`

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

Returns

- **void*** : Pointer to the transport context associated with this session
- **NULL** : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_transport_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session ‘transport’ context by socket descriptor.

See also:

`httpd_sess_set_ctx()`

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free_fn** –[in] Function that should be called to free the transport context

void ***httpd_get_global_user_ctx** (*httpd_handle_t* handle)

Get HTTPD global user context (it was set in the server config struct)

Parameters **handle** –[in] Handle to server returned by `httpd_start`

Returns global user context

void ***httpd_get_global_transport_ctx** (*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

Parameters **handle** –[in] Handle to server returned by `httpd_start`

Returns global transport context

esp_err_t **httpd_sess_trigger_close** (*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

Note: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

Returns

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note: Calling this API is only necessary if the LRU Purge Enable option is enabled.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

Returns

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_get_client_list** (*httpd_handle_t* handle, size_t *fds, int *client_fds)

Returns list of current socket descriptors of active sessions.

Note: Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client_fds** –[out] Array of client fds

Returns

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

Structures

struct **httpd_config**

HTTP Server Configuration Structure.

Note: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**

Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**

Maximum allowed uri handlers

uint16_t **max_resp_headers**

Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**

Number of backlog connections

bool **lru_purge_enable**

Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**

Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**

Timeout for send function (in seconds)

void ***global_user_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t **global_user_ctx_free_fn**

Free function for global user context

void ***global_transport_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

httpd_free_ctx_fn_t **global_transport_ctx_free_fn**

Free function for global transport context

bool **enable_so_linger**

bool to enable/disable linger

int **linger_timeout**

linger timeout (in seconds)

httpd_open_func_t **open_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

httpd_close_func_t **close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t **uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd_req**

HTTP Request Data Structure.

Public Members

httpd_handle_t **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method

const char **uri**[512 + 1]

The URI of this request (1 byte extra for null termination)

size_t **content_len**

Length of the request body

void ***aux**

Internally used members

void ***user_ctx**

User context pointer passed during URI registration.

void ***sess_ctx**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is `NULL`. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-`NULL`, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

httpd_free_ctx_fn_t **free_ctx**

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore_sess_ctx_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non `NULL`), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform

any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

struct **httpd_uri**

Structure for URI handler.

Public Members

const char ***uri**

The URI to handle

httpd_method_t **method**

Method supported by the URI

esp_err_t (***handler**)(*httpd_req_t* *r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

void ***user_ctx**

Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

HTTPD_DEFAULT_CONFIG ()

ESP_ERR_HTTPD_BASE

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct *httpd_req* **httpd_req_t**

HTTP Request Data Structure.

typedef struct *httpd_uri* **httpd_uri_t**

Structure for URI handler.

typedef int (***httpd_send_func_t**)(*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level send function.

Note: User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Param buf [in] buffer with bytes to send

Param buf_len [in] data size

Param flags [in] flags for the send() function

Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

typedef int (***httpd_recv_func_t**)(*httpd_handle_t* hd, int sockfd, char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level recv function.

Note: User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Param buf [in] buffer with bytes to send

Param buf_len [in] data size

Param flags [in] flags for the send() function

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket recv()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket recv()

typedef int (***httpd_pending_func_t**)(*httpd_handle_t* hd, int sockfd)

Prototype for HTTPDs low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- Bytes : The number of bytes waiting to be received

- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket pending()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket pending()

typedef *esp_err_t* (***httpd_err_handler_func_t**)(*httpd_req_t* *req, *httpd_err_code_t* error)

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

Param req [in] HTTP request for which the error needs to be handled

Param error [in] Error type

Return

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

typedef void ***httpd_handle_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method **httpd_method_t**

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (***httpd_free_ctx_fn_t**)(void *ctx)

Prototype for freeing context data (if any)

Param ctx [in] object to free

typedef *esp_err_t* (***httpd_open_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

typedef void (***httpd_close_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for closing a session.

Note: It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Param `hd` [in] server instance

Param `sockfd` [in] session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

Param `reference_uri` [in] URI/template with respect to which the other URI is matched

Param `uri_to_match` [in] URI/template being matched to the reference URI/template

Param `match_upto` [in] For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

Return true on match

```
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

Note: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```
typedef void (*httpd_work_fn_t)(void *arg)
```

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

Param `arg` [in] The arguments for this work function

Enumerations

```
enum httpd_err_code_t
```

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

enumerator `HTTPD_500_INTERNAL_SERVER_ERROR`

enumerator `HTTPD_501_METHOD_NOT_IMPLEMENTED`

enumerator `HTTPD_505_VERSION_NOT_SUPPORTED`

enumerator `HTTPD_400_BAD_REQUEST`

enumerator `HTTPD_401_UNAUTHORIZED`

enumerator `HTTPD_403_FORBIDDEN`

enumerator `HTTPD_404_NOT_FOUND`

enumerator `HTTPD_405_METHOD_NOT_ALLOWED`

enumerator `HTTPD_408_REQ_TIMEOUT`

enumerator `HTTPD_411_LENGTH_REQUIRED`

enumerator `HTTPD_414_URI_TOO_LONG`

enumerator `HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`

enumerator `HTTPD_ERR_CODE_MAX`

2.4.7 HTTPS server

Overview

This component is built on top of *esp_http_server*. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for *esp_http_server* applies also to a server you create this way.

Used APIs

The following API of *esp_http_server* should not be used with *esp_https_server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
 - `httpd_sess_set_send_override()`
 - `httpd_sess_set_rcv_override()`
 - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
 - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
 - `httpd_sess_set_transport_ctx()`
 - `httpd_get_global_transport_ctx()` - returns the shared SSL context
 - `httpd_config_t.global_transport_ctx`
 - `httpd_config_t.global_transport_ctx_free_fn`
 - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example [protocols/https_server](#) to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- [components/esp_https_server/include/esp_https_server.h](#)

Functions

esp_err_t **httpd_ssl_start** (*httpd_handle_t* *handle, *httpd_ssl_config_t* *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters

- **config** –[inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** –[out] - storage for the server handle, must be a valid pointer

Returns success

void **httpd_ssl_stop** (*httpd_handle_t* handle)

Stop the server. Blocks until the server is shut down.

Parameters **handle** –[in]

Structures

struct **esp_https_server_user_cb_arg**

Callback data struct, contains the ESP-TLS connection handle.

Public Members

const *esp_tls_t* ***tls**

ESP-TLS connection handle

struct **httpd_ssl_config**

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t ***cacert_pem**

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client_verify_cert_pem var) 2)There should be another variable servercert which would hold servers own certificate (should inherit current role of cacert var)

size_t **cacert_len**

CA certificate byte length

const uint8_t ***client_verify_cert_pem**

Client verify authority certificate (CA used to sign clients, or client cert itself)

size_t **client_verify_cert_len**

Client verify authority cert len

const uint8_t ***prvtkey_pem**

Private key

size_t **prvtkey_len**

Private key byte length

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

Macros

HTTPD_SSL_CONFIG_DEFAULT ()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

typedef struct *esp_https_server_user_cb_arg* **esp_https_server_user_cb_arg_t**

Callback data struct, contains the ESP-TLS connection handle.

typedef void **esp_https_server_user_cb** (*esp_https_server_user_cb_arg_t* *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Param user_cb Callback data struct

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

Enumerations

```
enum httpd_ssl_transport_mode_t
```

Values:

```
enumerator HTTPD_SSL_TRANSPORT_SECURE
```

```
enumerator HTTPD_SSL_TRANSPORT_INSECURE
```

2.4.8 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\r\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
```

(continues on next page)

```

uint16_t seqno;
ip_addr_t target_addr;
esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: [protocols/icmp_echo](#)

API Reference

Header File

- `components/lwip/include/apps/ping/ping_sock.h`

Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` *config, const `esp_ping_callbacks_t` *cbs, `esp_ping_handle_t` *hdl_out)

Create a ping session.

Parameters

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl_out** –handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t` hdl)

Delete a ping session.

Parameters **hdl** –handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully

`esp_err_t esp_ping_start` (`esp_ping_handle_t` hdl)

Start the ping session.

Parameters **hdl** –handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: start ping session successfully

`esp_err_t esp_ping_stop` (`esp_ping_handle_t` hdl)

Stop the ping session.

Parameters **hdl** –handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: stop ping session successfully

esp_err_t **esp_ping_get_profile** (*esp_ping_handle_t* hdl, *esp_ping_profile_t* profile, void *data, uint32_t size)

Get runtime profile of ping session.

Parameters

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP_OK: get profile successfully

Structures

struct **esp_ping_callbacks_t**

Type of "ping" callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (***on_ping_end**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct **esp_ping_config_t**

Type of "ping" configuration.

Public Members

uint32_t **count**

A "ping" session contains count procedures

uint32_t **interval_ms**

Milliseconds between each ping procedure

uint32_t **timeout_ms**

Timeout value (in milliseconds) of each ping procedure

uint32_t **data_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip_addr_t **target_addr**

Target IP address, either IPv4 or IPv6

uint32_t **task_stack_size**

Stack size of internal ping task

uint32_t **task_prio**

Priority of internal ping task

uint32_t **interface**

Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG ()

Default ping configuration.

ESP_PING_COUNT_INFINITE

Set ping count to zero will ping target infinitely

Type Definitions

typedef void ***esp_ping_handle_t**

Type of “ping” session handle.

Enumerations

enum **esp_ping_profile_t**

Profile of ping session.

Values:

enumerator **ESP_PING_PROF_SEQNO**

Sequence number of a ping procedure

enumerator **ESP_PING_PROF_TOS**

Type of service of a ping procedure

enumerator **ESP_PING_PROF_TTL**

Time to live of a ping procedure

enumerator **ESP_PING_PROF_REQUEST**

Number of request packets sent out

- enumerator **ESP_PING_PROF_REPLY**
Number of reply packets received
- enumerator **ESP_PING_PROF_IPADDR**
IP address of replied target
- enumerator **ESP_PING_PROF_SIZE**
Size of received packet
- enumerator **ESP_PING_PROF_TIMEGAP**
Elapsed time between request and reply packet
- enumerator **ESP_PING_PROF_DURATION**
Elapsed time of the whole ping session

2.4.9 ESP Local Control

Overview

ESP Local Control (**esp_local_ctrl**) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp_local_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = &(protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <----- */
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx          = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_
↪start");
extern const unsigned char cacert_pem_end[]   asm("_binary_cacert_pem_end
↪");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvkey_pem_start[] asm("_binary_prvkey_pem_
↪start");
extern const unsigned char prvkey_pem_end[]   asm("_binary_prvkey_pem_
↪end");
https_conf.prvkey_pem = prvkey_pem_start;
https_conf.prvkey_len = prvkey_pem_end - prvkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. **PROTCOM_SEC1**: specifies that end to end encryption is used.
2. **PROTCOM_SEC0**: specifies that data will be exchanged as a plain text.
3. **PROTCOM_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide *custom_handle* of type *protocomm_security_t* * in this context.

Creating a property

Now that we know how to start the **esp_local_ctrl** service, let' s add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp_local_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics

of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    esp_local_ctrl_prop_val_t *prop_
→values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t
→*prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
→props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
        }
    }
}
```

(continues on next page)

(continued from previous page)

```

        /* For keeping it simple, lets only log the incoming data */
        ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                prop_values[i].size, ESP_LOG_INFO);
    }
}
return ESP_OK;
}

```

For complete example see [protocols/esp_local_ctrl](#)

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp_local_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (*set / get*). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp_local_ctrl** service:

1. *get_prop_count* : This should simply return the total number of properties supported by the service
2. *get_prop_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set_prop_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get_prop_count* and then *get_prop_values*, hence form an index to name mapping for all properties. Now when calling *set_prop_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp_local_ctrl** are listed below:

Table 5: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl	<a href="https://<mdns-hostname>.local/esp_local_ctrl/version">https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl	<a href="https://<mdns-hostname>.local/esp_local_ctrl/control">https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

API Reference

Header File

- [components/esp_local_ctrl/include/esp_local_ctrl.h](#)

Functions

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_ble** (void)

Function for obtaining BLE transport mode.

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_httpd** (void)

Function for obtaining HTTPD transport mode.

esp_err_t **esp_local_ctrl_start** (const *esp_local_ctrl_config_t* *config)

Start local control service.

Parameters **config** –[in] Pointer to configuration structure

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_stop** (void)

Stop local control service.

esp_err_t **esp_local_ctrl_add_property** (const *esp_local_ctrl_prop_t* *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

Parameters **prop** –[in] Property description structure

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Parameters **name** –[in] Name of the property to remove

Returns

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

const *esp_local_ctrl_prop_t* ***esp_local_ctrl_get_property** (const char *name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

Parameters **name** –[in] Name of the property to find

Returns

- Pointer to property
- NULL if not found

esp_err_t **esp_local_ctrl_set_handler** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register `protocomm` handler for a custom endpoint.

This API can be called by the application to register a `protocomm` handler for an endpoint after the local control service has started.

Note: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Parameters

- **ep_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user_ctx** –[in] User data

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union **esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

struct **esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

char ***name**

Unique name of property

uint32_t **type**

Type of property. This may be set to application defined enums

size_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void ***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (***ctx_free_fn**)(void *ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_prop_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void ***data**

Pointer to memory holding property value

size_t **size**

Size of property value

void (***free_fn**)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct **esp_local_ctrl_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the current values for which have been requested by the client

Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

esp_err_t (***set_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], const
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

Note: If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

- Param props_count [in]** Total elements in the props array
- Param props [in]** Array of properties, the values for which the client requests to change
- Param prop_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument
- Param usr_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure
- Return** Returning different error codes will convey the corresponding protocol level errors to the client :
- `ESP_OK` : Success
 - `ESP_ERR_INVALID_ARG` : InvalidArgument
 - `ESP_ERR_INVALID_STATE` : InvalidProto
 - All other error codes : InternalError

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**)(void *usr_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_proto_sec_cfg**

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, `sec0/sec1` or `custom`. If `custom`, user must provide handle via `proto_sec_custom_handle` below

void ***custom_handle**

Custom security handle if security is set `custom` via `proto_sec` above. This handle must follow `protocomm_security_t` signature

void ***pop**

Proof of possession to be used for local control. Could be `NULL`.

struct **esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const *esp_local_ctrl_transport_t* ***transport**

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties

size_t **max_properties**

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct *esp_local_ctrl_prop* **esp_local_ctrl_prop_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* **esp_local_ctrl_prop_val_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* **esp_local_ctrl_handlers_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp_local_ctrl_transport* **esp_local_ctrl_transport_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm_ble_config* **esp_local_ctrl_transport_config_ble_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd_ssl_config* **esp_local_ctrl_transport_config_httpd_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`

typedef enum *esp_local_ctrl_proto_sec* **esp_local_ctrl_proto_sec_t**

Security types for `esp_local_control`.

typedef struct *esp_local_ctrl_proto_sec_cfg* **esp_local_ctrl_proto_sec_cfg_t**

Protocom security configs

typedef struct *esp_local_ctrl_config* **esp_local_ctrl_config_t**
Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

enum **esp_local_ctrl_proto_sec**

Security types for `esp_local_control`.

Values:

enumerator **PROTOCOLCOM_SEC0**

enumerator **PROTOCOLCOM_SEC1**

enumerator **PROTOCOLCOM_SEC_CUSTOM**

2.4.10 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on [Apple's support page](#). On Linux, mDNS is provided by [avahi](#) and is usually installed by default.

mDNS Properties

- `hostname`: the hostname that the device will respond to. If not set, the `hostname` will be read from the interface. Example: `my-esp32c3` will resolve to `my-esp32c3.local`
- `default_instance`: friendly name for your device, like `Jhon's ESP32-C3 Thing`. If not set, `hostname` will be used.

Example method to start mDNS for the STA interface and set `hostname` and `default_instance`:

```
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32c3");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32-C3 Thing");
}
```

mDNS Services mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- `instance_name`: friendly name for your service, like Jhon's ESP32-C3 Web Server. If not defined, `default_instance` will be used.
- `service_type`: (required) service type, prepended with underscore. Some common types can be found [here](#).
- `proto`: (required) protocol that the service runs on, prepended with underscore. Example: `_tcp` or `_udp`
- `port`: (required) network port that the service runs on
- `txt`: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-C3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "{esp32c3}"},
        {"u", "user"},
        {"p", "password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

mDNS Query mDNS provides methods for browsing for services and resolving host's IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!");
            return;
        }
        printf("Query Failed");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```

static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_
↳protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] ", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(&(a->addr.u_addr.ip4)));
            }
            a = a->next;
        }
        r = r->next;
    }
}

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

```

Example of using the methods above:

```

void my_app_some_method(){
    //search for esp32c3-mdns.local
    resolve_mdns_host("esp32c3-mdns");
}

```

(continues on next page)

(continued from previous page)

```

//search for HTTP servers
find_mdns_service("_http", "_tcp");
//or file servers
find_mdns_service("_smb", "_tcp"); //windows sharing
find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
find_mdns_service("_nfs", "_tcp"); //NFS server
find_mdns_service("_ftp", "_tcp"); //FTP server
//or networked printer
find_mdns_service("_printer", "_tcp");
find_mdns_service("_ipp", "_tcp");
}

```

Application Example

mDNS server/scanner example: [protocols/mdns](#).

API Reference

Header File

- [components/mdns/include/mdns.h](#)

Functions

esp_err_t **mdns_init** (void)

Initialize mDNS on given interface.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mdns task

void **mdns_free** (void)

Stop and free mDNS server.

esp_err_t **mdns_hostname_set** (const char *hostname)

Set the hostname for mDNS server required if you want to advertise services.

Parameters **hostname** –Hostname to set

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_delegate_hostname_add** (const char *hostname, const *mdns_ip_addr_t* *address_list)

Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

Parameters

- **hostname** –Hostname to add
- **address_list** –The IP address list of the host

Returns

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_delegate_hostname_remove** (const char *hostname)

Remove a delegated hostname All the services added to this host will also be removed.

Parameters **hostname** –Hostname to remove

Returns

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

bool **mdns_hostname_exists** (const char *hostname)

Query whether a hostname has been added.

Parameters **hostname** –Hostname to query

Returns

- true The hostname has been added.
- false The hostname has not been added.

esp_err_t **mdns_instance_name_set** (const char *instance_name)

Set the default instance name for mDNS server.

Parameters **instance_name** –Instance name to set

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_add** (const char *instance_name, const char *service_type, const char *proto, uint16_t port, *mdns_txt_item_t* txt[], size_t num_items)

Add service to mDNS server.

Note: The value length of txt items will be automatically decided by strlen

Parameters

- **instance_name** –instance name to set. If NULL, global instance name or hostname will be used. Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **port** –service port
- **txt** –string array of TXT data (eg. {{ “var” ,” val” }, { “other” ,” 2” }})
- **num_items** –number of items in TXT data

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

esp_err_t **mdns_service_add_for_host** (const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, *mdns_txt_item_t* txt[], size_t num_items)

Add service to mDNS server with a delegated hostname.

Note: The value length of txt items will be automatically decided by strlen

Parameters

- **instance_name** –instance name to set. If NULL, global instance name or hostname will be used Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **port** –service port
- **txt** –string array of TXT data (eg. `{{ “var” ,” val” },{ “other” ,” 2” }}`)
- **num_items** –number of items in TXT data

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

bool **mdns_service_exists** (const char *service_type, const char *proto, const char *hostname)

Check whether a service has been added.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

Returns

- true Correspondding service has been added.
- false Service not found.

bool **mdns_service_exists_with_instance** (const char *instance, const char *service_type, const char *proto, const char *hostname)

Check whether a service has been added.

Parameters

- **instance** –instance name
- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, checks for the local hostname.

Returns

- true Correspondding service has been added.
- false Service not found.

esp_err_t **mdns_service_remove** (const char *service_type, const char *proto)

Remove service from mDNS server.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_remove_for_host** (const char *service_type, const char *proto, const char *hostname)

Remove service from mDNS server with hostname.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If NULL, local hostname will be used.

Returns

- ESP_OK success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_instance_name_set` (const char *service_type, const char *proto, const char *instance_name)

Set instance name for service.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **instance_name** –instance name to set

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_instance_name_set_for_host` (const char *service_type, const char *proto, const char *hostname, const char *instance_name)

Set instance name for service with hostname.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **instance_name** –instance name to set

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_port_set` (const char *service_type, const char *proto, uint16_t port)

Set service port.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **port** –service port

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_port_set_for_host` (const char *service_type, const char *proto, const char *hostname, uint16_t port)

Set service port with hostname.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **port** –service port

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t **mdns_service_txt_set** (const char *service_type, const char *proto, *mdns_txt_item_t* txt[], uint8_t num_items)

Replace all TXT items for service.

Note: The value length of txt items will be automatically decided by strlen

Parameters

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num_items** –number of items in TXT data

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_set_for_host** (const char *service_type, const char *proto, const char *hostname, *mdns_txt_item_t* txt[], uint8_t num_items)

Replace all TXT items for service with hostname.

Note: The value length of txt items will be automatically decided by strlen

Parameters

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **txt** –array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
- **num_items** –number of items in TXT data

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_item_set** (const char *service_type, const char *proto, const char *key, const char *value)

Set/Add TXT item for service TXT record.

Note: The value length will be automatically decided by strlen

Parameters

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **key** –the key that you want to add/update
- **value** –the new value of the key

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t `mdns_service_txt_item_set_with_explicit_value_len` (const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)

Set/Add TXT item for service TXT record.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value_len** –the length of the value

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_txt_item_set_for_host` (const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)

Set/Add TXT item for service TXT record with hostname.

Note: The value length will be automatically decided by `strlen`

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NOT_FOUND` Service not found
- `ESP_ERR_NO_MEM` memory error

esp_err_t `mdns_service_txt_item_set_for_host_with_explicit_value_len` (const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, uint8_t value_len)

Set/Add TXT item for service TXT record with hostname and txt value length.

Parameters

- **service_type** –service type (`_http`, `_ftp`, etc)
- **proto** –service protocol (`_tcp`, `_udp`)
- **hostname** –service hostname. If `NULL`, local hostname will be used.
- **key** –the key that you want to add/update
- **value** –the new value of the key
- **value_len** –the length of the value

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_item_remove** (const char *service_type, const char *proto, const char *key)

Remove TXT item for service TXT record.

Parameters

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **key** –the key that you want to remove

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_txt_item_remove_for_host** (const char *service_type, const char *proto, const char *hostname, const char *key)

Remove TXT item for service TXT record with hostname.

Parameters

- **service_type** –service type (_http, _ftp, etc)
- **proto** –service protocol (_tcp, _udp)
- **hostname** –service hostname. If NULL, local hostname will be used.
- **key** –the key that you want to remove

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

esp_err_t **mdns_service_remove_all** (void)

Remove and free all services from mDNS server.

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **mdns_query_async_delete** (*mdns_search_once_t* *search)

Deletes the finished query. Call this only after the search has ended!

Parameters **search** –pointer to search object

Returns

- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

bool **mdns_query_async_get_results** (*mdns_search_once_t* *search, uint32_t timeout, *mdns_result_t* **results)

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

Parameters

- **search** –pointer to search object
- **timeout** –time in milliseconds to wait for answers
- **results** –pointer to the results of the query

Returns True if search has finished before or at timeout False if search timeout is over

mdns_search_once_t ***mdns_query_async_new** (const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, *mdns_query_notify_t* notifier)

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

Parameters

- **name** –service instance or host name (NULL for PTR queries)
- **service_type** –service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto** –service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS_TYPE_*)
- **timeout** –time in milliseconds during which mDNS query is active
- **max_results** –maximum results to be collected
- **notifier** –Notification function to be called when the result is ready, can be NULL

Returns *mdns_search_once_s* pointer to new search object if query initiated successfully. NULL otherwise.

esp_err_t **mdns_query** (const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, *mdns_result_t* **results)

Query mDNS for host or service All following query methods are derived from this one.

Parameters

- **name** –service instance or host name (NULL for PTR queries)
- **service_type** –service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto** –service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type** –type of query (MDNS_TYPE_*)
- **timeout** –time in milliseconds to wait for answers.
- **max_results** –maximum results to be collected
- **results** –pointer to the results of the query results must be freed using *mdns_query_results_free* below

Returns

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

void **mdns_query_results_free** (*mdns_result_t* *results)

Free query results.

Parameters **results** –linked list of results to be freed

esp_err_t **mdns_query_ptr** (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, *mdns_result_t* **results)

Query mDNS for service.

Parameters

- **service_type** –service type (_http, _arduino, _ftp etc.)
- **proto** –service protocol (_tcp, _udp, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **max_results** –maximum results to be collected
- **results** –pointer to the results of the query

Returns

- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

esp_err_t **mdns_query_srv** (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, *mdns_result_t* **result)

Query mDNS for SRV record.

Parameters

- **instance_name** –service instance name
- **service_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

esp_err_t **mdns_query_txt** (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, *mdns_result_t* **result)

Query mDNS for TXT record.

Parameters

- **instance_name** –service instance name
- **service_type** –service type (`_http`, `_arduino`, `_ftp` etc.)
- **proto** –service protocol (`_tcp`, `_udp`, etc.)
- **timeout** –time in milliseconds to wait for answer.
- **result** –pointer to the result of the query

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

esp_err_t **mdns_query_a** (const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)

Query mDNS for A record.

Parameters

- **host_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer.
- **addr** –pointer to the resulting IP4 address

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

esp_err_t **mdns_query_aaaa** (const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Parameters

- **host_name** –host name to look for
- **timeout** –time in milliseconds to wait for answer. If 0, `max_results` needs to be defined
- **addr** –pointer to the resulting IP6 address

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_STATE` mDNS is not running
- `ESP_ERR_NO_MEM` memory error
- `ESP_ERR_INVALID_ARG` parameter error

esp_err_t **mdns_handle_system_event** (void *ctx, *system_event_t* *event)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Parameters

- **ctx** –The system event context
- **event** –The system event

Structures

struct **mdns_txt_item_t**
mDNS basic text item structure Used in `mdns_service_add()`

Public Members

const char ***key**
item key name

const char ***value**
item value string

struct **mdns_ip_addr_s**
mDNS query linked list IP item

Public Members

esp_ip_addr_t **addr**
IP address

struct *mdns_ip_addr_s* ***next**
next IP, or NULL for the last IP in the list

struct **mdns_result_s**
mDNS query result structure

Public Members

struct *mdns_result_s* ***next**
next result, or NULL for the last result in the list

mdns_if_t **tcpip_if**
interface index

uint32_t **ttl**
time to live

mdns_ip_protocol_t **ip_protocol**
ip_protocol type of the interface (v4/v6)

char ***instance_name**
instance name

char ***service_type**
service type

char ***proto**
service protocol

char ***hostname**
hostname

uint16_t **port**
service port

mdns_txt_item_t ***txt**
txt record

uint8_t ***txt_value_len**
array of txt value len of each record

size_t **txt_count**
number of txt items

mdns_ip_addr_t ***addr**
linked list of IP addresses found

Macros

MDNS_TYPE_A

MDNS_TYPE_PTR

MDNS_TYPE_TXT

MDNS_TYPE_AAAA

MDNS_TYPE_SRV

MDNS_TYPE_OPT

MDNS_TYPE_NSEC

MDNS_TYPE_ANY

Type Definitions

typedef struct mdns_search_once_s **mdns_search_once_t**
Asynchronous query handle.

typedef struct *mdns_ip_addr_s* **mdns_ip_addr_t**
mDNS query linked list IP item

```
typedef enum mdns_if_internal mdns_if_t
```

```
typedef struct mdns_result_s mdns_result_t  
    mDNS query result structure
```

```
typedef void (*mdns_query_notify_t)(mdns_search_once_t *search)
```

Enumerations

```
enum mdns_ip_protocol_t  
    mDNS enum to specify the ip_protocol type
```

Values:

```
    enumerator MDNS_IP_PROTOCOL_V4
```

```
    enumerator MDNS_IP_PROTOCOL_V6
```

```
    enumerator MDNS_IP_PROTOCOL_MAX
```

```
enum mdns_if_internal
```

Values:

```
    enumerator MDNS_IF_STA
```

```
    enumerator MDNS_IF_AP
```

```
    enumerator MDNS_IF_ETH
```

```
    enumerator MDNS_IF_MAX
```

2.4.11 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces.

Options Of Usage

There are two options for using the ESP-Modbus library in your projects:

1. Using the `freemodbus` component included in the current release of ESP-IDF.
The ESP-IDF component `freemodbus` included in this release reflects the `esp-modbus` component of version v1.0.7. This release of the component is used by default in the existing examples mentioned below on this page.
The downside of this option is that the `freemodbus` component may not contain the latest fixes from `esp-modbus` repository. Because of this, it is recommended to use the original `esp-modbus` component for new projects (the option 2).
2. Using the `esp-modbus` component via the component manager instead of `freemodbus`.
Additional information for the ESP-Modbus component can be found in the separate repository:
 - [ESP-Modbus component on GitHub](#)

In order to use `esp-modbus` component, your application must include the statement below in its `CMakeLists.txt` file to exclude the `freemodbus` component from the build. The excluding of the `freemodbus` component is required to avoid compilation issues when `esp-modbus` is used in conjunction with the component manager.

```
set(EXCLUDE_COMPONENTS freemodbus)
```

If your project uses the make build system, the statement below needs to be added into project Makefile:

```
EXCLUDE_COMPONENTS := freemodbus
```

The main component folder of the new application shall include the component manager manifest file `idf_component.yml` as below:

```
dependencies:
  idf: ">=4.1"
  espressif/esp-modbus:
    version: "^1.0"
```

This option allows to use the latest `esp-modbus` component updates in any projects based on ESP-IDF versions from v4.1 up to v5.0. Refer to [component manager documentation](#) for more information on how to set up the component manager. The `esp-modbus` component can be found in [component manager registry](#).

Managed Documentation

The component documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb_slave](#)
- [protocols/modbus/serial/mb_master](#)
- [protocols/modbus/tcp/mb_tcp_slave](#)
- [protocols/modbus/tcp/mb_tcp_master](#)

Please refer to the specific example `README.md` for details.

2.4.12 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32-C3

Features

- Supports WebSocket over TCP, TLS with `mbedtls`
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
 - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
 - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

TLS Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

Note: If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem ``

This command will extract the second certificate in the chain and save it as a pem-file.

Subprotocol The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

Note: The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

Events

- **WEBSOCKET_EVENT_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the websocket.org server can be found here: [protocols/websocket](#).

Sending Text Data The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

Functions

`esp_websocket_client_handle_t esp_websocket_client_init` (const `esp_websocket_client_config_t` *config)

Start a Websocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

Parameters `config` **–[in]** The configuration

Returns

- `esp_websocket_client_handle_t`
- NULL if any errors

esp_err_t **esp_websocket_client_set_uri** (*esp_websocket_client_handle_t* client, const char *uri)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones. Must stop the WebSocket client before set URI if the client has been connected.

Parameters

- **client** –[in] The client
- **uri** –[in] The uri

Returns *esp_err_t*

esp_err_t **esp_websocket_client_start** (*esp_websocket_client_handle_t* client)

Open the WebSocket connection.

Parameters **client** –[in] The client

Returns *esp_err_t*

esp_err_t **esp_websocket_client_stop** (*esp_websocket_client_handle_t* client)

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

Parameters **client** –[in] The client

Returns *esp_err_t*

esp_err_t **esp_websocket_client_destroy** (*esp_websocket_client_handle_t* client)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

Parameters **client** –[in] The client

Returns *esp_err_t*

int **esp_websocket_client_send** (*esp_websocket_client_handle_t* client, const char *data, int len, TickType_t timeout)

Generic write data to the WebSocket connection; defaults to binary send.

Parameters

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

Returns

- Number of data was sent
- (-1) if any errors

int **esp_websocket_client_send_bin** (*esp_websocket_client_handle_t* client, const char *data, int len, TickType_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Parameters

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

Returns

- Number of data was sent
- (-1) if any errors

int **esp_websocket_client_send_text** (*esp_websocket_client_handle_t* client, const char *data, int len, TickType_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Parameters

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

Returns

- Number of data was sent
- (-1) if any errors

esp_err_t **esp_websocket_client_close** (*esp_websocket_client_handle_t* client, TickType_t timeout)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

Parameters

- **client** –[in] The client
- **timeout** –[in] Timeout in RTOS ticks for waiting

Returns `esp_err_t`

esp_err_t **esp_websocket_client_close_with_code** (*esp_websocket_client_handle_t* client, int code, const char *data, int len, TickType_t timeout)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:

- Cannot be called from the websocket event handler

Parameters

- **client** –[in] The client
- **code** –[in] Close status code as defined in RFC6455 section-7.4
- **data** –[in] Additional data to closing message
- **len** –[in] The length of the additional data
- **timeout** –[in] Timeout in RTOS ticks for waiting

Returns `esp_err_t`

bool **esp_websocket_client_is_connected** (*esp_websocket_client_handle_t* client)

Check the WebSocket client connection state.

Parameters **client** –[in] The client handle

Returns

- true
- false

esp_err_t **esp_websocket_register_events** (*esp_websocket_client_handle_t* client, *esp_websocket_event_id_t* event, *esp_event_handler_t* event_handler, void *event_handler_arg)

Register the Websocket Events.

Parameters

- **client** –The client handle
- **event** –The event id
- **event_handler** –The callback function
- **event_handler_arg** –User context

Returns esp_err_t

Structures

struct **esp_websocket_event_data_t**

Websocket event data.

Public Members

const char ***data_ptr**

Data pointer

int **data_len**

Data length

uint8_t **op_code**

Received opcode

esp_websocket_client_handle_t **client**

esp_websocket_client_handle_t context

void ***user_context**

user_data context, from *esp_websocket_client_config_t* user_data

int **payload_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

int **payload_offset**

Actual offset for the data associated with this event

struct **esp_websocket_client_config_t**

Websocket client setup configuration.

Public Members

const char ***uri**

Websocket URI, the information on the URI can be overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char ***username**

Using for Http authentication - Not supported for now

const char ***password**

Using for Http authentication - Not supported for now

const char ***path**

HTTP Path, if not set, default is /

bool **disable_auto_reconnect**

Disable the automatic reconnect function when disconnected

void ***user_context**

HTTP user data context

int **task_prio**

Websocket task priority

int **task_stack**

Websocket task stack

int **buffer_size**

Websocket buffer size

const char ***cert_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t **client_cert_len**

Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char ***client_key**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t **client_key_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

esp_websocket_transport_t **transport**

Websocket transport type, see `esp_websocket_transport_t`

const char ***subprotocol**

Websocket subprotocol

const char ***user_agent**

Websocket user-agent

const char ***headers**

Websocket additional headers

int **pingpong_timeout_sec**

Period before connection is aborted due to no PONGs received

bool **disable_pingpong_discon**

Disable auto-disconnect due to no PONG received within `pingpong_timeout_sec`

bool **use_global_ca_store**

Use a global `ca_store` for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

size_t **ping_interval_sec**

Websocket ping interval, defaults to 10 seconds if not set

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

Enumerations

enum **esp_websocket_event_id_t**

Websocket Client events id.

Values:

enumerator **WEBSOCKET_EVENT_ANY**

enumerator **WEBSOCKET_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **WEBSOCKET_EVENT_CONNECTED**

Once the Websocket has been connected to the server, no data exchange has been performed

enumerator **WEBSOCKET_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **WEBSOCKET_EVENT_DATA**

When receiving data from the server, possibly multiple portions of the packet

enumerator **WEBSOCKET_EVENT_CLOSED**

The connection has been closed cleanly

enumerator **WEBSOCKET_EVENT_MAX**

enum **esp_websocket_transport_t**

Websocket Client transport.

Values:

enumerator **WEBSOCKET_TRANSPORT_UNKNOWN**

Transport unknown

enumerator **WEBSOCKET_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **WEBSOCKET_TRANSPORT_OVER_SSL**

Transport over ssl

2.4.13 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp_serial_slave_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp_serial_slave_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- **Address:** 8-bit, master to slave, optional
For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

Data IO Modes In some IO modes, more data wires can be use to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here' s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined is determined by the command sent by the master (See [Supported Commands](#)), except from the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it' s not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit form the QPI mode, master can send EXQPI command.

Supported Commands

Note: The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

Segment Transaction Mode Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp_serial_slave_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave The ESP SDIO slave link (ESSL SDIO) devices relies on the *sdmmc* component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a *sdmmc* card (see `:doc:` Document of SDMMC driver </api-reference/storage/sdmmc>``) structure.
2. Call `sdmmc_card_init()` to initialize the card.

3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave

Note: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn't been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional) Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32-C3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

API Reference

Header File

- `components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

Functions

`esp_err_t` **essl_init** (*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl_wait_for_ready** (*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_get_tx_buffer_num** (*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Parameters

- **handle** –Handle of a ESSL device.
- **out_tx_num** –Output of buffer num that host can send data to ESSL slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_get_rx_data_size** (*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

Parameters

- **handle** –Handle of an ESSL device.
- **out_rx_size** –Output of data size to read from slave, in bytes
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_reset_cnt** (*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

Parameters **handle** –Handle of an ESSL device.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

esp_err_t **essl_send_packet** (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

Parameters

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init or other argument is not valid.
- `ESP_ERR_TIMEOUT`: No buffer to use, or error ftrom SDMMC host controller.
- `ESP_ERR_NOT_FOUND`: Slave is not ready for receiving.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_get_packet** (*essl_handle_t* handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **out_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out_length** –[out] Output of length the data actually received from slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success: All the data has been read from the slave.
- `ESP_ERR_INVALID_ARG`: Invalid argument, The handle is not initialized or the other arguments are invalid.
- `ESP_ERR_NOT_FINISHED`: Read was successful, but there is still data remaining.
- `ESP_ERR_NOT_FOUND`: Slave is not ready to send data.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

esp_err_t **essl_write_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

Note: sdio 28-31 are reserved, the lower API helps to skip.

Parameters

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value_o** –Output of the returned written value.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_read_reg** (*essl_handle_t* handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

Parameters

- **handle** –Handle of a `essl` device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o** –Output value read from the register.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl_wait_int** (`essl_handle_t` handle, `uint32_t` wait_ms)

wait for an interrupt of the slave

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

`esp_err_t` **essl_clear_intr** (`essl_handle_t` handle, `uint32_t` intr_mask, `uint32_t` wait_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to clear.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_get_intr** (`essl_handle_t` handle, `uint32_t` *intr_raw, `uint32_t` *intr_st, `uint32_t` wait_ms)

Get interrupt bits of ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_set_intr_ena** (`essl_handle_t` handle, `uint32_t` ena_mask, `uint32_t` wait_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters

- **handle** –Handle of an ESSL device.
- **ena_mask** –Mask of the interrupt bits to enable.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr_ena** (*essl_handle_t* handle, uint32_t *ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **ena_mask_o** –Output of interrupt bit enable mask.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK Success
- One of the error codes from SDMMC host controller

esp_err_t **essl_send_slave_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to send to slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

Header File

- [components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h](#)

Functions

esp_err_t **essl_sdio_init_dev** (*essl_handle_t* *out_handle, const *essl_sdio_config_t* *config)

Initialize the ESSL SDIO device and get its handle.

Parameters

- **out_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

Returns

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

esp_err_t **essl_sdio_deinit_dev** (*essl_handle_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

Parameters **handle** –Handle of the ESSL SDIO device to deinit.

Returns

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t ***card**

The initialized sdmmc card pointer of the slave.

int **recv_buffer_size**

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- [components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h](#)

Functions

esp_err_t **essl_spi_init_dev** (*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

Parameters

- **out_handle** –[out] Output of the handle
- **init_config** –Configuration for the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t **essl_spi_deinit_dev** (*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters **handle** –Handle of the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t **essl_spi_read_reg** (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see *rx_sync_reg* in *essl_spi_config_t*)

Parameters

- **arg** –Context of the component. (Member *arg* from *essl_handle_t*)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** –[out] Read buffer for the shared registers.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_get_packet** (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** –[out] Output data address
- **size** –The size of the output data.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl_spi_write_reg** (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

Note: Feature of checking the actual written value (`out_value`) is not supported.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out_value** –[out] Not supported, should be set to `NULL`.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl_spi_send_packet** (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl_spi_reset_cnt** (void *arg)

Reset the counter in Master context.

Note: Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters **arg** –Context of the component. (Member **arg** from **essl_handle_t**)

esp_err_t **essl_spi_rdbuf** (*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

Note: The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note: **out_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_rdbuf_polling** (*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in polling way.

Note: **out_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrbuf** (*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in ISR way.

Note: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t `essl_spi_wrbuf_polling` (*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

Note: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

esp_err_t `essl_spi_rddma` (*spi_device_handle_t* spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_rddma_seg** (*spi_device_handle_t* spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

Note: To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg_len** –Length of this segment
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_rddma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

Note: This is required only when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_wrdma** (*spi_device_handle_t* spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

Note: This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_wrdma_seg** (*spi_device_handle_t* spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

Note: To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** –Length of this segment
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note: This is required only when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Structures

struct **essl_spi_config_t**

Configuration of ESSL SPI device.

Public Members

spi_device_handle_t ***spi**

Pointer to SPI device handle.

uint32_t **tx_buf_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8_t **tx_sync_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t **rx_sync_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.4.14 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Apr 26 03:12:05 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

Configuration

Most configuration is done through `menuconfig`. Make and CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in [Updating the Certificate Bundle](#).

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https_x509_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https_mbedtls](#).

API Reference

Header File

- [components/mbedtls/esp_cert_bundle/include/esp_cert_bundle.h](#)

Functions

esp_err_t **esp_cert_bundle_attach** (void *conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

Parameters **conf** –[in] The config struct for the SSL connection.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_cert_bundle_detach** (mbedtls_ssl_config *conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters **conf** –[in] The config struct for the SSL connection.

esp_err_t **esp_cert_bundle_set** (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters

- **x509_bundle** –[in] A pointer to the certificate bundle.
- **bundle_size** –[in] Size of the certificate bundle in bytes.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

2.4.15 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

2.5 Provisioning API

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- **Communication security at application level -**
 - protocomm_security0 (no security)
 - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See [Unified Provisioning](#) for more details about the secure handshake logic.

Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/legacy/softap_prov](#)

```

/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                           const uint8_t *inbuf, ssize_t inlen,
                           uint8_t **outbuf, ssize_t *outlen,
                           void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

```

(continues on next page)

(continued from previous page)

```

/* Config for protocomm_httpd_start() */
protocomm_httpd_config_t pc_config = {
    .data = {
        .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
    }
};

/* Start protocomm server on top of HTTP */
protocomm_httpd_start(pc, &pc_config);

/* Create Proof of Possession object from pop_string. It must be valid
 * throughout the scope of protocomm endpoint. This need not be
↳static,
 * ie. could be dynamically allocated and freed at the time of
↳endpoint
 * removal */
const static protocomm_security_pop_t pop_obj = {
    .data = (const uint8_t *) strdup(pop_string),
    .len = strlen(pop_string)
};

/* Set security for communication at application level. Just like for
 * request handlers, setting security creates an endpoint and
↳registers
 * the handler provided by protocomm_security1. One can similarly use
 * protocomm_security0. Only one type of security can be set for a
 * protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
↳&pop_obj);

/* Private data passed to the endpoint must be valid throughout the
↳scope
 * of protocomm endpoint. This need not be static, ie. could be
↳dynamically
 * allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a
↳unique name
 * and register a handler function along with private data to be
↳passed at the
 * time of handler execution. Multiple endpoints can be added as long
↳as they
 * are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);
return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);
}

```

(continues on next page)

(continued from previous page)

```

/* Delete (deallocate) the protocomm instance */
protocomm_delete(pc);
}

```

Transport Example (BLE) with Security 0

For complete example see [provisioning/legacy/ble_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
->table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can
->be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
->NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
->NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

API Reference

Header File

- `components/protocomm/include/common/protocomm.h`

Functions

`protocomm_t*`**protocomm_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the `protocomm_t` structure initialized to NULL.

Returns

- `protocomm_t*` : On success
- NULL : No memory for allocating new instance

void **protocomm_delete** (`protocomm_t` *pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

Parameters `pc` –[in] Pointer to the protocomm instance to be deleted

`esp_err_t` **protocomm_add_endpoint** (`protocomm_t` *pc, const char *ep_name, `protocomm_req_handler_t` h, void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.
-

Parameters

- `pc` –[in] Pointer to the protocomm instance
- `ep_name` –[in] Endpoint identifier(name) string
- `h` –[in] Endpoint handler function
- `priv_data` –[in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

Returns

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

`esp_err_t` **protocomm_remove_endpoint** (`protocomm_t` *pc, const char *ep_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

Note:

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.
-

Parameters

- `pc` –[in] Pointer to the protocomm instance

- **ep_name** –[in] Endpoint identifier(name) string

Returns

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_open_session** (*protocomm_t* *pc, uint32_t session_id)

Allocates internal resources for new transport session.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **session_id** –[in] Unique ID for a communication session

Returns

- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_close_session** (*protocomm_t* *pc, uint32_t session_id)

Frees internal resources used by a transport session.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **session_id** –[in] Unique ID for a communication session

Returns

- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

esp_err_t **protocomm_req_handle** (*protocomm_t* *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - Resulting output buffer must be deallocated by the caller.
-

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep_name** –[in] Endpoint identifier(name) string
- **session_id** –[in] Unique ID for a communication session
- **inbuf** –[in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** –[in] Length of the input buffer
- **outbuf** –[out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** –[out] Buffer length of the allocated output buffer

Returns

- `ESP_OK` : Request handled successfully
- `ESP_FAIL` : Internal error in execution of registered handler
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

`esp_err_t` **protocomm_set_security** (`protocomm_t` *pc, const char *ep_name, const `protocomm_security_t` *sec, const `protocomm_security_pop_t` *pop)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
 - The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.
-

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep_name** –[in] Endpoint identifier(name) string
- **sec** –[in] Pointer to endpoint security instance
- **pop** –[in] Pointer to proof of possession for authenticating a client

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

`esp_err_t` **protocomm_unset_security** (`protocomm_t` *pc, const char *ep_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep_name** –[in] Endpoint identifier(name) string

Returns

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

`esp_err_t` **protocomm_set_version** (`protocomm_t` *pc, const char *ep_name, const char *version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
-

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep_name** –[in] Endpoint identifier(name) string

- **version** –[in] Version identifier(name) string

Returns

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

esp_err_t **protocomm_unset_version** (*protocomm_t* *pc, const char *ep_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep_name** –[in] Endpoint identifier(name) string

Returns

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn't exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note: Structure of the protocomm object is kept private

Header File

- [components/protocomm/include/security/protocomm_security.h](#)

Structures

```
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

Public Members

```
const uint8_t *data
```

Pointer to buffer containing the proof of possession data

```
uint16_t len
```

Length (in bytes) of the proof of possession data

```
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int **ver**

Unique version number of security implementation

esp_err_t (***init**)(*protocomm_security_handle_t* *handle)

Function for initializing/allocating security infrastructure

esp_err_t (***cleanup**)(*protocomm_security_handle_t* handle)

Function for deallocating security infrastructure

esp_err_t (***new_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t (***close_transport_session**)(*protocomm_security_handle_t* handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t (***security_req_handler**)(*protocomm_security_handle_t* handle, const *protocomm_security_pop_t* *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (***encrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (***decrypt**)(*protocomm_security_handle_t* handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct *protocomm_security_pop* **protocomm_security_pop_t**

Proof Of Possession for authenticating a secure session.

typedef void ***protocomm_security_handle_t**

typedef struct *protocomm_security* **protocomm_security_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Header File

- `components/protocomm/include/security/protocomm_security0.h`

Header File

- `components/protocomm/include/security/protocomm_security1.h`

Header File

- `components/protocomm/include/transport/protocomm_httpd.h`

Functions

`esp_err_t protocomm_httpd_start` (`protocomm_t *pc`, const `protocomm_httpd_config_t *config`)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

Note: This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

Parameters

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing HTTP server

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_SUPPORTED` : Transport layer bound to another protocomm instance
- `ESP_ERR_INVALID_STATE` : Transport layer already bound to this protocomm instance
- `ESP_ERR_NO_MEM` : Memory allocation for server resource failed
- `ESP_ERR_HTTPD_*` : HTTP server error on start

`esp_err_t protocomm_httpd_stop` (`protocomm_t *pc`)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

Parameters **pc** –[in] Same protocomm instance that was passed to `protocomm_httpd_start()`

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance pointer

Unions

union `protocomm_httpd_config_data_t`

`#include <protocomm_httpd.h>` Protocomm HTTPD Configuration Data

Public Members

void ***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

`protocomm_http_server_config_t` **config**

HTTP Server Configuration, if a server is not already active

Structures

struct **protocomm_http_server_config_t**
Config parameters for protocomm HTTP server.

Public Members

uint16_t **port**
Port on which the HTTP server will listen

size_t **stack_size**
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task_priority**
Priority of server task

struct **protocomm_httpd_config_t**
Config parameters for protocomm HTTP server.

Public Members

bool **ext_handle_provided**
Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t **data**
Protocomm HTTPD Configuration Data

Macros

PROTOCOLM_HTTPD_DEFAULT_CONFIG ()

Header File

- [components/protocomm/include/transport/protocomm_ble.h](#)

Functions

esp_err_t **protocomm_ble_start** (*protocomm_t* *pc, const *protocomm_ble_config_t* *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Parameters

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing BLE

Returns

- **ESP_OK** : Success
- **ESP_FAIL** : Simple BLE start error
- **ESP_ERR_NO_MEM** : Error allocating memory for internal resources
- **ESP_ERR_INVALID_STATE** : Error in ble config
- **ESP_ERR_INVALID_ARG** : Null arguments

esp_err_t **protocomm_ble_stop** (*protocomm_t* *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note: You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

Parameters **pc** –[in] Same `protocomm` instance that was passed to `protocomm_ble_start()`

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error
- `ESP_ERR_INVALID_ARG` : Null / incorrect `protocomm` instance

Structures

struct **name_uuid**

This structure maps handler required by `protocomm` layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char ***name**

Name of the handler, which is passed to `protocomm` layer

uint16_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm_ble_config**

Config parameters for `protocomm` BLE service.

Public Members

char **device_name**[29 + 1]

BLE device name being broadcast at the time of provisioning

uint8_t **service_uuid**[16]

128 bit UUID of the provisioning service

uint8_t ***manufacturer_data**

BLE device manufacturer data pointer in advertisement

ssize_t **manufacturer_data_len**

BLE device manufacturer data length in advertisement

ssize_t **nu_lookup_count**

Number of entries in the Name-UUID lookup table

`protocomm_ble_name_uuid_t *nu_lookup`

Pointer to the Name-UUID lookup table

unsigned `ble_bonding`

BLE bonding

unsigned `ble_sm_sc`

BLE security flag

Macros

`MAX_BLE_DEVNAME_LEN`

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

`BLE_UUID128_VAL_LENGTH`

`MAX_BLE_MANUFACTURER_DATA_LEN`

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

Type Definitions

typedef struct `name_uuid` `protocomm_ble_name_uuid_t`

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct `protocomm_ble_config` `protocomm_ble_config_t`

Config parameters for protocomm BLE service.

2.5.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*security1*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Fig. 17: Typical Provisioning Process

Architecture

The below diagram shows architecture of unified provisioning.

Fig. 18: Unified Provisioning Architecture

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

Sample Code

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage.

Fig. 19: Security1

Application implementation can be found as an example under [provisioning](#).

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [BLE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [BLE Provisioning app on app store](#).
 - [SoftAP Provisioning app on app Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.5.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure *Protocol Communication (protocomm)* sessions. The set of `wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Initialization `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- `scheme` : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by `protocomm`. Hence, we have three options :
 - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
 - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
 - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- `scheme_event_handler` : An event handler defined along with `scheme`. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future re-boot of a provisioned device, this reclamation of memory needs to be performed again. To reduce

this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
 - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
 - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- `app_event_handler` (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT`s` that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
↪*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                        "\n\tSSID      : %s\n\tPassword : %s",
                        (const char *) wifi_sta_cfg->ssid,
                        (const char *) wifi_sta_cfg->password);
                break;
            }
            case WIFI_PROV_CRED_FAIL: {
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↪reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                        "\n\tPlease reset to factory and retry_
↪provisioning",
                        (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                        "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
                break;
            }
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

Check Provisioning State Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start Provisioning Service At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

Note: If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

Waiting For Completion Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```

// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning( security, pop, service_
↳name, service_key ) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();

```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT` `s` and call `cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```

static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}

```

User Side Implementation When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related proto-comm endpoints can be identified as follows :

Table 6: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://<mdns-hostname>.local/prov-session">http://<mdns-hostname>.local/prov-session	Security endpoint used for session establishment
prov-scan	http://wifi-prov.local/prov-scan	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://<mdns-hostname>.local/prov-config">http://<mdns-hostname>.local/prov-config	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://<mdns-hostname>.local/proto-ver">http://<mdns-hostname>.local/proto-ver	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format

and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi_config* commands, serialized as Protobuf messages (the corresponding `.proto` files can be found under `wifi_provisioning/proto`):

- *get_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set_config* - For setting the Wi-Fi connection credentials
- *apply_config* - For applying the credentials saved during *set_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi_config* commands described above. The *wifi_scan* endpoint supports the following protobuf commands:

- *scan_start* - For starting Wi-Fi scan with various options:
 - *blocking* (input) - If true, the command returns only when the scanning is finished
 - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
 - *group_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting *group_channels* to 4, will create 5 groups, with each group having 3 channels, except the last one which will have $14 \% 3 = 2$ channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
 - *period_ms* (input) - Scan parameter specifying how long to wait on each channel
- *scan_status* - Gives the status of scanning process:
 - *scan_finished* (output) - When scan has finished this returns true
 - *result_count* (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- *scan_result* - For fetching scan results. This can be called even if scan is still on going
 - *start_index* (input) - Starting index from where to fetch the entries from the results list
 - *count* (input) - Number of entries to fetch from the starting index
 - *entries* (output) - List of entries returned. Each entry consists of *ssid*, *channel* and *rsni* information

Additional Endpoints In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See `protocomm` for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the

protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);  
wifi_prov_mgr_endpoint_create("custom-endpoint");  
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_  
→key);  
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, _  
→custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

When / How To Stop Provisioning Service? The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

Application Examples

For complete example implementation see [provisioning/wifi_prov_mgr](#)

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
 - [BLE Provisioning app on Play Store](#).
 - [SoftAP Provisioning app on Play Store](#).
 - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
 - [BLE Provisioning app on app store](#).
 - [SoftAP Provisioning app on app Store](#).
 - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

API Reference

Header File

- `components/wifi_provisioning/include/wifi_provisioning/manager.h`

Functions

esp_err_t **wifi_prov_mgr_init** (*wifi_prov_mgr_config_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

Parameters **config** –[in] Configuration structure

Returns

- ESP_OK : Success
- ESP_FAIL : Fail

void **wifi_prov_mgr_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

esp_err_t **wifi_prov_mgr_is_provisioned** (bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

Note: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

Parameters **provisioned** –[out] True if provisioned, else false

Returns

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

esp_err_t **wifi_prov_mgr_start_provisioning** (*wifi_prov_security_t* security, const char *pop, const char *service_name, const char *service_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- `wifi_prov_scheme_ble` : This starts `protocomm_ble`, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap` : This activates SoftAP mode of Wi-Fi and starts `protocomm_httpd`, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov._tcp`)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

Note: This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

Parameters

- **security** –[in] Specify which protocomm security scheme to use :
 - `WIFI_PROV_SECURITY_0` : For no security
 - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- **pop** –[in] Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- **service_name** –[in] Unique name of the service. This translates to:
 - Wi-Fi SSID when provisioning mode is softAP
 - Device name when provisioning mode is BLE
- **service_key** –[in] Key required by client to access the service (NULL if not needed). This translates to:
 - Wi-Fi password when provisioning mode is softAP
 - ignored when provisioning mode is BLE

Returns

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

void **wifi_prov_mgr_stop_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi_prov_mgr_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t **wifi_prov_mgr_disable_auto_stop** (uint32_t `cleanup_delay`)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may

want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing `wifi_prov_mgr_start_provisioning()`

Parameters `cleanup_delay` **–[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

esp_err_t `wifi_prov_mgr_set_app_info` (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov” , containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note: This must be called before executing `wifi_prov_mgr_start_provisioning()`

Parameters

- **label** **–[in]** String indicating the application name.
- **version** **–[in]** String indicating the application version. There is no constraint on format.
- **capabilities** **–[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total_capabilities** **–[in]** Size of capabilities array

Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

esp_err_t `wifi_prov_mgr_endpoint_create` (const char *ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

Note: This API can only be called BEFORE provisioning is started

Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Parameters **ep_name** –[in] unique name of the endpoint

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **wifi_prov_mgr_endpoint_register** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

Note: This API can only be called AFTER provisioning has started

Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Parameters

- **ep_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user_ctx** –[in] User data

Returns

- ESP_OK : Success
- ESP_FAIL : Failure

void **wifi_prov_mgr_endpoint_unregister** (const char *ep_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters **ep_name** –[in] Name of the endpoint

esp_err_t **wifi_prov_mgr_event_handler** (void *ctx, *system_event_t* *event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

Note: : This function is DEPRECATED, because events are now handled internally using the event loop library, `esp_event`. Calling this will do nothing and simply return ESP_OK.

Parameters

- **ctx** –[in] Event context data
- **event** –[in] Event info

Returns

- ESP_OK : Event handled successfully

esp_err_t **wifi_prov_mgr_get_wifi_state** (*wifi_prov_sta_state_t* *state)

Get state of Wi-Fi Station during provisioning.

Parameters **state** –[out] Pointer to *wifi_prov_sta_state_t* variable to be filled

Returns

- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_get_wifi_disconnect_reason** (*wifi_prov_sta_fail_reason_t* *reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters **reason** –[out] Pointer to *wifi_prov_sta_fail_reason_t* variable to be filled

Returns

- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

esp_err_t **wifi_prov_mgr_configure_sta** (*wifi_config_t* *wifi_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Parameters **wifi_cfg** –[in] Pointer to Wi-Fi configuration structure

Returns

- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

esp_err_t **wifi_prov_mgr_reset_provisioning** (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Returns

- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

esp_err_t **wifi_prov_mgr_reset_sm_state_on_failure** (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

Returns

- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

Structures

struct **wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t **event_cb**

Callback function to be executed on provisioning events

void ***user_data**

User context data to pass as parameter to callback function

struct **wifi_prov_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

- *wifi_prov_scheme_ble* : for provisioning over BLE transport + GATT server
 - *wifi_prov_scheme_softap* : for provisioning over SoftAP transport + HTTP server
 - *wifi_prov_scheme_console* : for provisioning over Serial UART transport + Console (for debugging)
-

Public Members

esp_err_t (***prov_start**)(*protocomm_t* *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (***prov_stop**)(*protocomm_t* *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void (***new_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov_start()*

void (***delete_config**)(void *config)

Function which is to be called by the manager to delete a configuration generated using *new_config()*

esp_err_t (***set_config_service**)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (***set_config_endpoint**)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t **wifi_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- *WIFI_MODE_APSTA* for SoftAP transport
- *WIFI_MODE_STA* for BLE transport

struct **wifi_prov_mgr_config_t**

Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

wifi_prov_event_handler_t app_event_handler

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

Macros

`WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

Type Definitions

```
typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
 - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
 - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
-

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

enumerator **WIFI_PROV_INIT**

Emitted when the manager is initialized

enumerator **WIFI_PROV_START**

Indicates that provisioning has started

enumerator **WIFI_PROV_CRED_RECV**

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

enumerator **WIFI_PROV_CRED_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator **WIFI_PROV_CRED_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator **WIFI_PROV_END**

Signals that provisioning service has stopped

enumerator **WIFI_PROV_DEINIT**

Signals that manager has been de-initialized

enum **wifi_prov_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

Values:

enumerator **WIFI_PROV_SECURITY_0**

No security (plain-text communication)

enumerator **WIFI_PROV_SECURITY_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

Header File

- [components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h](#)

Functions

void **wifi_prov_scheme_ble_event_cb_free_btdm** (void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_ble** (void *user_data, [wifi_prov_cb_event_t](#) event, void *event_data)

void **wifi_prov_scheme_ble_event_cb_free_bt** (void *user_data, *wifi_prov_cb_event_t* event, void *event_data)

esp_err_t **wifi_prov_scheme_ble_set_service_uuid** (uint8_t *uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

Note: The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

Parameters **uuid128** –[in] A custom 128 bit UUID

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

esp_err_t **wifi_prov_scheme_ble_set_mfg_data** (uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

Note: It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. $(mfg_data_len + 2) < 31 - (device_name_length + 2)$. If the `mfg_data` length exceeds this limit, the length will be truncated.

Parameters

- **mfg_data** –[in] Custom manufacturer data
- **mfg_data_len** –[in] Manufacturer data length

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

Macros

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h`

Functions

void **wifi_prov_scheme_softap_set_httpd_handle** (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

Note: This API should be called before `wifi_prov_mgr_start_provisioning()`

Parameters **handle** –[in] Handle to HTTPD server instance

Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_console.h`

Header File

- `components/wifi_provisioning/include/wifi_provisioning/wifi_config.h`

Functions

esp_err_t **wifi_prov_config_data_handler** (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (`protocomm_proto-comm_req_handler_t`) using `protocomm_add_endpoint()`

Structures

struct **wifi_prov_sta_conn_info_t**

WiFi STA connected status information.

Public Members

char **ip_addr**[IP4ADDR_STRLEN_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8_t **channel**

Channel of the AP

uint8_t **auth_mode**

Authorization mode of the AP

struct **wifi_prov_config_get_data_t**

WiFi status data to be sent in response to `get_status` request from master.

Public Members

wifi_prov_sta_state_t **wifi_state**

WiFi state of the station

wifi_prov_sta_fail_reason_t **fail_reason**

Reason for disconnection (valid only when *wifi_state* is `WIFI_STATION_DISCONNECTED`)

wifi_prov_sta_conn_info_t **conn_info**

Connection information (valid only when *wifi_state* is `WIFI_STATION_CONNECTED`)

struct **wifi_prov_config_set_data_t**

WiFi config data received by slave during `set_config` request from master.

Public Members

char **ssid**[33]

SSID of the AP to which the slave is to be connected

char **password**[64]

Password of the AP

char **bssid**[6]

BSSID of the AP

uint8_t **channel**

Channel of the AP

struct **wifi_prov_config_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Public Members

esp_err_t (***get_status_handler**)(*wifi_prov_config_get_data_t* *resp_data, *wifi_prov_ctx_t* **ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (***set_config_handler**)(const *wifi_prov_config_set_data_t* *req_data, *wifi_prov_ctx_t* **ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (***apply_config_handler**)(*wifi_prov_ctx_t* **ctx)

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

wifi_prov_ctx_t ***ctx**

Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx **wifi_prov_ctx_t**

Type of context data passed to each get/set/apply handler function set in [wifi_prov_config_handlers](#) structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct [wifi_prov_config_handlers](#) **wifi_prov_config_handlers_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

Enumerations

enum **wifi_prov_sta_state_t**

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator **WIFI_PROV_STA_CONNECTING**

enumerator **WIFI_PROV_STA_CONNECTED**

enumerator **WIFI_PROV_STA_DISCONNECTED**

enum **wifi_prov_sta_fail_reason_t**

WiFi STA connection fail reason.

Values:

enumerator **WIFI_PROV_STA_AUTH_ERROR**

enumerator **WIFI_PROV_STA_AP_NOT_FOUND**

Code examples for above API are provided in the [provisioning](#) directory of ESP-IDF examples.

Code example for above API is provided in [wifi/smart_config](#)

Code example for above API is provided in [wifi/wifi_easy_connect/dpp-enrollee](#)

2.6 Storage API

2.6.1 FAT Filesystem Support

ESP-IDF uses the [FatFs](#) library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
 - Path prefix where to mount the filesystem (e.g. `"/sdcard"`, `"/spiflash"`)
 - FatFs drive number
 - A variable which will receive the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see [FatFs documentation](#).
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, `"/sdcard/hello.txt"`). The filesystem uses [8.3 filenames](#) format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available [here](#).
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, use the POSIX `lseek` function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
7. Close all open files.
8. Call the FatFs function `f_mount` for the same drive number, with `NULL FATFS*` argument, to unmount the filesystem.
9. Call the FatFs function `ff_diskio_register()` with `NULL ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount`, `esp_vfs_fat_sdspi_mount` and `esp_vfs_fat_sdcard_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

```
esp_err_t esp_vfs_fat_register (const char *base_path, const char *fat_drive, size_t max_files, FATFS
                               **out_fs)
```

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

Note: This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Parameters

- **base_path** –path prefix where FATFS should be registered
- **fat_drive** –FATFS drive specification; if only one drive is used, can be an empty string
- **max_files** –maximum number of files which can be open at the same time
- **out_fs** –[out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

Returns

- `ESP_OK` on success

- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSEs already registered

esp_err_t **esp_vfs_fat_unregister_path** (const char *base_path)

Un-register FATFS from VFS.

Note: FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Parameters **base_path** –path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()` and `esp_vfs_fat_sdcard_unmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

esp_err_t **esp_vfs_fat_sdmmc_mount** (const char *base_path, const *sdmmc_host_t* *host_config, const void *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

Parameters

- **base_path** –path where partition should be registered (e.g. “/sdcard”)
- **host_config** –Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** –Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using SDMMC_SLOT_CONFIG_DEFAULT. (Deprecated) For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using SDSPI_SLOT_CONFIG_DEFAULT().
- **mount_config** –pointer to structure with extra parameters for mounting FATFS

- **out_card** –[out] if not NULL, pointer to the card information structure will be returned via this argument

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

esp_err_t **esp_vfs_fat_sdspi_mount** (const char *base_path, const *sdmmc_host_t* *host_config_input, const *sdspi_device_config_t* *slot_config, const *esp_vfs_fat_mount_config_t* *mount_config, *sdmmc_card_t* **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

Note: This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

Parameters

- **base_path** –path where partition should be registered (e.g. “/sdcard”)
- **host_config_input** –Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** –Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to *sdspi_device_config_t* structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
- **mount_config** –pointer to structure with extra parameters for mounting FATFS
- **out_card** –[out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’ s not suggested to use more than one card at the same time and unmount one of them in your application.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

struct **esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files

Max number of open files.

size_t allocation_unit_size

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and $128 * \text{sector size}$. For SD cards, sector size is always 512 bytes. For wear_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t **esp_vfs_fat_sdcard_unmount** (const char *base_path, *sdmmc_card_t* *card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

Using FatFs with VFS in read-only mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_rawflash_mount()` and `esp_vfs_fat_rawflash_unmount()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

esp_err_t **esp_vfs_fat_rawflash_mount** (const char *base_path, const char *partition_label, const *esp_vfs_fat_mount_config_t* *mount_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

Note: Wear levelling is not used when FAT is mounted in read-only mode using this function.

Parameters

- **base_path** –path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** –label of the partition which should be used
- **mount_config** –pointer to structure with extra parameters for mounting FATFS

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_rawflash_mount` was already called for the same partition

- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

esp_err_t **esp_vfs_fat_rawflash_unmount** (const char *base_path, const char *partition_label)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

Parameters

- **base_path** –path where partition should be registered (e.g. “/spiflash”)
- **partition_label** –label of partition to be unmounted

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn't been called

FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function *ff_diskio_register_sdmmc()*.

void **ff_diskio_register** (BYTE pdrv, const *ff_diskio_impl_t* *discio_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

Parameters

- **pdrv** –drive number
- **discio_impl** –pointer to *ff_diskio_impl_t* structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

Public Members

DSTATUS (***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (***status**)(unsigned char pdrv)

disk status check function

DRESULT (***read**)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (***write**)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (***ioctl**)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc** (unsigned char pdrv, *sdmmc_card_t* *card)

Register SD/MMC diskio driver

Parameters

- **pdrv** –drive number
- **card** –pointer to *sdmmc_card_t* structure describing a card; card should be initialized before calling `f_mount`.

esp_err_t **ff_diskio_register_wl_partition** (unsigned char pdrv, *wl_handle_t* flash_handle)

Register spi flash partition

Parameters

- **pdrv** –drive number
- **flash_handle** –handle of the wear levelling partition.

esp_err_t **ff_diskio_register_raw_partition** (unsigned char pdrv, const *esp_partition_t* *part_handle)

Register spi flash partition

Parameters

- **pdrv** –drive number
- **part_handle** –pointer to raw flash partition.

2.6.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#)
- [Flash Download tool](#) (available on Windows only). Just download it, unzip, and follow the instructions inside the *doc* folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on `esp-idf`'s NVS partition utility.

- **Operating System requirements:**
 - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
 - [Python](#)

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
 - You have installed the packages from *requirement.txt*, the file in the root of the `esp-idf` directory.
-

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace, <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

- before and after ‘,’
 - at the end of each line in a CSV file
-

Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,....
value1,value2,value3,....
```

Note: The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the `value` of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

value Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

Note: If the ‘`REPEAT`’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘`REPEAT`’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

Usage:

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

Optional Arguments:

```
+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪      |
+=====+=====+=====+=====+
| 1   | -h, --help | show this help message and exit |
↪      |
+-----+-----+-----+-----+
↪-----+
```

Commands:

```
Run mfg_gen.py {command} -h for additional help
+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪      |
+=====+=====+=====+=====+
| 1   | generate  | Generate NVS partition |
↪      |
+-----+-----+-----+-----+
↪-----+
```

(continues on next page)

(continued from previous page)

2	generate-key		Generate keys for encryption	↵
↵				
+-----+				
↵	-----+			

To generate factory images for each device (Default): Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                          [--keyfile KEYFILE] [--inputkey INPUTKEY]
                          [--outdir OUTDIR]
                          conf values prefix size
```

Positional Arguments:

Parameter	Description	↵
↵		
+-----+		
↵	conf	Path to configuration csv file to parse
↵		
+-----+		
↵	values	Path to values csv file to parse
↵		
+-----+		
↵	prefix	Unique name for each output filename prefix
↵		
+-----+		
↵	size	Size of NVS partition in bytes
↵		(must be multiple of 4096)
↵		
+-----+		

Optional Arguments:

Parameter	Description	↵
↵		
+-----+		
↵	-h, --help	show this help message and exit
↵		
+-----+		
↵	--fileid FILEID	Unique file identifier(any key in values file)
↵		for each filename suffix (Default: numeric value(1,
↵	↵2,3...)	
+-----+		
↵	--version {1,2}	Set multipage blob version.
↵		
↵		Version 1 - Multipage blob support disabled.
↵		Version 2 - Multipage blob support enabled.
↵		Default: Version 2
↵		

(continues on next page)

(continued from previous page)

Parameter	Description
<code>--keygen</code>	Generates key for encrypting NVS partition
<code>--inputkey INPUTKEY</code>	File having key for encrypting NVS partition
<code>--outdir OUTDIR</code>	Output directory to store files created (Default: current directory)

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --keygen
```

Note: Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

Note: This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

To generate only encryption keys: Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Parameter	Description
<code>-h, --help</code>	show this help message and exit

(continues on next page)

(continued from previous page)

↩-----+			
--keyfile KEYFILE		Path to output encryption keys file	↪
↩-----+			
↩-----+			
--outdir OUTDIR		Output directory to store files created.	↪
↩-----+		(Default: current directory)	↪
↩-----+			
↩-----+			

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

Note: To provide custom target filename use the `-keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

2.6.3 Non-volatile storage library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying storage Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and values NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
 - zero-terminated string
 - variable length binary data (blob)
-

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS iterators Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` returns iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find()` and `nvs_entry_next()` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator()`.

Security, tampering, and robustness NVS is not directly compatible with the ESP32-C3 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-C3 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when *Flash Encryption* is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the *NVS key partition*. Two partition tables containing the *NVS key partition* are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash_encryption](#) for how to configure and use NVS encryption feature.

NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted* and its size should be the minimum partition size (4KB). Refer to [Partition Tables](#) for more details. Two additional partition tables which contain the *NVS key partition* are provided under the partition table option (menuconfig->Partition Table). They can be directly used for *NVS Encryption*. The structure of these partitions is depicted below.

-----+-----+-----+-----+
XTS encryption key (32)
-----+-----+-----+-----+
XTS tweak key (32)
-----+-----+-----+-----+
CRC32 (4)
-----+-----+-----+-----+

The XTS encryption keys in the *NVS key partition* can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:
When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS key partition*. Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.
The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.
2. Use pre-generated key partition:
This option will be required by the user when keys in the *NVS key partition* are not generated by the application. The *NVS key partition* containing the XTS encryption keys can be generated with the

help of *NVS Partition Generator Utility*. Then the user can store the pre generated key partition on the flash with help of the following two commands:

i) Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

ii) Store the keys in the *NVS key partition* (on the flash) with the help of `parttool.py` (see Partition Tool section in *partition-tables* for more details)

```
parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_
↪partition offset" write_partition --partition-name="name of nvs_key_
↪partition" --input "nvs_key partition"
```

Since the key partition is marked as *encrypted* and *Flash Encryption* is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

Encrypted Read/Write The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

Encrypt the default NVS partition: To enable encryption for the default NVS partition no additional steps are necessary. When *CONFIG_NVS_ENCRYPTION* is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first *NVS key partition* found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

Encrypt a custom NVS partition: To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

Application Example

You can find code examples in the `storage` directory of ESP-IDF examples:

`storage/nvs_rw_value`

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-C3 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

[storage/nvs_rw_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-C3 module restarts.

- **value** - tracks the number of the ESP32-C3 module soft and hard restarts.
- **blob** - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

[storage/nvs_rw_value_cxx](#)

This example does exactly the same as [storage/nvs_rw_value](#), except that it uses the C++ NVS handle class.

Internals

Log of key-value pairs NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and entries NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

Active Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

+-----+	+-----+	+-----+	+-----+	
Page 1	Page 2	Page 3	Page 4	
Full +---->	Full +---->	Active	Empty	<- states
#11	#12	#14		<- sequence numbers
+-----+	+-----+	+-----+	+-----+	

(continues on next page)

(continued from previous page)

Structure of a page For now, we assume that flash sector size is 4096 bytes and that ESP32-C3 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-C3 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32-C3 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

Entry and entry state bitmap Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

Empty (2' b11) Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

Written (2' b10) A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

Erased (2' b00) A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

Structure of entry For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

Individual fields in entry structure have the following meanings:

NS Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

Type One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

Span Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

ChunkIndex Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

CRC32 Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

Key Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

Data For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

Namespaces As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

(continues on next page)

(continued from previous page)

+-----+ NS=0 Type=uint8_t Key="pwm" Value=2	Entry describing namespace "pwm"
+-----+ NS=2 Type=uint16_t Key="channel" Value=20	Key "channel" in namespace "pwm"
+-----+	

Item hash list To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, *Page::findItem* first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

API Reference

Header File

- [components/nvs_flash/include/nvs_flash.h](#)

Functions

esp_err_t **nvs_flash_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
- If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled) .

esp_err_t **nvs_flash_init_partition** (const char *partition_label)

Initialize NVS flash storage for the specified partition.

Parameters **partition_label** –[in] Label of the partition. Must be no longer than 16 characters.

Returns

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_init_partition_ptr** (const *esp_partition_t* *partition)

Initialize NVS flash storage for the partition specified by partition pointer.

Parameters **partition** –[in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Returns

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

esp_err_t **nvs_flash_deinit_partition** (const char *partition_label)

Deinitialize NVS storage for the given NVS partition.

Parameters **partition_label** –[in] Label of the partition

Returns

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

esp_err_t **nvs_flash_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

esp_err_t **nvs_flash_erase_partition** (const char *part_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters **part_name** –[in] Name (label) of the partition which should be erased

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

esp_err_t **nvs_flash_erase_partition_ptr** (const *esp_partition_t* *partition)

Erase custom partition.

Erase all content of specified custom partition.

Note: If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Parameters **partition** –[in] pointer to a partition obtained by the ESP partition API.

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init** (*nvs_sec_cfg_t* *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

Parameters **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If *cfg* is NULL, no encryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_secure_init_partition** (const char *partition_label, *nvs_sec_cfg_t* *cfg)

Initialize NVS flash storage for the specified partition.

Parameters

- **partition_label** –[in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If *cfg* is null, no encryption/decryption is used.

Returns

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures

- one of the error codes from the underlying flash storage driver

esp_err_t **nvs_flash_generate_keys** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Generate and store NVS keys in the provided esp partition.

Parameters

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

Returns -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from `esp_partition_write/erase` APIs.

esp_err_t **nvs_flash_read_security_cfg** (const *esp_partition_t* *partition, *nvs_sec_cfg_t* *cfg)

Read NVS security configuration from a partition.

Note: Provided partition is assumed to be marked ‘encrypted’ .

Parameters

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

Returns -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

Structures

struct **nvs_sec_cfg_t**

Key for encryption and decryption.

Public Members

uint8_t **eky**[32]

XTS encryption and decryption key

uint8_t **tky**[32]

XTS tweak key

Macros

Header File

- [components/nvs_flash/include/nvs.h](#)

Functions

esp_err_t **nvs_set_i8** (*nvs_handle_t* handle, const char *key, int8_t value)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set.

Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs_handle_t* handle, const char *key, uint8_t value)

set uint8_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs_handle_t* handle, const char *key, int16_t value)

set int16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs_handle_t* handle, const char *key, uint16_t value)

set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs_handle_t* handle, const char *key, int32_t value)

set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs_handle_t* handle, const char *key, uint32_t value)

set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs_handle_t* handle, const char *key, int64_t value)

set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs_handle_t* handle, const char *key, uint64_t value)

set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs_handle_t* handle, const char *key, const char *value)

set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

- **value** –[in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

Returns

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

esp_err_t **nvs_get_i8** (*nvs_handle_t* handle, const char *key, int8_t *out_value)

get int8_t value for given key

These functions retrieve value for the key, given its name. If *key* does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, *out_value* is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Parameters

- **handle** –[in] Handle obtained from *nvs_open* function.
- **key** –[in] Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn't be empty.
- **out_value** –Pointer to the output value. May be NULL for *nvs_get_str* and *nvs_get_blob*, in this case required length will be returned in length argument.

Returns

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn't satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

esp_err_t **nvs_get_u8** (*nvs_handle_t* handle, const char *key, uint8_t *out_value)

get uint8_t value for given key

This function is the same as *nvs_get_i8* except for the data type.

esp_err_t **nvs_get_i16** (*nvs_handle_t* handle, const char *key, int16_t *out_value)

get int16_t value for given key

This function is the same as *nvs_get_i8* except for the data type.

esp_err_t **nvs_get_u16** (*nvs_handle_t* handle, const char *key, uint16_t *out_value)

get uint16_t value for given key

This function is the same as *nvs_get_i8* except for the data type.

esp_err_t **nvs_get_i32** (*nvs_handle_t* handle, const char *key, int32_t *out_value)

get int32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u32** (*nvs_handle_t* handle, const char *key, uint32_t *out_value)

get uint32_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_i64** (*nvs_handle_t* handle, const char *key, int64_t *out_value)

get int64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_u64** (*nvs_handle_t* handle, const char *key, uint64_t *out_value)

get uint64_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

esp_err_t **nvs_get_str** (*nvs_handle_t* handle, const char *key, char *out_value, size_t *length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out_value** –[out] Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** –[inout] A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

Returns

- `ESP_OK` if the value was retrieved successfully

- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

`esp_err_t nvs_get_blob` (*nvs_handle_t* handle, const char *key, void *out_value, size_t *length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

`esp_err_t nvs_open` (const char *name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

Parameters

- **name** –[in] Namespace name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **open_mode** –[in] `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

Returns

- `ESP_OK` if storage handle was opened successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "nvs" is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

`esp_err_t nvs_open_from_partition` (const char *part_name, const char *name, *nvs_open_mode_t* open_mode, *nvs_handle_t* *out_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

Parameters

- **part_name** –[in] Label (name) of the partition of interest for object read/write/erase
- **name** –[in] Namespace name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **open_mode** –[in] `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

Returns

- `ESP_OK` if storage handle was opened successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized

- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with specified name is not found
- `ESP_ERR_NVS_NOT_FOUND` id namespace doesn't exist yet and mode is `NVS_READONLY`
- `ESP_ERR_NVS_INVALID_NAME` if namespace name doesn't satisfy constraints
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set.
- **length** –[in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char *key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters

- **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

Returns

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- other error codes from the underlying storage driver

`esp_err_t nvs_erase_all(nvs_handle_t handle)`

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

Parameters **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if `handle` has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if `handle` was opened as read only
- other error codes from the underlying storage driver

`esp_err_t nvs_commit (nvs_handle_t handle)`

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

Parameters **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

Returns

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if `handle` has been closed or is `NULL`
- other error codes from the underlying storage driver

`void nvs_close (nvs_handle_t handle)`

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

Parameters **handle** –[in] Storage handle to close

`esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)`

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
→entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
→entries);
```

Parameters

- **part_name** –[in] Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` ("nvs").
- **nvs_stats** –[out] Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

Returns

- `ESP_OK` if the changes have been written successfully. Return param `nvs_stats` will be filled.
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "name" is not found. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` equal to `NULL`.

- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

esp_err_t **nvs_get_used_entry_count** (*nvs_handle_t* handle, size_t *used_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs_
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

Parameters

- **handle** –[in] Handle obtained from `nvs_open` function.
- **used_entries** –[out] Returns amount of used entries from a namespace.

Returns

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` equal to `NULL`.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

nvs_iterator_t **nvs_entry_find** (const char *part_name, const char *namespace_name, *nvs_type_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified_
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no_
↳other
// element for specified criteria was found.
}
```

Parameters

- **part_name** –[in] Partition name

- **namespace_name** –[in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** –[in] One of `nvs_type_t` values.

Returns Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

nvs_iterator_t **nvs_entry_next** (*nvs_iterator_t* iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

Parameters **iterator** –[in] Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

Returns NULL if no entry was found, valid `nvs_iterator_t` otherwise.

void **nvs_entry_info** (*nvs_iterator_t* iterator, *nvs_entry_info_t* *out_info)

Fills *nvs_entry_info_t* structure with information about entry pointed to by the iterator.

Parameters

- **iterator** –[in] Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- **out_info** –[out] Structure to which entry information is copied.

void **nvs_release_iterator** (*nvs_iterator_t* iterator)

Release iterator.

Parameters **iterator** –[in] Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

Structures

struct **nvs_entry_info_t**

information about entry obtained from `nvs_entry_info` function

Public Members

char **namespace_name**[16]

Namespace to which key-value belong

char **key**[16]

Key of stored key-value pair

nvs_type_t **type**

Type of stored key-value pair

struct **nvs_stats_t**

Note: Info about storage space NVS.

Public Members

size_t **used_entries**

Amount of used entries.

size_t **free_entries**

Amount of free entries.

size_t **total_entries**

Amount all available entries.

size_t **namespace_count**

Amount name space.

Macros

ESP_ERR_NVS_BASE

Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED

The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND

Id namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH

The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY

Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE

There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME

Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE

Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG

Key name is too long

ESP_ERR_NVS_PAGE_FULL

Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH

String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND

Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND

NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED

XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED

XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED

XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND

XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED

NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED

NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART

NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS

Internal error; never returned by `nvs` API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME

Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE

maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE

Maximal length of NVS key name (including null terminator)

Type Definitions

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

```
typedef struct nvs_opaque_iterator_t *nvs_iterator_t
```

Opaque pointer type representing iterator to nvs entries

Enumerations

```
enum nvs_open_mode_t
```

Mode of opening the non-volatile storage.

Values:

```
enumerator NVS_READONLY
```

Read only

```
enumerator NVS_READWRITE
```

Read and write

```
enum nvs_type_t
```

Types of variables.

Values:

```
enumerator NVS_TYPE_U8
```

Type uint8_t

```
enumerator NVS_TYPE_I8
```

Type int8_t

```
enumerator NVS_TYPE_U16
```

Type uint16_t

```
enumerator NVS_TYPE_I16
```

Type int16_t

```
enumerator NVS_TYPE_U32
```

Type uint32_t

```
enumerator NVS_TYPE_I32
```

Type int32_t

enumerator **NVS_TYPE_U64**

Type uint64_t

enumerator **NVS_TYPE_I64**

Type int64_t

enumerator **NVS_TYPE_STR**

Type string

enumerator **NVS_TYPE_BLOB**

Type blob

enumerator **NVS_TYPE_ANY**

Must be last

2.6.4 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in *requirements.txt* in the root of the esp-idf directory.

CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the <code>file</code> type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value.	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> is fixed and is not configurable. Any values in these cells are ignored.

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key,type,encoding,value      <-- column header
namespace_name,namespace,,  <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

Note:

Make sure there are no spaces:

- before and after `'`,
 - at the end of each line in a CSV file
-

NVS Entry and Namespace association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

Note: First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of entry*. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to [NVS Encryption](#) for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to [NVS Encryption](#) for more details.

Running the utility

Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

Optional Arguments:

No.	Parameter	Description
1	-h, --help	show this help message and exit

Commands:

Run `nvs_partition_gen.py {command} -h` **for** additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption
3	encrypt	Generate NVS encrypted partition
4	decrypt	Decrypt NVS encrypted partition

To generate NVS partition (Default):

Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir_
↳OUTDIR]
input output size
```

(continues on next page)

(continued from previous page)

Positional Arguments:		
Parameter	Description	
<code>input</code>	Path to CSV file to parse	
<code>output</code>	Path to output NVS binary file	
<code>size</code>	Size of NVS partition in bytes (must be multiple of 4096)	
Optional Arguments:		
Parameter	Description	
<code>-h, --help</code>	show this help message and exit	
<code>--version {1,2}</code>	Set multipage blob version.	
	Version 1 - Multipage blob support disabled.	
	Version 2 - Multipage blob support enabled.	
	Default: Version 2	
<code>--outdir OUTDIR</code>	Output directory to store files created	
	(Default: current directory)	

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

To generate only encryption keys:

Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                         [--outdir OUTDIR]
```

(continues on next page)

(continued from previous page)

```
Optional Arguments:
+-----+-----+
| Parameter | Description |
+-----+-----+
| -h, --help | show this help message and exit |
+-----+-----+
| --keyfile KEYFILE | Path to output encryption keys file |
+-----+-----+
| --outdir OUTDIR | Output directory to store files created. |
| | (Default: current directory) |
+-----+-----+
```

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

To generate encrypted NVS partition:

Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
[--keyfile KEYFILE] [--inputkey_
↳INPUTKEY]
                                [--outdir OUTDIR]
                                input output size

Positional Arguments:
+-----+-----+
| Parameter | Description |
+-----+-----+
| input | Path to CSV file to parse |
+-----+-----+
| output | Path to output NVS binary file |
+-----+-----+
| size | Size of NVS partition in bytes (must be multiple_
↳of 4096) |
+-----+-----+

Optional Arguments:
+-----+-----+
| Parameter | Description |
+-----+-----+
```

(continues on next page)

(continued from previous page)

<code>-h, --help</code>	show this help message and exit	↵
↵		↵
↵		↵
-----+ <code>--version {1,2}</code>	Set multipage blob version.	↵
↵	Version 1 - Multipage blob support disabled.	↵
↵	Version 2 - Multipage blob support enabled.	↵
↵	Default: Version 2	↵
↵		↵
-----+ <code>--keygen</code>	Generates key for encrypting NVS partition	↵
↵		↵
-----+ <code>--keyfile KEYFILE</code>	Path to output encryption keys file	↵
↵		↵
-----+ <code>--inputkey INPUTKEY</code>	File having key for encrypting NVS partition	↵
↵		↵
-----+ <code>--outdir OUTDIR</code>	Output directory to store files created	↵
↵	(Default: current directory)	↵
↵		↵
-----+ ↵		↵

You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↵0x3000 --keygen
```

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↵0x3000 --keygen --keyfile sample_keys.bin
```

Note: Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

Note: This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to *NVS key partition* for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↳0x3000 --inputkey sample_keys.bin
```

To decrypt encrypted NVS partition:

Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key
↳output
```

Positional Arguments:

Parameter	Description
input	Path to encrypted NVS partition file to parse
key	Path to file having keys for decryption
output	Path to output decrypted binary file

Optional Arguments:

Parameter	Description
-h, --help	show this help message and exit
--outdir OUTDIR	Output directory to store files created (Default: current directory)

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

Multipage Blob Support Disabled (Version 1): You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↳-version 1
```

Multipage Blob Support Enabled (Version 2): You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --  
↪version 2
```

Note: *Minimum NVS Partition Size needed is 0x3000 bytes.*

Note: *When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.*

Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.6.5 SD/SDIO/MMC Driver

Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc_host.h](#) and [driver/include/driver/sdspi_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SD SPI host, see [SD SPI Host API](#)

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the [storage/sd_card](#) directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

Combo (memory + IO) cards The driver does not support SD combo cards. Combo cards are treated as IO cards.

Thread safety Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

API Reference

Header File

- `components/sdmmc/include/sdmmc_cmd.h`

Functions

esp_err_t **sdmmc_card_init** (const *sdmmc_host_t* *host, *sdmmc_card_t* *out_card)

Probe and initialize SD/MMC card using given host

Note: Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

Parameters

- **host** –pointer to structure defining host controller
- **out_card** –pointer to structure which will receive information about the card when the function completes

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info** (FILE *stream, const *sdmmc_card_t* *card)

Print information about the card to a stream.

Parameters

- **stream** –stream obtained using fopen or fdopen
- **card** –card information structure initialized using `sdmmc_card_init`

esp_err_t **sdmmc_get_status** (*sdmmc_card_t* *card)

Get status of SD/MMC card

Parameters **card** –pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_write_sectors** (*sdmmc_card_t* *card, const void *src, size_t start_sector, size_t sector_count)

Write given number of sectors to SD/MMC card

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **src** –pointer to data buffer to read data from; data size must be equal to `sector_count * card->csd.sector_size`
- **start_sector** –sector where to start writing
- **sector_count** –number of sectors to write

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_read_sectors** (*sdmmc_card_t* *card, void *dst, size_t start_sector, size_t sector_count)

Read given number of sectors from the SD/MMC card

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **dst** –pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- **start_sector** –sector where to start reading

- **sector_count** –number of sectors to read

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_byte** (*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t *out_byte)

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **reg** –byte address within IO function
- **out_byte** –[out] output, receives the value read from the card

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_byte** (*sdmmc_card_t* *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **reg** –byte address within IO function
- **in_byte** –value to be written
- **out_byte** –[out] if not NULL, receives new byte value read from the card (read-after-write).

Returns

- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_bytes** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where reading starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_bytes** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written

- **size** –number of bytes to write

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_read_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, void *dst, size_t size)

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read, must be divisible by the card block size.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_write_blocks** (*sdmmc_card_t* *card, uint32_t function, uint32_t addr, const void *src, size_t size)

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to read, must be divisible by the card block size.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

esp_err_t **sdmmc_io_enable_int** (*sdmmc_card_t* *card)

Enable SDIO interrupt in the SDMMC host

Parameters **card** –pointer to card information structure previously initialized using `sdmmc_card_init`

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

esp_err_t **sdmmc_io_wait_int** (*sdmmc_card_t* *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout_ticks** –time to wait for the interrupt, in RTOS ticks

Returns

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

```
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Parameters

- **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
- **out_buffer** – Output buffer of the CIS data
- **buffer_size** – Size of the buffer.
- **inout_cis_size** – Mandatory, pointer to a size, input and output.
 - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
 - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_RESPONSE`: if the card does not (correctly) support CIS.
- `ESP_ERR_INVALID_SIZE`: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- `ESP_ERR_NOT_FOUND`: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

```
esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
```

Parse and print the CIS information of an SDIO card.

Note: Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

Parameters

- **buffer** – Buffer to parse
- **buffer_size** – Size of the buffer.
- **fp** – File pointer to print to, set to `NULL` to print to stdout.

Returns

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: if the value from the card is not supported to be parsed.
- `ESP_ERR_INVALID_SIZE`: if the CIS size fields are not correct.

Structures

```
struct sdmmc_csd_t
```

Decoded values from SD card Card Specific Data register

Public Members

int **csd_ver**

CSD structure format

int **mmc_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector_size**

sector size in bytes

int **read_block_len**

block length for reads

int **card_command_class**

Card Command Class for SD

int **tr_speed**

Max transfer speed

struct **sdmmc_cid_t**

Decoded values from SD card Card IDentification register

Public Members

int **mfg_id**

manufacturer identification number

int **oem_id**

OEM/product identification number

char **name**[8]

product name (MMC v1 has the longest)

int **revision**

product revision

int **serial**

product serial number

int **date**

manufacturing date

struct **sdmmc_scr_t**

Decoded values from SD Configuration Register

Public Members**int `sd_spec`**

SD Physical layer specification version, reported by card

int `bus_width`

bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

struct **`sdmmc_ext_csd_t`**

Decoded values of Extended Card Specific Data

Public Members**uint8_t `power_class`**

Power class used by the card

struct **`sdmmc_switch_func_rsp_t`**

SD SWITCH_FUNC response buffer

Public Members**uint32_t `data`[512 / 8 / sizeof(uint32_t)]**

response data

struct **`sdmmc_command_t`**

SD/MMC command information

Public Members**uint32_t `opcode`**

SD or MMC command index

uint32_t `arg`

SD/MMC command argument

***`sdmmc_response_t`* `response`**

response buffer

void *`data`

buffer to send or read into

size_t `datalen`

length of data buffer

size_t `blklen`

block length

int **flags**

see below

esp_err_t **error**

error returned from transfer

int **timeout_ms**

response timeout, in milliseconds

struct **sdmmc_host_t**

SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t **flags**

flags defining host properties

int **slot**

slot number, to be passed to host functions

int **max_freq_khz**

max frequency supported by the host

float **io_voltage**

I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (***init**)(void)

Host function to initialize the driver

esp_err_t (***set_bus_width**)(int slot, size_t width)

host function to set bus width

size_t (***get_bus_width**)(int slot)

host function to get bus width

esp_err_t (***set_bus_ddr_mode**)(int slot, bool ddr_enable)

host function to set DDR mode

esp_err_t (***set_card_clk**)(int slot, uint32_t freq_khz)

host function to set card clock frequency

esp_err_t (***set_cclk_always_on**)(int slot, bool cclk_always_on)

host function to set whether the clock is always enabled

esp_err_t (***do_transaction**)(int slot, *sdmmc_command_t* *cmdinfo)

host function to do a transaction

esp_err_t (***deinit**)(void)

host function to deinitialize the driver

esp_err_t (***deinit_p**)(int slot)

host function to deinitialize the driver, called with the `slot`

esp_err_t (***io_int_enable**)(int slot)

Host function to enable SDIO interrupt line

esp_err_t (***io_int_wait**)(int slot, TickType_t timeout_ticks)

Host function to wait for SDIO interrupt line to be active

int **command_timeout_ms**

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct **sdmmc_card_t**

SD/MMC card information structure

Public Members

sdmmc_host_t **host**

Host with which the card is associated

uint32_t **ocr**

OCR (Operation Conditions Register) value

sdmmc_cid_t **cid**

decoded CID (Card Identification) register value

sdmmc_response_t **raw_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t **csd**

decoded CSD (Card-Specific Data) register value

sdmmc_scr_t **scr**

decoded SCR (SD card Configuration Register) value

sdmmc_ext_csd_t **ext_csd**

decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t **rca**

RCA (Relative Card Address)

uint16_t **max_freq_khz**

Maximum frequency, in kHz, supported by the card

uint32_t **is_mem**

Bit indicates if the card is a memory card

uint32_t **is_sdio**

Bit indicates if the card is an IO card

uint32_t **is_mmc**

Bit indicates if the card is MMC

uint32_t **num_io_functions**

If `is_sdio` is 1, contains the number of IO functions on the card

uint32_t **log_bus_width**

\log_2 (bus width supported by card)

uint32_t **is_ddr**

Card supports DDR mode

uint32_t **reserved**

Reserved for future expansion

Macros

SD/MMC command response buffer

2.6.6 SPI Flash API**Overview**

The `spi_flash` component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The `spi_flash` component also has higher-level API functions which work with partitions defined in the [partition table](#).

Different from the API before IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.

However due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after IDF v4.0 are no longer *atomic*. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

Kconfig option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` can be used to switch `spi_flash_*` functions back to the implementation before ESP-IDF v4.0. However, the code size may get bigger if you use the new API and the old API at the same time.

Encrypted reads and writes use the old implementation, even if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for features of flash chips

Quad/Dual mode chips Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don't need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Optional Features

Optional features for flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

Note: When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
 - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
-

Attention: This document only shows that IDF code has supported the features of those flash chips. It's not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume This feature is only supported on ESP32-C3 for now.

The support for ESP32-S3 may be added in the future.

List of Flash chips that support this feature:

1. XM25QxxC series.

Attention: There are multiple limitations about the auto-suspend feature, please do read [When auto suspend is enabled](#) for more information before you enable this feature.

Flash unique ID This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD

3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3 may be added in the future.

OPI flash support This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

32-bit Address Flash Chips This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regrettably, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

Important: Over 16 MBytes space on flash mentioned above can be only used for `data saving`, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please upgrade to ESP-IDF v5.2 and read the latest docs.

There are some features that are not supported by all flash models, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16MB) that needs longer address to access.
- Flash unique ID - means that flash supports its unique 64-bits ID.
- Suspend & Resume - means that flash can accept suspend/resume command during its writing/erasing. The ESP32-C3 may keep the cache on when the flash is being written/erased and suspend it to read its contents randomly.

If you want to use these features, you need to ensure ESP32-C3 supports this feature, and ALL the flash chips in your product have this feature. For more details, refer [Optional features for flash](#).

Users can also customize their own flash chip driver, see [Overriding Default Chip Drivers](#) for more details.

Warning: Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
 - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
 - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
 - `CMakeLists.txt` and `linker.lf` files
 Modify the files above properly.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
 1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
 2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support `suspend` and `read unique id`).
 3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom_flash_driver](#).

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib      spi_flash      COMPONENT_LIB)
set_property(TARGET      ${spi_flash_lib}      APPEND      PROPERTY      INTER-
FACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
```
5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
6. Build your project, and you will see the new flash driver is used.

Example See also [storage/custom_flash_driver](#).

Initializing a flash device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of *partition-specific functions*.

SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

Concurrency Constraints for flash on SPI1

Concurrency Constraints for flash on SPI1 The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-C3, the config option `CONFIG_SPI_FLASH_AUTO_SUSPEND` (enabled by default) allows the cache to read flash & PSRAM concurrently with SPI1 operations. See *When auto suspend is enabled* for more details.

If this option is disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see *When the caches are disabled*. This constraints will cause more IRAM/DRAM usages.

When the caches are disabled This means that all CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur. If you use the API functions documented here, then the caches will be disabled automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

See also [OS functions](#), [SPI Bus Lock](#).

IRAM-Safe Interrupt Handlers If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the [interrupt handler is registered](#).

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to place code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

Note: When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

When auto suspend is enabled

Important: The flash chip you are using must have suspend/resume function, even then, and not all flash chips with suspend/resume support auto-suspend on ESP32-C3. If you use suspend feature on a unsupported chip, it may cause a severe crash. Therefore, we strongly suggest you reading the flash chip datasheets first. Ensure the flash chip satisfies the following conditions at minimum. Even then, thorough testing is recommended.

1. SUS bit in status registers should in SR2 bit7 (or SR bit15)(This is caused by the restriction of out software implementation).
 2. Suspend command is 75H, resume command is 7AH(This is caused by the restriction of out software implementation).
 3. When the flash is successfully suspended, all address of the flash, except from the section/block being erased, can be read correctly. And resume can be sent immediately at this state.
 4. When the flash is successfully resumed, another suspend can be sent immediately at this state.
-

When auto suspend is enabled, the cache will be kept enabled while accessing the SPI1 bus (e.g. erasing/writing/reading main flash). The hardware handles the arbitration between them.

If SPI1 operation is short (like reading operation), the CPU and the cache will wait until the SPI1 operation is done. However if it's an erasing, auto suspend will happen, interrupting the erasing, making the CPU able to read from cache in limited time.

This way some code/variables can be put into the flash/psram instead of IRAM/DRAM, while still able to be executed during flash erasing. This reduces the some usage of IRAM/DRAM.

Please note this feature has the overhead of the flash suspend/resume. The flash erasing can be extremely long if the erasing is interrupted too often. Use FreeRTOS task priorities to ensure that only real-time critical tasks are executed at higher priority than flash erase, to allow the flash erase to complete in reasonable time.

In other words, there are three kinds of code:

1. Critical code: inside IRAM/DRAM. This kind of code usually has high performance requirements, related to cache/flash/psram, or called very often.

2. Cached code: inside flash/psram. This kind of code has lower performance requirements or called less often. They will execute during erasing, with some overhead.
3. Low priority code: inside flash/psram and disabled during erasing. This kind of code should be forbidden from executed to avoid affecting the flash erasing, by setting a lower task priority than the erasing task.

Attention: The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See [Concurrency Constraints for flash on SPI1](#) for more details.

Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

Note: Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

Memory mapping API

ESP32-C3 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

Note: `mmap` is supported by cache, so it can only be used on main flash.

SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

Host driver The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-C3 memory-spi functionalities. However due to the speed limitations of ESP32-C3, the HAL layer can't provide high-speed implementations to some reading commands (So we didn't do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access to the flash regardless of the low-level hardware.

Chip driver The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

OS functions Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.

3. Some devices of SPI Master driver may requires to use the bus monopolized during a period. (especially when the device doesn't have CS wire, or the wire is controlled by the software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

See also

- [Partition Table documentation](#)

- [Non-Volatile Storage \(NVS\) API](#) provides a structured API for storing small pieces of data in SPI flash.

Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

Functions

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Parameters

- `out_chip` –Pointer to hold the initialized chip.
- `config` –Configuration of the chips to initialize.

Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

esp_err_t **spi_bus_remove_flash_device** (*esp_flash_t* *chip)

Remove a SPI Flash device from the SPI bus.

Parameters **chip** –The flash device to remove.

Returns

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Structures

struct **esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

Public Members

spi_host_device_t **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

esp_flash_io_mode_t **io_mode**

IO mode to read from the Flash.

esp_flash_speed_t **speed**

Speed of the Flash clock.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

Header File

- [components/spi_flash/include/esp_flash.h](#)

Functions

esp_err_t **esp_flash_init** (*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note: Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

Note: If the `chip->drv` pointer is NULL, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized** (const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

Returns true if set, otherwise false.

esp_err_t **esp_flash_read_id** (*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_id** –[out] Pointer to receive ID value.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size** (*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_size** –[out] Detected size in bytes, standing for the size in the binary image header.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_physical_size** (*esp_flash_t* *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash_size** –[out] Detected size in bytes.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id** (*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Note: This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out_id** –[**out**] Pointer to receive unique ID value.

Returns

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn't support read id.

esp_err_t **esp_flash_erase_chip** (*esp_flash_t* *chip)

Erase flash chip contents.

Parameters **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region** (*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **start** –Address to start erasing flash. Must be sector aligned.
- **len** –Length of region to erase. Must also be sector aligned.

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect** (*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

Note: A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **write_protected** –[**out**] Pointer to boolean, set to the value of the write protect flag.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect** (*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **write_protect** –Boolean value for the write protect flag

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions** (const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** –[out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** –[out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions' .

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

Note: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(...).
- **out_protected** –[out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

Note: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

Note: Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **protect** –Write protection flag to set.

Returns `ESP_OK` on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read** (*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Note: If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **buffer** –Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** –Address on flash to read from. Must be less than `chip->size` field.
- **length** –Length (in bytes) of data to read.

Returns

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write** (*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **address** –Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.

- **length** –Length (in bytes) of data to write.

Returns

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted** (*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

Note: Both address & length must be 16 byte aligned, as this is the encryption block size

Parameters

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** –Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write.
- **length** –Length (in bytes) of data to write. 16 byte aligned.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

esp_err_t **esp_flash_read_encrypted** (*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

Parameters

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** –Address on flash to read from.
- **out_buffer** –Pointer to a buffer for the data to read to.
- **length** –Length (in bytes) of data to read.

Returns

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi_flash_read_encrypted().

static inline bool **esp_flash_is_quad_mode** (const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

Parameters **chip** –Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

`uint32_t offset`

Start address of this region.

`uint32_t size`

Size of the region.

struct `esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

`esp_err_t (*start)(void *arg)`

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

`esp_err_t (*end)(void *arg)`

Called after completing any flash operation.

`esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)`

Called before any erase/write operations to check whether the region is limited by the OS

`esp_err_t (*delay_us)(void *arg, uint32_t us)`

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

`void (*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)`

Called for get temp buffer when buffer from application cannot be directly read into/write from.

`void (*release_temp_buffer)(void *arg, void *temp_buf)`

Called for release temp buffer.

`esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)`

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

`esp_err_t (*yield)(void *arg, uint32_t *out_status)`

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

struct `esp_flash_t`

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific "host_driver" structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp_flash_os_functions_t* ***os_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void ***os_func_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

esp_flash_io_mode_t **read_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32_t **chip_id**

Detected chip id.

uint32_t **busy**

This flag is used to verify chip's status.

uint32_t **hpm_dummy_ena**

This flag is used to verify whether flash works under HPM status.

uint32_t **reserved_flags**

reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

Type Definitions

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

typedef struct *esp_flash_t* **esp_flash_t**

Header File

- [components/hal/include/hal/spi_flash_types.h](#)

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to salve.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**

Read flash status register(2) command.

uint32_t **sus_cmd**

Flash suspend command.

uint32_t **res_cmd**

Flash resume command.

uint32_t **reserved**

Reserved, set to 0.

struct **spi_flash_encryption_t**

Structure for flash encryption operations.

Public Members

void (***flash_encryption_enable**)(void)

Enable the flash encryption.

void (***flash_encryption_disable**)(void)

Disable the flash encryption.

void (***flash_encryption_data_prepare**)(uint32_t address, const uint32_t *buffer, uint32_t size)

Prepare flash encryption before operation.

Note: address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.

Param buffer Data for programming

Param size Size to program.

void (***flash_encryption_done**)(void)

flash data encryption operation is done.

void (***flash_encryption_destroy**)(void)

Destroy encrypted result

bool (***flash_encryption_check**)(uint32_t address, uint32_t length)

Check if is qualified to encrypt the buffer

Param address the address of written flash partition.

Param length Buffer size.

struct **spi_flash_host_inst_t**

SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* ***driver**

Pointer to the implementation function table.

struct **spi_flash_host_driver_s**

Host driver configuration and context structure.

Public Members

esp_err_t (***dev_config**)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (***common_command**)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (***read_id**)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (***erase_chip**)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (***erase_sector**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (***erase_block**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (***read_status**)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (***set_write_protect**)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (***program_page**)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (***supports_direct_write**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether given buffer can be directly used to write

int (***write_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write

Param len Length request to write

Param align_addr Output of the aligned address to write to

Param page_size Physical page size of the flash chip

Return Length that can be actually written in one `program_page` call

esp_err_t (***read**)(*spi_flash_host_inst_t* *host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (***supports_direct_read**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether given buffer can be directly used to read

int (***read_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read

Param len Length request to read

Param align_addr Output of the aligned address to read

Param page_size Physical page size of the flash chip

Return Length that can be actually read in one `read` call

uint32_t (***host_status**)(*spi_flash_host_inst_t* *host)

Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (***configure_host_io_mode**)(*spi_flash_host_inst_t* *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, *esp_flash_io_mode_t* io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (***poll_cmd_done**)(*spi_flash_host_inst_t* *host)

Internal use, poll the HW until the last operation is done.

esp_err_t (***flush_cache**)(*spi_flash_host_inst_t* *host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (***check_suspend**)(*spi_flash_host_inst_t* *host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (***resume**)(*spi_flash_host_inst_t* *host)

Resume flash from suspend manually

void (***suspend**)(*spi_flash_host_inst_t* *host)

Set flash in suspend status manually

```
esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16

Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO

Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

ESP_FLASH_SPEED_MIN

Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_CONFIG_CONF_BITS

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

Enumerations

```
enum esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator **ESP_FLASH_5MHZ**

The flash runs under 5MHz.

enumerator **ESP_FLASH_10MHZ**

The flash runs under 10MHz.

enumerator **ESP_FLASH_20MHZ**

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

API Reference - Partition Table

Header File

- `components/spi_flash/include/esp_partition.h`

Functions

`esp_partition_iterator_t esp_partition_find` (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, const char *label)

Find partition based on one or more parameters.

Parameters

- **type** –Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

const `esp_partition_t` *`esp_partition_find_first` (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, const char *label)

Find first partition based on one or more parameters.

Parameters

- **type** –Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

const `esp_partition_t` *`esp_partition_get` (`esp_partition_iterator_t` iterator)

Get `esp_partition_t` structure for given partition.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

`esp_partition_iterator_t esp_partition_next` (`esp_partition_iterator_t` iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. Must be non-NULL.

Returns NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

void `esp_partition_iterator_release` (`esp_partition_iterator_t` iterator)

Release partition iterator.

Parameters **iterator** –Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

const `esp_partition_t` *`esp_partition_verify` (const `esp_partition_t` *partition)

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from *esp_partition_get()*, as a test for equality.

Parameters **partition** –Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns

- If partition not found, returns NULL.
- If found, returns a pointer to the *esp_partition_t* structure in flash. This pointer is always valid for the lifetime of the application.

esp_err_t **esp_partition_read** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

Parameters

- **partition** –Pointer to partition structure obtained using *esp_partition_find_first* or *esp_partition_get*. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if *src_offset* exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using *esp_partition_erase_range* function.

Partitions marked with an encryption flag will automatically be written via the *spi_flash_write_encrypted()* function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the *spi_flash_write_encrypted()* function for more details. Unencrypted partitions do not have this restriction.

Note: Prior to writing to flash memory, make sure it has been erased with *esp_partition_erase_range* call.

Parameters

- **partition** –Pointer to partition structure obtained using *esp_partition_find_first* or *esp_partition_get*. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if *dst_offset* exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_read_raw** (const *esp_partition_t* *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

Note: This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

Returns ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_write_raw** (const *esp_partition_t* *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Note: This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

Note: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

esp_err_t **esp_partition_erase_range** (const *esp_partition_t* *partition, size_t offset, size_t size)

Erase part of the partition.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

Returns ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or `dst` are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

esp_err_t **esp_partition_mmap** (const *esp_partition_t* *partition, size_t offset, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where mapping should start.
- **size** –Size of the area to be mapped.
- **memory** –Memory space where the region should be mapped
- **out_ptr** –Output, pointer to the mapped memory region
- **out_handle** –Output, handle which should be used for `spi_flash_munmap` call

Returns ESP_OK, if successful

esp_err_t **esp_partition_get_sha256** (const *esp_partition_t* *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters

- **partition** –[in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** –[out] Returned SHA-256 digest for a given partition.

Returns

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn't contain a valid app image.
- ESP_FAIL: An allocation error occurred.

bool **esp_partition_check_identity** (const *esp_partition_t* *partition_1, const *esp_partition_t* *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters

- **partition_1** –[in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** –[in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns

- True: In case of the two firmware is equal.
- False: Otherwise

esp_err_t **esp_partition_register_external** (*esp_flash_t* *flash_chip, size_t offset, size_t size, const char *label, *esp_partition_type_t* type, *esp_partition_subtype_t* subtype, const *esp_partition_t* **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp_flash_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp_partition* API.

Parameters

- **flash_chip** –Pointer to the structure identifying the flash chip
- **offset** –Address in bytes, where the partition starts
- **size** –Size of the partition in bytes
- **label** –Partition name
- **type** –One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** –One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** –[out] Output, if non-NULL, receives the pointer to the resulting *esp_partition_t* structure

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn't fit into the flash chip size

esp_err_t **esp_partition_deregister_external** (const *esp_partition_t* *partition)

Deregister the partition previously registered using *esp_partition_register_external*.

Parameters **partition** –pointer to the partition structure obtained from *esp_partition_register_external*,

Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using *esp_partition_register_external* function.

Structures

struct **esp_partition_t**

partition information structure

This is not the format in flash, that format is *esp_partition_info_t*.

However, this is the format used by this API.

Public Members

esp_flash_t ***flash_chip**

SPI flash chip on which the partition resides

esp_partition_type_t **type**

partition type (app/data)

esp_partition_subtype_t **subtype**

partition subtype

uint32_t **address**
starting address of the partition in flash

uint32_t **size**
size of the partition, in bytes

char **label**[17]
partition label, zero-terminated ASCII string

bool **encrypted**
flag is set to true if partition is encrypted

Macros

ESP_PARTITION_SUBTYPE_OTA (i)
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

Type Definitions

typedef struct esp_partition_iterator_opaque_ ***esp_partition_iterator_t**
Opaque partition iterator type.

Enumerations

enum **esp_partition_type_t**
Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator **ESP_PARTITION_TYPE_APP**
Application partition type.

enumerator **ESP_PARTITION_TYPE_DATA**
Data partition type.

enumerator **ESP_PARTITION_TYPE_ANY**
Used to search for partitions with any type.

enum **esp_partition_subtype_t**
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

Note: These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**

Factory application partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**

Base for OTA partition subtypes.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_0**

OTA partition 0.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_1**

OTA partition 1.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_2**

OTA partition 2.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_3**

OTA partition 3.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**

OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**

OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**

OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**

OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**

OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**

OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**

OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**

OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**

OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**

OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**

OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**

OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**

Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**

Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**

OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**

PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**

NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**

COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**

Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**

Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**

FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**

SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**

Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File

- [components/bootloader_support/include/esp_flash_encrypt.h](#)

Functions

static inline bool **esp_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update** (void)

esp_err_t **esp_flash_encrypt_region** (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

Note: This function resets RTC_WDT between operations with sectors.

Parameters

- **src_addr** –Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** –Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

Returns ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt** (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t **esp_get_flash_encryption_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

Returns

void **esp_flash_encryption_init_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

Note: This function is called automatically during app startup, it doesn't need to be called from the app.

esp_err_t **esp_flash_encryption_enable_secure_features** (void)

Set all secure eFuse features related to flash encryption.

Returns

- ESP_OK - Successfully

void **esp_flash_encryption_set_release_mode** (void)

Switches Flash Encryption from “Development” to “Release” .

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator **ESP_FLASH_ENC_MODE_DISABLED**

enumerator **ESP_FLASH_ENC_MODE_DEVELOPMENT**

enumerator **ESP_FLASH_ENC_MODE_RELEASE**

2.6.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. [here](#)) and in the official [SPIFFS github repository](#). The issue can be partially mitigated by the [SPIFFS configuration](#).
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
- When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official [SPIFFS FAQ](#).

Tools

spiffsgen.py `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_
→dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image`—the image size is automatically obtained from the project's partition table.

Due to the differences in structure between Make and CMake, it is important to note that:

- for Make `spiffs_create_partition_image` must be called from the project Makefile
- for CMake `spiffs_create_partition_image` must be called from one of the component CMake-Lists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` or `make flash` by specifying `FLASH_IN_PROJECT`. For example,

in Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image.

in Make:

```
dep:
    ...
```

(continues on next page)

(continued from previous page)

```
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in CMake:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see [storage/spiffsgen](#).

mkspiffs Another tool for creating SPIFFS partition images is [mkspiffs](#). Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size:** 4096 (standard for SPI Flash)
- **Page Size:** 256 (standard for SPI Flash)
- **Image Size:** Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset:** Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-C3 at offset 0x110000, run:

```
python esptool.py --chip esp32c3 --port [port] --baud [baud] write_flash -z_
→0x110000 spiffs.bin
```

Notes on which SPIFFS tool to use The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

Application Example

An example of using SPIFFS is provided in the [storage/spiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- `components/spiffs/include/esp_spiffs.h`

Functions

esp_err_t **esp_vfs_spiffs_register** (const *esp_vfs_spiffs_conf_t* *conf)

Register and mount SPIFFS to VFS with given path prefix.

Parameters *conf* –Pointer to *esp_vfs_spiffs_conf_t* configuration structure

Returns

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

esp_err_t **esp_vfs_spiffs_unregister** (const char *partition_label)

Unregister and unmount SPIFFS from VFS

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`.

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

bool **esp_spiffs_mounted** (const char *partition_label)

Check if SPIFFS is mounted

Parameters *partition_label* –Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

Returns

- true if mounted
- false if not mounted

esp_err_t **esp_spiffs_format** (const char *partition_label)

Format the SPIFFS partition

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`.

Returns

- ESP_OK if successful
- ESP_FAIL on error

esp_err_t **esp_spiffs_info** (const char *partition_label, size_t *total_bytes, size_t *used_bytes)

Get information for SPIFFS

Parameters

- *partition_label* –Same label as passed to `esp_vfs_spiffs_register`
- *total_bytes* –[out] Size of the file system
- *used_bytes* –[out] Current used bytes in the file system

Returns

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

esp_err_t **esp_spiffs_check** (const char *partition_label)

Check integrity of SPIFFS

Parameters *partition_label* –Same label as passed to `esp_vfs_spiffs_register`

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error

Structures

struct **esp_vfs_spiffs_conf_t**

Configuration structure for `esp_vfs_spiffs_register`.

Public Members

const char ***base_path**

File path prefix associated with the filesystem.

const char ***partition_label**

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t **max_files**

Maximum files that could be open at the same time.

bool **format_if_mount_failed**

If true, it will format the file system if it fails to mount.

2.6.8 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as `fopen` and `fprintf`, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. The VFS component will then call the function `open` of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

Synchronous input/output multiplexing Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

Non-socket VFS drivers If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

Note: `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- [peripherals/uart/uart_select](#)
- [system/select](#)

Socket VFS drivers A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32/vfs_lwip.c](#) for a reference socket driver implementation using LWIP.

Note: If you use `select()` for socket file descriptors only then you can enable the `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` option to reduce the code size and improve performance.

Note: Don't change the socket driver during an active `select()` call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on `/data`
- FS 2 on `/data/static`

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html` does not exist in FS 2, FS 1 will *not* be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (`/`) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (`.`) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/../log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

File descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `newlib's sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

Standard IO streams (stdin, stdout, stderr)

If the `menuconfig` option `UART` for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use `UART0` or `UART1` for standard IO. By default, `UART0` is used with 115200 baud rate; TX pin is `GPIO1`; RX pin is `GPIO3`. These parameters can be changed in `menuconfig`.

Writing to `stdout` or `stderr` will send characters to the UART transmit FIFO. Reading from `stdin` will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (`'\n'`) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via `menuconfig`, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

Standard streams and FreeRTOS tasks `FILE` objects for `stdin`, `stdout`, and `stderr` are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in `newlib libc`. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `stdin`, `stdout`, and `stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default `stdin`, `stdout`, or `stderr` using `fclose` will close the FILE stream object, which will affect all other tasks.
- To change the default `stdin`, `stdout`, `stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin(_stdout, _stderr)` before creating the task.

Event fds

`eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC`, `EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and the write the `eventfd` in an interrupt handler.

Note that creating an `eventfd` with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

Functions

`ssize_t esp_vfs_write` (`struct _reent *r`, `int fd`, `const void *data`, `size_t size`)

These functions are to be used in `newlib syscall table`. They will be called by `newlib` when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (`struct _reent *r`, `int fd`, `off_t size`, `int mode`)

`ssize_t esp_vfs_read` (`struct _reent *r`, `int fd`, `void *dst`, `size_t size`)
