

# ESP32-S2

## ESP-IDF Programming Guide

Release v5.0.4  
Espressif Systems  
Sep 14, 2023

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	52
1.3 Installation	52
1.3.1 IDE	53
1.3.2 Manual Installation	53
1.4 Build Your First Project	80
1.5 Uninstall ESP-IDF	81
<b>2 API Reference</b>	<b>83</b>
2.1 API Conventions	83
2.1.1 Error handling	83
2.1.2 Configuration structures	83
2.1.3 Private APIs	84
2.1.4 Components in example projects	84
2.1.5 API Stability	85
2.2 Application Protocols	86
2.2.1 ASIO port	86
2.2.2 ESP-Modbus	86
2.2.3 ESP-MQTT	87
2.2.4 ESP-TLS	102
2.2.5 ESP HTTP Client	117
2.2.6 ESP Local Control	132
2.2.7 ESP Serial Slave Link	141
2.2.8 ESP x509 Certificate Bundle	155
2.2.9 HTTP Server	157
2.2.10 HTTPS Server	185
2.2.11 ICMP Echo	188
2.2.12 mDNS Service	193
2.2.13 Mbed TLS	194
2.2.14 IP Network Layer	195
2.3 Error Codes Reference	195
2.4 Networking APIs	202
2.4.1 Wi-Fi	202
2.4.2 Ethernet	310
2.4.3 Thread	339
2.4.4 ESP-NETIF	345
2.4.5 IP Network Layer	377
2.4.6 Application Layer	379
2.5 Peripherals API	379
2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver	379
2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver	389
2.5.3 Analog to Digital Converter (ADC) Calibration Driver	397

2.5.4	Clock Tree	399
2.5.5	Digital To Analog Converter (DAC)	406
2.5.6	GPIO & RTC GPIO	411
2.5.7	General Purpose Timer (GPTimer)	431
2.5.8	Dedicated GPIO	442
2.5.9	Hash-based Message Authentication Code (HMAC)	448
2.5.10	Digital Signature (DS)	452
2.5.11	Inter-Integrated Circuit (I2C)	458
2.5.12	Inter-IC Sound (I2S)	475
2.5.13	LCD	499
2.5.14	LED Control (LEDC)	516
2.5.15	Pulse Counter (PCNT)	534
2.5.16	Remote Control Transceiver (RMT)	549
2.5.17	SD SPI Host Driver	574
2.5.18	Sigma-Delta Modulation (SDM)	579
2.5.19	SPI Master Driver	584
2.5.20	SPI Slave Driver	605
2.5.21	SPI Slave Half Duplex	611
2.5.22	Temperature Sensor	619
2.5.23	Touch Sensor	622
2.5.24	Touch Element	650
2.5.25	Two-Wire Automotive Interface (TWAI)	677
2.5.26	Universal Asynchronous Receiver/Transmitter (UART)	695
2.5.27	USB Device Driver	719
2.5.28	USB Host	723
2.6	Project Configuration	759
2.6.1	Introduction	759
2.6.2	Project Configuration Menu	759
2.6.3	Using sdkconfig.defaults	759
2.6.4	Kconfig Formatting Rules	759
2.6.5	Backward Compatibility of Kconfig Options	760
2.6.6	Configuration Options Reference	760
2.7	Provisioning API	1015
2.7.1	Protocol Communication	1015
2.7.2	Unified Provisioning	1029
2.7.3	Wi-Fi Provisioning	1034
2.8	Storage API	1053
2.8.1	FAT Filesystem Support	1053
2.8.2	Manufacturing Utility	1061
2.8.3	Non-volatile Storage Library	1065
2.8.4	NVS Partition Generator Utility	1087
2.8.5	SD/SDIO/MMC Driver	1092
2.8.6	SPI Flash API	1105
2.8.7	SPIFFS Filesystem	1141
2.8.8	Virtual filesystem component	1145
2.8.9	Wear Levelling API	1161
2.9	System API	1164
2.9.1	App Image Format	1164
2.9.2	Application Level Tracing	1169
2.9.3	Call function with external stack	1174
2.9.4	Chip Revision	1176
2.9.5	Console	1178
2.9.6	eFuse Manager	1187
2.9.7	Error Codes and Helper Functions	1215
2.9.8	ESP HTTPS OTA	1218
2.9.9	Event Loop Library	1224
2.9.10	FreeRTOS (Overview)	1237
2.9.11	FreeRTOS (ESP-IDF)	1239

2.9.12	FreeRTOS (Supplemental Features)	1356
2.9.13	Heap Memory Allocation	1376
2.9.14	Heap Memory Debugging	1389
2.9.15	High Resolution Timer (ESP Timer)	1400
2.9.16	Internal and Unstable APIs	1406
2.9.17	Interrupt allocation	1407
2.9.18	Logging library	1413
2.9.19	Miscellaneous System APIs	1420
2.9.20	Over The Air Updates (OTA)	1435
2.9.21	Performance Monitor	1446
2.9.22	Power Management	1450
2.9.23	POSIX Threads Support	1456
2.9.24	Random Number Generation	1460
2.9.25	Sleep Modes	1462
2.9.26	SoC Capabilities	1474
2.9.27	System Time	1486
2.9.28	The Async memcpy API	1491
2.9.29	ULP Coprocessor programming	1495
2.9.30	ULP RISC-V Coprocessor programming	1532
2.9.31	Watchdogs	1537
<b>3</b>	<b>Hardware Reference</b>	<b>1543</b>
3.1	Chip Series Comparison	1543
3.1.1	Related Documents	1546
<b>4</b>	<b>API Guides</b>	<b>1547</b>
4.1	Application Level Tracing library	1547
4.1.1	Overview	1547
4.1.2	Modes of Operation	1547
4.1.3	Configuration Options and Dependencies	1548
4.1.4	How to Use This Library	1549
4.2	Application Startup Flow	1557
4.2.1	First stage bootloader	1557
4.2.2	Second stage bootloader	1558
4.2.3	Application startup	1558
4.3	Bootloader	1559
4.3.1	Bootloader compatibility	1560
4.3.2	Log Level	1560
4.3.3	Factory reset	1560
4.3.4	Boot from Test Firmware	1561
4.3.5	Rollback	1561
4.3.6	Watchdog	1561
4.3.7	Bootloader Size	1562
4.3.8	Fast boot from Deep Sleep	1562
4.3.9	Custom bootloader	1562
4.4	Build System	1563
4.4.1	Overview	1563
4.4.2	Using the Build System	1563
4.4.3	Example Project	1565
4.4.4	Project CMakeLists File	1566
4.4.5	Component CMakeLists Files	1567
4.4.6	Component Configuration	1570
4.4.7	Preprocessor Definitions	1570
4.4.8	Component Requirements	1570
4.4.9	Overriding Parts of the Project	1574
4.4.10	Configuration-Only Components	1575
4.4.11	Debugging CMake	1575
4.4.12	Example Component CMakeLists	1575

4.4.13	Custom sdkconfig defaults	1579
4.4.14	Flash arguments	1580
4.4.15	Building the Bootloader	1580
4.4.16	Writing Pure CMake Components	1581
4.4.17	Using Third-Party CMake Projects with Components	1581
4.4.18	Using Prebuilt Libraries with Components	1582
4.4.19	Using ESP-IDF in Custom CMake Projects	1582
4.4.20	ESP-IDF CMake Build System API	1583
4.4.21	File Globbing & Incremental Builds	1587
4.4.22	Build System Metadata	1587
4.4.23	Build System Internals	1588
4.4.24	Migrating from ESP-IDF GNU Make System	1589
4.5	Core Dump	1591
4.5.1	Overview	1591
4.5.2	Configurations	1591
4.5.3	Save core dump to flash	1592
4.5.4	Print core dump to UART	1592
4.5.5	ROM Functions in Backtraces	1593
4.5.6	Dumping variables on demand	1593
4.5.7	Running <code>espcoredump.py</code>	1593
4.6	Deep Sleep Wake Stubs	1594
4.6.1	Rules for Wake Stubs	1596
4.6.2	Implementing A Stub	1596
4.6.3	Loading Code Into RTC Memory	1597
4.6.4	Loading Data Into RTC Memory	1597
4.6.5	CRC Check For Wake Stubs	1598
4.6.6	Example	1598
4.7	Device Firmware Upgrade via USB	1598
4.7.1	USB Connection	1598
4.8	Building the DFU Image	1599
4.9	Flashing the DFU Image	1599
4.9.1	Udev Rule (Linux only)	1599
4.9.2	USB Drivers (Windows only)	1600
4.9.3	Common Errors and Known Issues	1600
4.10	Error Handling	1600
4.10.1	Overview	1600
4.10.2	Error codes	1601
4.10.3	Converting error codes to error messages	1601
4.10.4	<code>ESP_ERROR_CHECK</code> macro	1601
4.10.5	<code>ESP_ERROR_CHECK_WITHOUT_ABORT</code> macro	1602
4.10.6	<code>ESP_RETURN_ON_ERROR</code> macro	1602
4.10.7	<code>ESP_GOTO_ON_ERROR</code> macro	1602
4.10.8	<code>ESP_RETURN_ON_FALSE</code> macro	1602
4.10.9	<code>ESP_GOTO_ON_FALSE</code> macro	1602
4.10.10	CHECK MACROS Examples	1602
4.10.11	Error handling patterns	1603
4.10.12	C++ Exceptions	1604
4.11	ESP-WIFI-MESH	1604
4.11.1	Overview	1604
4.11.2	Introduction	1604
4.11.3	ESP-WIFI-MESH Concepts	1606
4.11.4	Building a Network	1611
4.11.5	Managing a Network	1616
4.11.6	Data Transmission	1619
4.11.7	Channel Switching	1621
4.11.8	Performance	1624
4.11.9	Further Notes	1625
4.12	Event Handling	1625

4.12.1	Wi-Fi, Ethernet, and IP Events	1625
4.12.2	Mesh Events	1626
4.12.3	Bluetooth Events	1627
4.13	Fatal Errors	1627
4.13.1	Overview	1627
4.13.2	Panic Handler	1627
4.13.3	Register Dump and Backtrace	1628
4.13.4	GDB Stub	1630
4.13.5	RTC Watchdog Timeout	1631
4.13.6	Guru Meditation Errors	1631
4.13.7	Other Fatal Errors	1633
4.14	Flash Encryption	1635
4.14.1	Introduction	1636
4.14.2	Relevant eFuses	1636
4.14.3	Flash Encryption Process	1637
4.14.4	Flash Encryption Configuration	1638
4.14.5	Possible Failures	1645
4.14.6	ESP32-S2 Flash Encryption Status	1646
4.14.7	Reading and Writing Data in Encrypted Flash	1646
4.14.8	Updating Encrypted Flash	1647
4.14.9	Disabling Flash Encryption	1648
4.14.10	Key Points About Flash Encryption	1648
4.14.11	Limitations of Flash Encryption	1649
4.14.12	Flash Encryption and Secure Boot	1649
4.14.13	Advanced Features	1649
4.14.14	External RAM	1651
4.14.15	Technical Details	1651
4.15	Hardware Abstraction	1651
4.15.1	Architecture	1651
4.15.2	LL (Low Level) Layer	1652
4.15.3	HAL (Hardware Abstraction Layer)	1653
4.16	High-Level Interrupts	1654
4.16.1	Interrupt Levels	1654
4.16.2	Notes	1655
4.17	JTAG Debugging	1655
4.17.1	Introduction	1656
4.17.2	How it Works?	1656
4.17.3	Selecting JTAG Adapter	1657
4.17.4	Setup of OpenOCD	1657
4.17.5	Configuring ESP32-S2 Target	1657
4.17.6	Launching Debugger	1663
4.17.7	Debugging Examples	1663
4.17.8	Building OpenOCD from Sources	1663
4.17.9	Tips and Quirks	1668
4.17.10	Related Documents	1672
4.18	Linker Script Generation	1697
4.18.1	Overview	1697
4.18.2	Quick Start	1697
4.18.3	Linker Script Generation Internals	1700
4.19	lwIP	1707
4.19.1	Supported APIs	1707
4.19.2	BSD Sockets API	1707
4.19.3	Netconn API	1711
4.19.4	lwIP FreeRTOS Task	1711
4.19.5	IPv6 Support	1711
4.19.6	esp-lwip custom modifications	1712
4.19.7	Performance Optimization	1713
4.20	Memory Types	1715

4.20.1	DRAM (Data RAM)	1715
4.20.2	IRAM (Instruction RAM)	1715
4.20.3	IROM (code executed from flash)	1716
4.20.4	DROM (data stored in flash)	1717
4.20.5	RTC Slow memory	1717
4.20.6	RTC FAST memory	1717
4.20.7	DMA Capable Requirement	1717
4.20.8	DMA Buffer in the stack	1718
4.21	OpenThread	1718
4.21.1	Modes of the OpenThread stack	1718
4.21.2	How to Write an OpenThread Application	1719
4.21.3	The OpenThread Border Router	1720
4.22	Partition Tables	1720
4.22.1	Overview	1720
4.22.2	Built-in Partition Tables	1721
4.22.3	Creating Custom Tables	1721
4.22.4	Generating Binary Partition Table	1724
4.22.5	Partition Size Checks	1724
4.22.6	Flashing the partition table	1724
4.22.7	Partition Tool (parttool.py)	1725
4.23	Performance	1726
4.23.1	How to Optimize Performance	1726
4.23.2	Guides	1726
4.24	RF calibration	1742
4.24.1	Partial calibration	1742
4.24.2	Full calibration	1742
4.24.3	No calibration	1743
4.24.4	PHY initialization data	1743
4.24.5	API Reference	1743
4.25	Secure Boot V2	1746
4.25.1	Background	1746
4.25.2	Advantages	1746
4.25.3	Secure Boot V2 Process	1746
4.25.4	Signature Block Format	1747
4.25.5	Secure Padding	1748
4.25.6	Verifying a Signature Block	1748
4.25.7	Verifying an Image	1748
4.25.8	Bootloader Size	1748
4.25.9	eFuse usage	1749
4.25.10	How To Enable Secure Boot V2	1749
4.25.11	Restrictions after Secure Boot is enabled	1750
4.25.12	Generating Secure Boot Signing Key	1750
4.25.13	Remote Signing of Images	1750
4.25.14	Secure Boot Best Practices	1751
4.25.15	Key Management	1751
4.25.16	Multiple Keys	1752
4.25.17	Key Revocation	1752
4.25.18	Technical Details	1753
4.25.19	Secure Boot & Flash Encryption	1753
4.25.20	Signed App Verification Without Hardware Secure Boot	1753
4.25.21	Advanced Features	1754
4.26	Support for External RAM	1754
4.26.1	Introduction	1754
4.26.2	Hardware	1754
4.26.3	Configuring External RAM	1755
4.26.4	Restrictions	1756
4.26.5	Failure to initialize	1756
4.26.6	Encryption	1756

4.27	Thread Local Storage . . . . .	1757
4.27.1	Overview . . . . .	1757
4.27.2	FreeRTOS Native API . . . . .	1757
4.27.3	Pthread API . . . . .	1757
4.27.4	C11 Standard . . . . .	1757
4.28	Tools . . . . .	1758
4.28.1	IDF Frontend - idf.py . . . . .	1758
4.28.2	IDF Docker Image . . . . .	1761
4.28.3	IDF Windows Installer . . . . .	1763
4.28.4	IDF Component Manager . . . . .	1764
4.28.5	IDF Clang Tidy . . . . .	1765
4.28.6	Downloadable Tools . . . . .	1766
4.29	Unit Testing in ESP32-S2 . . . . .	1780
4.29.1	Normal Test Cases . . . . .	1780
4.29.2	Multi-device Test Cases . . . . .	1781
4.29.3	Multi-stage Test Cases . . . . .	1782
4.29.4	Tests For Different Targets . . . . .	1782
4.29.5	Building Unit Test App . . . . .	1783
4.29.6	Running Unit Tests . . . . .	1783
4.29.7	Timing Code with Cache Compensated Timer . . . . .	1784
4.29.8	Mocks . . . . .	1785
4.30	Unit Testing on Linux . . . . .	1787
4.30.1	Embedded Software Tests . . . . .	1787
4.30.2	IDF Unit Tests on Linux Host . . . . .	1788
4.31	USB OTG Console . . . . .	1789
4.31.1	Hardware Requirements . . . . .	1789
4.31.2	Software Configuration . . . . .	1789
4.31.3	Uploading the Application . . . . .	1789
4.31.4	Limitations . . . . .	1790
4.32	Wi-Fi Driver . . . . .	1791
4.32.1	ESP32-S2 Wi-Fi Feature List . . . . .	1791
4.32.2	How To Write a Wi-Fi Application . . . . .	1791
4.32.3	ESP32-S2 Wi-Fi API Error Code . . . . .	1792
4.32.4	ESP32-S2 Wi-Fi API Parameter Initialization . . . . .	1792
4.32.5	ESP32-S2 Wi-Fi Programming Model . . . . .	1792
4.32.6	ESP32-S2 Wi-Fi Event Description . . . . .	1793
4.32.7	ESP32-S2 Wi-Fi Station General Scenario . . . . .	1796
4.32.8	ESP32-S2 Wi-Fi AP General Scenario . . . . .	1799
4.32.9	ESP32-S2 Wi-Fi Scan . . . . .	1799
4.32.10	ESP32-S2 Wi-Fi Station Connecting Scenario . . . . .	1806
4.32.11	ESP32-S2 Wi-Fi Station Connecting When Multiple APs Are Found . . . . .	1813
4.32.12	Wi-Fi Reconnect . . . . .	1813
4.32.13	Wi-Fi Beacon Timeout . . . . .	1813
4.32.14	ESP32-S2 Wi-Fi Configuration . . . . .	1813
4.32.15	Wi-Fi Easy Connect™ (DPP) . . . . .	1819
4.32.16	Wireless Network Management . . . . .	1820
4.32.17	Radio Resource Measurement . . . . .	1820
4.32.18	Wi-Fi Location . . . . .	1821
4.32.19	ESP32-S2 Wi-Fi Power-saving Mode . . . . .	1821
4.32.20	ESP32-S2 Wi-Fi Throughput . . . . .	1823
4.32.21	Wi-Fi 80211 Packet Send . . . . .	1823
4.32.22	Wi-Fi Sniffer Mode . . . . .	1825
4.32.23	Wi-Fi Multiple Antennas . . . . .	1825
4.32.24	Wi-Fi Channel State Information . . . . .	1827
4.32.25	Wi-Fi Channel State Information Configure . . . . .	1828
4.32.26	Wi-Fi HT20/40 . . . . .	1828
4.32.27	Wi-Fi QoS . . . . .	1828
4.32.28	Wi-Fi AMSDU . . . . .	1829

4.32.29	Wi-Fi Fragment	1829
4.32.30	WPS Enrollee	1829
4.32.31	Wi-Fi Buffer Usage	1829
4.32.32	How to Improve Wi-Fi Performance	1830
4.32.33	Wi-Fi Menuconfig	1834
4.32.34	Troubleshooting	1837
4.33	Wi-Fi Security	1840
4.33.1	ESP32-S2 Wi-Fi Security Features	1840
4.33.2	Protected Management Frames (PMF)	1843
4.33.3	WPA3-Personal	1844
4.34	Reproducible Builds	1845
4.34.1	Introduction	1845
4.34.2	Reasons for non-reproducible builds	1845
4.34.3	Enabling reproducible builds in ESP-IDF	1845
4.34.4	How reproducible builds are achieved	1845
4.34.5	Reproducible builds and debugging	1846
4.34.6	Factors which still affect reproducible builds	1846
<b>5</b>	<b>Migration Guides</b>	<b>1847</b>
5.1	ESP-IDF 5.x Migration Guide	1847
5.1.1	Migration from 4.4 to 5.0	1847
<b>6</b>	<b>Libraries and Frameworks</b>	<b>1877</b>
6.1	Cloud Frameworks	1877
6.1.1	ESP RainMaker	1877
6.1.2	AWS IoT	1877
6.1.3	Azure IoT	1877
6.1.4	Google IoT Core	1877
6.1.5	Aliyun IoT	1877
6.1.6	Joylink IoT	1877
6.1.7	Tencent IoT	1878
6.1.8	Tencentyun IoT	1878
6.1.9	Baidu IoT	1878
6.2	Espressif's Frameworks	1878
6.2.1	Espressif Audio Development Framework	1878
6.2.2	ESP-CSI	1878
6.2.3	Espressif DSP Library	1878
6.2.4	ESP-WIFI-MESH Development Framework	1879

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#) and [ESP32-C Series SoCs](#).

This document describes using ESP-IDF with the ESP32-S2 SoC.

		
<a href="#">Get Started</a>	<a href="#">API Reference</a>	<a href="#">API Guides</a>

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-S2 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-S2 board.

---

**Note:** This is documentation for stable version v5.0.4 of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-S2 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- High performance single core Xtensa® 32-bit LX7 CPU
- Ultra Low Power co-processor running either RISC-V or FSM core
- Multiple peripherals
- Built-in security hardware
- USB OTG interface

Powered by 40 nm technology, ESP32-S2 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-S2 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An **ESP32-S2** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

---

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

---

If you have one of ESP32-S2 official development boards listed below, you can click on the link to learn more about the hardware.

### ESP32-S2-Saola-1

This user guide provides information on ESP32-S2-Saola-1, a small-sized [ESP32-S2 Datasheet](#) based development board produced by Espressif.

Fig. 1: ESP32-S2-Saola-1

The document consists of the following major sections:

- [Getting started](#): Provides an overview of the ESP32-S2-Saola-1 and hardware/software setup instructions to get started.
- [Hardware reference](#): Provides more detailed information about the ESP32-S2-Saola-1's hardware.
- [Hardware Revision Details](#): Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-Saola-1.
- [Related Documents](#): Gives links to related documentation.

**Getting Started** This section describes how to get started with ESP32-S2-Saola-1. It begins with a few introductory sections about the ESP32-S2-Saola-1, then Section [Start Application Development](#) provides instructions on how to get the ESP32-S2-Saola-1 ready and flash firmware into it.

**Overview** ESP32-S2-Saola-1 is a small-sized ESP32-S2 based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-Saola-1 on a breadboard.

To cover a wide range of users' needs, ESP32-S2-Saola-1 supports:

- [ESP32-S2-WROVER](#)
- [ESP32-S2-WROVER-I](#)
- [ESP32-S2-WROOM](#)
- [ESP32-S2-WROOM-I](#)

In this guide, we take ESP32-S2-Saola-1 equipped with ESP32-S2-WROVER as an example.

### Contents and Packaging

**Retail orders** If you order a few samples, each ESP32-S2-Saola-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

Fig. 2: ESP32-S2-Saola-1 - front

**Description of Components** The key components of the board are described in a clockwise direction.

Key Component	Description
ESP32-S2-WROVER	ESP32-S2-WROVER is a powerful, generic Wi-Fi MCU module that integrates ESP32-S2. It has a PCB antenna, a 4 MB external SPI flash and an additional 2 MB PSRAM.
Pin Headers	All available GPIO pins (except for the SPI bus for flash and PSRAM) are broken out to the pin headers on the board. Users can program ESP32-S2 chip to enable multiple functions such as SPI, I2S, UART, I2C, touch sensors, PWM etc.
3.3 V Power On LED	Turns on when the USB power is connected to the board.
USB-to-UART Bridge	Single USB-UART bridge chip provides transfer rates up to 3 Mbps.
Reset Button	Reset button.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-S2 chip.
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
RGB LED	Addressable RGB LED (WS2812), driven by GPIO18.

**Start Application Development** Before powering up your ESP32-S2-Saola-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-Saola-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

**Software Setup** Please proceed to [Get Started](#), where Section [Installation](#) will quickly help you set up the development environment and then flash an application example into your ESP32-S2-Saola-1.

**Note:** ESP32-S2 series of chips only supports ESP-IDF master or version v4.2 and higher.

## Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP32-S2-Saola-1 and their interconnections.

Fig. 3: ESP32-S2-Saola-1 (click to enlarge)

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro-USB port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

**Header Block** The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J2 and J3). The pin header names are shown in [ESP32-S2-Saola-1 - front](#). The numbering is the same as in the [ESP32-S2-Saola-1 Schematics](#) (PDF).

**J2**

No.	Name	Type <sup>Page 7, 1</sup>	Function
1	3V3	P	3.3 V power supply
2	IO0	I/O	GPIO0, Boot
3	IO1	I/O	GPIO1, ADC1_CH0, TOUCH_CH1

## ESP32-S2-DevKitM-1(U)

This user guide provides information on Espressif’s small-sized development board ESP32-S2-DevKitM-1(U).

ESP32-S2-DevKitM-1(U) is a general-purpose development board based on [ESP32-S2FH4](#) chip, which falls into ESP32-S2 chip series. With a rich peripheral set and optimized pinout, this board allows rapid prototyping.

ESP32-S2-DevKitM-1 is embedded with [ESP32-S2-MINI-1](#) module (on-board PCB antenna), while ESP32-S2-DevKitM-1U with [ESP32-S2-MINI-1U](#) module (external antenna connector).

The document consists of the following major sections:

- *Getting started*: Provides an overview of the ESP32-S2-DevKitM-1(U) and hardware/software setup instructions to get started.
- *Hardware reference*: Provides more detailed information about the ESP32-S2-DevKitM-1(U)' s hardware.
- *Hardware Revision Details*: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-DevKitM-1(U).
- *Related Documents*: Gives links to related documentation.

**Getting Started** This section describes how to get started with ESP32-S2-DevKitM-1(U). It begins with a few introductory sections about the ESP32-S2-DevKitM-1(U), then Section *Start Application Development* provides instructions on how to get the ESP32-S2-DevKitM-1(U) ready and flash firmware into it.

**Overview** ESP32-S2-DevKitM-1(U) is entry-level development board equipped with either ESP32-S2-MINI-1 or ESP32-S2-MINI-1U module. Most of the I/O pins on the module are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-DevKitM-1(U) on a breadboard.

### Contents and Packaging

**Retail orders** If you order a few samples, each ESP32-S2-DevKitM-1(U) comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

**Description of Components** The key components of the board are described in a clockwise direction.

Fig. 5: ESP32-S2-DevKitM-1 - front

Fig. 6: ESP32-S2-DevKitM-1U - front

Key Component	Description
ESP32-S2-MINI-1 or ESP32-S2-MINI-1U	ESP32-S2-MINI-1 and ESP32-S2-MINI-1U are two powerful, generic Wi-Fi MCU modules that integrate ESP32-S2FH4 chip. ESP32-S2-MINI-1 comes with a PCB antenna, and ESP32-S2-MINI-1U with an external antenna connector. They both feature a 4 MB external SPI flash.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. Users can program ESP32-S2FH4 chip to enable multiple functions such as SPI, I2S, UART, I2C, touch sensors, PWM etc. For details, please see <a href="#">Header Block</a> .
3.3 V Power On LED	Turns on when the USB power is connected to the board.
USB to UART Bridge	Single USB-UART bridge chip provides transfer rates up to 3 Mbps.
Reset Button	Reset button.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-S2FH4 chip.
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
RGB LED	Addressable RGB LED, driven by GPIO18.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
External Antenna Connector	On <b>ESP32-S2-MINI-1U</b> module only. For connector dimensions, please refer to Section External Antenna Connector Dimensions in <a href="#">ESP32-S2-MINI-1 &amp; ESP32-S2-MINI-1U Datasheet</a> .

**Start Application Development** Before powering up your ESP32-S2-DevKitM-1(U), please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-DevKitM-1(U)
  - For ESP32-S2-DevKitM-1U, an antenna is also required.
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

---

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

---

**Software Setup** Please proceed to [Get Started](#), where Section [Installation](#) will quickly help you set up the development environment and then flash an application example into your ESP32-S2-DevKitM-1(U).

---

**Note:** ESP32-S2 series of chips only is only supported in ESP-IDF master or version v4.2 and higher.

---

### Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP32-S2-DevKitM-1 and their interconnections.

### ESP32-S2-DevKitC-1

This user guide will help you get started with ESP32-S2-DevKitC-1 and will also provide more in-depth information.

ESP32-S2-DevKitC-1 is an entry-level development board based on ESP32-S2-SOLO (on-board PCB antenna) or ESP32-S2-SOLO-U (external antenna connector), which are two general-purpose modules with a 4 MB SPI flash. This board integrates complete Wi-Fi functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-DevKitC-1 on a breadboard.

Fig. 9: ESP32-S2-DevKitC-1 with the ESP32-S2-SOLO Module

The document consists of the following major sections:

- *Getting Started*: Overview of ESP32-S2-DevKitC-1 and hardware/software setup instructions to get started.
- *Hardware Reference*: More detailed information about the ESP32-S2-DevKitC-1's hardware.
- *Hardware Revision Details*: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-DevKitC-1.
- *Related Documents*: Links to related documentation.

**Getting Started** This section provides a brief introduction of ESP32-S2-DevKitC-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

Fig. 10: ESP32-S2-DevKitC-1 - front

**Description of Components** The key components of the board are described in a clockwise direction.

Key Component	Description
ESP32-S2-SOLO or ESP32-S2-SOLO-U	ESP32-S2-SOLO and ESP32-S2-SOLO-U are two general-purpose Wi-Fi modules. ESP32-S2-SOLO comes with an on-board PCB antenna and ESP32-S2-SOLO-U comes with a connector for an external antenna. ESP32-S2-SOLO or ESP32-S2-SOLO-U on the board may come either with a 4 MB flash, or a 4 MB flash plus a 2 MB PSRAM embedded in the chip.
3.3 V Power On LED	Turns on when the USB power is connected to the board.
USB-to-UART Bridge	Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see <a href="#">Header Block</a> .
ESP32-S2 USB Port	ESP32-S2 full-speed USB OTG interface, compliant with the USB 1.1 specifications. The interface is used for power supply to the board, for flashing applications to the chip, and for communication with the chip using USB 1.1 protocols.
Reset Button	Press this button to restart the system.
Boot Button	Download button. Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB-to-UART Port	A Micro-USB port used for power supply to the board, for flashing applications to the chip, as well as the communication with the chip via the on-board USB-to-UART bridge.
RGB LED	Addressable RGB LED, driven by GPIO18.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.

**Start Application Development** Before powering up your ESP32-S2-DevKitC-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-DevKitC-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

**Hardware Setup** Connect the board with the computer using **USB-to-UART Port**. Connection using **ESP32-S2 USB Port** is not fully documented. In subsequent steps, **USB-to-UART Port** will be used by default.

**Software Setup** Please proceed to [ESP-IDF Get Started](#), where Section [Installation Step by Step](#) will quickly help you set up the development environment and then flash an application example into your ESP32-S2-DevKitC-1.

## Contents and Packaging

**Retail orders** If you order a few samples, each ESP32-S2-DevKitC-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

## Hardware Reference

**Block Diagram** The block diagram below shows the components of ESP32-S2-DevKitC-1 and their interconnections.

Fig. 11: ESP32-S2-DevKitC-1 (click to enlarge)

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- USB-to-UART Port and ESP32-S2 USB Port (either one or both), default power supply (recommended)
- 5V and G (GND) pins
- 3V3 and G (GND) pins

**Header Block** The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in *ESP32-S2-DevKitC-1 - front*. The numbering is the same as in the *ESP32-S2-DevKitC-1 Schematic* (PDF).

### J1

## ESP32-S2-Kaluga-1 Kit v1.3

Older version: [ESP32-S2-Kaluga-1 Kit v1.2](#)

The ESP32-S2-Kaluga-1 kit v1.3 is a development kit by Espressif that is mainly created to:

- Demonstrate the ESP32-S2's human-computer interaction functionalities
- Provide the users with the tools for development of human-computer interaction applications based on the ESP32-S2

There are many ways of how the ESP32-S2's abundant functionalities can be used. For starters, the possible use cases may include:

- **Smart home:** From simplest smart lighting, smart door locks, smart sockets, to video streaming devices, security cameras, OTT devices, and home appliances
- **Battery-powered equipment:** Wi-Fi mesh sensor networks, Wi-Fi-networked toys, wearable devices, health management equipment
- **Industrial automation equipment:** Wireless control and robot technology, intelligent lighting, HVAC control equipment, etc.
- **Retail and catering industry:** POS machines and service robots

Fig. 13: ESP32-S2-Kaluga-1-Kit Overview (click to enlarge)

The ESP32-S2-Kaluga-1 kit consists of the following boards:

- Main board: *ESP32-S2-Kaluga-1*
- Extension boards:
  - *ESP-LyraT-8311A v1.3* - audio player
  - *ESP-LyraP-TouchA v1.1* - touch panel
  - *ESP-LyraP-LCD32 v1.2* - 3.2" LCD screen
  - *ESP-LyraP-CAM v1.1* - camera board

Due to the presence of multiplexed pins on ESP32-S2, certain extension board combinations have limited compatibility. For more details, please see [Compatibility of Extension Boards](#).

This document is **mostly dedicated to the main board** and its interaction with the extension boards. For more detailed information on each extension board, click their respective links.

This guide covers:

- [Getting Started](#): Provides an overview of the ESP32-S2-Kaluga-1 and hardware/software setup instructions to get started.
- [Hardware reference](#): Provides more detailed information about the ESP32-S2-Kaluga-1's hardware.
- [Hardware Revision Details](#): Covers revision history, known issues, and links to user guides for previous versions of the ESP32-S2-Kaluga-1.
- [Related Documents](#): Gives links to related documentation.

**Getting Started** This section describes how to get started with the ESP32-S2-Kaluga-1. It begins with a few introductory sections about the ESP32-S2-Kaluga-1, then Section [Start Application Development](#) provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-S2-Kaluga-1.

**Overview** The ESP32-S2-Kaluga-1 main board is the heart of the kit. It integrates the ESP32-S2-WROVER module and all the connectors for extension boards. This board is the key tool in prototyping human-computer interaction interfaces.

The ESP32-S2-Kaluga-1 board has connectors for boards with:

- Extension header (ESP-LyraT-8311A, ESP-LyraP-LCD32)
- Camera header (ESP-LyraP-CAM)
- Touch FPC connector (ESP-LyraP-TouchA)
- LCD FPC connector (no official extension boards yet)
- I2C FPC connector (no official extension boards yet)

Fig. 14: ESP32-S2-Kaluga-1 (click to enlarge)

All the four extension boards are specially designed to support the following features:

- **Touch panel control**
  - Six touch buttons
  - Supports acrylic panels up to 5 mm
  - Wet hand operation
  - Water rejection, ESP32-S2 can be configured to disable all touchpads automatically if multiple pads are simultaneously covered with water and to re-enable touchpads if the water is removed
- **Audio playback**
  - Connect speakers to play audio
  - Use together with the Touch panel to control audio playback and adjust volume
- **LCD display**
  - LCD interface (8-bit parallel RGB, 8080, and 6800 interface)
- **Camera image acquisition**
  - Supports OV2640 and OV3660 camera modules
  - 8-bit DVP image sensor interface (ESP32-S2 also supports 16-bit DVP image sensors, you can design it yourself)
  - Clock frequency up to 40 MHz
  - Optimized DMA transmission bandwidth for easier transmission of high-resolution images

Fig. 15: ESP32-S2-Kaluga-1 - front (click to enlarge)

Fig. 16: ESP32-S2-Kaluga-1 - back (click to enlarge)

**Description of Components** The description of components starts from the ESP32-S2 module on the left side and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.

Key Component	Description
ESP32-S2-WROVER Module	Module integrating the ESP32-S2 chip that provides Wi-Fi connectivity, data processing power, and flexible data storage.
4.3" LCD FPC Connector	(Reserved) Connect to a 4.3" LCD extension board using the FPC cable.
ESP Prog Connector	(Reserved) Connection for Espressif's download device (ESP-Prog) to flash ESP32-S2 system.
JTAG Switch	Switch to ON to enable connection between ESP32-S2 and FT2232; JTAG debugging will then be possible using USB-UART/JTAG Port. See also <a href="#">JTAG Debugging</a> .
Breakout Header 2	Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.
USB-to-UART/JTAG Bridge	FT2232 adapter board allowing for communication over USB port using UART/JTAG protocols.
Camera Header	Mount a camera extension board here (e.g., ESP-LyraP-CAM).
Extension Header	Mount the extension boards having such connectors here.
Reset Button	Press this button to restart the system
Boot Button	Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB-UART/JTAG Port	Communication interface (UART or JTAG) between a PC and the ESP32-S2 module.
USB Power Port	Power supply for the board.
Battery Port	Connect an external battery to the 2-pin battery connector.
Power On LED	Turns on when the USB or an external power supply is connected to the board.
Power Switch	Switch to ON to power the system.
RGB Jumper	To have access to the RGB LED, place a jumper onto the pins.
RGB LED	Programmable RGB LED and controlled by GPIO45. Before using it, you need to put RGB Jumper ON.
Power Regulator	Regulator converts 5 V to 3.3 V.
I2C FPC Connector	(Reserved) Connect to other I2C extension boards using the FPC cable.
Breakout Header 1	Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.
Touch FPC Connector	Connect the ESP-LyraP-TouchA extension board using the FPC cable.
Touch Switch	In OFF position, GPIO1 to GPIO14 are used for connection to touch sensors; switch to ON if you want to use them for other purposes.
3.2" LCD FPC connector	Connect a 3.2" LCD extension board (e.g., ESP-LyraP-LCD32) using the FPC cable.

**Start Application Development** Before powering up your ESP32-S2-Kaluga-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-Kaluga-1
- Two USB 2.0 cables (Standard-A to Micro-B)
  - For power supply
  - For UART/JTAG communication
- Computer running Windows, Linux, or macOS
- Any extension boards of your choice

### Hardware Setup

1. Connect the extension board(s) of your choice (go to their respective user guides if necessary)
2. Plug in both USB cables
3. Turn the **Power Switch** to ON - the Power On LED will light up

**Software Setup** Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment.

The programming guide and application examples for your ESP32-S2-Kaluga-1 kit can be found in [esp-dev-kits](#) repository on GitHub.

A Board Support Package can be found in [IDF Component Registry](#).

### Contents and Packaging

**Retail orders** If you order one or several samples of the kit, each ESP32-S2-Kaluga-1 development kit comes in an individual package.

Fig. 17: ESP32-S2-Kaluga-1 - package

The contents are as follows:

- **Main Board**
  - ESP32-S2-Kaluga-1
- **Extension Boards:**
  - ESP-LyraT-8311A
  - ESP-LyraP-CAM

- ESP-LyraP-TouchA
- ESP-LyraP-LCD32
- **Connectors**
  - 20-pin FPC cable (to connect ESP32-S2-Kaluga-1 to ESP-LyraP-TouchA)
- **Fasteners**
  - Mounting bolts (x8)
  - Screws (x4)
  - Nuts (x4)

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

## Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP32-S2-Kaluga-1 and their interconnections.

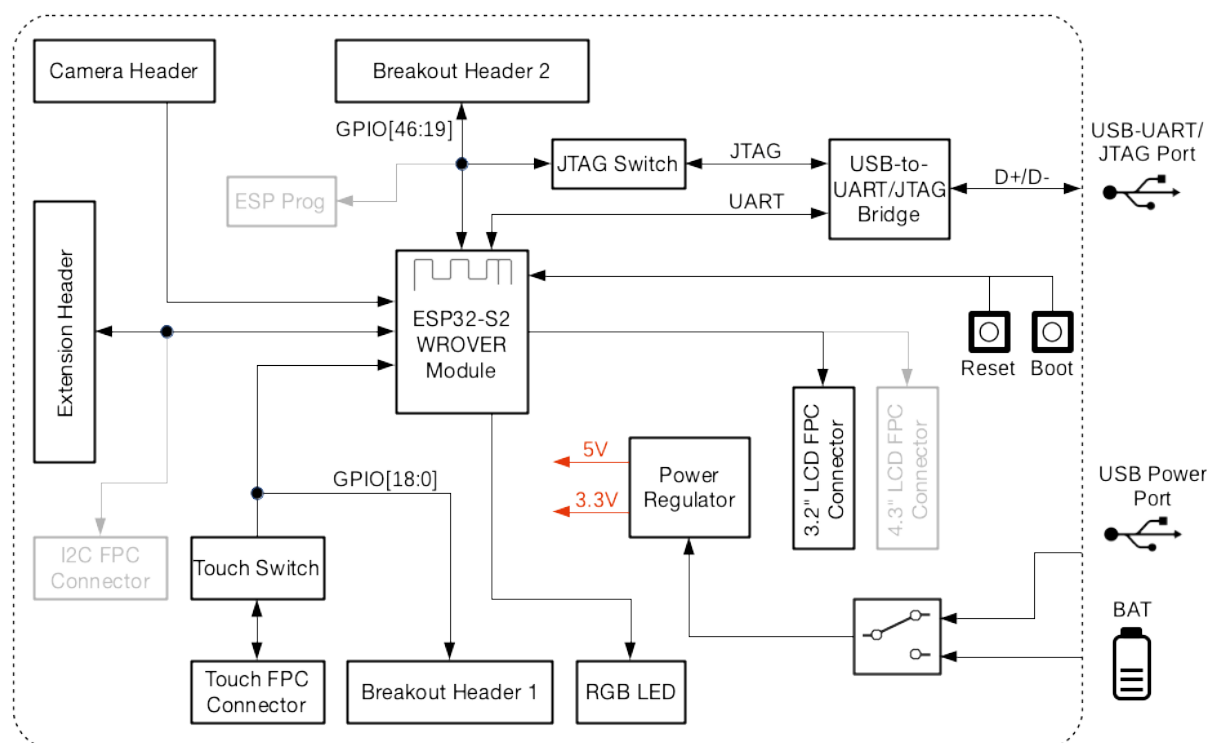

Fig. 18: ESP32-S2-Kaluga-1 block diagram

**Power Supply Options** There are four ways to provide power to the board:

- Micro USB port, default power supply
- External battery via the 2-pin battery connector
- 5V and GND header pins
- 3V3 and GND header pins

**Compatibility of Extension Boards** If you want to use more than one extension board at the same time, please check the table given below.

Boards Used	HW Conflict	Limitations	Solution
8311A v1.3 + CAM v1.1	I2S Controller	ESP32-S2 has only one I2S interface. But both extension boards require connection via the ESP32-S2's I2S interface (LyraT-8311A in Standard mode, ESP-LyraP-CAM in Camera mode).	Utilize time division multiple access, or use a different audio module that can be connected via other GPIOs or DAC.
TouchA v1.1 + LCD32 v1.2	IO11, IO6	Touch actions cannot be triggered because of the multiplexed pin IO11. ESP-LyraP-LCD32 will not be affected because its BLCT pin will be disconnected from IO6.	Do not initialize IO11 (NETWORK) for your ESP-LyraP-TouchA, or configure the BLCT pin to <i>-1</i> (= do not use BLCT) for your ESP-LyraP-LCD32.
8311A v1.3 + LCD32 v1.2	IO6	BLCT pin of ESP32-S2-Kaluga-1 will be disconnected from IO6.	Configure the BK pin to <i>-1</i> (= do not use BLCT) for your ESP-LyraP-LCD32.
TouchA v1.1 + 8311A v1.3	Pin BT_ADC on ESP-LyraT-8311A	This pin is required for initialization of the six button on ESP-LyraT-8311A. At the same time, ESP-LyraP-TouchA needs this pin for its touch actions.	If you plan to use buttons on ESP-LyraT-8311A, do not initialize pin IO6 (PHOTO) for your ESP-LyraP-TouchA.
TouchA v1.1 + CAM v1.1	IO1, IO2, IO3	Cannot be used simultaneously because of the mentioned multiplexed pins.	For ESP-LyraP-TouchA, do not initialize IO1 (VOL_UP), IO2 (PLAY), and IO3 (VOL_DOWN).
TouchA v1.1 + LCD32 v1.2 + CAM v1.1	IO1, IO2, IO3, IO11	Conflicts on the mentioned multiplexed pins.	For ESP-LyraP-TouchA, do not initialize IO1 (VOL_UP), IO2 (PLAY), IO3 (VOL_DOWN), and IO11 (NETWORK).
TouchA v1.1 + LCD32 v1.2 + 8311A v1.3	IO6, IO11	If ESP-LyraT-8311A's pin BT_ADC is used to initialize the board's six buttons, IO6 and IO11 will not be available for the other boards.	Do not initialize IO11 (NETWORK) for your ESP-LyraP-TouchA. Also, if you need to use BT_ADC, do not initialize IO6 (PHOTO).

Also, all extension boards and the *JTAG interface* share the same pins IO39, IO40, IO41 and IO42. For this reason, the following may disturb the JTAG operation:

- Plugging in any extension board
- Debugging an application that is using an extension board

## Hardware Revision Details

### ESP32-S2-Kaluga-1 Kit v1.3

- The following pins re-assigned to fix the download issue
  - Camera D2: GPIO36
  - Camera D3: GPIO37
  - AU\_I2S1\_SDI: GPIO34
  - AU\_WAKE\_INT: GPIO46
- RGB pin header moved to the board's edge
- All dip switches moved to the flip side for convenient operation

### ESP32-S2-Kaluga-1 Kit v1.2 *Initial release*

## Related Documents

### ESP32-S2-Kaluga-1 Kit v1.2

New version available: [ESP32-S2-Kaluga-1 Kit v1.3](#)

The ESP32-S2-Kaluga-1 kit v1.2 is a development kit by Espressif that is mainly created to:

- Demonstrate the ESP32-S2's human-computer interaction functionalities
- Provide the users with the tools for development of human-computer interaction applications based on the ESP32-S2

There are many ways of how the ESP32-S2's abundant functionalities can be used. For starters, the possible use cases may include:

- **Smart home:** From simplest smart lighting, smart door locks, smart sockets, to video streaming devices, security cameras, OTT devices, and home appliances
- **Battery-powered equipment:** Wi-Fi mesh sensor networks, Wi-Fi-networked toys, wearable devices, health management equipment
- **Industrial automation equipment:** Wireless control and robot technology, intelligent lighting, HVAC control equipment, etc.
- **Retail and catering industry:** POS machines and service robots

Fig. 19: ESP32-S2-Kaluga-1-Kit Overview (click to enlarge)

The ESP32-S2-Kaluga-1 kit consists of the following boards:

- Main board: *ESP32-S2-Kaluga-1*
- Extension boards:
  - *ESP-LyraT-8311A v1.2* - audio player
  - *ESP-LyraP-TouchA v1.1* - touch panel
  - *ESP-LyraP-LCD32 v1.1* - 3.2" LCD screen
  - *ESP-LyraP-CAM v1.0* - camera board

Due to the presence of multiplexed pins on ESP32-S2, certain extension board combinations have limited compatibility. For more details, please see [Compatibility of Extension Boards](#).

This document is **mostly dedicated to the main board** and its interaction with the extension boards. For more detailed information on each extension board, click their respective links.

This guide covers:

- *Getting Started*: Provides an overview of the ESP32-S2-Kaluga-1 and hardware/software setup instructions to get started.

- *Hardware reference*: Provides more detailed information about the ESP32-S2-Kaluga-1's hardware.
- *Hardware Revision Details*: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-S2-Kaluga-1.
- *Related Documents*: Gives links to related documentation.

**Getting Started** This section describes how to get started with the ESP32-S2-Kaluga-1. It begins with a few introductory sections about the ESP32-S2-Kaluga-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-S2-Kaluga-1.

**Overview** The ESP32-S2-Kaluga-1 main board is the heart of the kit. It integrates the ESP32-S2-WROVER module and all the connectors for extension boards. This board is the key tool in prototyping human-computer interaction interfaces.

The ESP32-S2-Kaluga-1 board has connectors for boards with:

- Extension header (ESP-LyraT-8311A, ESP-LyraP-LCD32)

**Description of Components** The description of components starts from the ESP32-S2 module on the left side and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.

Key Component	Description
ESP32-S2-WROVER Module	Module integrating the ESP32-S2 chip that provides Wi-Fi connectivity, data processing power, and flexible data storage.
4.3" LCD FPC Connector	(Reserved) Connect to a 4.3" LCD extension board using the FPC cable.
ESP Prog Connector	(Reserved) Connection for Espressif's download device (ESP-Prog) to flash ESP32-S2 system.
JTAG Switch	Switch to ON to enable connection between ESP32-S2 and FT2232; JTAG debugging will then be possible using USB-UART/JTAG Port. See also <a href="#">JTAG Debugging</a> .
Breakout Header 2	Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.
USB-to-UART/JTAG Bridge	FT2232 adapter board allowing for communication over USB port using UART/JTAG protocols.
Camera Header	Mount a camera extension board here (e.g., ESP-LyraP-CAM).
Extension Header	Mount the extension boards having such connectors here.
Reset Button	Press this button to restart the system.
Boot Button	Holding down <b>Boot</b> and then pressing <b>Reset</b> initiates Firmware Download mode for downloading firmware through the serial port.
USB-UART/JTAG Port	Communication interface (UART or JTAG) between a PC and the ESP32-S2 module.
USB Power Port	Power supply for the board.
Battery Port	Connect an external battery to the 2-pin battery connector.
Power On LED	Turns on when the USB or an external power supply is connected to the board.
Power Switch	Switch to ON to power the system.
RGB Jumper	To have access to the RGB LED, place a jumper onto the pins.
RGB LED	Programmable RGB LED and controlled by GPIO45. Before using it, you need to put RGB Jumper ON.
Power Regulator	Regulator converts 5 V to 3.3 V.
I2C FPC Connector	(Reserved) Connect to other I2C extension boards using the FPC cable.
Breakout Header 1	Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.
Touch FPC Connector	Connect the ESP-LyraP-TouchA extension board using the FPC cable.
Touch Switch	In OFF position, GPIO1 to GPIO14 are used for connection to touch sensors; switch to ON if you want to use them for other purposes.
3.2" LCD FPC connector	Connect a 3.2" LCD extension board (e.g., ESP-LyraP-LCD32) using the FPC cable.

**Start Application Development** Before powering up your ESP32-S2-Kaluga-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-Kaluga-1
- Two USB 2.0 cables (Standard-A to Micro-B)
  - For power supply
  - For UART/JTAG communication
- Computer running Windows, Linux, or macOS
- Any extension boards of your choice

### Hardware Setup

1. Connect the extension board(s) of your choice (go to their respective user guides if necessary)
2. Plug in both USB cables
3. Turn the **Power Switch** to ON - the Power On LED will light up

**Software Setup** Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment.

The programming guide and application examples for your ESP32-S2-Kaluga-1 kit can be found in [esp-dev-kits](#) repository on GitHub.

## Contents and Packaging

**Retail orders** If you order one or several samples of the kit, each ESP32-S2-Kaluga-1 development kit comes in an individual package containing:

- **Main Board**
  - ESP32-S2-Kaluga-1
- **Extension Boards:**
  - ESP-LyraT-8311A
  - ESP-LyraP-CAM
  - ESP-LyraP-TouchA
  - ESP-LyraP-LCD32
- **Connectors**
  - 20-pin FPC cable (to connect ESP32-S2-Kaluga-1 to ESP-LyraP-TouchA)
- **Fasteners**
  - Mounting bolts (x8)
  - Screws (x4)
  - Nuts (x4)

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

## Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP32-S2-Kaluga-1 and their interconnections.

**Power Supply Options** There are four ways to provide power to the board:

- Micro USB port, default power supply
- External battery via the 2-pin battery connector
- 5V and GND header pins
- 3V3 and GND header pins

**Compatibility of Extension Boards** If you want to use more than one extension board at the same time, please check the table given below.

Fig. 22: ESP32-S2-Kaluga-1 block diagram

Boards Used	HW Conflict	Limitations	Solution
8311A v1.2 + CAM v1.0	I2S Controller, IO46	ESP32-S2 has only one I2S interface. But both extension boards require connection via the ESP32-S2's I2S interface (ESP-LyraT-8311A in Standard mode, ESP-LyraP-CAM in Camera mode). If IO46 is used by both extension boards at the same time, ESP-LyraP-CAM experiences interferences when used.	No ready solution for now.
TouchA v1.1 + LCD32 v1.1	IO11, IO6	Touch actions cannot be triggered because of the multiplexed pin IO11. ESP-LyraP-LCD32 is also affected because its BK (BLCT) pin is connected to pin IO6.	Do not initialize IO11 (NETWORK) and IO6 (PHOTO) for your ESP-LyraP-TouchA.
8311A v1.2 + LCD32 v1.1	IO6	The two extension boards can be used at the same time. However, since the BK (BLCT) pin of ESP32-S2-Kaluga-1 is connected to IO6, ESP-LyraT-8311A's pin BT_ADC cannot be used and the board's six buttons will not be available.	There is a solution that will allow you to use ESP-LyraT-8311A's pin BT_ADC, but will stop you from controlling the display background brightness with software: on your ESP-LyraP-LCD32 board, remove R39, change R41 to 100 Ohm, switch BLCT_L to on.
TouchA v1.1 + 8311A v1.2	Pin BT_ADC on ESP-LyraT-8311A	The two extension boards can be used at the same time. However, ESP-LyraP-TouchA cannot be triggered if ESP-LyraT-8311A's pin BT_ADC is used	If you plan to use ESP-LyraT-8311A's pin BT_ADC, do not initialize pin IO6 (PHOTO) for your ESP-LyraP-TouchA.
Espressif Systems		to initialize the board's six buttons	Release v5.0.4
TouchA v1.1 + CAM v1.0	IO1, IO2, IO3	Cannot be used simultaneously because of the mentioned multiplexed pins	For ESP-LyraP-TouchA, do not initialize IO1 (VOL_UP), IO2 (PLAY), and IO3 (VOL_DOWN)

Also, all extension boards and the *JTAG interface* share the same pins IO39, IO40, IO41 and IO42. For this reason, the following may disturb the JTAG operation:

- Plugging in any extension board
- Debugging an application that is using an extension board

### Known issues

Hardware Issue	Description	Reason for Failure	Solution
ESP-LyraP-CAM v1.0, pin IO45, IO46	Flashing firmware might be impossible with the extension board connected to the main board.	Incorrect timing sequence is fed to strapping pins IO45 and IO46 when the board is powered on. It stops the board from booting successfully.	While flashing the main board, keep the extension board disconnected.
ESP-LyraP-CAM v1.0, pin IO45, IO46	Rebooting the board by pressing Reset might not lead to desired results.	Incorrect timing sequence is fed to strapping pins IO45 and IO46 when the board is powered on. It stops the board from booting successfully.	No ready solution for v1.2. This bug is fixed in ESP32-S2-Kaluga-1 V1.3.
ESP-LyraT-8311A v1.2, pin IO46	Flashing firmware might be impossible with the extension board connected to the main board.	Incorrect timing sequence is fed to strapping pin IO46 when the board is powered on. It stops the board from booting successfully.	While flashing the main board, keep the extension board disconnected.
ESP-LyraT-8311A v1.2, pin IO46	Rebooting the board by pressing Reset might not lead to desired results.	Incorrect timing sequence is fed to strapping pin IO46 when the board is powered on. It stops the board from booting successfully.	No ready solution for v1.2. This bug is fixed in ESP32-S2-Kaluga-1 V1.3.

**Hardware Revision Details** No previous versions available.

### Related Documents

#### ESP-LyraP-CAM v1.0

This user guide provides information on the ESP-LyraP-CAM extension board.

This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraP-CAM v1.0 is sold as part of the [ESP32-S2-Kaluga-1 Kit v1.2](#).

The ESP-LyraP-CAM extends the functionality of your main board by adding a camera.

The document consists of the following major sections:

- *Overview*: Provides an overview and hardware/software setup instructions to get started.
- *Hardware reference*: Provides more detailed information about the ESP-LyraP-CAM's hardware.
- *Hardware Revision Details*: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-CAM.
- *Related Documents*: Gives links to related documentation.

**Overview** This extension board adds a camera to your main board.

Fig. 23: ESP-LyraP-CAM

Fig. 24: ESP-LyraP-CAM - front and back

### Description of Components

Key Component	Description
Main Board Camera Header	Mount onto main board's Camera Header
Power ON LED	Red LED is on if the power supply voltage is applied
Camera Module Connector	Supports OV2640 and OV3660 camera modules; this extension board is supplied with an OV2640 camera module
Power Regulators	LDO Regulators converting 3.3 V to 2.8 V and 1.5 V

**Start Application Development** Before powering up your ESP-LyraP-CAM, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a female Camera Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraP-CAM extension board
- Computer running Windows, Linux, or macOS

**Hardware Setup** Insert the ESP-LyraP-CAM extension board into your board's female Camera Header.

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

### Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP-LyraP-CAM and their interconnections.

Fig. 25: ESP-LyraP-CAM block diagram

## ESP-LyraP-LCD32 v1.1

This user guide provides information on the ESP-LyraP-LCD32 extension board.

This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraP-LCD32 v1.1 is sold as part of the [ESP32-S2-Kaluga-1 Kit v1.2](#).

The ESP-LyraP-LCD32 extends the functionality of your main board by adding an LCD graphic display.

Fig. 26: ESP-LyraP-LCD32 (click to enlarge)

The document consists of the following major sections:

- **Overview:** Provides an overview and hardware/software setup instructions to get started.
- **Hardware reference:** Provides more detailed information about the ESP-LyraP-LCD32's hardware.
- **Hardware Revision Details:** Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-LCD32.
- **Related Documents:** Gives links to related documentation.

**Overview** This extension board adds a 3.2" LCD graphic display with the resolution of 320x240. This display is connected to ESP32-S2 over the SPI bus.

**Description of Components** In the description of components below, **Reserved** means that the functionality is available, but the current version of the kit does not use it.

Fig. 27: ESP-LyraP-LCD32 - front (click to enlarge)

Key Component	Description
Extension Header	Male Extension Header for mounting onto a female Extension Header
LCD display	This version has a 3.2" 320x240 SPI LCD display module; the display driver/controller is Sitronix ST7789V
Touch Screen Switch	No support for touch screens, keep the switches to OFF to make the pins available for other uses
Main Board 3.2" LCD FPC Connector	(Reserved) Connect to main board's 3.2" LCD FPC connector
Control Switch	Switch to ON to set Reset/Backlight_control/CS to default high or low; switch to OFF to make the pins available for other uses

**Start Application Development** Before powering up your ESP-LyraP-LCD32, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1, ESP-LyraT-8311A)
- ESP-LyraP-LCD32 extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

**Hardware Setup** To mount your ESP-LyraP-LCD32 onto the board with a female Extension Header:

1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraP-LCD32 with the bolts and Extension Header and insert it carefully

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

## Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP-LyraP-LCD32 and their interconnections.

Fig. 28: ESP-LyraP-LCD32 block diagram

**Hardware Revision Details** No previous versions available.

### ESP-LyraP-TouchA v1.1

This user guide provides information on the ESP-LyraP-TouchA extension board.

This board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraP-TouchA v1.1 is sold as part of the following kits:

- [ESP32-S2-Kaluga-1 Kit v1.3](#)
- [ESP32-S2-Kaluga-1 Kit v1.2](#)

The ESP-LyraP-TouchA extends the functionality of your main board by adding touch buttons.

The document consists of the following major sections:

- *Overview*: Provides an overview and hardware setup instructions.
- *Hardware reference*: Provides more detailed information about the ESP-LyraP-TouchA's hardware.
- *Hardware Revision Details*: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-TouchA.
- *Related Documents*: Gives links to related documentation.

**Overview** The ESP-LyraP-TouchA has six touch buttons and is mainly designed for audio applications. However, the touch buttons can also be used for any other purposes.

Fig. 29: ESP-LyraP-TouchA

Fig. 30: ESP-LyraP-TouchA

### Description of Components

Key Component	Description
Main Board Touch FPC Connector	Connect to main board's Touch FPC Connector.
Touchpad	Capacitive touch electrode.
Guard Ring	Connected to a touch sensor, the guard ring triggers an interrupt if wet (Water rejection). It indicates that the sensor array is also wet and most (if not all) touchpads are unusable due to the false detection of touches. After receiving this interrupt, the user might consider disabling all the touch sensors via software.

**Start Application Development** Before powering up your ESP-LyraP-TouchA, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a Touch FPC connector (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraP-TouchA extension board
- FPC cable
- Computer running Windows, Linux, or macOS

**Hardware Setup** Connect the two FPC connectors with the FPC cable.

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

### Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP-LyraP-TouchA and their interconnections.

Fig. 31: ESP-LyraP-TouchA-v1.1 block diagram

**Hardware Revision Details** No previous versions available.

## ESP-LyraT-8311A v1.2

This user guide provides information on the ESP-LyraT-8311A extension board.

This board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraT-8311A v1.2 is sold as part of the [ESP32-S2-Kaluga-1 Kit v1.2](#).

The ESP-LyraT-8311A extends the functionality of your main board by adding sound processing functionality:

- Audio playback/recording
- Processing of audio signals
- Programmable buttons for easy control

This extension board can be used in many ways. The applications might include voice user interface, voice control, voice authorization, recording and playback of sound, etc.

Fig. 32: ESP-LyraT-8311A (click to enlarge)

The document consists of the following major sections:

- [Overview](#): Provides an overview and hardware setup instructions.
- [Hardware reference](#): Provides more detailed information about the ESP-LyraT-8311A's hardware.
- [Hardware Revision Details](#): Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraT-8311A.
- [Related Documents](#): Gives links to related documentation.

**Overview** The ESP-LyraT-8311A is mainly designed for audio applications. However, you can use your creativity to come up with any other use cases.

Fig. 33: ESP-LyraT-8311A - front (click to enlarge)

**Description of Components** The description of components starts from the top right corner and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.

Key Component	Description
Extension Header	Male Extension Header on the flip side is for mounting onto main board's Extension Header; Female Extension Header is for mounting other boards that have a Male Extension Header
Function Button	This board has six programmable buttons
Microphone	Supports Electret and MEMS microphones; this extension board is supplied with an electret microphone
Headphone Connector	6.3 mm (1/8") stereo headphone connector
Speaker Connector	Connect an external speaker to the 2-pin connector
PA	3 W Audio signal amplifier for the external speaker
External Mic-Matrix Connector	(Reserved) FPC connector for external Mic-Matrix (microphone boards)
ADC	(Reserved) high-performance ADC/ES7243: 1 channel for microphone, 1 channel for acoustic echo cancellation (AEC) function
Mono Audio Codec	ES8311 audio ADC and DAC; it can convert the analog signal picked up by the microphone or convert digital signal to play it back through a speaker or headphones

**Start Application Development** Before powering up your ESP-LyraT-8311A, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraT-8311A extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

**Hardware Setup** To mount your ESP-LyraT-8311A onto the board with a female Extension Header:

1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraT-8311A with the bolts and Extension Header and insert it carefully

**Software Setup** Depending on your application, see:

- [ESP-ADF Getting Started Guide](#) if you develop with ESP-ADF (Espressif Audio Development Framework).
- Section [Software Setup](#) of the ESP32-S2-Kaluga-1 kit user guide if you develop directly with ESP-IDF (Espressif IOT Development Framework).

### Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP-LyraT-8311A and their interconnections.

Fig. 34: ESP-LyraT-8311A block diagram

**Hardware Revision Details** No previous versions available.

### ESP-LyraP-CAM v1.1

This user guide provides information on the ESP-LyraP-CAM extension board.

This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraP-CAM v1.1 is sold as part of the [ESP32-S2-Kaluga-1 Kit v1.3](#).

The ESP-LyraP-CAM extends the functionality of your main board by adding a camera.

Fig. 35: ESP-LyraP-CAM

The document consists of the following major sections:

- *Overview*: Provides an overview and hardware/software setup instructions to get started.
- *Hardware reference*: Provides more detailed information about the ESP-LyraP-CAM's hardware.
- *Hardware Revision Details*: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-CAM.
- *Related Documents*: Gives links to related documentation.

**Overview** This extension board adds a camera to your main board.

Fig. 36: ESP-LyraP-CAM - front and back

### Description of Components

Key Component	Description
Main Board Camera Header	Mount onto main board's Camera Header
Power ON LED	Red LED is on if the power supply voltage is correct
Camera Module Connector	Supports OV2640 and OV3660 camera modules; this extension board is supplied with an OV2640 camera module
Power Regulators	LDO Regulators converting 3.3 V to 2.8 V and 1.5 V

**Start Application Development** Before powering up your ESP-LyraP-CAM, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a female Camera Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraP-CAM extension board
- Computer running Windows, Linux, or macOS

**Hardware Setup** Insert the ESP-LyraP-CAM extension board into your board's female Camera Header.

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

### Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP-LyraP-CAM and their interconnections.

### Hardware Revision Details

- *Hardware Revision Details*: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraT-8311A.
- *Related Documents*: Gives links to related documentation.

**Overview** The ESP-LyraT-8311A is mainly designed for audio applications. However, you can use your creativity to come up with any other use cases.

Fig. 43: ESP-LyraT-8311A - front (click to enlarge)

**Description of Components** The description of components starts from the top right corner and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.

Key Component	Description
Extension Header	Male Extension Header on the flip side is for mounting onto main board's Extension Header; Female Extension Header is for mounting other boards that have a Male Extension Header
Function Button	This board has six programmable buttons
Microphone	Supports Electret and MEMS microphones; this extension board is supplied with an electret microphone
Headphone Connector	6.3 mm (1/8") stereo headphone connector
Speaker Connector	Connect an external speaker to the 2-pin connector
PA	3 W Audio signal amplifier for the external speaker
External Mic-Matrix Connector	(Reserved) FPC connector for external Mic-Matrix (microphone boards)
ADC	(Reserved) high-performance ADC/ES7243: 1 channel for microphone, 1 channel for acoustic echo cancellation (AEC) function
Mono Audio Codec	ES8311 audio ADC and DAC; it can convert the analog signal picked up by the microphone or convert digital signal to play it back through a speaker or headphones

**Start Application Development** Before powering up your ESP-LyraT-8311A, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraT-8311A extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

**Hardware Setup** To mount your ESP-LyraT-8311A onto the board with a female Extension Header:

1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraT-8311A with the bolts and Extension Header and insert it carefully

**Software Setup** Depending on your application, see:

- [ESP-ADF Getting Started Guide](#) if you develop with ESP-ADF (Espressif Audio Development Framework).
- Section [Software Setup](#) of the ESP32-S2-Kaluga-1 kit user guide if you develop directly with ESP-IDF (Espressif IOT Development Framework).

### Hardware Reference

**Block Diagram** A block diagram below shows the components of ESP-LyraT-8311A and their interconnections.

Fig. 44: ESP-LyraT-8311A block diagram

### Hardware Revision Details

#### ESP-LyraT-8311A v1.3

- ADC/ES7243 and ADC/ES7210 removed as the Mono Audio Codec chip provides all the needed functionality.

#### ESP-LyraT-8311A v1.2 *Initial release*

## 1.2.2 Software

To start using ESP-IDF on **ESP32-S2**, install the following software:

- **Toolchain** to compile code for ESP32-S2
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-S2
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-S2 and scripts to operate the **Toolchain**

## 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

## 1.3.1 IDE

---

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

## 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

### Standard Setup of Toolchain for Windows

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

---

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

---

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#) .

**Components of the installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (`cmd.exe`). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 45: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

**Using the Command Prompt** For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7
Using Git in c:/Program Files/Git/cmd/
git version 2.29.2.windows.1
Setting IDF_PATH: C:/Users/developer/Desktop/esp-idf
Adding ESP-IDF tools to PATH...

  C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 48: ESP-IDF Command Prompt

two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-S2. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-S2](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

## Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target

may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
      Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode   [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 49: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello\_word”, since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See [Additional Tips](#) for more information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
```

(continues on next page)

(continued from previous page)

```

../../../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↳-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↳bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↳partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device** Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello\_world.bin) onto your ESP32-S2 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-S2 board's serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

**Encountered Issues While Flashing?** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-S2 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-S2](#)). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP\_PU (EN) pins of ESP32-S2, thus changes in the voltage levels of DTR and RTS will boot ESP32-S2 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP\_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S2 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (GPIO0) and press the **EN** button (CHIP\_PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation** When flashing, you will see the output log similar to the following:

```

...
esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB_
↳0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin_
↳0x10000 hello_world.bin
esptool.py v3.0-dev

```

(continues on next page)

(continued from previous page)

```

Hard resetting via RTS pin...
Done

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you’ d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
  This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2MB
↪external flash
Minimum free heap size: 253900 bytes
  Restarting in 9 seconds...
  Restarting in 8 seconds...
  Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

---

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

### That's all that you need to get started with ESP32-S2!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the Failed to open port `/dev/ttyUSB0` error message when flashing the ESP32-S2. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Start with Board Support Package** To speed up prototyping on some development boards, you can use [Board Support Packages \(BSPs\)](#), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via [IDF Component Manager](#), so they can be found in [IDF Component Registry](#).

**Here's an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:**

```
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in [BSP examples folder](#).

**Related Documents** For advanced users who want to customize the install process:

- [Updating ESP-IDF tools on Windows](#)
- [Establish Serial Connection with ESP32-S2](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

### Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt” . This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### Establish Serial Connection with ESP32-S2

This section provides guidance how to establish serial connection between ESP32-S2 and PC.

**Connect ESP32-S2 to PC** Connect the ESP32-S2 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-S2 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-S2 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-S2 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Fig. 50: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

**Check port on Linux and macOS** To check the device name for the serial port of your ESP32-S2 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

**Note:** macOS users: if you don't see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-S2 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

Fig. 51: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

**Adding user to dialout on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection** Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-S2.

The default console baud rate on ESP32-S2 is 115200.

**Windows and Linux** In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 52: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-S2. The log contents will depend on application loaded to ESP32-S2, see [Example Output](#).

Fig. 53: Setting Serial Communication in PuTTY on Linux

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

---

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in *Check port on Linux and macOS*, run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-S2, see *Example Output*. To exit the **screen** session type `Ctrl-A + \`.

---

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```

I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-S2.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-S2 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32-S2 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

## IDF Monitor

IDF Monitor is mainly a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+] ]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+] ]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses <code>idf_monitor</code> to run the <code>project flash</code> target, then resumes <code>idf_monitor</code> . Any changed source files are recompiled and then re-flashed. Target <code>encrypted-flash</code> is run if <code>idf_monitor</code> was started with argument <code>-E</code> .
• Ctrl+A (or A)	Build and flash the app only	Pauses <code>idf_monitor</code> to run the <code>app-flash</code> target, then resumes <code>idf_monitor</code> . Similar to the <code>flash</code> target, but only the main app is built and re-flashed. Target <code>encrypted-app-flash</code> is run if <code>idf_monitor</code> was started with argument <code>-E</code> .
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the <code>--timestamp-format</code> command line argument.
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	
Ctrl+C	Interrupt running application	Pauses IDF Monitor and run <a href="#">GDB</a> project debugger to debug the application at runtime. This requires <code>:ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME</code> option to be enabled.

Any keys pressed, other than `Ctrl-]` and `Ctrl-T`, will be sent through the serial port.

## IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4\_\_\_\_\_, IDF Monitor uses `addr2line_` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was
↳unhandled.
Register dump:
PC      : 0x400f360d  PS      : 0x00060330  A0      : 0x800dbf56  A1      :

```

To decode each address, IDF Monitor runs the following command in the background:

```
xtensa-esp32s2-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

---

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

---

**Target Reset on Connection** By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf_monitor.py --no-reset`).

---

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

---

**Launching GDB with GDBStub** GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub` on `runtime`. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub` on `panic`. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board's Reset button).

---

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
xtensa-esp32s2-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex_
↪interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

---

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, \*} referring to a level for *logging*.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

---

**Note:** Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

---

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

### Known Issues with IDF Monitor

#### Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.

- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

## Standard Toolchain Setup for Linux and macOS

**Installation Step by Step** This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment** These are the steps for setting up the ESP-IDF for your ESP32-S2.

- [Step 1. Install Prerequisites](#)
- [Step 2. Get ESP-IDF](#)
- [Step 3. Set up the tools](#)
- [Step 4. Set up the environment variables](#)
- [Step 5. First Steps on ESP-IDF](#)

**Step 1. Install Prerequisites** In order to use ESP-IDF with the ESP32-S2, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

**For Linux Users** To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusb
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja ccache dfu-util libusb
```

---

### Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf\_tools.py install cmake” to install a suitable version if your OS versions doesn’ t have one.
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
- 

**For macOS Users** ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),  
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is  
↳present, but tool was not found  
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to  
↳install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-  
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-S2, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.0.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-S2.

```
cd ~/esp/esp-idf
./install.sh esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s2
```

The above commands install tools for ESP32-S2 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

---

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

---

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

---

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the `esp-idf` environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-S2. You can start with [get-started/hello\\_world](#) project from `examples` directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device** Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-S2](#) for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 54: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello\_world”, since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See [Additional Tips](#) for more information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition-table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary `.bin` files.

**Flash onto the Device** Flash the binaries that you just built (`bootloader.bin`, `partition-table.bin` and `hello_world.bin`) onto your ESP32-S2 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with your ESP32-S2 board’s serial port name.

You can also change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

**Encountered Issues While Flashing?** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple

solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-S2 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-S2](#)). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP\_PU (EN) pins of ESP32-S2, thus changes in the voltage levels of DTR and RTS will boot ESP32-S2 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP\_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S2 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (GPIO0) and press the **EN** button (CHIP\_PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB
↳0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin
↳0x10000 hello_world.bin
esptool.py v3.0-dev

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application. If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor  
Running idf_monitor in directory [...]/esp/hello_world/build  
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_  
↪world/build/hello_world.elf"...  
--- idf_monitor on <PORT> 115200 ---  
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---  
ets Jun  8 2016 00:22:57  
  
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)  
ets Jun  8 2016 00:22:57  
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...  
Hello world!  
Restarting in 10 seconds...  
This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2MB_  
↪external flash  
Minimum free heap size: 253900 bytes  
Restarting in 9 seconds...  
Restarting in 8 seconds...  
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of `idf.py` commands and options.

**That’s all that you need to get started with ESP32-S2!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32-S2. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Start with Board Support Package** To speed up prototyping on some development boards, you can use [Board Support Packages \(BSPs\)](#), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via [IDF Component Manager](#), so they can be found in [IDF Component Registry](#).

**Here's an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:**

```
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in [BSP examples folder](#).

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

## 1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

## 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

# Chapter 2

## API Reference

### 2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the *build system guide*.
- *Kconfig* options can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

#### 2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See *Error Handling* section for more information about error handling approaches. *Error Code Reference* contains the list of error codes returned by ESP-IDF components.

#### 2.1.2 Configuration structures

---

**Important:** Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

---

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);

```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```

esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);

```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};

```

C++ language doesn't support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```

esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;

```

## Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```

httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);

```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

## 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as [hal](#) only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

## 2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.

This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [versions page](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system [renaming mechanism](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don't fall into the categories below.

- [Private APIs](#).
- [Components in example projects](#).
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.

- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of *Kconfig* options in menuconfig.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO port

Asio is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`

#### Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

### 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (*esp-modbus*) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESP-Modbus component on GitHub](#)

#### Hosted Documentation

The documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

#### Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example README.md for details.

## Protocol References

- <https://modbus.org/specs.php>: Modbus Organization with protocol specifications.

### 2.2.3 ESP-MQTT

#### Overview

ESP-MQTT is an implementation of [MQTT](mqtt.org) protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

#### Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

#### Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tls, default port 8883
- [protocols/mqtt/ssl\\_ds](#): MQTT over tls using digital signature peripheral for authentication, default port 8883.
- [protocols/mqtt/ssl\\_mutual\\_auth](#): MQTT over tls using certificates for authentication, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over tls using pre-shared keys for authentication, default port 8883.
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

#### Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `broker` - Allow to set address and security verification.
- `credentials` - Client credentials for authentication.
- `session` - Configuration for MQTT session aspects.
- `network` - Networking related configuration.
- `task` - Allow to configure FreeRTOS task.
- `buffer` - Buffer size for input and output.

In the following session the most common aspects are detailed.

#### Broker

**Address** Broker address can be set by usage of `broker.address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in websocket connections.

The `uri` field is used in the following format `scheme://hostname:port/path`. - Curently support `mqtt`, `mqttps`, `ws`, `wss` schemes - MQTT over TCP samples:

- `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:

- `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqttps://mqtt.eclipseprojects.io:MQTT over SSL, port 8883`
  - `mqttps://mqtt.eclipseprojects.io:8884:MQTT over SSL, port 8884`
- MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    ↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

**Verification** For secure connections TLS is used, and to guarantee Broker's identity the `broker_verification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER the equivalent `_len` field must be set, otherwise a NULL terminated string in PEM format should be provided to certificate field.

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqttps://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};
```

To details on other fields check the Reference API and [TLS Server verification](#).

**Client Credentials** All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI.
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format

**Authentication** It's possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- Using a password by setting `authentication.password`.
- Mutual authentication with TLS by setting `authentication.certificate` and `authentication.key`, both can be provided in PEM or DER format.
- Using secure element available in ESP32-WROOM-32SE, setting `authentication.use_secure_element`.
- Using Digital Signature Peripheral available in some Espressif devices, setting `authentication.ds_data`.

**Session** For MQTT session related configurations `session` fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t.session.last_will`-struct.

- `topic`: pointer to the LWT message topic
- `msg`: pointer to the LWT message
- `msg_len`: length of the LWT message, required if `msg` is not null-terminated
- `qos`: quality of service for the LWT message
- `retain`: specifies the retain flag of the LWT message

**Change settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menuconfig`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` \*config)

Creates *MQTT* client handle based on the configuration.

**Parameters** `config` –MQTT configuration structure

**Returns** `mqtt_client_handle` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char \*uri)

Sets MQTT connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Parameters**

- `client` –MQTT client handle
- `uri` –

**Returns** `ESP_FAIL` if URI parse error, `ESP_OK` on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts MQTT client with already created client handle.

**Parameters** `client` –MQTT client handle

**Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` on other error

`esp_err_t esp_mqtt_client_reconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force reconnection upon a specific event.

**Parameters** `client` –MQTT client handle

**Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

`esp_err_t esp_mqtt_client_disconnect` (`esp_mqtt_client_handle_t` client)

This api is typically used to force disconnection from the broker.

**Parameters** `client` –MQTT client handle

**Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization

`esp_err_t esp_mqtt_client_stop` (`esp_mqtt_client_handle_t` client)

Stops MQTT client tasks.

- Notes:
- Cannot be called from the MQTT event handler

**Parameters** `client` –MQTT client handle

**Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

int `esp_mqtt_client_subscribe` (`esp_mqtt_client_handle_t` client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Parameters**

- `client` –MQTT client handle
- `topic` –
- `qos` –// TODO describe parameters

**Returns** `message_id` of the subscribe message on success -1 on failure

int `esp_mqtt_client_unsubscribe` (`esp_mqtt_client_handle_t` client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message

- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**

- **client** –MQTT client handle
- **topic** –

**Returns** `message_id` of the subscribe message on success -1 on failure

int `esp_mqtt_client_publish` (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

**Parameters**

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag

**Returns** `message_id` of the publish message (for QoS 0 `message_id` will always be zero) on success. -1 on failure.

int `esp_mqtt_client_enqueue` (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the `mqtt-task` context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

**Parameters**

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** `message_id` if queued successfully, -1 otherwise

*esp\_err\_t* `esp_mqtt_client_destroy` (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

**Parameters** **client** –MQTT client handle

**Returns** `ESP_OK` `ESP_ERR_INVALID_ARG` on wrong initialization

`esp_err_t esp_mqtt_set_config` (`esp_mqtt_client_handle_t` client, const `esp_mqtt_client_config_t` \*config)

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event.

#### Parameters

- **client** –MQTT client handle
- **config** –MQTT configuration structure

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

`esp_err_t esp_mqtt_client_register_event` (`esp_mqtt_client_handle_t` client, `esp_mqtt_event_id_t` event, `esp_event_handler_t` event\_handler, void \*event\_handler\_arg)

Registers MQTT event.

#### Parameters

- **client** –MQTT client handle
- **event** –event type
- **event\_handler** –handler callback
- **event\_handler\_arg** –handlers context

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_OK on success

int `esp_mqtt_client_get_outbox_size` (`esp_mqtt_client_handle_t` client)

Get outbox size.

**Parameters** **client** –MQTT client handle

**Returns** outbox size 0 on wrong initialization

## Structures

struct `esp_mqtt_error_codes`

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	<code>esp_tls_last_esp_err</code> , <code>esp_tls_stack_err</code> , <code>esp_tls_cert_verify_flags</code> , <code>sock_errno</code>	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	<code>connect_return_code</code>	Internal error reported from MQTT broker on connection

## Public Members

`esp_err_t esp_tls_last_esp_err`

last esp\_err code reported from esp-tls component

int `esp_tls_stack_err`

tls specific error code reported from underlying tls stack

int `esp_tls_cert_verify_flags`

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT\* broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

struct **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

### Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

*MQTT* event type

*esp\_mqtt\_client\_handle\_t* **client**

*MQTT* client handle for this event

char \***data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char \***topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

*MQTT* messaged id of message

int **session\_present**

*MQTT* session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

struct **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t* **broker**

Broker address and security verification

struct *esp\_mqtt\_client\_config\_t::credentials\_t* **credentials**

User credentials for broker

struct *esp\_mqtt\_client\_config\_t::session\_t* **session**

*MQTT* session configuration.

struct *esp\_mqtt\_client\_config\_t::network\_t* **network**

Network configuration

struct *esp\_mqtt\_client\_config\_t::task\_t* **task**

FreeRTOS task configuration.

struct *esp\_mqtt\_client\_config\_t::buffer\_t* **buffer**

Buffer size configuration.

struct **broker\_t**

Broker related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t::address\_t* **address**

Broker address configuration

```
struct esp_mqtt_client_config_t::broker_t::verification_t verification
```

Security verification of the broker

```
struct address_t
```

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

### Public Members

```
const char *uri
```

Complete *MQTT* broker URI

```
const char *hostname
```

Hostname, to set ipv4 pass it as string)

```
esp_mqtt_transport_t transport
```

Selects transport

```
const char *path
```

Path in the URI

```
uint32_t port
```

*MQTT* server port

```
struct verification_t
```

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

### Public Members

```
bool use_global_ca_store
```

Use a global ca\_store, look esp-tls documentation for details.

```
esp_err_t (*crt_bundle_attach)(void *conf)
```

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

```
const char *certificate
```

Certificate data, default is NULL, not required to verify the server.

```
size_t certificate_len
```

Length of the buffer pointed to by certificate.

const struct *psk\_key\_hint* \***psk\_hint\_key**

Pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char \*\***alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN

struct **buffer\_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

### Public Members

int **size**

size of *MQTT* send/receive buffer

int **out\_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by *buffer\_size*

struct **credentials\_t**

Client related credentials for authentication.

### Public Members

const char \***username**

*MQTT* username

const char \***client\_id**

Set *MQTT* client identifier. Ignored if *set\_null\_client\_id* == true If NULL set the default client id. Default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool **set\_null\_client\_id**

Selects a NULL client id

struct *esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t* **authentication**

Client authentication

struct **authentication\_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

### Public Members

const char **\*password**

*MQTT* password

const char **\*certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with *key*.

size\_t **certificate\_len**

Length of the buffer pointed to by *certificate*.

const char **\*key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also *certificate* has to be provided.

size\_t **key\_len**

Length of the buffer pointed to by *key*.

const char **\*key\_password**

Client key decryption password, not PEM nor DER, if provided *key\_password\_len* must be correctly set.

int **key\_password\_len**

Length of the password pointed to by *key\_password*

bool **use\_secure\_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void **\*ds\_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct **network\_t**

Network related configuration

### Public Members

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

bool **disable\_auto\_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

struct **session\_t**

*MQTT* Session related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::session\_t::last\_will\_t* **last\_will**

Last will configuration

bool **disable\_clean\_session**

*MQTT* clean session, default `clean_session` is true

int **keepalive**

*MQTT* keepalive, default is 120 seconds

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection.

int **message\_retransmit\_timeout**

timeout for retransmitting of failed packet

struct **last\_will\_t**

Last Will and Testament message configuration.

### Public Members

const char **\*topic**

LWT (Last Will and Testament) message topic

const char **\*msg**

LWT message, may be NULL terminated

int **msg\_len**

LWT message length, if `msg` isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task\_t**  
Client task configuration

### Public Members

int **priority**  
*MQTT* task priority

int **stack\_size**  
*MQTT* task stack size

### Macros

#### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

**MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT** error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from **MQTT\_ERROR\_TYPE\_ESP\_TLS** layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

### Type Definitions

typedef struct esp\_mqtt\_client \***esp\_mqtt\_client\_handle\_t**

typedef enum *esp\_mqtt\_event\_id\_t* **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- *client* - *MQTT* client handle
- various other data depending on event type

typedef enum *esp\_mqtt\_connect\_return\_code\_t* **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_error\_type\_t* **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_transport\_t* **esp\_mqtt\_transport\_t**

typedef enum *esp\_mqtt\_protocol\_ver\_t* **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

typedef struct *esp\_mqtt\_error\_codes* **esp\_mqtt\_error\_codes\_t**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking *error\_type* first and then appropriate error code depending on the source of the error:

| *error\_type* | related member variables | note | | **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT** |  
*esp\_tls\_last\_esp\_err*, *esp\_tls\_stack\_err*, *esp\_tls\_cert\_verify\_flags*, *sock\_errno* | Error reported from

tcp\_transport/esp-tls | MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED | connect\_return\_code | Internal error reported from *MQTT* broker on connection |

typedef struct *esp\_mqtt\_event\_t* **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

typedef *esp\_mqtt\_event\_t* \***esp\_mqtt\_event\_handle\_t**

typedef *esp\_err\_t* (\***mqtt\_event\_callback\_t**)(*esp\_mqtt\_event\_handle\_t* event)

typedef struct *esp\_mqtt\_client\_config\_t* **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

## Enumerations

enum **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- *client* - *MQTT* client handle
- various other data depending on event type

*Values:*

enumerator **MQTT\_EVENT\_ANY**

enumerator **MQTT\_EVENT\_ERROR**

on error event, additional context: connection return code, error handle from *esp\_tls* (if supported)

enumerator **MQTT\_EVENT\_CONNECTED**

connected event, additional context: *session\_present* flag

enumerator **MQTT\_EVENT\_DISCONNECTED**

disconnected event

enumerator **MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- *msg\_id* message id
- data pointer to the received data
- *data\_len* length of the data for this event

enumerator **MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event

enumerator **MQTT\_EVENT\_PUBLISHED**

published event, additional context: `msg_id`

enumerator **MQTT\_EVENT\_DATA**

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- `retain` retain flag of the message
- `qos` QoS level of the message
- `dup` dup flag of the message Note: Multiple **MQTT\_EVENT\_DATA** could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

enumerator **MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enum **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

enumerator **MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

*MQTT* connection refused reason: Wrong protocol

enumerator **MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

*MQTT* connection refused reason: ID rejected

enumerator **MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

*MQTT* connection refused reason: Server unavailable

enumerator **MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

*MQTT* connection refused reason: Wrong user

enumerator **MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

*MQTT* connection refused reason: Wrong username or password

enum **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_ERROR\_TYPE\_NONE**

enumerator **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

enumerator **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

enum **esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

*MQTT* over TCP, using scheme: **MQTT**

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

*MQTT* over SSL, using scheme: **MQTTS**

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

*MQTT* over Websocket, using scheme: **ws**

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

*MQTT* over Websocket Secure, using scheme: **wss**

enum **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

enumerator **MQTT\_PROTOCOL\_V\_5**

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert\_buf** and **cacert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA cert.
  - `cacert_bytes` - size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

### ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**Note:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in CMakeLists.txt of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations

set to default. (*mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively*)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

**Note:** *These values are subject to change with change in configuration options and version of respective libraries.*

## Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S2. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in [Digital Signature](#).

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## API Reference

### Header File

- `components/esp-tls/esp_tls.h`

### Functions

`esp_tls_t *esp_tls_init` (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns** tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_http\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_http\_new\_async*)

#### Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.

**Returns** pointer to *esp\_tls\_t*, or NULL if connection couldn’t be opened.

int **esp\_tls\_conn\_new\_sync** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

#### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_http\_new\_sync** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp\_tls\_conn\_new\_sync*() API. However this API accepts host’s url.

#### Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

#### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_new\_async** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

#### Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. *non\_block* member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp\_tls\_conn\_http\_new\_async** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp\_tls\_conn\_new\_async() API. However this API accepts host’s url.

**Parameters**

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as esp\_tls\_cfg\_t.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer ‘data’ into specified tls connection.

**Parameters**

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

**Returns**

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP\_TLS\_ERR\_SSL\_WANT\_READ/ ESP\_TLS\_ERR\_SSL\_WANT\_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \*tls, void \*data, size\_t datalen)

Read from specified tls connection into the buffer ‘data’ .

**Parameters**

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

**Returns**

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int **esp\_tls\_conn\_destroy** (*esp\_tls\_t* \*tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp\_tls\_conn\_new\_sync() (or esp\_tls\_conn\_http\_new\_sync()) and esp\_tls\_conn\_new\_async() (or esp\_tls\_conn\_http\_new\_async()) APIs.

**Parameters** **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns** - 0 on success

- -1 if socket error or an invalid argument

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \*tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls\_ssl\_get\_bytes\_avail() API.

**Parameters** `tls` **–[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

*esp\_err\_t* `esp_tls_get_conn_sockfd` (*esp\_tls\_t* \*tls, int \*sockfd)

Returns the connection socket file descriptor from esp\_tls session.

**Parameters**

- `tls` **–[in]** handle to esp\_tls context
- `sockfd` **–[out]** int pointer to sockfd value.

**Returns** - ESP\_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd == NULL)

void \*`esp_tls_get_ssl_context` (*esp\_tls\_t* \*tls)

Returns the ssl context.

**Parameters** `tls` **–[in]** handle to esp\_tls context

**Returns** - ssl\_ctx pointer to ssl context of underlying TLS layer on success

- NULL in case of error

*esp\_err\_t* `esp_tls_init_global_ca_store` (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Returns**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* `esp_tls_set_global_ca_store` (const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Parameters**

- `cacert_pem_buf` **–[in]** Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- `cacert_pem_bytes` **–[in]** Length of the buffer.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void `esp_tls_free_global_ca_store` (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* `esp_tls_get_and_clear_last_error` (*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in esp\_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- `h` **–[in]** esp-tls error handle.

- **esp\_tls\_code** –[out] last error code returned from mbedtls api (set to zero if none)  
This pointer could be NULL if caller does not care about esp\_tls\_code
- **esp\_tls\_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred
- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type** (*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in esp\_tls of a specific type The error information is cleared internally upon return.

**Parameters**

- **h** –[in] esp-tls error handle.
- **err\_type** –[in] specific error type
- **error\_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

*esp\_err\_t* **esp\_tls\_get\_error\_handle** (*esp\_tls\_t* \*tls, *esp\_tls\_error\_handle\_t* \*error\_handle)

Returns the ESP-TLS error\_handle.

**Parameters**

- **tls** –[in] handle to esp\_tls context
- **error\_handle** –[out] pointer to the error handle.

**Returns**

- ESP\_OK on success and error\_handle will be updated with the ESP-TLS error handle.
- ESP\_ERR\_INVALID\_ARG if (tls == NULL || error\_handle == NULL)

*mbedtls\_x509\_crt* \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call esp\_tls\_set\_global\_ca\_store(). Then the same CA store could be used by the application for APIs other than esp\_tls.

---

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

**Returns**

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

*esp\_err\_t* **esp\_tls\_plain\_tcp\_connect** (const char \*host, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_error\_handle\_t* error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] ESP-TLS configuration as esp\_tls\_cfg\_t.
- **error\_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –[out] Socket descriptor if successfully connected on TCP layer

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG if invalid output parameters ESP-TLS based error codes on failure

## Structures

struct **psk\_key\_hint**

ESP-TLS preshared key and hint structure.

### Public Members

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

struct **tls\_keep\_alive\_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time (second)

int **keep\_alive\_interval**

Keep-alive interval time (second)

int **keep\_alive\_count**

Keep-alive packet retry send count

struct **esp\_tls\_cfg**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
-

## Public Members

const char **\*\*alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **\*\*alpn\_protos** = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char **\*cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char **\*clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char **\*clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char **\*clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char **\*common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* **\*keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* **\*psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (**\*crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void **\*ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

*esp\_tls\_addr\_family\_t* **addr\_family**

The address family to use when connecting to a host.

## Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp\_tls\_addr\_family* **esp\_tls\_addr\_family\_t**

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef struct esp\_tls **esp\_tls\_t**

## Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

enum **esp\_tls\_addr\_family**

*Values:*

enumerator **ESP\_TLS\_AF\_UNSPEC**

Unspecified address family.

enumerator **ESP\_TLS\_AF\_INET**

IPv4 address family.

enumerator **ESP\_TLS\_AF\_INET6**

IPv6 address family.

### Header File

- [components/esp-tls/esp\\_tls\\_errors.h](#)

### Structures

struct **esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

### Public Members

*esp\_err\_t* **last\_error**

error code (based on **ESP\_ERR\_ESP\_TLS\_BASE**) of the last occurred error

int **esp\_tls\_error\_code**

esp\_tls error code from last esp\_tls failed api

int **esp\_tls\_flags**

last certification verification flags

### Macros

**ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

**ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

**ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

**ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

**ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

**ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set/get socket option

**ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

**ESP\_ERR\_ESP\_TLS\_SE\_FAILED**

**ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN**

**ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

**ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp\_tls\_conn\_read()
- esp\_tls\_conn\_write()

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE****ESP\_TLS\_ERR\_SSL\_TIMEOUT****Type Definitions**

```
typedef struct esp_tls_last_error *esp_tls_error_handle_t
```

```
typedef struct esp_tls_last_error esp_tls_last_error_t
```

Error structure containing relevant errors in case tls error occurred.

**Enumerations**

```
enum esp_tls_error_type_t
```

Definition of different types/sources of error codes reported from different components

*Values:*

enumerator **ESP\_TLS\_ERR\_TYPE\_UNKNOWN**

enumerator **ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error `&#8212; errno`

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type `&#8212; esp_err_t`

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type `&#8212; invalid entry`

## 2.2.5 ESP HTTP Client

### Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at [protocols/esp\\_http\\_client](protocols/esp_http_client).

### Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

## Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

## HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

---

**Note:** While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

---

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)

## HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

**ESP HTTP client supports both Basic and Digest Authentication.**

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.

- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

### Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## API Reference

### Header File

- [components/esp\\_http\\_client/include/esp\\_http\\_client.h](#)

### Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` \*config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters** `config` **–[in]** The configurations, see `http_client_config_t`

#### Returns

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

---

**Parameters** `client` –The `esp_http_client` handle

**Returns**

- `ESP_OK` on successful
- `ESP_FAIL` on error

*esp\_err\_t* `esp_http_client_set_url` (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**

- `client` –[in] The `esp_http_client` handle
- `url` –[in] The url

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* `esp_http_client_set_post_field` (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- `client` –[in] The `esp_http_client` handle
- `data` –[in] post data pointer
- `len` –[in] post length

**Returns**

- `ESP_OK`
- `ESP_FAIL`

int `esp_http_client_get_post_field` (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Parameters**

- `client` –[in] The client
- `data` –[out] Point to post data pointer

**Returns** Size of post data

*esp\_err\_t* `esp_http_client_set_header` (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Parameters**

- `client` –[in] The `esp_http_client` handle
- `key` –[in] The header key
- `value` –[in] The header value

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* `esp_http_client_get_header` (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The header key
- **value** –[out] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp\_http\_client\_init.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **value** –[out] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **username** –[in] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp\_http\_client\_init.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **value** –[out] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **password** –[in] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **auth\_type** –[in] The esp\_http\_client auth type

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session errno.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **method** –[in] The method

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **timeout\_ms** –[in] The timeout value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The key

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **write\_len** –[in] HTTP Content length need to write to the server

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

**Returns**

- (-1) if any errors
- Length of data written

`int64_t esp_http_client_fetch_headers` (*esp\_http\_client\_handle\_t* client)

This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked_response`)
- (-1: `ESP_FAIL`) if any errors
- (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) if call is timed-out before any data was ready
- Download data length defined by content-length header

`bool esp_http_client_is_chunked_response` (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns** true or false

`int esp_http_client_read` (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

---

**Note:** (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) is returned when call is timed-out before any data was ready

---

**Parameters**

- `client` –[in] The `esp_http_client` handle
- `buffer` –The buffer
- `len` –[in] The length

**Returns**

- (-1) if any errors
- Length of data was read

`int esp_http_client_get_status_code` (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns** Status code

`int64_t esp_http_client_get_content_length` (*esp\_http\_client\_handle\_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- (-1) Chunked transfer
- Content-Length value as bytes

*esp\_err\_t* `esp_http_client_close` (*esp\_http\_client\_handle\_t* client)

Close http connection, still kept all http request resources.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* `esp_http_client_cleanup` (*esp\_http\_client\_handle\_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t* client)

Get transport type.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- ESP\_OK
- ESP\_FAIL

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

---

**Parameters** **client** –[in] The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] The buffer length

**Returns**

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **len** –Length of data discarded

**Returns**

- ESP\_OK If successful, len will have discarded length
- ESP\_FAIL If failed to read response
- ESP\_ERR\_INVALID\_ARG If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **len** –[out] Variable to store length

**Returns**

- ESP\_OK If successful, len will have length of current chunk
- ESP\_FAIL If the server is not a chunked server
- ESP\_ERR\_INVALID\_ARG If the client or len are NULL

**Structures**

struct **esp\_http\_client\_event**

HTTP Client events data.

**Public Members**

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

esp\_http\_client\_handle\_t context

void \***data**

data of the event

int **data\_len**

data length of data

void \***user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char \***header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header key

char \***header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it' s store current http header value

struct **esp\_http\_client\_config\_t**

HTTP configuration.

### Public Members

const char \***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char \***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

const char \***username**

Using for Http authentication

const char \***password**

Using for Http authentication

*esp\_http\_client\_auth\_type\_t* **auth\_type**

Http authentication type, see esp\_http\_client\_auth\_type\_t

const char \***path**

HTTP Path, if not set, default is /

const char \***query**

HTTP query

const char \***cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size\_t **cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

const char \***client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size\_t **client\_cert\_len**

Length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem

const char \***client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

size\_t **client\_key\_len**

Length of the buffer pointed to by client\_key\_pem. May be 0 for null-terminated pem

const char \***client\_key\_password**

Client key decryption password string

size\_t **client\_key\_password\_len**

String length of the password pointed to by client\_key\_password

const char \***user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see esp\_http\_client\_transport\_t

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void \***user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to `esp_crt_bundle_attach`. Enables the use of certification bundle for server verification, must be enabled in `menuconfig`

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of `errno` `EAGAIN` to `esp_err_t`

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

## Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

## Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

```
enumerator HTTP_EVENT_ERROR
```

This event occurs when there are any errors during execution

```
enumerator HTTP_EVENT_ON_CONNECTED
```

Once the HTTP has been connected to the server, no data exchange has been performed

```
enumerator HTTP_EVENT_HEADERS_SENT
```

After sending all the headers to the server

```
enumerator HTTP_EVENT_HEADER_SENT
```

This header has been kept for backward compatability and will be deprecated in future versions esp-idf

```
enumerator HTTP_EVENT_ON_HEADER
```

Occurs when receiving each header sent from the server

```
enumerator HTTP_EVENT_ON_DATA
```

Occurs when receiving data from the server, possibly multiple portions of the packet

```
enumerator HTTP_EVENT_ON_FINISH
```

Occurs when finish a HTTP session

```
enumerator HTTP_EVENT_DISCONNECTED
```

The connection has been disconnected

```
enumerator HTTP_EVENT_REDIRECT
```

Intercepting HTTP redirects to handle them manually

```
enum esp_http_client_transport_t
```

HTTP Client transport.

*Values:*

```
enumerator HTTP_TRANSPORT_UNKNOWN
```

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator **HttpStatus\_Ok**

enumerator **HttpStatus\_MultipleChoices**

enumerator **HttpStatus\_MovedPermanently**

enumerator **HttpStatus\_Found**

enumerator **HttpStatus\_SeeOther**

enumerator **HttpStatus\_TemporaryRedirect**

enumerator **HttpStatus\_PermanentRedirect**

enumerator **HttpStatus\_BadRequest**

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----<
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
```

(continues on next page)

(continued from previous page)

```

extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvkey_pem_start[] asm("_binary_prvkey_pem_
↪start");
extern const unsigned char prvkey_pem_end[] asm("_binary_prvkey_pem_
↪end");
https_conf.prvkey_pem = prvkey_pem_start;
https_conf.prvkey_len = prvkey_pem_end - prvkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOL_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOL\_SEC2*: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. *PROTOCOL\_SEC1*: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. *PROTOCOL\_SEC0*: specifies that data will be exchanged as a plain text (no security).
4. *PROTOCOL\_SEC\_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t* \* in this context.

---

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocol security version section in *Protocol Communication* for more details.

---

### Creating a property

Now that we know how to start the **esp\_local\_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp\_local\_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE\_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a *ctx* field, which is set to point to some custom *func\_get\_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get\_prop\_values()* handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
                                     ↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of *set\_prop\_values()* handler. Notice how we restrict from writing to read-only properties.

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t
                                     ↪
                                     ↪*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
            ↪
            ↪prop_values[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
```

(continues on next page)

(continued from previous page)

```

ESP_LOGI(TAG, "Setting %s", props[i].name);

/* For keeping it simple, lets only log the incoming data */
ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                        prop_values[i].size, ESP_LOG_INFO);
    }
}
return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

## Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp\_local\_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp\_local\_ctrl** service:

1. *get\_prop\_count* : This should simply return the total number of properties supported by the service
2. *get\_prop\_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set\_prop\_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get\_prop\_count* and then *get\_prop\_values*, hence form an index to name mapping for all properties. Now when calling *set\_prop\_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- [components/esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)

### Functions

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_ble** (void)

Function for obtaining BLE transport mode.

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_httpd** (void)

Function for obtaining HTTPD transport mode.

*esp\_err\_t* **esp\_local\_ctrl\_start** (const *esp\_local\_ctrl\_config\_t* \*config)

Start local control service.

**Parameters** **config** –[in] Pointer to configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_stop** (void)

Stop local control service.

*esp\_err\_t* **esp\_local\_ctrl\_add\_property** (const *esp\_local\_ctrl\_prop\_t* \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

**Parameters** **prop** –[in] Property description structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** **name** –[in] Name of the property to remove

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

const *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

**Parameters** **name** –[in] Name of the property to find

**Returns**

- Pointer to property
- NULL if not found

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**Note:** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

---

**Parameters**

- **ep\_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user\_ctx** –[in] User data

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

## Unions

union **esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \***ble**

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \***httpd**

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

## Structures

struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32\_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void \***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (\***ctx\_free\_fn**)(void \*ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

### Public Members

void \***data**

Pointer to memory holding property value

size\_t **size**

Size of property value

void (\***free\_fn**)(void \*data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct **esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

### Public Members

*esp\_err\_t* (\***get\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for retrieving current values of properties.

---

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

*esp\_err\_t* (\***set\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], const *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for changing values of properties.

---

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : InvalidArgument
- `ESP_ERR_INVALID_STATE` : InvalidProto
- All other error codes : InternalError

void **\*usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (**\*usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

### Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void **\*custom\_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void **\*pop**

Proof of possession to be used for local control. Could be NULL.

const void **\*sec\_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

## Public Members

const *esp\_local\_ctrl\_transport\_t* \***ttransport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **ttransport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

## Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

## Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

```
typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
```

Security types for esp\_local\_control.

```
typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t
```

```
typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t
```

```
typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
```

Protocom security configs

```
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
```

Configuration structure to pass to esp\_local\_ctrl\_start()

### Enumerations

```
enum esp_local_ctrl_proto_sec
```

Security types for esp\_local\_control.

*Values:*

enumerator **PROTOCOLCOM\_SEC0**

enumerator **PROTOCOLCOM\_SEC1**

enumerator **PROTOCOLCOM\_SEC2**

enumerator **PROTOCOLCOM\_SEC\_CUSTOM**

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

#### ESP SPI Slave HD (Half Duplex) Mode Protocol

**SPI Slave Capabilities of Espressif chips**

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave  
This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address:** 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave

3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

### Application Example

The example below shows how ESP32-S2 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- `components/driver/test/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

### Functions

`esp_err_t` **essl\_init** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Initialize the slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (*essl\_handle\_t* handle, uint32\_t \*out\_tx\_num, uint32\_t wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** –Handle of a ESSL device.
- **out\_tx\_num** –Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_rx\_size** –Output of data size to read from slave, in bytes
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** –Handle of an ESSL device.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP\_ERR\_TIMEOUT: No buffer to use, or error ftrom SDMMC host controller.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready for receiving.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** –[out] Output of length the data actually received from slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success: All the data has been read from the slave.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP\_ERR\_NOT\_FINISHED: Read was successful, but there is still data remaining.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready to send data.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value\_o** –Output of the returned written value.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t add, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** –Handle of a `essl` device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** –Output value read from the register.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_wait\_int** (`essl_handle_t` handle, `uint32_t` wait\_ms)

wait for an interrupt of the slave

**Parameters**

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: If interrupt is triggered.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- ESP\_ERR\_TIMEOUT: No interrupts before timeout.

`esp_err_t` **essl\_clear\_intr** (`essl_handle_t` handle, `uint32_t` intr\_mask, `uint32_t` wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Parameters**

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to clear.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr** (`essl_handle_t` handle, `uint32_t` \*intr\_raw, `uint32_t` \*intr\_st, `uint32_t` wait\_ms)

Get interrupt bits of ESSL slave.

**Parameters**

- **handle** –Handle of an ESSL device.
- **intr\_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr\_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_INVALID\_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, `uint32_t` ena\_mask, `uint32_t` wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** –Handle of an ESSL device.
- **ena\_mask** –Mask of the interrupt bits to enable.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **ena\_mask\_o** –Output of interrupt bit enable mask.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

#### Parameters

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to send to slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

## Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

## Header File

- [components/driver/test/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

## Functions

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)

Initialize the ESSL SDIO device and get its handle.

#### Parameters

- **out\_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** –Handle of the ESSL SDIO device to deinit.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

## Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- `components/driver/test/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

### Parameters

- **out\_handle** –[out] Output of the handle
- **init\_config** –Configuration for the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** –Handle of the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

### Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE, registers for M/S sync are reserved, see note1).
- **out\_value** –[out] Read buffer for the shared registers.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.
- ESP\_ERR\_INVALID\_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** –[out] Output data address
- **size** –The size of the output data.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out\_value** –[out] Not supported, should be set to `NULL`.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** –Context of the component. (Member **arg** from **essl\_handle\_t**)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf\_polling** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

*esp\_err\_t* **essl\_spi\_rddma** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.2.8 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-S2 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jul 19 03:12:06 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {  
    .cert_bundle_attach = esp_cert_bundle_attach,  
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;  
mbedtls_ssl_config_init(&conf);  
  
esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

## Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

## Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

## API Reference

### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**Parameters** **conf** –[in] The config struct for the SSL connection.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** **conf** –[in] The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

- **x509\_bundle** –[in] A pointer to the certificate bundle.
- **bundle\_size** –[in] Size of the certificate bundle in bytes.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

## 2.2.9 HTTP Server

## Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-S2. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri name`, `method type` (eg. `HTTPD_GET/HTTPD_POST/HTTPD_PUT` etc.), `function pointer of type esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

## Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */

```

(continues on next page)

(continued from previous page)

```
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
```

**Simple HTTP Server Example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↳data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↳context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

### Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http\\_server/ws\\_echo\\_server](#) example which demonstrates usage of the websocket feature.

### Event Handling

ESP HTTP Server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP Server. `esp_http_server_event_id_t` has all the events which can happen for ESP HTTP Server.

#### Expected data type for different ESP HTTP Server events in event loop:

- HTTP\_SERVER\_EVENT\_ERROR: httpd\_err\_code\_t
- HTTP\_SERVER\_EVENT\_START: NULL
- HTTP\_SERVER\_EVENT\_ON\_CONNECTED: int
- HTTP\_SERVER\_EVENT\_ON\_HEADER: int
- HTTP\_SERVER\_EVENT\_HEADERS\_SENT: int
- HTTP\_SERVER\_EVENT\_ON\_DATA: esp\_http\_server\_event\_data
- HTTP\_SERVER\_EVENT\_SENT\_DATA: esp\_http\_server\_event\_data
- HTTP\_SERVER\_EVENT\_DISCONNECTED: int
- HTTP\_SERVER\_EVENT\_STOP: NULL

### API Reference

#### Header File

- [components/esp\\_http\\_server/include/esp\\_http\\_server.h](#)

## Functions

*esp\_err\_t* **httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, const *httpd\_uri\_t* \*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

---

**Note:** URI handlers can be registered in real time as long as the server handle is valid.

---

### Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri\_handler** –[in] pointer to handler that needs to be registered

### Returns

- ESP\_OK : On successfully registering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_HANDLERS\_FULL : If no slots left for new handler
- ESP\_ERR\_HTTPD\_HANDLER\_EXISTS : If handler with same URI and method is already registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, const char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

### Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string

- **method** –[in] HTTP method

**Returns**

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

**Parameters**

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

**Returns**

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv\_func** –[in] The receive function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **send\_func** –[in] The send function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

#### Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending\_func** –[in] The receive function to be set for this session

#### Returns

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

int `httpd_req_to_sockfd` (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

---

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

---

**Parameters** **r** –[in] The request whose socket descriptor should be found

#### Returns

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int `httpd_req_recv` (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

#### Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf\_len** –[in] Length of the buffer

#### Returns

- Bytes : Number of bytes read into the buffer successfully

- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it' s value.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - Once httpd\_resp\_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

**Returns**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

*esp\_err\_t* **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - Once httpd\_resp\_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  - Use httpd\_req\_get\_hdr\_value\_len() to know the right buffer length
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** –[in] Size of the user buffer “val”

**Returns**

- ESP\_OK : Field found in the request header and value string copied
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

---

**Note:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid

---

**Parameters** **r** –[in] The request being responded to

**Returns**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**Note:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

---

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[out] Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** –[in] Length of output buffer

**Returns**

- ESP\_OK : Query is found in the request URL and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Query not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**Note:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

---

**Parameters**

- **qry** –[in] Pointer to query string
- **key** –[in] The key to be searched in the query string
- **val** –[out] Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** –[in] Size of the user buffer “val”

**Returns**

- ESP\_OK : Key is found in the URL query string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

#### Parameters

- **req** –[in] Pointer to the HTTP request
- **cookie\_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP\_OK is returned and required buffer length incase ESP\_ERR\_HTTPD\_RESULT\_TRUNC is returned.

#### Returns

- ESP\_OK : Key is found in the cookie string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
- ESP\_ERR\_NO\_MEM : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “\*” anywhere else in the template will be taken literally.

#### Parameters

- **uri\_template** –[in] URI template (pattern)
- **uri\_to\_match** –[in] URI to be matched
- **match\_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

**Returns** true if a match was found

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet chunk
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

static inline *esp\_err\_t* **httpd\_resp\_sendstr\_chunk** (*httpd\_req\_t* \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the status string is valid till send function is called.
- 

#### Parameters

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_type** (*httpd\_req\_t* \*r, const char \*type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’ .

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the type string is valid till send function is called.
- 

#### Parameters

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of *max\_resp\_headers* in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

**Returns**

- *ESP\_OK* : On successfully appending new header
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_HDR* : Total additional headers exceed max allowed
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

**Returns**

- *ESP\_OK* : On successfully sending the response packet
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_SEND* : Error in raw send
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_404** (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_408` (`httpd_req_t` \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_500` (`httpd_req_t` \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

int `httpd_send` (`httpd_req_t` \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
- 

**Parameters**

- **r** `–[in]` The request being responded to
- **buf** `–[in]` Buffer from where the fully constructed packet is to be read
- **buf\_len** `–[in]` Length of the buffer

**Returns**

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_send` (*[httpd\\_handle\\_t](#)* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**Parameters**

- **hd** `–[in]` server instance
- **sockfd** `–[in]` session socket file descriptor
- **buf** `–[in]` buffer with bytes to send
- **buf\_len** `–[in]` data size
- **flags** `–[in]` flags for the send() function

**Returns**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*[httpd\\_handle\\_t](#)* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

**Parameters**

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf\_len** –[in] data size
- **flags** –[in] flags for the send() function

**Returns**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd\_err\_code\_t*. See prototype *httpd\_err\_handler\_func\_t* above for details.

**Parameters**

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler\_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**

- ESP\_OK : handler registered successfully
- ESP\_ERR\_INVALID\_ARG : invalid error code or server handle

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Parameters**

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

**Returns**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)

- `ESP_ERR_HTTPD_ALLOC_MEM` : Failed to allocate memory for instance
- `ESP_ERR_HTTPD_TASK` : Failed to launch server task

`esp_err_t httpd_stop` (`httpd_handle_t` handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Parameters** `handle` –[in] Handle to server returned by `httpd_start`

**Returns**

- `ESP_OK` : Server stopped successfully
- `ESP_ERR_INVALID_ARG` : Handle argument is Null

`esp_err_t httpd_queue_work` (`httpd_handle_t` handle, `httpd_work_fn_t` work, void \*arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

**Parameters**

- `handle` –[in] Handle to server returned by `httpd_start`
- `work` –[in] Pointer to the function to be executed in the HTTPD' s context
- `arg` –[in] Pointer to the arguments that should be passed to this function

**Returns**

- `ESP_OK` : On successfully queueing the work
- `ESP_FAIL` : Failure in ctrl socket
- `ESP_ERR_INVALID_ARG` : Null arguments

void \*`httpd_sess_get_ctx` (`httpd_handle_t` handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- `handle` –[in] Handle to server returned by `httpd_start`
- `sockfd` –[in] The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the context

void \***httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**

httpd\_sess\_get\_ctx()

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session ‘transport’ context by socket descriptor.

**See also:**

httpd\_sess\_set\_ctx()

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the transport context

void \***httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

**Parameters** **handle** –[in] Handle to server returned by httpd\_start

**Returns** global user context

void \***httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters** **handle** –[in] Handle to server returned by httpd\_start

**Returns** global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

**Returns**

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

**Returns**

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client\_fds** –[out] Array of client fds

**Returns**

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

**Structures**

struct **esp\_http\_server\_event\_data**

Argument structure for `HTTP_SERVER_EVENT_ON_DATA` and `HTTP_SERVER_EVENT_SENT_DATA` event

**Public Members**

int **fd**

Session socket file descriptor

int **data\_len**

Data length

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**Note:** Use HTTPD\_DEFAULT\_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

### Public Members

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge “Least Recently Used” connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_transport_ctx_free_fn`

Free function for global transport context

`bool enable_so_linger`

bool to enable/disable linger

`int linger_timeout`

linger timeout (in seconds)

`bool keep_alive_enable`

Enable keep-alive timeout

`int keep_alive_idle`

Keep-alive idle time. Default is 5 (second)

`int keep_alive_interval`

Keep-alive interval time. Default is 5 (second)

`int keep_alive_count`

Keep-alive packet retry send count. Default is 3 counts

[\*httpd\\_open\\_func\\_t\*](#) `open_fn`

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

***httpd\_close\_func\_t* close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

***httpd\_uri\_match\_func\_t* uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct `httpd_req`**

HTTP Request Data Structure.

**Public Members*****httpd\_handle\_t* handle**

Handle to server instance

**int `method`**

The type of HTTP request, -1 if unsupported method

**const char `uri`[HTTPD\_MAX\_URI\_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size\_t `content_len`**

Length of the request body

**void \*`aux`**

Internally used members

**void \*`user_ctx`**

User context pointer passed during URI registration.

**void \*`sess_ctx`**

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

#### *httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

#### bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

#### struct **httpd\_uri**

Structure for URI handler.

#### **Public Members**

##### const char \***uri**

The URI to handle

##### *httpd\_method\_t* **method**

Method supported by the URI

##### *esp\_err\_t* (\***handler**)(*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

##### void \***user\_ctx**

Pointer to user context data which will be available to handler

#### **Macros**

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD\_SOCK\_ERR\_FAIL**

**HTTPD\_SOCK\_ERR\_INVALID**

**HTTPD\_SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**ESP\_HTTPD\_DEF\_CTRL\_PORT**

HTTP Server control socket port

**HTTPD\_DEFAULT\_CONFIG ()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN**

### Type Definitions

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

---

**Note:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param `buf_len` [in]** data size

**Param `flags` [in]** flags for the `send()` function

**Return**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

---

**Note:** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param buf\_len [in]** data size

**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

---

**Note:** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD\_SOCK\_ERR\_ codes, which will be handled accordingly in the server task.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd\_resp\_send\_err() must be invoked inside this function if user wishes to generate HTTP error responses.
  - When invoked, the validity of uri, method, content\_len and user\_ctx fields of the httpd\_req\_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return ESP\_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD\_500\_INTERNAL\_SERVER\_ERROR and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- ESP\_OK : error handled successful
- ESP\_FAIL : failure indicates that the underlying socket needs to be closed

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over “enum http\_method” available in “http\_parser” library.

typedef void (\***httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef *esp\_err\_t* (\***httpd\_open\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- ESP\_OK : On success
- Any value other than ESP\_OK will signal the server to close the socket immediately

typedef void (\***httpd\_close\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for closing a session.

---

**Note:** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

typedef bool (\***httpd\_uri\_match\_func\_t**)(const char \*reference\_uri, const char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

typedef struct *httpd\_config* **httpd\_config\_t**

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (\***httpd\_work\_fn\_t**)(void \*arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

## Enumerations

enum **httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD\_500\_INTERNAL\_SERVER\_ERROR**

enumerator **HTTPD\_501\_METHOD\_NOT\_IMPLEMENTED**

enumerator **HTTPD\_505\_VERSION\_NOT\_SUPPORTED**

enumerator **HTTPD\_400\_BAD\_REQUEST**

enumerator **HTTPD\_401\_UNAUTHORIZED**

enumerator **HTTPD\_403\_FORBIDDEN**

enumerator **HTTPD\_404\_NOT\_FOUND**

enumerator **HTTPD\_405\_METHOD\_NOT\_ALLOWED**

enumerator **HTTPD\_408\_REQ\_TIMEOUT**

enumerator **HTTPD\_411\_LENGTH\_REQUIRED**

enumerator **HTTPD\_414\_URI\_TOO\_LONG**

enumerator **HTTPD\_431\_REQ\_HDR\_FIELDS\_TOO\_LARGE**

enumerator **HTTPD\_ERR\_CODE\_MAX**

enum **esp\_http\_server\_event\_id\_t**

HTTP Server events id.

*Values:*

enumerator **HTTP\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_SERVER\_EVENT\_START**

This event occurs when HTTP Server is started

enumerator **HTTP\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP\_SERVER\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP\_SERVER\_EVENT\_HEADERS\_SENT**

After sending all the headers to the client

enumerator **HTTP\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTP\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_SERVER\_EVENT\_STOP**

This event occurs when HTTP Server is stopped

## 2.2.10 HTTPS Server

### Overview

This component is built on top of *HTTP Server*. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for *HTTP Server* applies also to a server you create this way.

### Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send” , “receive” and “pending” callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

### Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- `components/esp_https_server/include/esp_https_server.h`

### Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t *handle`, `httpd_ssl_config_t *config`)

Create a SSL capable HTTP server (secure mode may be disabled in config)

#### Parameters

- **config** –[inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** –[out] - storage for the server handle, must be a valid pointer

**Returns** success

`esp_err_t httpd_ssl_stop` (`httpd_handle_t handle`)

Stop the server. Blocks until the server is shut down.

**Parameters** `handle` –[in]

#### Returns

- ESP\_OK: Server stopped successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_FAIL: Failure to shut down server

### Structures

struct `esp_https_server_user_cb_arg`

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

### Public Members

`httpd_ssl_user_cb_state_t user_cb_state`

State of user callback

`esp_tls_t *tls`

ESP-TLS connection handle

struct `httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

### Public Members

`httpd_config_t httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8\_t \***servercert**

Server certificate

size\_t **servercert\_len**

Server certificate byte length

const uint8\_t \***cacert\_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size\_t **cacert\_len**

CA certificate byte length

const uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

*httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

bool **session\_tickets**

Enable tls session tickets

bool **use\_secure\_element**

Enable secure element for server session

*esp\_https\_server\_user\_cb* \***user\_cb**

User callback for esp\_https\_server

void \***ssl\_userdata**

user data to add to the ssl context

esp\_tls\_handshake\_callback **cert\_select\_cb**

Certificate selection callback to use

### Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ()

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'

- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

### Type Definitions

typedef struct *esp\_https\_server\_user\_cb\_arg* **esp\_https\_server\_user\_cb\_arg\_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void **esp\_https\_server\_user\_cb** (*esp\_https\_server\_user\_cb\_arg\_t* \*user\_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

typedef struct *httpd\_ssl\_config* **httpd\_ssl\_config\_t**

### Enumerations

enum **httpd\_ssl\_transport\_mode\_t**

*Values:*

enumerator **HTTPD\_SSL\_TRANSPORT\_SECURE**

enumerator **HTTPD\_SSL\_TRANSPORT\_INSECURE**

enum **httpd\_ssl\_user\_cb\_state\_t**

Indicates the state at which the user callback is executed, i.e at session creation or session close.

*Values:*

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CREATE**

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CLOSE**

## 2.2.11 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
    ↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
    ↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
    ↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,
    ↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
}
```

(continues on next page)

(continued from previous page)

```

freeaddrinfo(res);

esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
ping_config.target_addr = target_addr;           // target IP address
ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↳ping_stop can stop it

/* set callback functions */
esp_ping_callbacks_t cbs;
cbs.on_ping_success = test_on_ping_success;
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
↳can be NULL
cbs.cb_args = eth_event_group;

esp_ping_handle_t ping;
esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- `components/lwip/include/apps/ping/ping_sock.h`

### Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` \*config, const `esp_ping_callbacks_t` \*cbs, `esp_ping_handle_t` \*hdl\_out)

Create a ping session.

#### Parameters

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl\_out** –handle of ping session

#### Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)

- ESP\_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

*esp\_err\_t* **esp\_ping\_delete\_session** (*esp\_ping\_handle\_t* hdl)

Delete a ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

**Parameters**

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP\_OK: get profile successfully

## Structures

struct **esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

## Public Members

void \***cb\_args**

arguments for callback functions

void (**\*on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (**\*on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (\***on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**

Type of “ping” configuration.

### Public Members

uint32\_t **count**

A “ping” session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of “ping” session handle.

## Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

enumerator **ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

enumerator **ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

enumerator **ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

enumerator **ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

enumerator **ESP\_PING\_PROF\_REPLY**

Number of reply packets received

enumerator **ESP\_PING\_PROF\_IPADDR**

IP address of replied target

enumerator **ESP\_PING\_PROF\_SIZE**

Size of received packet

enumerator **ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component *mDNS* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run *idf.py add-dependency espressif/mdns*.

#### Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**Note:** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

---

**Note:** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](#).

---

#### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF [here](#).

---

**Note:** Please refer the [ESP-IDF Migration Guide](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

#### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

#### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

#### Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedtls`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3

- [\*CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE\*](#): Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- [\*CONFIG\\_MBEDTLS\\_CLIENT\\_SSL\\_SESSION\\_TICKETS\*](#): Support for TLS Session Resumption: Client session tickets
- [\*CONFIG\\_MBEDTLS\\_SERVER\\_SSL\\_SESSION\\_TICKETS\*](#): Support for TLS Session Resumption: Server session tickets
- [\*CONFIG\\_MBEDTLS\\_HARDWARE\\_SHA\*](#): Support for hardware SHA acceleration
- [\*CONFIG\\_MBEDTLS\\_HARDWARE\\_AES\*](#): Support for hardware AES acceleration
- [\*CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI\*](#): Support for hardware MPI (bignum) acceleration

**Note:** Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

## Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed Test	TLS	Related Configs	Heap Usage (approx.)
Default		NA	42196 B
Enable Variable Length	SSL	<a href="#"><i>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</i></a>	42120 B
Disable Peer Certificate	Keep	<a href="#"><i>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</i></a>	38533 B
Enable Dynamic Buffer	Dy- namic TX/RX	<a href="#"><i>CONFIG_MBEDTLS_DYNAMIC_BUFFER</i></a> <a href="#"><i>FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</i></a> <a href="#"><i>FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</i></a>	<a href="#">CON-</a> <a href="#">CON-</a> 22013 B

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

### 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.3 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

[\*ESP\\_FAIL\*](#) (-1): Generic esp\_err\_t code indicating failure

*ESP\_OK* (0): *esp\_err\_t* value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (0x101): Out of memory

*ESP\_ERR\_INVALID\_ARG* (0x102): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (0x103): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (0x104): Invalid size

*ESP\_ERR\_NOT\_FOUND* (0x105): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (0x106): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (0x107): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (0x108): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (0x109): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (0x10a): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (0x10b): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (0x10c): There are items remained to retrieve

*ESP\_ERR\_NVS\_BASE* (0x1100): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (0x1101): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (0x1102): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (0x1104): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (0x1105): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (0x1106): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED* (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG* (0x1109): Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL* (0x110a): Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE* (0x110b): NVS is in an inconsistent state due to a previous error. Call *nvs\_flash\_init* and *nvs\_open* again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH* (0x110c): String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES* (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call *nvs\_flash\_init* again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG* (0x110e): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND* (0x110f): Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND* (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED* (0x1111): XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED* (0x1112): XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED* (0x1113): XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND* (**0x1114**): XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED* (**0x1115**): NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED* (**0x1116**): NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART* (**0x1117**): NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS* (**0x1118**): Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION* (**0x1119**): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE* (**0x1200**): Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG* (**0x1201**): Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR* (**0x1202**): Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL* (**0x1203**): More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL* (**0x1204**): Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE* (**0x1205**): Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE* (**0x1500**): Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT* (**0x1501**): Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID* (**0x1502**): Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED* (**0x1503**): Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER* (**0x1504**): Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED* (**0x1505**): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE* (**0x1506**): Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE* (**0x1600**): Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT* (**0x1601**): OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL* (**0x1602**): Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG* (**0x1603**): Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING* (**0x1604**): Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS* (**0x1605**): Error not enough unused key blocks available

*ESP\_ERR\_DAMAGED\_READING* (**0x1606**): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

*ESP\_ERR\_IMAGE\_BASE* (**0x2000**)

*ESP\_ERR\_IMAGE\_FLASH\_FAIL* (**0x2001**)

*ESP\_ERR\_IMAGE\_INVALID* (**0x2002**)

*ESP\_ERR\_WIFI\_BASE* (**0x3000**): Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT* (**0x3001**): WiFi driver was not installed by *esp\_wifi\_init*

*ESP\_ERR\_WIFI\_NOT\_STARTED* (**0x3002**): WiFi driver was not started by *esp\_wifi\_start*

*ESP\_ERR\_WIFI\_NOT\_STOPPED (0x3003)*: WiFi driver was not stopped by esp\_wifi\_stop

*ESP\_ERR\_WIFI\_IF (0x3004)*: WiFi interface error

*ESP\_ERR\_WIFI\_MODE (0x3005)*: WiFi mode error

*ESP\_ERR\_WIFI\_STATE (0x3006)*: WiFi internal state error

*ESP\_ERR\_WIFI\_CONN (0x3007)*: WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS (0x3008)*: WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC (0x3009)*: MAC address is invalid

*ESP\_ERR\_WIFI\_SSID (0x300a)*: SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD (0x300b)*: Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT (0x300c)*: Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL (0x300d)*: WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK (0x300e)*: The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT (0x300f)*: Station still in disconnect status

*ESP\_ERR\_WIFI\_POST (0x3012)*: Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE (0x3013)*: Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE (0x3014)*: Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC (0x3015)*: The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW (0x3016)*: The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_DISCARD (0x3017)*: Discard frame

*ESP\_ERR\_WIFI\_REGISTRAR (0x3033)*: WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE (0x3034)*: WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM (0x3035)*: WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE (0x3064)*: ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT (0x3065)*: ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG (0x3066)*: Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM (0x3067)*: Out of memory

*ESP\_ERR\_ESPNOW\_FULL (0x3068)*: ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND (0x3069)*: ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL (0x306a)*: Internal error

*ESP\_ERR\_ESPNOW\_EXIST (0x306b)*: ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF (0x306c)*: Interface error

*ESP\_ERR\_DPP\_FAILURE (0x3097)*: Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE (0x3098)*: DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR (0x3099)*: Encountered invalid DPP Attribute

*ESP\_ERR\_MESH\_BASE (0x4000)*: Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START (0x4001)*

*ESP\_ERR\_MESH\_NOT\_INIT (0x4002)*

*ESP\_ERR\_MESH\_NOT\_CONFIG (0x4003)*

*ESP\_ERR\_MESH\_NOT\_START (0x4004)*

*ESP\_ERR\_MESH\_NOT\_SUPPORT* (0x4005)  
*ESP\_ERR\_MESH\_NOT\_ALLOWED* (0x4006)  
*ESP\_ERR\_MESH\_NO\_MEMORY* (0x4007)  
*ESP\_ERR\_MESH\_ARGUMENT* (0x4008)  
*ESP\_ERR\_MESH\_EXCEED\_MTU* (0x4009)  
*ESP\_ERR\_MESH\_TIMEOUT* (0x400a)  
*ESP\_ERR\_MESH\_DISCONNECTED* (0x400b)  
*ESP\_ERR\_MESH\_QUEUE\_FAIL* (0x400c)  
*ESP\_ERR\_MESH\_QUEUE\_FULL* (0x400d)  
*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND* (0x400e)  
*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND* (0x400f)  
*ESP\_ERR\_MESH\_OPTION\_NULL* (0x4010)  
*ESP\_ERR\_MESH\_OPTION\_UNKNOWN* (0x4011)  
*ESP\_ERR\_MESH\_XON\_NO\_WINDOW* (0x4012)  
*ESP\_ERR\_MESH\_INTERFACE* (0x4013)  
*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE* (0x4014)  
*ESP\_ERR\_MESH\_DISCARD* (0x4015)  
*ESP\_ERR\_MESH\_VOTING* (0x4016)  
*ESP\_ERR\_MESH\_XMIT* (0x4017)  
*ESP\_ERR\_MESH\_QUEUE\_READ* (0x4018)  
*ESP\_ERR\_MESH\_PS* (0x4019)  
*ESP\_ERR\_MESH\_RECV\_RELEASE* (0x401a)  
*ESP\_ERR\_ESP\_NETIF\_BASE* (0x5000)  
*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS* (0x5001)  
*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY* (0x5002)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (0x5003)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED* (0x5004)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED* (0x5005)  
*ESP\_ERR\_ESP\_NETIF\_NO\_MEM* (0x5006)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED* (0x5007)  
*ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED* (0x5008)  
*ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED* (0x5009)  
*ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED* (0x500a)  
*ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED* (0x500b)  
*ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED* (0x500c)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (0x500d)  
*ESP\_ERR\_FLASH\_BASE* (0x6000): Starting number of flash error codes  
*ESP\_ERR\_FLASH\_OP\_FAIL* (0x6001)  
*ESP\_ERR\_FLASH\_OP\_TIMEOUT* (0x6002)

*ESP\_ERR\_FLASH\_NOT\_INITIALISED* (**0x6003**)

*ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST* (**0x6004**)

*ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP* (**0x6005**)

*ESP\_ERR\_FLASH\_PROTECTED* (**0x6006**)

*ESP\_ERR\_HTTP\_BASE* (**0x7000**): Starting number of HTTP error codes

*ESP\_ERR\_HTTP\_MAX\_REDIRECT* (**0x7001**): The error exceeds the number of HTTP redirects

*ESP\_ERR\_HTTP\_CONNECT* (**0x7002**): Error open the HTTP connection

*ESP\_ERR\_HTTP\_WRITE\_DATA* (**0x7003**): Error write HTTP data

*ESP\_ERR\_HTTP\_FETCH\_HEADER* (**0x7004**): Error read HTTP header from server

*ESP\_ERR\_HTTP\_INVALID\_TRANSPORT* (**0x7005**): There are no transport support for the input scheme

*ESP\_ERR\_HTTP\_CONNECTING* (**0x7006**): HTTP connection hasn't been established yet

*ESP\_ERR\_HTTP\_EAGAIN* (**0x7007**): Mapping of errno EAGAIN to esp\_err\_t

*ESP\_ERR\_HTTP\_CONNECTION\_CLOSED* (**0x7008**): Read FIN from peer and the connection closed

*ESP\_ERR\_ESP\_TLS\_BASE* (**0x8000**): Starting number of ESP-TLS error codes

*ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME* (**0x8001**): Error if hostname couldn't be resolved upon tls connection

*ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET* (**0x8002**): Failed to create socket

*ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY* (**0x8003**): Unsupported protocol family

*ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST* (**0x8004**): Failed to connect to host

*ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED* (**0x8005**): failed to set/get socket option

*ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT* (**0x8006**): new connection in esp\_tls\_low\_level\_conn connection timed out

*ESP\_ERR\_ESP\_TLS\_SE\_FAILED* (**0x8007**)

*ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN* (**0x8008**)

*ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK* (**0x8010**): mbedtls parse certificates was partly successful

*ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED* (**0x8011**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED* (**0x8012**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED* (**0x8013**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED* (**0x8014**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_X509\_CERT\_PARSE\_FAILED* (**0x8015**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED* (**0x8016**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED* (**0x8017**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED* (**0x8018**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED* (**0x8019**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED* (**0x801a**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED* (**0x801b**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED* (**0x801c**): mbedtls api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED* (**0x8031**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED* (**0x8032**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED* (**0x8033**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED* (**0x8034**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED* (**0x8035**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED* (**0x8036**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED* (**0x8037**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED* (**0x8038**): wolfSSL api returned failed

*ESP\_ERR\_HTTPS\_OTA\_BASE* (**0x9000**)

*ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS* (**0x9001**)

*ESP\_ERR\_PING\_BASE* (**0xa000**)

*ESP\_ERR\_PING\_INVALID\_PARAMS* (**0xa001**)

*ESP\_ERR\_PING\_NO\_MEM* (**0xa002**)

*ESP\_ERR\_HTTPD\_BASE* (**0xb000**): Starting number of HTTPD error codes

*ESP\_ERR\_HTTPD\_HANDLERS\_FULL* (**0xb001**): All slots for registering URI handlers have been consumed

*ESP\_ERR\_HTTPD\_HANDLER\_EXISTS* (**0xb002**): URI handler with same method and target URI already registered

*ESP\_ERR\_HTTPD\_INVALID\_REQ* (**0xb003**): Invalid request pointer

*ESP\_ERR\_HTTPD\_RESULT\_TRUNC* (**0xb004**): Result string truncated

*ESP\_ERR\_HTTPD\_RESP\_HDR* (**0xb005**): Response header field larger than supported

*ESP\_ERR\_HTTPD\_RESP\_SEND* (**0xb006**): Error occurred while sending response packet

*ESP\_ERR\_HTTPD\_ALLOC\_MEM* (**0xb007**): Failed to dynamically allocate memory for resource

*ESP\_ERR\_HTTPD\_TASK* (**0xb008**): Failed to launch server task/thread

*ESP\_ERR\_HW\_CRYPTO\_BASE* (**0xc000**): Starting number of HW cryptography module error codes

*ESP\_ERR\_HW\_CRYPTO\_DS\_HMAC\_FAIL* (**0xc001**): HMAC peripheral problem

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_KEY* (**0xc002**)

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_DIGEST* (**0xc004**)

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_PADDING* (**0xc005**)

*ESP\_ERR\_MEMPROT\_BASE* (**0xd000**): Starting number of Memory Protection API error codes

*ESP\_ERR\_MEMPROT\_MEMORY\_TYPE\_INVALID* (**0xd001**)

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_INVALID* (**0xd002**)

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_OUT\_OF\_RANGE* (**0xd003**)

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_UNALIGNED* (**0xd004**)

*ESP\_ERR\_MEMPROT\_UNIMGMT\_BLOCK\_INVALID* (**0xd005**)

*ESP\_ERR\_MEMPROT\_WORLD\_INVALID* (**0xd006**)

*ESP\_ERR\_MEMPROT\_AREA\_INVALID* (**0xd007**)

*ESP\_ERR\_MEMPROT\_CPUID\_INVALID* (**0xd008**)

*ESP\_ERR\_TCP\_TRANSPORT\_BASE* (**0xe000**): Starting number of TCP Transport error codes

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_TIMEOUT* (**0xe001**): Connection has timed out

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_CLOSED\_BY\_FIN* (**0xe002**): Read FIN from peer and the connection has closed (in a clean way)

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_FAILED* (**0xe003**): Failed to connect to the peer

*ESP\_ERR\_TCP\_TRANSPORT\_NO\_MEM* (**0xe004**): Memory allocation failed

## 2.4 Networking APIs

### 2.4.1 Wi-Fi

#### ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

#### Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.

- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32-S2 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

## Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnow](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW repository](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_now.h](#)

### Functions

*esp\_err\_t* **esp\_now\_init** (void)

Initialize ESPNOW function.

#### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_INTERNAL : Internal error

*esp\_err\_t* **esp\_now\_deinit** (void)

De-initialize ESPNOW function.

#### Returns

- ESP\_OK : succeed

*esp\_err\_t* **esp\_now\_get\_version** (uint32\_t \*version)

Get the version of ESPNOW.

**Parameters** *version* –ESPNOW version

#### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_register\_recv\_cb** (*esp\_now\_recv\_cb\_t* cb)

Register callback function of receiving ESPNOW data.

**Parameters** *cb* –callback function of receiving ESPNOW data

#### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_unregister\_recv\_cb** (void)

Unregister callback function of receiving ESPNOW data.

#### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* cb)

Register callback function of sending ESPNOW data.

**Parameters** *cb* –callback function of sending ESPNOW data

#### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (const uint8\_t \*peer\_addr, const uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If peer\_addr is not NULL, send data to the peer whose MAC address matches peer\_addr

**Attention** 2. If peer\_addr is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than `ESP_NOW_MAX_DATA_LEN`

**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp\_now\_send returns

#### Parameters

- **peer\_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

*esp\_err\_t* **esp\_now\_add\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Add a peer to peer list.

**Parameters** **peer** –peer information

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

*esp\_err\_t* **esp\_now\_del\_peer** (const uint8\_t \*peer\_addr)

Delete a peer from peer list.

**Parameters** **peer\_addr** –peer MAC address

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

*esp\_err\_t* **esp\_now\_mod\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Modify a peer.

**Parameters** **peer** –peer information

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

*esp\_err\_t* **esp\_wifi\_config\_espnw\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_start()`.

**Parameters**

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_now\_get\_peer** (const uint8\_t \*peer\_addr, *esp\_now\_peer\_info\_t* \*peer)

Get a peer whose MAC address matches peer\_addr from peer list.

**Parameters**

- **peer\_addr** –peer MAC address
- **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

*esp\_err\_t* **esp\_now\_fetch\_peer** (bool from\_head, *esp\_now\_peer\_info\_t* \*peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- **from\_head** –fetch from head of list or not
- **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

bool **esp\_now\_is\_peer\_exist** (const uint8\_t \*peer\_addr)

Peer exists or not.

**Parameters** **peer\_addr** –peer MAC address

**Returns**

- true : peer exists
- false : peer not exists

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \*num)

Get the number of peers.

**Parameters** **num** –number of peers

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Parameters** **pmk** –primary master key

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set wake window for esp\_now to wake up in interval unit.

**Attention 1.** This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention 2.** Default value is the maximum.

**Parameters** **window** –Milliseconds would the chip keep waked each interval, from 0 to 65535.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

## Structures

struct **esp\_now\_peer\_info**

ESPNOW peer information parameters.

### Public Members

uint8\_t **peer\_addr**[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

struct **esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is `ESP_NOW_MAX_ENCRYPT_PEER_NUM`

struct **esp\_now\_rcv\_info**

ESPNOW packet information.

### Public Members

uint8\_t \***src\_addr**

Source address of ESPNOW packet

uint8\_t \***des\_addr**

Destination address of ESPNOW packet

*wifi\_pkt\_rx\_ctrl\_t* \***rx\_ctrl**

Rx control info of ESPNOW packet

### Macros

**ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**

ESPNOW peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**

ESPNOW peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**

Internal error

**ESP\_ERR\_ESPNOW\_EXIST**

ESPNOW peer has existed

**ESP\_ERR\_ESPNOW\_IF**

Interface error

**ESP\_NOW\_ETH\_ALEN**

Length of ESPNOW peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

**Type Definitions**

typedef struct *esp\_now\_peer\_info* **esp\_now\_peer\_info\_t**

ESPNOW peer information parameters.

typedef struct *esp\_now\_peer\_num* **esp\_now\_peer\_num\_t**

Number of ESPNOW peers which exist currently.

typedef struct *esp\_now\_recv\_info* **esp\_now\_recv\_info\_t**

ESPNOW packet information.

typedef void (\***esp\_now\_recv\_cb\_t**)(const *esp\_now\_recv\_info\_t* \*esp\_now\_info, const uint8\_t \*data, int data\_len)

Callback function of receiving ESPNOW data.

**Attention** `esp_now_info` is a local variable, it can only be used in the callback.

**Param `esp_now_info`** received ESPNOW packet information

**Param `data`** received data

**Param `data_len`** length of received data

typedef void (\***esp\_now\_send\_cb\_t**)(const uint8\_t \*mac\_addr, *esp\_now\_send\_status\_t* status)

Callback function of sending ESPNOW data.

**Param `mac_addr`** peer MAC address

**Param `status`** status of sending ESPNOW data (succeed or fail)

**Enumerations**

enum **esp\_now\_send\_status\_t**

Status of sending ESPNOW data .

*Values:*

enumerator **ESP\_NOW\_SEND\_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP\_NOW\_SEND\_FAIL**

Send ESPNOW data fail

## ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. [ESP-WIFI-MESH Programming Model](#)
2. [Writing an ESP-WIFI-MESH Application](#)
3. [Self Organized Networking](#)
4. [Application Examples](#)
5. [API Reference](#)

For documentation regarding the ESP-WIFI-MESH protocol, please see the [ESP-WIFI-MESH API Guide](#). For more information about ESP-WIFI-MESH Development Framework, please see [ESP-WIFI-MESH Development Framework](#).

### ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

Fig. 1: ESP-WIFI-MESH Software Stack

**System Events** An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

Fig. 2: ESP-WIFI-MESH System Events Delivery

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`.** In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```
ESP_ERROR_CHECK(esp_netif_init());

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. [Initialize Mesh](#)
2. [Configuring an ESP-WIFI-MESH Network](#)
3. [Start Mesh](#)

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```

/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));

```

**Configuring an ESP-WIFI-MESH Network** ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code>
Router	Router Configuration, see <code>mesh_router_t</code>
Mesh AP	Mesh AP Configuration, see <code>mesh_ap_cfg_t</code>
Crypto Functions	Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```

/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
      strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
      strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

**Start Mesh** The following code snippet demonstrates how to start ESP-WIFI-MESH.

```

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self Organized Networking** Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.**

**Toggle Self Organized Networking** Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking** The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking  
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking** ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> <li>• Nodes already connected to a parent node will remain connected.</li> <li>• Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• A root node already connected to router will stay connected.</li> <li>• A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.</li> </ul>
Y	N	<ul style="list-style-type: none"> <li>• Nodes without a parent node will automatically select a preferred parent and connect.</li> <li>• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• For a root node to connect to a parent node, it must give up it's role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.</li> </ul>

The following code snippet demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using

## ESP-WIFI-MESH.

```
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

**Application Examples** ESP-IDF contains these ESP-WIFI-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_mesh.h](#)

### Functions

*esp\_err\_t* **esp\_mesh\_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources **and** stop the mesh

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI\_PS\_NONE.

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

### Parameters

- **to** –[in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ( “to” parameter isn’ t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-blocking, MESH\_DATA\_NONBLOCK should be set. Otherwise, may use esp\_mesh\_send\_block\_time() to specify a blocking time.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’ t read out in time by esp\_mesh\_rcv\_toDS().  
Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- **opt** –[in] options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- **opt\_count** –[in] option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

### Returns

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

[esp\\_err\\_t esp\\_mesh\\_send\\_block\\_time](#) (uint32\_t time\_ms)

Set blocking time of `esp_mesh_send()`

**Attention** This API shall be called before mesh is started.

**Parameters** `time_ms` –[in] blocking time of `esp_mesh_send()`, unit:ms

**Returns**

- ESP\_OK

`esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**Parameters**

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout\_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[out] bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- **opt\_count** –[in] option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### Parameters

- **from** –[**out**] the address of the original source of the packet
- **to** –[**out**] the address contains remote IP address and port (IPv4:PORT)
- **data** –[**out**] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout\_ms** –[**in**] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[**out**] bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[**out**] options desired to receive
- **opt\_count** –[**in**] option count desired to receive

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

*esp\_err\_t* **esp\_mesh\_set\_config** (const *mesh\_cfg\_t* \*config)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max\_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters** **config** –[**in**] pointer to mesh stack configuration

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_get\_config** (*mesh\_cfg\_t* \*config)

Get mesh stack configuration.

**Parameters** `config` –[out] pointer to mesh stack configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_router` (const *mesh\_router\_t* \*router)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters** `router` –[in] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_get_router` (*mesh\_router\_t* \*router)

Get router configuration.

**Parameters** `router` –[out] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_id` (const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters** `id` –[in] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

*esp\_err\_t* `esp_mesh_get_id` (*mesh\_addr\_t* \*id)

Get mesh network ID.

**Parameters** `id` –[out] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_type` (*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters** `type` –[in] device type

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int max\_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters** **max\_layer** –[in] max layer value

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

**Returns** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**

- **pwd** –[in] pointer to the password
- **len** –[in] password length

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** **authmode** –[in] authentication mode

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Returns** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** **connections** –[in] the number of max connections

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh max connection configuration.

**Returns** the number of mesh max connections

int **esp\_mesh\_get\_non\_mesh\_connections** (void)

Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Parameters** **bssid** –[out] pointer to parent BSSID

**Returns**

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool enable, bool select\_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

#### Parameters

- **enable** –[in] enable or disable self-organized networking
- **select\_parent** –[in] Only valid when self-organized networking is enabled.
  - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

#### Returns

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_get\_self\_organized** (void)

Return whether enable self-organized networking or not.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_waive\_root** (const *mesh\_vote\_t* \*vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

#### Parameters

- **vote** –[in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field `is_rc_specified` shall be false.
  - Field `attempts` shall be at least 15 times.
- **reason** –[in] only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters** **percentage** **–[in]** vote percentage threshold

**Returns**

- ESP\_OK
- ESP\_FAIL

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

**Returns** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters** **seconds** **–[in]** the expired time

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Returns** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Returns** the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \*mac, int len, int \*size)

Get routing table of this device's sub-network (including itself)

**Parameters**

- **mac** **–[out]** pointer to routing table
- **len** **–[in]** routing table size(in bytes)
- **size** **–[out]** pointer to the number of devices in routing table (including itself)

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool reachable)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Parameters** **reachable** –[in] this state represents whether the root is able to access external IP network

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \*pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** **pending** –[out] pointer to the TX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \*pending)

Return the number of packets available in the queue waiting to be received by applications.

**Parameters** **pending** –[out] pointer to the RX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**Parameters**

- **addr** –[in] self address or an associate children address
- **xseqno\_in** –[out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is:  $wnd = xon\_qsize / (2 * max\_connection + 1)$ . However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

**Attention** This API shall be called before mesh is started.

**Parameters** **qsize** –[in] default:32 (min:16)

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Returns** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

**Parameters** **allowed** –[in] allow or not

**Returns**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**Parameters**

- **addr** –[in] pointer to new group ID addresses
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

**Parameters**

- **addr** –[in] pointer to deleted group ID address
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

**Returns** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)

Get group ID addresses.

**Parameters**

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \*addr)

Check whether the specified group address is my group.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int num)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Parameters** **num** –[in] mesh network capacity

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

**Returns** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const mesh\_crypto\_funcs\_t \*crypto\_funcs)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Parameters** **crypto\_funcs** –[in] crypto functions for mesh IE

- If **crypto\_funcs** is set to NULL, mesh IE is no longer encrypted.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \*key, int len)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Parameters**

- **key** –[in] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \*key, int len)

Get mesh IE crypto key.

**Parameters**

- **key** –[out] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int delay\_ms)

Set delay time before starting root healing.

**Parameters** **delay\_ms** –[in] delay time in milliseconds

**Returns**

- ESP\_OK

int **esp\_mesh\_get\_root\_healing\_delay** (void)

Get delay time before network starts root healing.

**Returns** delay time in milliseconds

*esp\_err\_t* **esp\_mesh\_fix\_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Parameters** **enable** –[in] enable or not

**Returns**

- ESP\_OK

bool **esp\_mesh\_is\_root\_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_parent** (const *wifi\_config\_t* \*parent, const *mesh\_addr\_t* \*parent\_mesh\_id, *mesh\_type\_t* my\_type, int my\_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

#### Parameters

- **parent** –[in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent\_mesh\_id** –[in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my\_type** –[in] mesh type
  - MESH\_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my\_type shall set MESH\_ROOT and my\_layer shall set MESH\_ROOT\_LAYER.
- **my\_layer** –[in] mesh layer
  - my\_layer of the device may change after joining the network.
  - If my\_type is set MESH\_NODE, my\_layer shall be greater than MESH\_ROOT\_LAYER.
  - If my\_type is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

#### Returns

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_ie\_len** (int \*len)

Get mesh networking IE length of one AP.

**Parameters** len –[out] mesh networking IE length

#### Returns

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t* \*ap\_record, void \*buffer)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual\_networking” example.

#### Parameters

- **ap\_record** –[out] pointer to one AP record
- **buffer** –[out] pointer to the mesh networking IE of this AP

#### Returns

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (const *mesh\_addr\_t* \*child\_mac, int \*nodes\_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**

- **child\_mac** –[in] an associated child address of this device
- **nodes\_num** –[out] pointer to the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_list** (const *mesh\_addr\_t* \*child\_mac, *mesh\_addr\_t* \*nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

**Parameters**

- **child\_mac** –[in] an associated child address of this device
- **nodes** –[out] pointer to nodes in the subnet of a specific child
- **nodes\_num** –[in] the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_disconnect** (void)

Disconnect from current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_connect** (void)

Connect to current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*new\_bssid, int csa\_newchan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**

- **new\_bssid** **–[in]** the new router BSSID if the router changes
- **csa\_newchan** **–[in]** the new channel number to which the whole network is moving
- **csa\_count** **–[in]** channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_router\_bssid** (uint8\_t \*router\_bssid)

Get the router BSSID.

**Parameters** **router\_bssid** **–[out]** pointer to the router BSSID

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_WIFI\_ARG

int64\_t **esp\_mesh\_get\_tsf\_time** (void)

Get the TSF time.

**Returns** the TSF time

*esp\_err\_t* **esp\_mesh\_set\_topology** (*esp\_mesh\_topology\_t* topo)

Set mesh topology. The default value is MESH\_TOPO\_TREE.

- MESH\_TOPO\_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters** **topo** **–[in]** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_mesh\_topology\_t* **esp\_mesh\_get\_topology** (void)

Get mesh topology.

**Returns** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_err\_t* **esp\_mesh\_enable\_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_disable\_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

bool **esp\_mesh\_is\_ps\_enabled** (void)

Check whether the mesh Power Save function is enabled.

**Returns** true/false

bool **esp\_mesh\_is\_device\_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_active\_duty\_cycle** (int dev\_duty, int dev\_duty\_type)

Set the device duty cycle and type.

- The range of dev\_duty values is 1 to 100. The default value is 10.
- dev\_duty = 100, the PS will be stopped.
- dev\_duty is better to not less than 5.
- dev\_duty\_type could be MESH\_PS\_DEVICE\_DUTY\_REQUEST or MESH\_PS\_DEVICE\_DUTY\_DEMAND.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the device will use a nwk\_duty provided by the network.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the device will use the specified dev\_duty.

**Attention** This API can be called at any time after mesh is started.

**Parameters**

- **dev\_duty** **–[in]** device duty cycle
- **dev\_duty\_type** **–[in]** device PS duty cycle type, not accept MESH\_PS\_NETWORK\_DUTY\_MASTER

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_active\_duty\_cycle** (int \*dev\_duty, int \*dev\_duty\_type)

Get device duty cycle and type.

**Parameters**

- **dev\_duty** **–[out]** device duty cycle
- **dev\_duty\_type** **–[out]** device PS duty cycle type

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int nwk\_duty, int duration\_mins, int applied\_rule)

Set the network duty cycle, duration and rule.

- The range of nwk\_duty values is 1 to 100. The default value is 10.
- nwk\_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk\_duty is known as a NWK-DUTY-MASTER.

- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `(-1)`.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to `(-1)`; (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

#### Parameters

- **`nwk_duty`** `-[in]` network duty cycle
- **`duration_mins`** `-[in]` duration (unit: minutes)
- **`applied_rule`** `-[in]` only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_network\_duty\_cycle** (int \*nwk\_duty, int \*duration\_mins, int \*dev\_duty\_type, int \*applied\_rule)

Get the network duty cycle, duration, type and rule.

#### Parameters

- **`nwk_duty`** `-[out]` current network duty cycle
- **`duration_mins`** `-[out]` the duration of current `nwk_duty`
- **`dev_duty_type`** `-[out]` if it includes `MESH_PS_DEVICE_DUTY_MASTER`, this device is the current NWK-DUTY-MASTER.
- **`applied_rule`** `-[out]` `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### Returns

- ESP\_OK

int **esp\_mesh\_get\_running\_active\_duty\_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons,

and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Returns** the running active duty cycle

*esp\_err\_t* **esp\_mesh\_ps\_duty\_signaling** (int fwd\_times)

Duty signaling.

**Parameters** **fwd\_times** –[in] the times of forwarding duty signaling packets

**Returns**

- ESP\_OK

## Unions

union **mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

### Public Members

uint8\_t **addr**[6]

mac address

*mip\_t* **mip**

mip address

union **mesh\_event\_info\_t**

*#include <esp\_mesh.h>* Mesh event information.

### Public Members

*mesh\_event\_channel\_switch\_t* **channel\_switch**

channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**

child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**

child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**

routing table change

*mesh\_event\_connected\_t* **connected**

parent connected

*mesh\_event\_disconnected\_t* **disconnected**

parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**

no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**

layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**

vote started

*mesh\_event\_root\_address\_t* **root\_addr**

root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**

root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**

other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**

fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**

scan done

*mesh\_event\_network\_state\_t* **network\_state**

network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**

network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**

new router information

*mesh\_event\_ps\_duty\_t* **ps\_duty**

PS duty information

union **mesh\_rc\_config\_t**

*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

struct **mip\_t**

IP address and port.

#### Public Members

ip4\_addr\_t **ip4**

IP address

uint16\_t **port**

port

struct **mesh\_event\_channel\_switch\_t**

Channel switch information.

#### Public Members

uint8\_t **channel**

new channel

struct **mesh\_event\_connected\_t**

Parent connected information.

#### Public Members

*wifi\_event\_sta\_connected\_t* **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16\_t **self\_layer**

layer

uint8\_t **duty**

parent duty

struct **mesh\_event\_no\_parent\_found\_t**

No parent found information.

#### Public Members

int **scan\_times**

scan times being through

struct **mesh\_event\_layer\_change\_t**

Layer change information.

### Public Members

uint16\_t **new\_layer**

new layer

struct **mesh\_event\_vote\_started\_t**

vote started information

### Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**

root address specified by users via API `esp_mesh_waive_root()`

struct **mesh\_event\_find\_network\_t**

find a mesh network that this device can join

### Public Members

uint8\_t **channel**

channel number of the new found network

uint8\_t **router\_bssid**[6]

router BSSID

struct **mesh\_event\_root\_switch\_req\_t**

Root switch request information.

### Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**

the address of root switch requester

struct **mesh\_event\_root\_conflict\_t**

Other powerful root address.

### Public Members

int8\_t **rss\_i**

rss\_i with router

uint16\_t **capacity**

the number of devices in current network

uint8\_t **addr**[6]

other powerful root address

struct **mesh\_event\_routing\_table\_change\_t**

Routing table change.

### Public Members

uint16\_t **rt\_size\_new**

the new value

uint16\_t **rt\_size\_change**

the changed value

struct **mesh\_event\_root\_fixed\_t**

Root fixed.

### Public Members

bool **is\_fixed**

status

struct **mesh\_event\_scan\_done\_t**

Scan done event information.

### Public Members

uint8\_t **number**

the number of APs scanned

struct **mesh\_event\_network\_state\_t**

Network state information.

### Public Members

bool **is\_rootless**

whether current mesh network has a root

struct **mesh\_event\_ps\_duty\_t**

PS duty information.

### Public Members

uint8\_t **duty**

parent or child duty

*mesh\_event\_child\_connected\_t* **child\_connected**

child info

struct **mesh\_opt\_t**

Mesh option.

### Public Members

uint8\_t **type**

option type

uint16\_t **len**

option length

uint8\_t \***val**

option value

struct **mesh\_data\_t**

Mesh data for esp\_mesh\_send() and esp\_mesh\_rcv()

### Public Members

uint8\_t \***data**

data

uint16\_t **size**

data size

*mesh\_proto\_t* **proto**

data protocol

*mesh\_tos\_t* **tos**

data type of service

struct **mesh\_router\_t**

Router configuration.

### Public Members

uint8\_t **ssid**[32]  
SSID

uint8\_t **ssid\_len**  
length of SSID

uint8\_t **bssid**[6]  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

uint8\_t **password**[64]  
password

bool **allow\_router\_switch**

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

### Public Members

uint8\_t **password**[64]  
mesh softAP password

uint8\_t **max\_connection**  
max number of stations allowed to connect in, default 6, max 10 = max\_connection + non-mesh\_max\_connection max mesh connections

uint8\_t **nonmesh\_max\_connection**  
max non-mesh connections

struct **mesh\_cfg\_t**  
Mesh initialization configuration.

### Public Members

uint8\_t **channel**  
channel, the mesh network on

bool **allow\_channel\_switch**  
if this value is set, when “fail” (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**

mesh network identification

*mesh\_router\_t* **router**

router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**

mesh softAP configuration

const *mesh\_crypto\_funcs\_t* \***crypto\_funcs**

crypto functions

struct **mesh\_vote\_t**

Vote.

### **Public Members**

float **percentage**

vote percentage threshold for approval of being a root

bool **is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**

vote address configuration

struct **mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

### **Public Members**

int **to\_parent**

to parent queue

int **to\_parent\_p2p**

to parent (P2P) queue

int **to\_child**

to child queue

int **to\_child\_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh\_rx\_pending\_t**

The number of packets available in the queue waiting to be received by applications.

### Public Members

int **toDS**

to external DS

int **toSelf**

to self

### Macros

**MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**

mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**

mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_PS**

mesh PS is not specified as enable or disable

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_rcv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_rcv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_rcv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_rcv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_PS\_DEVICE\_DUTY\_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH\_PS\_DEVICE\_DUTY\_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH\_PS\_NETWORK\_DUTY\_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK****MESH\_INIT\_CONFIG\_DEFAULT ()**

### Type Definitions

typedef *mesh\_addr\_t* **mesh\_event\_root\_address\_t**

Root address.

typedef *wifi\_event\_sta\_disconnected\_t* **mesh\_event\_disconnected\_t**

Parent disconnected information.

typedef *wifi\_event\_ap\_staconnected\_t* **mesh\_event\_child\_connected\_t**

Child connected information.

typedef *wifi\_event\_ap\_stadisconnected\_t* **mesh\_event\_child\_disconnected\_t**

Child disconnected information.

typedef *wifi\_event\_sta\_connected\_t* **mesh\_event\_router\_switch\_t**

New router information.

### Enumerations

enum **mesh\_event\_id\_t**

Enumerated list of mesh event id.

*Values:*

enumerator **MESH\_EVENT\_STARTED**

mesh is started

enumerator **MESH\_EVENT\_STOPPED**

mesh is stopped

enumerator **MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

enumerator **MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

enumerator **MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

enumerator **MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

enumerator **MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

enumerator **MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

enumerator **MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator **MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

enumerator **MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH\_EVENT\_PS\_PARENT\_DUTY**

parent duty

enumerator **MESH\_EVENT\_PS\_CHILD\_DUTY**

child duty

enumerator **MESH\_EVENT\_PS\_DEVICE\_DUTY**

device duty

enumerator **MESH\_EVENT\_MAX**enum **mesh\_type\_t**

Device type.

*Values:*

enumerator **MESH\_IDLE**

hasn't joined the mesh network yet

enumerator **MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH\_LEAF**

has no forwarding ability

enumerator **MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

enumerator **MESH\_PROTO\_BIN**

binary

enumerator **MESH\_PROTO\_HTTP**

HTTP protocol

enumerator **MESH\_PROTO\_JSON**

JSON format

enumerator **MESH\_PROTO\_MQTT**

MQTT protocol

enumerator **MESH\_PROTO\_AP**

IP network mesh communication of node's AP interface

enumerator **MESH\_PROTO\_STA**

IP network mesh communication of node's STA interface

enum **mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

enumerator **MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH\_TOS\_DEF**

no retransmission on mesh stack

enum **mesh\_vote\_reason\_t**

Vote reason.

*Values:*

enumerator **MESH\_VOTE\_REASON\_ROOT\_INITIATED**

vote is initiated by the root

enumerator **MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

enum **mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

enumerator **MESH\_REASON\_CYCLIC**

cyclic is detected

enumerator **MESH\_REASON\_PARENT\_IDLE**

parent is idle

enumerator **MESH\_REASON\_LEAF**

the connected device is changed to a leaf

enumerator **MESH\_REASON\_DIFF\_ID**

in different mesh ID

enumerator **MESH\_REASON\_ROOTS**

root conflict is detected

enumerator **MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

enumerator **MESH\_REASON\_SCAN\_FAIL**

scan fail

enumerator **MESH\_REASON\_IE\_UNKNOWN**

unknown IE

enumerator **MESH\_REASON\_WAIVE\_ROOT**

waive root

enumerator **MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

enumerator **MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp\_mesh\_topology\_t**

Mesh topology.

*Values:*

enumerator **MESH\_TOPO\_TREE**

tree topology

enumerator **MESH\_TOPO\_CHAIN**

chain topology

enum **mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:*

enumerator **MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH\_TODS\_REACHABLE**

the root is able to access external IP network

## SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S2 devices, check [Provisioning API](#).

**Application Example** Connect ESP32-S2 to target AP using SmartConfig: [wifi/smart\\_config](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_smartconfig.h](#)

### Functions

const char \***esp\_smartconfig\_get\_version** (void)

Get the version of SmartConfig.

#### Returns

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (const *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

**Parameters** `config` –pointer to smartconfig start configure structure

#### Returns

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

**Parameters** `time_s` –range 15s~255s, offset:45s.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Parameters** `type` –Choose from the `smartconfig_type_t`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Parameters** `enable` –false-disable(default); true-enable;

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \*rvd\_data, uint8\_t len)

Get reserved data of ESPTouch v2.

**Parameters**

- `rvd_data` –reserved data
- `len` –length of reserved data

**Returns**

- ESP\_OK: succeed
- others: fail

## Structures

struct **smartconfig\_event\_got\_ssid\_pswd\_t**  
Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

uint8\_t **ssid**[32]  
SSID of the AP. Null terminated string.

uint8\_t **password**[64]  
Password of the AP. Null terminated string.

bool **bssid\_set**  
whether set MAC address of target AP or not.

uint8\_t **bssid**[6]  
MAC address of target AP.

*smartconfig\_type\_t* **type**  
Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**  
Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]  
IP address of cellphone.

struct **smartconfig\_start\_config\_t**  
Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**  
Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**  
Enable ESPTouch v2 crypt.

char \***esp\_touch\_v2\_key**  
ESPTouch v2 crypt key, len should be 16.

## Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

## Enumerations

enum **smartconfig\_type\_t**

*Values:*

enumerator **SC\_TYPE\_ESPTOUCH**

protocol: ESPTouch

enumerator **SC\_TYPE\_AIRKISS**

protocol: AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_V2**

protocol: ESPTouch v2

enum **smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

enumerator **SC\_EVENT\_SCAN\_DONE**

ESP32 station smartconfig has finished to scan for APs

enumerator **SC\_EVENT\_FOUND\_CHANNEL**

ESP32 station smartconfig has found the channel of the target AP

enumerator **SC\_EVENT\_GOT\_SSID\_PSWD**

ESP32 station smartconfig got the SSID and password

enumerator **SC\_EVENT\_SEND\_ACK\_DONE**

ESP32 station smartconfig has sent ACK to cellphone

## Wi-Fi

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-S2 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-S2 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-S2.
- Station/AP-coexistence mode (ESP32-S2 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** The `wifi` directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple [esp-idf-template](#) application to demonstrate a minimal IDF project structure.

## API Reference

### Header File

- components/esp\_wifi/include/esp\_wifi.h

### Functions

*esp\_err\_t* **esp\_wifi\_init** (const *wifi\_init\_config\_t* \*config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use WIFI\_INIT\_CONFIG\_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into *wifi\_init\_config\_t* in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI\_INIT\_CONFIG\_DEFAULT. Please be notified that the field ‘magic’ of *wifi\_init\_config\_t* should always be WIFI\_INIT\_CONFIG\_MAGIC!

**Parameters** **config** –pointer to WiFi initialized configuration structure; can point to a temporary variable.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_NO\_MEM: out of memory
- others: refer to error code esp\_err.h

*esp\_err\_t* **esp\_wifi\_deinit** (void)

Deinit WiFi Free all resource allocated in esp\_wifi\_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_mode** (*wifi\_mode\_t* mode)

Set the WiFi operating mode.

Set the WiFi operating mode **as** station, soft-AP **or** station+soft-AP,  
The default mode **is** station mode.

**Parameters** **mode** –WiFi operating mode

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Parameters** **mode** –[out] store current WiFi mode

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

- `ESP_ERR_INVALID_ARG`: invalid argument

#### `esp_err_t esp_wifi_start` (void)

Start WiFi according to current configuration. If mode is `WIFI_MODE_STA`, it creates station control block and starts station. If mode is `WIFI_MODE_AP`, it creates soft-AP control block and starts soft-AP. If mode is `WIFI_MODE_APSTA`, it creates soft-AP and station control block and starts soft-AP and station.

##### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_FAIL`: other WiFi internal errors

#### `esp_err_t esp_wifi_stop` (void)

Stop WiFi. If mode is `WIFI_MODE_STA`, it stops station and frees station control block. If mode is `WIFI_MODE_AP`, it stops soft-AP and frees soft-AP control block. If mode is `WIFI_MODE_APSTA`, it stops station/soft-AP and frees station/soft-AP control block.

##### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

#### `esp_err_t esp_wifi_restore` (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- `esp_wifi_set_bandwidth`,
- `esp_wifi_set_protocol`,
- `esp_wifi_set_config` related
- `esp_wifi_set_mode`

##### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

#### `esp_err_t esp_wifi_connect` (void)

Connect the ESP32 WiFi station to the AP.

**Attention** 1. This API only impacts `WIFI_MODE_STA` or `WIFI_MODE_APSTA` mode.

**Attention** 2. If the ESP32 is connected to an AP, call `esp_wifi_disconnect` to disconnect.

**Attention** 3. The scanning triggered by `esp_wifi_scan_start()` will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number `ESP_ERR_WIFI_STATE`. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn't exist, and you still try reconnection after ESP32 received disconnect event with the reason code `WIFI_REASON_NO_AP_FOUND`.

##### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_ERR_WIFI_SSID`: SSID of AP which station connects is invalid

#### `esp_err_t esp_wifi_disconnect` (void)

Disconnect the ESP32 WiFi station from the AP.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi was not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_wifi\_deauth\_sta** (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**Parameters** **aid** –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

*esp\_err\_t* **esp\_wifi\_scan\_start** (const *wifi\_scan\_config\_t* \*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp\_wifi\_scan\_get\_ap\_records, so generally, call esp\_wifi\_scan\_get\_ap\_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**

- **config** –configuration of scanning
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_TIMEOUT: blocking scan is timeout
- ESP\_ERR\_WIFI\_STATE: wifi still connecting when invoke esp\_wifi\_scan\_start
- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters** **number** **–[out]** store number of APIs found in last scan

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

**Parameters**

- **number** **–[inout]** As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- **ap\_records** **–***wifi\_ap\_record\_t* array to hold the found APs

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_clear\_ap\_list** (void)

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_sta\_get\_ap\_info** (*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** **ap\_info** **–**the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** **–**power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** –[out] store current power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_11AC|WIFI\_PROTOCOL\_11AD|WIFI\_PROTOCOL\_11AH|WIFI\_PROTOCOL\_11AY|WIFI\_PROTOCOL\_11AX|WIFI\_PROTOCOL\_11AX\_11N|WIFI\_PROTOCOL\_11AX\_11N\_11AC|WIFI\_PROTOCOL\_11AX\_11N\_11AC\_11AD|WIFI\_PROTOCOL\_11AX\_11N\_11AC\_11AD\_11AH|WIFI\_PROTOCOL\_11AX\_11N\_11AC\_11AD\_11AH\_11AY|WIFI\_PROTOCOL\_11AX\_11N\_11AC\_11AD\_11AH\_11AY\_11AX)

**Attention** Support 802.11b or 802.11bg or 802.11bgn or LR mode

**Parameters**

- **ifx** –interfaces
- **protocol\_bitmap** –WiFi protocol bitmap

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_protocol** (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

**Parameters**

- **ifx** –interface
- **protocol\_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_set\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Parameters**

- **ifx** –interface to be configured
- **bw** –bandwidth

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_channel** (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp\_wifi\_start() and before esp\_wifi\_stop()

**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp\_wifi\_set\_config() to store the channel info in NVS.

**Parameters**

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_get\_channel** (uint8\_t \*primary, *wifi\_second\_chan\_t* \*second)

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**

- **primary** –store current primary channel
- **second** –[out] store current second channel

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_country** (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp\_wifi\_set\_country\_code instead.

**Attention** 2. The default country is “01” (world safe mode) `{.cc=“ 01” , .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}`.

**Attention** 3. The third octet of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.

**Attention** 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc=“ US” , .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc=“ JP” , .schan=1, .nchan=14}` then the country info that will be used is `{.cc=“ JP” , .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back to the country info of the station automatically, `{.cc=“ US” , .schan=1, .nchan=11}` in the example.

**Attention** 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Parameters** `country` –the configured country info

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

`esp_err_t esp_wifi_get_country (wifi_country_t *country)`

get the current country info

**Parameters** `country` –country info

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

`esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])`

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

**Parameters**

- `ifx` –interface
- `mac` –the MAC address

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- others: refer to error codes in `esp_err.h`

`esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])`

Get mac of specified interface.

**Parameters**

- `ifx` –interface

- **mac** **–[out]** store mac of the interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters** **cb** –callback

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Parameters** **en** –false - disable, true - enable

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Parameters** **en** **–[out]** store the current status of promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

---

**Note:** The default filter is to filter all packets except WIFI\_PKT\_MISC

---

**Parameters** **filter** –the packet type filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Parameters** **filter** **–[out]** store the current status of promiscuous filter

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

---

**Note:** The default filter is to filter none control packet.

---

**Parameters** **filter** –the subtype of the control packet filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters** **filter** –[out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Attention** 4. The configuration will be stored in NVS

**Parameters**

- **interface** –interface
- **conf** –station or soft-AP configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the erro code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**Parameters**

- **interface** –interface
- **conf** –[out] station or soft-AP configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_list** (*wifi\_sta\_list\_t* \*sta)

Get STAs associated with soft-AP.

**Attention** SSC only API

**Parameters** **sta** –[out] station list ap can get the connected sta's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_sta\_info\_t* struct. For example, phy\_11b = 1 imply that sta support 802.11b mode

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

*esp\_err\_t* `esp_wifi_ap_get_sta_aid` (const uint8\_t mac[6], uint16\_t \*aid)

Get AID of STA connected with soft-AP.

**Parameters**

- `mac` –STA's mac address
- `aid` –[out] Store the AID corresponding to STA mac

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: Requested resource not found
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

*esp\_err\_t* `esp_wifi_set_storage` (*wifi\_storage\_t* storage)

Set the WiFi API configuration storage type.

**Attention** 1. The default value is `WIFI_STORAGE_FLASH`

**Parameters** `storage` –: storage type

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* `esp_wifi_set_vendor_ie` (bool enable, *wifi\_vendor\_ie\_type\_t* type, *wifi\_vendor\_ie\_id\_t* idx, const void \*vnd\_ie)

Set 802.11 Vendor-Specific Information Element.

**Parameters**

- `enable` –If true, specified IE is enabled. If false, specified IE is removed.
- `type` –Information Element type. Determines the frame type to associate with the IE.
- `idx` –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *wifi\_vendor\_ie\_data\_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init()`
- `ESP_ERR_INVALID_ARG`: Invalid argument, including if first byte of `vnd_ie` is not `WIFI_VENDOR_IE_ELEMENT_ID` (0xDD) or second byte is an invalid length.
- `ESP_ERR_NO_MEM`: Out of memory

*esp\_err\_t* `esp_wifi_set_vendor_ie_cb` (*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

**Parameters**

- `cb` –Callback function
- `ctx` –Context argument, passed to callback function.

**Returns**

- `ESP_OK`: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_max_tx_power` (int8\_t power)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the `max_tx_power` of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Parameters** `power` –Maximum WiFi transmitting power.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument, e.g. parameter is out of range

`esp_err_t esp_wifi_get_max_tx_power` (int8\_t \*power)

Get maximum transmitting power after WiFi start.

**Parameters** `power` –Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_ARG`: invalid argument

`esp_err_t esp_wifi_set_event_mask` (uint32\_t mask)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRECVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Parameters** `mask` –WiFi event mask.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_get_event_mask` (uint32\_t \*mask)

Get mask of WiFi events.

**Parameters** `mask` –WiFi event mask.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_ARG`: invalid argument

`esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

#### Parameters

- **ifx** –interface if the Wi-Fi mode is Station, the ifx should be WIFI\_IF\_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI\_IF\_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI\_IF\_STA or WIFI\_IF\_AP. If the ifx is wrong, the API returns ESP\_ERR\_WIFI\_IF.
- **buffer** –raw ieee80211 buffer
- **len** –the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en\_sys\_seq** –indicate whether use the internal sequence number. If en\_sys\_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp\_wifi\_80211\_tx is called before the Wi-Fi connection has been set up, both en\_sys\_seq==true and en\_sys\_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en\_sys\_seq must be true, otherwise ESP\_ERR\_WIFI\_ARG is returned.

#### Returns

- ESP\_OK: success
- ESP\_ERR\_WIFI\_IF: Invalid interface
- ESP\_ERR\_INVALID\_ARG: Invalid parameter
- ESP\_ERR\_WIFI\_NO\_MEM: out of memory

`esp_err_t esp_wifi_set_csi_rx_cb(wifi_csi_cb_t cb, void *ctx)`

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

#### Parameters

- **cb** –callback
- **ctx** –context argument, passed to callback function

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

`esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)`

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters config** –configuration

`esp_err_t esp_wifi_set_csi(bool en)`

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **en** –true - enable, false - disable

*esp\_err\_t* **esp\_wifi\_set\_ant\_gpio** (const *wifi\_ant\_gpio\_config\_t* \*config)

Set antenna GPIO configuration.

**Parameters** **config** –Antenna GPIO configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

*esp\_err\_t* **esp\_wifi\_get\_ant\_gpio** (*wifi\_ant\_gpio\_config\_t* \*config)

Get current antenna GPIO configuration.

**Parameters** **config** –Antenna GPIO configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

*esp\_err\_t* **esp\_wifi\_set\_ant** (const *wifi\_ant\_config\_t* \*config)

Set antenna configuration.

**Parameters** **config** –Antenna configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

*esp\_err\_t* **esp\_wifi\_get\_ant** (*wifi\_ant\_config\_t* \*config)

Get current antenna configuration.

**Parameters** **config** –Antenna configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument, e.g. parameter is NULL

*int64\_t* **esp\_wifi\_get\_tsf\_time** (*wifi\_interface\_t* interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters** **interface** –The interface whose tsf\_time is to be retrieved.

**Returns** 0 or the TSF time

*esp\_err\_t* **esp\_wifi\_set\_inactive\_time** (*wifi\_interface\_t* ifx, *uint16\_t* sec)

Set the inactive time of the ESP32 STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

#### Parameters

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t \*sec)

Get inactive time of specified interface.

#### Parameters

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_stats\_dump** (uint32\_t modules)

Dump WiFi statistics.

**Parameters** **modules** –statistic modules to be dumped

#### Returns

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_set\_rssi\_threshold** (int32\_t rssi)

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event is received.

**Parameters** **rssi** –threshold value in dbm between -100 to 0

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_ftm\_initiate\_session** (*wifi\_ftm\_initiator\_cfg\_t* \*cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Parameters** **cfg** –FTM Initiator session configuration

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_end\_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_resp\_set\_offset** (int16\_t offset\_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters** **offset\_cm** –T1 Offset to be added in centimeters

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_config\_11b\_rate** (*wifi\_interface\_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Attention** 2. Only when really need to disable 11b rate call this API otherwise don't call this.

**Parameters**

- **ifx** –Interface to be configured.
- **disable** –true means disable 11b rate while false means enable 11b rate.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_connectionless\_module\_set\_wake\_interval** (uint16\_t wake\_interval)

Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.

**Attention** 2. This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention** 3. Event WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START would be posted each time wake interval starts.

**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Attention** 5. Recommend to configure interval to ESP\_WIFI\_CONNECTIONLESS\_INTERVAL\_DEFAULT\_MODE to get stable performance at coexistence mode.

**Parameters** **wake\_interval** –Milliseconds after would the chip wake up, from 1 to 65535.

*esp\_err\_t* **esp\_wifi\_set\_country\_code** (const char \*country, bool ieee80211d\_enabled)

configure country

**Attention** 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention** 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 4. The country configuration is stored into flash.

**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention** 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

**Attention** 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention** 8. The default country is “01” (world safe mode) and `ieee80211d_enabled` is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ‘‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘‘.

#### Parameters

- **country** –the configured country ISO code
- **ieee80211d\_enabled** –802.11d is enabled or not

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country\_code** (char \*country)

get the current country code

**Parameters** **country** –country code

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_config\_80211\_tx\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

#### Parameters

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

#### Returns

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_disable\_pmf\_config** (*wifi\_interface\_t* ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

**Parameters** `ifx` –Interface to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* `esp_wifi_sta_get_aid` (uint16\_t \*aid)

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters** `aid` –[out] store the aid

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* `esp_wifi_sta_get_negotiated_phymode` (*wifi\_phy\_mode\_t* \*phymode)

Get the negotiated phymode after connection.

**Attention** Operation phy mode, BIT[5]: indicate whether LR enabled, BIT[0-4]: `wifi_phy_mode_t`

**Parameters** `phymode` –[out] store the negotiated phymode.

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* `esp_wifi_sta_get_rssi` (int \*rssi)

Get the rssi info after station connected to AP.

**Attention** This API should be called after station connected to AP.

**Parameters** `rssi` –store the rssi info received from last beacon.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_FAIL: failed

## Structures

struct `wifi_init_config_t`

WiFi stack configuration parameters passed to `esp_wifi_init` call.

## Public Members

`wifi_osi_funcs_t` \*`osi_funcs`

WiFi OS functions

`wpa_crypto_funcs_t` \*`wpa_crypto_funcs`

WiFi station crypto functions when connect

int `static_rx_buf_num`

WiFi static RX buffer number

- int dynamic\_rx\_buf\_num**  
WiFi dynamic RX buffer number
- int tx\_buf\_type**  
WiFi TX buffer type
- int static\_tx\_buf\_num**  
WiFi static TX buffer number
- int dynamic\_tx\_buf\_num**  
WiFi dynamic TX buffer number
- int cache\_tx\_buf\_num**  
WiFi TX cache buffer number
- int csi\_enable**  
WiFi channel state information enable flag
- int ampdu\_rx\_enable**  
WiFi AMPDU RX feature enable flag
- int ampdu\_tx\_enable**  
WiFi AMPDU TX feature enable flag
- int amsdu\_tx\_enable**  
WiFi AMSDU TX feature enable flag
- int nvs\_enable**  
WiFi NVS flash enable flag
- int nano\_enable**  
Nano option for printf/scan family enable flag
- int rx\_ba\_win**  
WiFi Block Ack RX window size
- int wifi\_task\_core\_id**  
WiFi Task Core ID
- int beacon\_max\_len**  
WiFi softAP maximum length of the beacon
- int mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32
- uint64\_t feature\_caps**  
Enables additional WiFi features and capabilities

bool **sta\_disconnected\_pm**  
WiFi Power Management for station at disconnected status

int **espnw\_max\_encrypt\_num**  
Maximum encrypt number of peers supported by espnw

int **magic**  
WiFi init magic number, it should be the last field

### Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**  
WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**  
WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**  
WiFi interface error

**ESP\_ERR\_WIFI\_MODE**  
WiFi mode error

**ESP\_ERR\_WIFI\_STATE**  
WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**  
WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**  
WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**  
MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**  
SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**  
Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**  
Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**  
WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**

The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**

Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC**

The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW**

The WiFi TX is disallowed

**ESP\_ERR\_WIFI\_DISCARD**

Discard frame

**WIFI\_STATIC\_TX\_BUFFER\_NUM**

**WIFI\_CACHE\_TX\_BUFFER\_NUM**

**WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

**WIFI\_CSI\_ENABLED**

**WIFI\_AMPDU\_RX\_ENABLED**

**WIFI\_INIT\_CONFIG\_MAGIC**

**WIFI\_DEFAULT\_RX\_BA\_WIN**

**WIFI\_TASK\_CORE\_ID**

WIFI\_SOFTAP\_BEACON\_MAX\_LEN

WIFI\_MGMT\_SBUF\_NUM

WIFI\_STA\_DISCONNECTED\_PM\_ENABLED

CONFIG\_FEATURE\_WPA3\_SAE\_BIT

CONFIG\_FEATURE\_CACHE\_TX\_BUF\_BIT

CONFIG\_FEATURE\_FTM\_INITIATOR\_BIT

CONFIG\_FEATURE\_FTM\_RESPONDER\_BIT

WIFI\_INIT\_CONFIG\_DEFAULT()

ESP\_WIFI\_CONNECTIONLESS\_INTERVAL\_DEFAULT\_MODE

### Type Definitions

typedef void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef void (\***esp\_vendor\_ie\_cb\_t**)(void \*ctx, *wifi\_vendor\_ie\_type\_t* type, const uint8\_t sa[6], const *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd\_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

typedef void (\***wifi\_csi\_cb\_t**)(void \*ctx, *wifi\_csi\_info\_t* \*data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data **is** received, the callback function will be called.

**Param ctx** context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_types.h](#)

## Unions

union **wifi\_config\_t**

*#include <esp\_wifi\_types.h>* Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**

configuration of AP

*wifi\_sta\_config\_t* **sta**

configuration of STA

## Structures

struct **wifi\_country\_t**

Structure describing WiFi country-based regional restrictions.

### Public Members

char **cc**[3]

country code string

uint8\_t **schan**

start channel

uint8\_t **nchan**

total channel number

int8\_t **max\_tx\_power**

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**

country policy

struct **wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

### Public Members

uint32\_t **min**

minimum active scan time per channel, units: millisecond

uint32\_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

### Public Members

*wifi\_active\_scan\_time\_t* **active**

active scan time per channel, units: millisecond.

uint32\_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_config\_t**

Parameters for an SSID scan.

### Public Members

uint8\_t \***ssid**

SSID of AP

uint8\_t \***bssid**

MAC address of AP

uint8\_t **channel**

channel, scan the specific channel

bool **show\_hidden**

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

uint8\_t **home\_chan\_dwell\_time**

time spent at home channel between scanning consecutive channels.

struct **wifi\_ap\_record\_t**

Description of a WiFi AP.

**Public Members****uint8\_t bssid[6]**

MAC address of AP

**uint8\_t ssid[33]**

SSID of AP

**uint8\_t primary**

channel of AP

*wifi\_second\_chan\_t* **second**

secondary channel of AP

**int8\_t rssi**

signal strength of AP

*wifi\_auth\_mode\_t* **authmode**

authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

group cipher of AP

*wifi\_ant\_t* **ant**

antenna used to receive beacon from AP

**uint32\_t phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

**uint32\_t phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

**uint32\_t phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

**uint32\_t phy\_lr**

bit: 3 flag to identify if low rate is enabled or not

**uint32\_t wps**

bit: 4 flag to identify if WPS is supported or not

**uint32\_t ftm\_responder**

bit: 5 flag to identify if FTM is supported in responder mode

**uint32\_t ftm\_initiator**

bit: 6 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved**

bit: 7..31 reserved

*wifi\_country\_t* **country**

country information of AP

struct **wifi\_scan\_threshold\_t**

Structure describing parameters for a WiFi fast scan.

### Public Members

int8\_t **rss**

The minimum rssi to accept in the fast scan mode

*wifi\_auth\_mode\_t* **authmode**

The weakest authmode to accept in the fast scan mode Note: In case this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI\_AUTH\_WEP/WIFI\_AUTH\_WPA\_PSK to connect to WEP/WPA networks

struct **wifi\_pmf\_config\_t**

Configuration structure for Protected Management Frame

### Public Members

bool **capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct **wifi\_ap\_config\_t**

Soft-AP configuration settings for the ESP32.

### Public Members

uint8\_t **ssid**[32]

SSID of ESP32 soft-AP. If ssid\_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid\_len.

uint8\_t **password**[64]

Password of ESP32 soft-AP.

uint8\_t **ssid\_len**

Optional length of SSID field.

uint8\_t **channel**

Channel of soft-AP

*wifi\_auth\_mode\_t* **authmode**

Auth mode of soft-AP. Do not support AUTH\_WEP, AUTH\_WAPI\_PSK and AUTH\_OWE in soft-AP mode. When the auth mode is set to WPA2\_PSK, WPA2\_WPA3\_PSK or WPA3\_PSK, the pairwise cipher will be overwritten with WIFI\_CIPHER\_TYPE\_CCMP.

uint8\_t **ssid\_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

uint8\_t **max\_connection**

Max number of stations allowed to connect in

uint16\_t **beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

*wifi\_cipher\_type\_t* **pairwise\_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

bool **ftm\_responder**

Enable FTM Responder mode

*wifi\_pmf\_config\_t* **pmf\_cfg**

Configuration for Protected Management Frame

struct **wifi\_sta\_config\_t**

STA configuration settings for the ESP32.

## Public Members

uint8\_t **ssid**[32]

SSID of target AP.

uint8\_t **password**[64]

Password of target AP.

*wifi\_scan\_method\_t* **scan\_method**

do all channel scan or fast scan

bool **bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

`uint8_t bssid[6]`

MAC address of target AP

`uint8_t channel`

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

`uint16_t listen_interval`

Listen interval for ESP32 station to receive beacon when `WIFI_PS_MAX_MODEM` is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

`wifi_sort_method_t sort_method`

sort the connect AP in the list by rssi or security mode

`wifi_scan_threshold_t threshold`

When `sort_method` is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

`wifi_pmf_config_t pmf_cfg`

Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

`uint32_t rm_enabled`

Whether Radio Measurements are enabled for the connection

`uint32_t btm_enabled`

Whether BSS Transition Management is enabled for the connection

`uint32_t mbo_enabled`

Whether MBO is enabled for the connection

`uint32_t ft_enabled`

Whether FT is enabled for the connection

`uint32_t owe_enabled`

Whether OWE is enabled for the connection

`uint32_t transition_disable`

Whether to enable transition disable feature

`uint32_t reserved`

Reserved for future feature set

`wifi_sae_pwe_method_t sae_pwe_h2e`

Whether SAE hash to element is enabled

`uint8_t failure_retry_cnt`

Number of connection retries station will do before moving to next AP. `scan_method` should be set as `WIFI_ALL_CHANNEL_SCAN` to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

struct **wifi\_sta\_info\_t**

Description of STA associated with AP.

### Public Members

uint8\_t **mac**[6]

mac address

int8\_t **rss\_i**

current average rssi of sta connected

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **is\_mesh\_child**

bit: 4 flag to identify mesh child

uint32\_t **reserved**

bit: 5..31 reserved

struct **wifi\_sta\_list\_t**

List of stations associated with the ESP32 Soft-AP.

### Public Members

*wifi\_sta\_info\_t* **sta**[ESP\_WIFI\_MAX\_CONN\_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

### Public Members

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

uint8\_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

### Public Members

signed **rssi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_**

reserved

unsigned **sig\_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_**

reserved

unsigned **smoothing**

reserved

unsigned **not\_sounding**

reserved

unsigned **\_\_pad3\_\_**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **\_\_pad4\_\_**

reserved

unsigned **ampdu\_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary\_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad5\_\_**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad6\_\_**

reserved

unsigned **\_\_pad7\_\_**

reserved

unsigned **\_\_pad8\_\_**

reserved

unsigned **ant**

antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

signed **noise\_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **\_\_pad9\_\_**

reserved

unsigned **sig\_len**

length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad10\_\_**

reserved

unsigned **rx\_state**

state of the packet. 0: no error; others: error numbers which are not public

struct **wifi\_promiscuous\_pkt\_t**

Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

metadata header

uint8\_t **payload[0]**

Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

struct **wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**

OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

struct **wifi\_csi\_config\_t**

Channel state information(CSI) configuration type.

### Public Members

bool **lltf\_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htl1tf\_en**

enable to receive HT long training field(htl1tf) data. Default enabled

bool **stbc\_htl1tf2\_en**

enable to receive space time block code HT long training field(stbc-htl1tf2) data. Default enabled

bool **l1tf\_merge\_en**

enable to generate h1lft data by averaging l1tf and ht\_l1tf data when receiving HT packet. Otherwise, use ht\_l1tf data directly. Default enabled

bool **channel\_filter\_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi\_csi\_info\_t**

CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

received packet radio metadata header of the CSI data

uint8\_t **mac**[6]

source MAC address of the CSI data

uint8\_t **dmac**[6]

destination MAC address of the CSI data

bool **first\_word\_invalid**

first four bytes of the CSI data is invalid or not

int8\_t \***buf**

buffer of CSI data

uint16\_t **len**

length of CSI data

struct **wifi\_ant\_gpio\_t**

WiFi GPIO configuration for antenna selection.

**Public Members**`uint8_t gpio_select`

Whether this GPIO is connected to external antenna switch

`uint8_t gpio_num`

The GPIO number that connects to external antenna switch

struct `wifi_ant_gpio_config_t`

WiFi GPIOs configuration for antenna selection.

**Public Members**`wifi_ant_gpio_t gpio_cfg[4]`

The configurations of GPIOs that connect to external antenna switch

struct `wifi_ant_config_t`

WiFi antenna configuration.

**Public Members**`wifi_ant_mode_t rx_ant_mode`

WiFi antenna mode for receiving

`wifi_ant_t rx_ant_default`Default antenna mode for receiving, it's ignored if `rx_ant_mode` is not `WIFI_ANT_MODE_AUTO``wifi_ant_mode_t tx_ant_mode`WiFi antenna mode for transmission, it can be set to `WIFI_ANT_MODE_AUTO` only if `rx_ant_mode` is set to `WIFI_ANT_MODE_AUTO``uint8_t enabled_ant0`Index (in antenna GPIO configuration) of enabled `WIFI_ANT_MODE_ANT0``uint8_t enabled_ant1`Index (in antenna GPIO configuration) of enabled `WIFI_ANT_MODE_ANT1`struct `wifi_action_tx_req_t`

Action Frame Tx Request.

**Public Members**`wifi_interface_t ifx`

WiFi interface to send request to

`uint8_t dest_mac[6]`

Destination MAC address

bool **no\_ack**

Indicates no ack required

*wifi\_action\_rx\_cb\_t* **rx\_cb**

Rx Callback to receive any response

uint32\_t **data\_len**

Length of the appended Data

uint8\_t **data**[0]

Appended Data payload

struct **wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

### Public Members

uint8\_t **resp\_mac**[6]

MAC address of the FTM Responder

uint8\_t **channel**

Primary channel of the FTM Responder

uint8\_t **frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested time period between consecutive FTM bursts in 100<sup>7</sup> s of milliseconds (0 - No pref)

struct **wifi\_event\_sta\_scan\_done\_t**

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

### Public Members

uint32\_t **status**

status of scanning APs: 0 — success, 1 - failure

uint8\_t **number**

number of scan results

uint8\_t **scan\_id**

scan sequence number, used for block scan

struct **wifi\_event\_sta\_connected\_t**

Argument structure for WIFI\_EVENT\_STA\_CONNECTED event

**Public Members**`uint8_t ssid[32]`

SSID of connected AP

`uint8_t ssid_len`

SSID length of connected AP

`uint8_t bssid[6]`

BSSID of connected AP

`uint8_t channel`

channel of connected AP

`wifi_auth_mode_t authmode`

authentication mode used by AP

struct `wifi_event_sta_disconnected_t`

Argument structure for WIFI\_EVENT\_STA\_DISCONNECTED event

**Public Members**`uint8_t ssid[32]`

SSID of disconnected AP

`uint8_t ssid_len`

SSID length of disconnected AP

`uint8_t bssid[6]`

BSSID of disconnected AP

`uint8_t reason`

reason of disconnection

`int8_t rssi`

rssi of disconnection

struct `wifi_event_sta_authmode_change_t`

Argument structure for WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE event

**Public Members**`wifi_auth_mode_t old_mode`

the old auth mode of AP

`wifi_auth_mode_t new_mode`

the new auth mode of AP

struct **wifi\_event\_sta\_wps\_er\_pin\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

### Public Members

uint8\_t **ap\_cred\_cnt**

Number of AP credentials received

uint8\_t **ssid**[MAX\_SSID\_LEN]

SSID of AP

uint8\_t **passphrase**[MAX\_PASSPHRASE\_LEN]

Passphrase for the AP

struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[MAX\_WPS\_AP\_CRED]

All AP credentials received from WPS handshake

struct **wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

### Public Members

uint8\_t **mac**[6]

MAC address of the station connected to ESP32 soft-AP

uint8\_t **aid**

the aid that ESP32 soft-AP gives to the station connected to

bool **is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

### Public Members

uint8\_t **mac**[6]

MAC address of the station disconnects to ESP32 soft-AP

uint8\_t **aid**

the aid that ESP32 soft-AP gave to the station disconnects to

bool **is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

### Public Members

int **rssi**

Received probe request signal strength

uint8\_t **mac**[6]

MAC address of the station which send probe request

struct **wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event

### Public Members

int32\_t **rssi**

RSSI value of bss

struct **wifi\_ftm\_report\_entry\_t**

Argument structure for

### Public Members

uint8\_t **dlog\_token**

Dialog Token of the FTM frame

int8\_t **rssi**

RSSI of the FTM frame received

uint32\_t **rtt**

Round Trip Time in pSec with a peer

uint64\_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64\_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64\_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64\_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi\_event\_ftm\_report\_t**

Argument structure for WIFI\_EVENT\_FTM\_REPORT event

### Public Members

uint8\_t **peer\_mac**[6]

MAC address of the FTM Peer

*wifi\_ftm\_status\_t* **status**

Status of the FTM operation

uint32\_t **rtt\_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32\_t **rtt\_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32\_t **dist\_est**

Estimated one-way distance in Centi-Meters

*wifi\_ftm\_report\_entry\_t* \***ftm\_report\_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8\_t **ftm\_report\_num\_entries**

Number of entries in the FTM Report data

struct **wifi\_event\_action\_tx\_status\_t**

Argument structure for WIFI\_EVENT\_ACTION\_TX\_STATUS event

### Public Members

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint32\_t **context**

Context to identify the request

uint8\_t **da**[6]

Destination MAC address

uint8\_t **status**

Status of the operation

struct **wifi\_event\_roc\_done\_t**

Argument structure for WIFI\_EVENT\_ROC\_DONE event

### Public Members

uint32\_t **context**

Context to identify the request

struct **wifi\_event\_ap\_wps\_rg\_pin\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_PIN event

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_ap\_wps\_rg\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_FAILED event

### Public Members

*wps\_fail\_reason\_t* **reason**

WPS failure reason *wps\_fail\_reason\_t*

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_ap\_wps\_rg\_success\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS event

### Public Members

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

### Macros

**WIFI\_OFFCHAN\_TX\_REQ**

**WIFI\_OFFCHAN\_TX\_CANCEL**

**WIFI\_ROC\_REQ**

**WIFI\_ROC\_CANCEL**

**WIFI\_PROTOCOL\_11B**

**WIFI\_PROTOCOL\_11G**

**WIFI\_PROTOCOL\_11N**

**WIFI\_PROTOCOL\_LR**

**ESP\_WIFI\_MAX\_CONN\_NUM**

max number of stations which can connect to ESP32/ESP32S3/ESP32S2 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**

filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**

filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**

filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**

filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**

filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**

filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**

filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**

filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**

filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**

filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**

mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**

mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**

mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATIS\_RXTX**

**WIFI\_STATIS\_HW**

**WIFI\_STATIS\_DIAG**

**WIFI\_STATIS\_PS**

**WIFI\_STATIS\_ALL**

## Type Definitions

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

**Param hdr** pointer to the IEEE 802.11 Header structure

**Param payload** pointer to the Payload following 802.11 Header

**Param len** length of the Payload

**Param channel** channel number the frame is received on

## Enumerations

```
enum wifi_mode_t
```

*Values:*

enumerator **WIFI\_MODE\_NULL**

null mode

enumerator **WIFI\_MODE\_STA**

WiFi station mode

enumerator **WIFI\_MODE\_AP**

WiFi soft-AP mode

enumerator **WIFI\_MODE\_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI\_MODE\_MAX**

```
enum wifi_interface_t
```

*Values:*

enumerator **WIFI\_IF\_STA**

enumerator **WIFI\_IF\_AP**

```
enum wifi_country_policy_t
```

*Values:*

enumerator **WIFI\_COUNTRY\_POLICY\_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI\_COUNTRY\_POLICY\_MANUAL**

Country policy is manual, always use the configured country info

```
enum wifi_auth_mode_t
```

*Values:*

enumerator **WIFI\_AUTH\_OPEN**

authenticate mode : open

enumerator **WIFI\_AUTH\_WEP**

authenticate mode : WEP

enumerator **WIFI\_AUTH\_WPA\_PSK**

authenticate mode : WPA\_PSK

enumerator **WIFI\_AUTH\_WPA2\_PSK**

authenticate mode : WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA\_WPA2\_PSK**

authenticate mode : WPA\_WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA2\_ENTERPRISE**

authenticate mode : WPA2\_ENTERPRISE

enumerator **WIFI\_AUTH\_WPA3\_PSK**

authenticate mode : WPA3\_PSK

enumerator **WIFI\_AUTH\_WPA2\_WPA3\_PSK**

authenticate mode : WPA2\_WPA3\_PSK

enumerator **WIFI\_AUTH\_WAPI\_PSK**

authenticate mode : WAPI\_PSK

enumerator **WIFI\_AUTH\_OWE**

authenticate mode : OWE

enumerator **WIFI\_AUTH\_MAX**

enum **wifi\_err\_reason\_t**

*Values:*

enumerator **WIFI\_REASON\_UNSPECIFIED**

enumerator **WIFI\_REASON\_AUTH\_EXPIRE**

enumerator **WIFI\_REASON\_AUTH\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_EXPIRE**

enumerator **WIFI\_REASON\_ASSOC\_TOOMANY**

enumerator **WIFI\_REASON\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_NOT\_ASSOCED**

enumerator **WIFI\_REASON\_ASSOC\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_DISASSOC\_PWRCAP\_BAD**

enumerator **WIFI\_REASON\_DISASSOC\_SUPCHAN\_BAD**

enumerator **WIFI\_REASON\_BSS\_TRANSITION\_DISASSOC**

enumerator **WIFI\_REASON\_IE\_INVALID**

enumerator **WIFI\_REASON\_MIC\_FAILURE**

enumerator **WIFI\_REASON\_4WAY\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_GROUP\_KEY\_UPDATE\_TIMEOUT**

enumerator **WIFI\_REASON\_IE\_IN\_4WAY\_DIFFERS**

enumerator **WIFI\_REASON\_GROUP\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_PAIRWISE\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_AKMP\_INVALID**

enumerator **WIFI\_REASON\_UNSUPP\_RSN\_IE\_VERSION**

enumerator **WIFI\_REASON\_INVALID\_RSN\_IE\_CAP**

enumerator **WIFI\_REASON\_802\_1X\_AUTH\_FAILED**

enumerator **WIFI\_REASON\_CIPHER\_SUITE\_REJECTED**

enum **wifi\_second\_chan\_t**

*Values:*

enumerator **WIFI\_SECOND\_CHAN\_NONE**

the channel width is HT20

enumerator **WIFI\_SECOND\_CHAN\_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI\_SECOND\_CHAN\_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi\_scan\_type\_t**

*Values:*

enumerator **WIFI\_SCAN\_TYPE\_ACTIVE**

active scan

enumerator **WIFI\_SCAN\_TYPE\_PASSIVE**

passive scan

enum **wifi\_cipher\_type\_t**

*Values:*

enumerator **WIFI\_CIPHER\_TYPE\_NONE**

the cipher type is none

enumerator **WIFI\_CIPHER\_TYPE\_WEP40**

the cipher type is WEP40

enumerator **WIFI\_CIPHER\_TYPE\_WEP104**

the cipher type is WEP104

enumerator **WIFI\_CIPHER\_TYPE\_TKIP**

the cipher type is TKIP

enumerator **WIFI\_CIPHER\_TYPE\_CCMP**

the cipher type is CCMP

enumerator **WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI\_CIPHER\_TYPE\_AES\_CM128**

the cipher type is AES-CMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_SMS4**

the cipher type is SMS4

enumerator **WIFI\_CIPHER\_TYPE\_GCMP**

the cipher type is GCMP

enumerator **WIFI\_CIPHER\_TYPE\_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI\_CIPHER\_TYPE\_UNKNOWN**

the cipher type is unknown

enum **wifi\_ant\_t**

WiFi antenna.

*Values:*

enumerator **WIFI\_ANT\_ANT0**

WiFi antenna 0

enumerator **WIFI\_ANT\_ANT1**

WiFi antenna 1

enumerator **WIFI\_ANT\_MAX**

Invalid WiFi antenna

enum **wifi\_scan\_method\_t**

*Values:*

enumerator **WIFI\_FAST\_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi\_sort\_method\_t**

*Values:*

enumerator **WIFI\_CONNECT\_AP\_BY\_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

enum **wifi\_ps\_type\_t**

*Values:*

enumerator **WIFI\_PS\_NONE**

No power save

enumerator **WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen\_interval parameter in *wifi\_sta\_config\_t*

enum **wifi\_bandwidth\_t**

*Values:*

enumerator **WIFI\_BW\_HT20**

enumerator **WIFI\_BW\_HT40**

enum **wifi\_sae\_pwe\_method\_t**

Configuration for SAE PWE derivation

*Values:*

enumerator **WPA3\_SAE\_PWE\_UNSPECIFIED**

enumerator **WPA3\_SAE\_PWE\_HUNT\_AND\_PECK**

enumerator **WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT**

enumerator **WPA3\_SAE\_PWE\_BOTH**

enum **wifi\_storage\_t**

*Values:*

enumerator **WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

enum **wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

enumerator **WIFI\_VND\_IE\_TYPE\_BEACON**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

enum **wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

enumerator **WIFI\_VND\_IE\_ID\_0**

enumerator **WIFI\_VND\_IE\_ID\_1**

enum **wifi\_phy\_mode\_t**

Operation Phymode.

*Values:*

enumerator **WIFI\_PHY\_MODE\_LR**

PHY mode for Low Rate

enumerator **WIFI\_PHY\_MODE\_11B**

PHY mode for 11b

enumerator **WIFI\_PHY\_MODE\_11G**

PHY mode for 11g

enumerator **WIFI\_PHY\_MODE\_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI\_PHY\_MODE\_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI\_PHY\_MODE\_HE20**

PHY mode for Bandwidth HE20

enum **wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

enumerator **WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

enum **wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:*

enumerator **WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

enum **wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:*

enumerator **WIFI\_PHY\_RATE\_1M\_L**

1 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_L**

2 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_5M\_L**

5.5 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_11M\_L**

11 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_S**

2 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_5M\_S**

5.5 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_11M\_S**

11 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_48M**

48 Mbps

enumerator **WIFI\_PHY\_RATE\_24M**

24 Mbps

enumerator **WIFI\_PHY\_RATE\_12M**

12 Mbps

enumerator **WIFI\_PHY\_RATE\_6M**

6 Mbps

enumerator **WIFI\_PHY\_RATE\_54M**

54 Mbps

enumerator **WIFI\_PHY\_RATE\_36M**

36 Mbps

enumerator **WIFI\_PHY\_RATE\_18M**

18 Mbps

enumerator **WIFI\_PHY\_RATE\_9M**

9 Mbps

enumerator **WIFI\_PHY\_RATE\_MCS0\_LGI**

MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS1\_LGI**

MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS2\_LGI**

MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS3\_LGI**

MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS4\_LGI**

MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS5\_LGI**

MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS6\_LGI**

MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS7\_LGI**

MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS0\_SGI**

MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS1\_SGI**

MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS2\_SGI**

MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS3\_SGI**

MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS4\_SGI**

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS5\_SGI**

MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS6\_SGI**

MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_MCS7\_SGI**

MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator **WIFI\_PHY\_RATE\_LORA\_250K**

250 Kbps

enumerator **WIFI\_PHY\_RATE\_LORA\_500K**

500 Kbps

enumerator **WIFI\_PHY\_RATE\_MAX**

enum **wifi\_event\_t**

WiFi event declarations

*Values:*

enumerator **WIFI\_EVENT\_WIFI\_READY**

ESP32 WiFi ready

enumerator **WIFI\_EVENT\_SCAN\_DONE**

ESP32 finish scanning AP

enumerator **WIFI\_EVENT\_STA\_START**

ESP32 station start

enumerator **WIFI\_EVENT\_STA\_STOP**

ESP32 station stop

enumerator **WIFI\_EVENT\_STA\_CONNECTED**

ESP32 station connected to AP

enumerator **WIFI\_EVENT\_STA\_DISCONNECTED**

ESP32 station disconnected from AP

enumerator **WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by ESP32 station changed

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

ESP32 station wps succeeds in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

ESP32 station wps fails in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

ESP32 station wps timeout in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

ESP32 station wps pin code in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

ESP32 station wps overlap in enrollee mode

enumerator **WIFI\_EVENT\_AP\_START**

ESP32 soft-AP start

enumerator **WIFI\_EVENT\_AP\_STOP**

ESP32 soft-AP stop

enumerator **WIFI\_EVENT\_AP\_STA\_CONNECTED**

a station connected to ESP32 soft-AP

enumerator **WIFI\_EVENT\_AP\_STA\_DISCONNECTED**

a station disconnected from ESP32 soft-AP

enumerator **WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

enumerator **WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP' s RSSI crossed configured threshold

enumerator **WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

enumerator **WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

enumerator **WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

ESP32 station beacon timeout

enumerator **WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START**

ESP32 connectionless module wake interval start

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PBC\_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI\_EVENT\_MAX**

Invalid WiFi event ID

enum **wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

enumerator **WPS\_FAIL\_REASON\_NORMAL**

ESP32 WPS normal fail reason

enumerator **WPS\_FAIL\_REASON\_RECV\_M2D**

ESP32 WPS receive M2D frame

enumerator **WPS\_FAIL\_REASON\_MAX**

enum **wifi\_ftm\_status\_t**

FTM operation status types.

*Values:*

enumerator **FTM\_STATUS\_SUCCESS**

FTM exchange is successful

enumerator **FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM\_STATUS\_NO\_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM\_STATUS\_FAIL**

Unknown error during FTM exchange

enum **wps\_fail\_reason\_t**

*Values:*

enumerator **WPS\_AP\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_AP\_FAIL\_REASON\_CONFIG**

WPS failed due to incorrect config

enumerator **WPS\_AP\_FAIL\_REASON\_AUTH**

WPS failed during auth

enumerator **WPS\_AP\_FAIL\_REASON\_MAX**

### Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-S2 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S2 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-S2 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

## API Reference

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_dpp.h](#)

### Functions

*esp\_err\_t* **esp\_supp\_dpp\_init** (*esp\_supp\_dpp\_event\_cb\_t* evt\_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant **and** initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

**Parameters** *evt\_cb* –Callback function to receive DPP related events

void **esp\_supp\_dpp\_deinit** (void)

De-initialize DPP Supplicant.

Frees memory **from DPP** Supplicant Data Structures.

*esp\_err\_t* **esp\_supp\_dpp\_bootstrap\_gen** (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information **as** an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

#### Parameters

- **chan\_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

#### Returns

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* **esp\_supp\_dpp\_start\_listen** (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel **from Channel** List **for** a pre-defined wait time.

#### Returns

- **ESP\_OK**: Success
- **ESP\_FAIL**: Generic Failure
- **ESP\_ERR\_INVALID\_STATE**: ROC attempted before WiFi is started
- **ESP\_ERR\_NO\_MEM**: Memory allocation failed while posting ROC request

void **esp\_supp\_dpp\_stop\_listen** (void)

Stop listening on Channels.

Stops listening on Channels **and** cancels ongoing listen operation.

## Macros

### **ESP\_ERR\_DPP\_FAILURE**

Generic failure during DPP Operation

### **ESP\_ERR\_DPP\_TX\_FAILURE**

DPP Frame Tx failed OR not Acked

### **ESP\_ERR\_DPP\_INVALID\_ATTR**

Encountered invalid DPP Attribute

## Type Definitions

typedef enum *dpp\_bootstrap\_type* **esp\_supp\_dpp\_bootstrap\_t**

Types of Bootstrap Methods for DPP.

typedef void (\***esp\_supp\_dpp\_event\_cb\_t**)(*esp\_supp\_dpp\_event\_t* evt, void \*data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called **with** DPP related information.

**Param evt** DPP event ID

**Param data** Event data payload

## Enumerations

enum **dpp\_bootstrap\_type**

Types of Bootstrap Methods for DPP.

*Values:*

enumerator **DPP\_BOOTSTRAP\_QR\_CODE**

QR Code Method

enumerator **DPP\_BOOTSTRAP\_PKEX**

Proof of Knowledge Method

enumerator **DPP\_BOOTSTRAP\_NFC\_URI**

NFC URI record Method

enum **esp\_supp\_dpp\_event\_t**

Types of Callback Events received from DPP Supplicant.

*Values:*

enumerator **ESP\_SUPP\_DPP\_URI\_READY**

URI is ready through Bootstrapping

enumerator **ESP\_SUPP\_DPP\_CFG\_RECVD**

Config received via DPP Authentication

enumerator **ESP\_SUPP\_DPP\_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

## 2.4.2 Ethernet

### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. [Basic Ethernet Concepts](#)
2. [Configure MAC and PHY](#)
3. [Connect Driver to TCP/IP Stack](#)
4. [Misc control of Ethernet driver](#)

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

Fig. 3: Ethernet Data Frame Format

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length** The type/length field is a 2-byte field, if the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH

- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They're not supported in ESP-IDF.

---

**Configure MAC and PHY** Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.

- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

### SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // apply default
↳common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // apply default PHY
↳configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                // alter the PHY
↳address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // alter the GPIO
↳used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

### Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don't have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's spec and the examples in esp-idf.

**Install Driver** To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↳configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the_
↳handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that running in_
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);_
↳// register Ethernet event handler (to deal with user specific stuffs when event_
↳like link up/down happened)
```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can't obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to [LwIP](#).

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to [Network Interface](#).

```
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user's handlers.

**Misc control of Ethernet driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
↪addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: [ethernet/basic](#).
- Ethernet iperf example: [ethernet/iperf](#).
- Ethernet to Wi-Fi AP “router” : [ethernet/eth2ap](#).
- Most of protocol examples should also work for Ethernet: [protocols](#).

### Advanced Topics

**Custom PHY Driver** There are multiple PHY manufactures with their wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies user’s actual needs due to either price, features, stock availability etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in 22.2.4 Management functions section. It defines provisions of so called “MII Management Interface” for the purposes of controlling the PHY and gathering status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration etc. This basic management functionality is addressed by [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) in ESP-IDF and so it makes a creation of new custom PHY chip driver quite a simple task.

---

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

---

Majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) however, the following may require developing chip specific management functions:

- link status which is almost always chip specific,
- chip initialization, even though it is not strictly required, should be customized to at least ensure that expected chip is used and
- chip specific features configuration.

#### Steps to create custom PHY driver:

1. Define vendor specific registry layout based on PHY datasheet. See [esp\\_eth/src/esp\\_eth\\_phy\\_ip101.c](#) as an example.
2. Prepare derived PHY management object infostructure which
  - must contain at least parent IEEE 802.3 [phy\\_802\\_3\\_t](#) object and
  - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp\\_eth/src/esp\\_eth\\_phy\\_ksz80xx.c](#) as an example.
3. Define chip specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among with other users via [IDF Component Registry](#).

### API Reference

#### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)

#### Header File

- [components/esp\\_eth/include/esp\\_eth\\_driver.h](#)

### Functions

`esp_err_t esp_eth_driver_install` (const `esp_eth_config_t` \*config, `esp_eth_handle_t` \*out\_hdl)

Install Ethernet driver.

#### Parameters

- **config** –[in] configuration of the Ethernet driver
- **out\_hdl** –[out] handle of Ethernet driver

#### Returns

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

`esp_err_t esp_eth_driver_uninstall` (`esp_eth_handle_t` hdl)

Uninstall Ethernet driver.

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

#### Returns

- ESP\_OK: uninstall esp\_eth driver successfully

- `ESP_ERR_INVALID_ARG`: uninstall `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: uninstall `esp_eth` driver failed because it has more than one reference
- `ESP_FAIL`: uninstall `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**Note:** This API will start driver state machine and internal software timer (for checking link status).

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: start `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: start `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: start `esp_eth` driver failed because driver has started already
- `ESP_FAIL`: start `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

---

**Note:** This function does the oppsite operation of `esp_eth_start`.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: stop `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: stop `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: stop `esp_eth` driver failed because driver has not started yet
- `ESP_FAIL`: stop `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)(*esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv), void \*priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**Note:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **stack\_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, size\_t length)

General Transmit.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

**Returns**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit\_vargs** (*esp\_eth\_handle\_t* hdl, uint32\_t argc, ...)

Special Transmit with variable number of arguments.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **argc** –[in] number variable arguments
- ... –variable arguments

**Returns**

- ESP\_OK: transmit successfull
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Etherent driver.

The following common IO control commands are supported:

- ETH\_CMD\_S\_MAC\_ADDR sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH\_CMD\_G\_MAC\_ADDR gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH\_CMD\_S\_PHY\_ADDR sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32\_t* datatype from where the configuration option is read.
- ETH\_CMD\_G\_PHY\_ADDR gets PHY address. *data* argument is pointer to memory of *uint32\_t* datatype to which the PHY address is to be stored.
- ETH\_CMD\_S\_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH\_CMD\_G\_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype to which the current configuration is to be stored.
- ETH\_CMD\_S\_SPEED sets the Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH\_CMD\_G\_SPEED gets current Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype to which the speed is to be stored.
- ETH\_CMD\_S\_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_FLOW\_CTRL sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_DUPLEX\_MODE sets the Ethernet duplex mode. *data* argument is pointer to memory of *eth\_duplex\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **cmd** –[in] IO control command
- **data** –[inout] address of data for `set` command or address where to store the data when used with `get` command

**Returns**

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**Note:** Ethernet driver handle can be obtained by `os timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

**Structures**

struct **esp\_eth\_config\_t**

Configuration of Ethernet driver.

**Public Members**

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (\***stack\_input**)(*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Param eth\_handle [in]** handle of Ethernet driver

**Param buffer [in]** frame buffer that will get input to upper stack

**Param length [in]** length of the frame buffer

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

*esp\_err\_t* (\***on\_lowlevel\_init\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding

---

read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

### Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

typedef void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

### Enumerations

enum **esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:*

enumerator **ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

enumerator **ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

enumerator **ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

enumerator **ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

enumerator **ETH\_CMD\_G\_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH\_CMD\_S\_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_SPEED**

Set Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH\_CMD\_S\_FLOW\_CTRL**

Set flow control

enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**

Get Duplex mode

enumerator **ETH\_CMD\_S\_DUPLEX\_MODE**

Set Duplex mode

enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**

Set PHY loopback

enumerator **ETH\_CMD\_CUSTOM\_MAC\_CMDS**

enumerator **ETH\_CMD\_CUSTOM\_PHY\_CMDS**

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_com.h](#)

## Structures

struct **esp\_eth\_mediator\_s**

Ethernet mediator.

## Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully

- **ESP\_FAIL**: write PHY register failed because some error occurred

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- **ESP\_OK**: deliver packet to upper stack successfully
- **ESP\_FAIL**: deliver packet failed because some error occurred

*esp\_err\_t* (**\*on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- **ESP\_OK**: process the new state successfully
- **ESP\_FAIL**: process the new state failed because some error occurred

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac.h](#)

### Unions

union **eth\_mac\_clock\_config\_t**

*#include* <esp\_eth\_mac.h> Ethernet MAC Clock Configuration.

### Public Members

struct *eth\_mac\_clock\_config\_t*::[anonymous] **mii**

EMAC MII Clock Configuration

*emac\_rmii\_clock\_mode\_t* **clock\_mode**

RMII Clock Mode Configuration

*emac\_rmii\_clock\_gpio\_t* **clock\_gpio**

RMII Clock GPIO Configuration

struct *eth\_mac\_clock\_config\_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

### Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

### Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (\***init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***transmit**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***transmit\_vargs**)(*esp\_eth\_mac\_t* \*mac, uint32\_t argc, va\_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

---

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

---

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param argc [in]** number variable arguments

**Param args [in]** variable arguments

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

---

**Note:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, eth\_speed\_t speed)

Set speed of MAC.

**Param ma:c [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, eth\_duplex\_t duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, eth\_link\_t link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (**\*set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (**\*enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (**\*set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (**\*custom\_ioctl**)(*esp\_eth\_mac\_t* \*mac, uint32\_t cmd, void \*data)

Custom IO function of MAC driver. This function is intended to extend common options of `esp_eth_ioctl` to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

---

**Param mac [in]** Ethernet MAC instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for `set` command or address where to store the data when used with `get` command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (**\*del**)(*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

uint32\_t **flags**

Flags that specify extra capability for mac driver

### Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG ()**

Default configuration for Ethernet MAC object.

### Type Definitions

typedef struct *esp\_eth\_mac\_s* **esp\_eth\_mac\_t**

Ethernet MAC.

### Enumerations

enum **emac\_rmii\_clock\_mode\_t**

RMII Clock Mode Options.

*Values:*

enumerator **EMAC\_CLK\_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC\_CLK\_EXT\_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

---

**Note:** MAC will get RMI clock from outside. Note that ESP32 only supports GPIO0 to input the RMI clock.

---

enumerator **EMAC\_CLK\_OUT**

Output RMI Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac\_rmii\_clock\_gpio\_t**

RMI Clock GPIO number Options.

*Values:*

enumerator **EMAC\_CLK\_IN\_GPIO**

MAC will get RMI clock from outside at this GPIO.

---

**Note:** ESP32 only supports GPIO0 to input the RMI clock.

---

enumerator **EMAC\_APPL\_CLK\_OUT\_GPIO**

Output RMI Clock from internal APLL Clock available at GPIO0.

---

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMI clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC\_CLK\_OUT\_GPIO**

Output RMI Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC\_CLK\_OUT\_180\_GPIO**

Inverted Output RMI Clock from internal APLL Clock available at GPIO17.

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy.h](#)

## Functions

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ip101** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of IP101.

**Parameters** *config* –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of RTL8201.

**Parameters** *config* –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully

- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan87xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN87xx.

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of DP83848.

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ksz80xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

## Structures

struct **esp\_eth\_phy\_s**

Ethernet PHY.

## Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Param phy** [in] Ethernet PHY instance

**Param mediator** [in] mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

*esp\_err\_t* (\***reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

---

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***autonego\_ctrl**)(*esp\_eth\_phy\_t* \*phy, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Configure auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego\_en\_stat [out]** Address where to store current status of auto negotiation configuration

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid command

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrctl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (\***loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Sets the PHY to loopback mode.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: PHY instance loopback mode has been configured successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_phy\_t* \*phy, eth\_speed\_t speed)

Sets PHY speed mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param speed [in]** Speed mode to be set

**Return**

- ESP\_OK: PHY instance speed mode has been configured successfully
- ESP\_FAIL: PHY instance speed mode configuration failed because some error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_phy\_t* \*phy, eth\_duplex\_t duplex)

Sets PHY duplex mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param duplex [in]** Duplex mode to be set

**Return**

- ESP\_OK: PHY instance duplex mode has been configured successfully
- ESP\_FAIL: PHY instance duplex mode configuration failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_phy\_t* \*phy, uint32\_t cmd, void \*data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of PHY chip.

---

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

---

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (\***del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset\_gpio\_num**  
Reset GPIO number, -1 means no hardware reset

### Macros

**ESP\_ETH\_PHY\_ADDR\_AUTO**  
**ETH\_PHY\_DEFAULT\_CONFIG()**  
Default configuration for Ethernet PHY object.

### Type Definitions

typedef struct *esp\_eth\_phy\_s* **esp\_eth\_phy\_t**  
Ethernet PHY.

### Enumerations

enum **eth\_phy\_autoneg\_cmd\_t**  
Auto-negotiation controll commands.  
*Values:*  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_RESTART**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_EN**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_DIS**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_G\_STAT**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy\\_802\\_3.h](#)

### Functions

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset\_hw** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t reset\_assert\_us)  
Performs hardware reset with specific reset pin assertion time.

#### Parameters

- **phy\_802\_3** –IEEE 802.3 PHY object infostructure
- **reset\_assert\_us** –Hardware reset pin assertion time

#### Returns

- ESP\_OK: reset Ethernet PHY successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)  
Detect PHY address.

#### Parameters

- **eth** –Mediator of Ethernet driver
- **detected\_addr** –[out] a valid address after detection

#### Returns

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip initialization.

---

**Note:** It should be called as the first function in PHY specific driver instance

---

**Parameters** *phy\_802\_3* –IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: initialized Ethernet PHY successfully
- ESP\_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: PHY device not detected
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip de-initialization.

---

**Note:** It should be called as the last function in PHY specific driver instance

---

**Parameters** *phy\_802\_3* –IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: de-initialized Ethernet PHY successfully
- ESP\_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_oui** (*phy\_802\_3\_t* \*phy\_802\_3, *uint32\_t* \*oui)

Reads raw content of OUI field.

**Parameters**

- *phy\_802\_3* –IEEE 802.3 PHY object infostructure
- *oui* –[out] OUI value

**Returns**

- ESP\_OK: OUI field read successfully
- ESP\_FAIL: OUI field read failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid *oui* argument
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_manufac\_info** (*phy\_802\_3\_t* \*phy\_802\_3, *uint8\_t* \*model, *uint8\_t* \*rev)

Reads manufacturer' s model and revision number.

**Parameters**

- *phy\_802\_3* –IEEE 802.3 PHY object infostructure
- *model* –[out] Manufacturer' s model number (can be NULL when not required)
- *rev* –[out] Manufacturer' s revision number (can be NULL when not required)

**Returns**

- ESP\_OK: Manufacturer' s info read successfully
- ESP\_FAIL: Manufacturer' s info read failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*phy\_802\_3\_t* \***esp\_eth\_phy\_into\_phy\_802\_3** (*esp\_eth\_phy\_t* \*phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters** `phy` –Ethernet PHY instance

**Returns** `phy_802_3_t*`

- address to parent IEEE 802.3 PHY object infostructure

`esp_err_t esp_eth_phy_802_3_obj_config_init` (`phy_802_3_t *phy_802_3`, const `eth_phy_config_t *config`)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**

- `phy_802_3` –Address to IEEE 802.3 PHY object infostructure
- `config` –Configuration of the IEEE 802.3 PHY object

**Returns**

- `ESP_OK`: configuration initialized successfully
- `ESP_ERR_INVALID_ARG`: invalid `config` argument

## Structures

struct `phy_802_3_t`

IEEE 802.3 PHY object infostructure.

## Public Members

`esp_eth_phy_t parent`

Parent Ethernet PHY instance

`esp_eth_mediator_t *eth`

Mediator of Ethernet driver

int `addr`

PHY address

uint32\_t `reset_timeout_ms`

Reset timeout value (Unit: ms)

uint32\_t `autonego_timeout_ms`

Auto-negotiation timeout value (Unit: ms)

eth\_link\_t `link_status`

Current Link status

int `reset_gpio_num`

Reset GPIO number, -1 means no hardware reset

## Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`

## Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**Note:** netif glue is used to attach io driver to TCP/IP netif

---

**Parameters** **eth\_hdl** –Ethernet driver handle

**Returns** glue object, which inherits esp\_netif\_driver\_base\_t

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**Parameters** **eth\_netif\_glue** –netif glue

**Returns** -ESP\_OK: delete netif glue successfully

### Type Definitions

```
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

## 2.4.3 Thread

### Thread

**Introduction** [Thread](#) is a IP-based mesh networking protocol. It' s based on the 802.15.4 physical and MAC layer.

**Application Examples** The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot\\_cli](#).
- The Thread border router [openthread/ot\\_br](#).
- The Thread radio co-processor [openthread/ot\\_rcp](#).

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

### Header File

- [components/openthread/include/esp\\_openthread.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_init** (const *esp\_openthread\_platform\_config\_t* \*init\_config)

Initializes the full OpenThread stack.

---

**Note:** The OpenThread instance will also be initialized in this function.

---

**Parameters** **init\_config** –[in] The initialization configuration.

**Returns**

- ESP\_OK on success

- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_ARG if radio or host connection mode not supported
- ESP\_ERR\_INVALID\_STATE if already initialized

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**Note:** This function will not return unless error happens when running the OpenThread stack.

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**Note:** This function can be called on other tasks without lock.

---

**Returns** The OpenThread instance pointer

### Header File

- [components/openthread/include/esp\\_openthread\\_types.h](#)

### Structures

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a select() based mainloop.

#### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

### Public Members

*uart\_port\_t* **port**

UART port number

*uart\_config\_t* **uart\_config**

UART configuration, see *uart\_config\_t* docs

int **rx\_pin**

UART RX pin

int **tx\_pin**

UART TX pin

struct **esp\_openthread\_radio\_config\_t**

The OpenThread radio configuration.

### Public Members

*esp\_openthread\_radio\_mode\_t* **radio\_mode**

The radio mode

*esp\_openthread\_uart\_config\_t* **radio\_uart\_config**

The uart configuration to RCP

struct **esp\_openthread\_host\_connection\_config\_t**

The OpenThread host connection configuration.

### Public Members

*esp\_openthread\_host\_connection\_mode\_t* **host\_connection\_mode**

The host connection mode

*esp\_openthread\_uart\_config\_t* **host\_uart\_config**

The uart configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

### Public Members

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

### Public Members

*esp\_openthread\_radio\_config\_t* **radio\_config**

The radio configuration

*esp\_openthread\_host\_connection\_config\_t* **host\_config**

The host connection configuration

*esp\_openthread\_port\_config\_t* **port\_config**

The port configuration

### Type Definitions

typedef void (\***esp\_openthread\_rcp\_failure\_handler**)(void)

### Enumerations

enum **esp\_openthread\_event\_t**

OpenThread event declarations.

*Values:*

enumerator **OPENTHREAD\_EVENT\_START**

OpenThread stack start

enumerator **OPENTHREAD\_EVENT\_STOP**

OpenThread stack stop

enumerator **OPENTHREAD\_EVENT\_IF\_UP**

OpenThread network interface up

enumerator **OPENTHREAD\_EVENT\_IF\_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD\_EVENT\_GOT\_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD\_EVENT\_LOST\_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_TREL\_ADD\_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_REMOVE\_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)

## Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This functions acquires the OpenThread API lock.

---

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

---

**Parameters** **block\_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.

### Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

## Header File

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)

## Functions

void **\*esp\_openthread\_netif\_glue\_init** (const *esp\_openthread\_platform\_config\_t* \*config)

This function initializes the OpenThread network interface glue.

**Parameters** **config** –[in] The platform configuration.

### Returns

- glue pointer on success
- NULL on failure

void **esp\_openthread\_netif\_glue\_deinit** (void)

This function deinitializes the OpenThread network interface glue.

*esp\_netif\_t* **\*esp\_openthread\_get\_netif** (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

## Macros

**ESP\_NETIF\_INHERENT\_DEFAULT\_OPENTHREAD** ()

Default configuration reference of OT esp-netif.

**ESP\_NETIF\_DEFAULT\_OPENTHREAD** ()

## Header File

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)

## Functions

void **esp\_openthread\_set\_backbone\_netif** (*esp\_netif\_t* \*backbone\_netif)

Sets the backbone interface used for border routing.

---

**Note:** This function must be called before `esp_openthread_init`

---

**Parameters** `backbone_netif` –[in] The backbone network interface (WiFi or ethernet)

*esp\_err\_t* **esp\_openthread\_border\_router\_init** (void)

Initializes the border router features of OpenThread.

---

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

---

### Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

*esp\_err\_t* **esp\_openthread\_border\_router\_deinit** (void)

Deinitializes the border router features of OpenThread.

### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

*esp\_netif\_t* \***esp\_openthread\_get\_backbone\_netif** (void)

Gets the backbone interface of OpenThread border router.

**Returns** The backbone interface or `NULL` if border router not initialized.

void **esp\_openthread\_register\_rcp\_failure\_handler** (*esp\_openthread\_rcp\_failure\_handler* handler)

Registers the callback for RCP failure.

void **esp\_openthread\_rcp\_deinit** (void)

Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the [openthread](#) directory of ESP-IDF examples.

## 2.4.4 ESP-NETIF

### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

**ESP-NETIF architecture**

### Data and event flow in the diagram

- . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<---->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down

- DHCP server and client API
- DNS API

6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to [Virtual filesystem component](#) to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

### ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#) first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP\\_MAX\\_FDS](#) and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.

- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to `0x05DC`, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval `<0, 0x05DC>` at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than `0x05DC`, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

---

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. `0x8100` or `0x88A8`) and process the VLAN tagged frames in user application.

---

---

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- `components/esp_netif/include/esp_netif.h`

### Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

---

**Note:** This function should be called exactly once from application code, when the application starts up.

---

#### Returns

- ESP\_OK on success
- ESP\_FAIL if initializing failed

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization **is not** supported yet

#### Returns

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t` \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters** `esp_netif_config` –pointer esp-netif configuration

#### Returns

- pointer to esp-netif object on success
- NULL otherwise

void `esp_netif_destroy` (`esp_netif_t` \*esp\_netif)

Destroys the esp\_netif object.

**Parameters** `esp_netif` –[in] pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_driver\_ifconfig\_t* \*driver\_config)

Configures driver related options of esp\_netif object.

**Parameters**

- **esp\_netif** –[inout] pointer to the object to be configured
- **driver\_config** –[in] pointer esp-netif io driver related configuration

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_io\_driver\_handle\_t* driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

**Parameters**

- **esp\_netif** –[inout] pointer to esp\_netif object to be attached
- **driver\_handle** –[in] pointer to the driver handle

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Received data
- **len** –[in] Length of the data frame
- **eb** –[in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

- ESP\_OK

void **esp\_netif\_action\_start** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_stop** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver stop event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_connected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver connected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon network got IP event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

*esp\_err\_t* **esp\_netif\_set\_default\_netif** (*esp\_netif\_t* \*esp\_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route\_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route\_prio number (unless the selected netif gets destroyed)

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_join\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to join

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_leave\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to leave

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **mac** –[in] Desired mac address for the related network interface

#### Returns

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_get\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Get the mac address for the interface instance.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **mac** –[out] Resultant mac address for the related network interface

#### Returns

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG\_LWIP\_LOCAL\_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **hostname** –[in] New hostname for the interface. Maximum length 32 bytes.

#### Returns

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

*esp\_err\_t* **esp\_netif\_get\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*\*hostname)

Get interface hostname.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **hostname** –[out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

bool **esp\_netif\_is\_netif\_up** (*esp\_netif\_t* \*esp\_netif)

Test if supplied interface is up or down.

**Parameters** *esp\_netif* –[in] Handle to esp-netif instance

**Returns**

- true - Interface is up
- false - Interface is down

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Parameters**

- *esp\_netif* –[in] Handle to esp-netif instance
- *ip\_info* –[out] If successful, IP information will be returned in this argument.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Parameters**

- *esp\_netif* –[in] Handle to esp-netif instance
- *ip\_info* –[out] If successful, IP information will be returned in this argument.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**Note:** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

---

**Parameters**

- *esp\_netif* –[in] Handle to esp-netif instance
- *ip\_info* –[in] IP information to set on the specified interface

**Returns**

- ESP\_OK

- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED` If DHCP server or client is still running

*esp\_err\_t* `esp_netif_set_old_ip_info` (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

#### Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `ip_info` –[in] Store the old IP information for the specified interface

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

int `esp_netif_get_netif_impl_index` (*esp\_netif\_t* \*esp\_netif)

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

---

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

*esp\_err\_t* `esp_netif_get_netif_impl_name` (*esp\_netif\_t* \*esp\_netif, char \*name)

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

---

#### Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `name` –[out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t* `esp_netif_dhcps_option` (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP server option.

#### Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `opt_op` –[in] `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- `opt_id` –[in] Option index to get or set, must be one of the supported enum values.
- `opt_val` –[inout] Pointer to the option parameter.
- `opt_len` –[in] Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **opt\_op** –[in] ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt\_val** –[inout] Pointer to the option parameter.
- **opt\_len** –[in] Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**Note:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**Note:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP client status.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP Server status.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcps\_get\_clients\_by\_mac** (*esp\_netif\_t* \*esp\_netif, int num, *esp\_netif\_pair\_mac\_ip\_t* \*mac\_ip\_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **num** –[in] Number of clients with specified MAC addresses in the array of pairs
- **mac\_ip\_pair** –[inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS on invalid params
- ESP\_ERR\_NOT\_SUPPORTED if DHCP server not enabled

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance

- **type** *–[in]* Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** *–[in]* DNS Server address to set

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **type** *–[in]* Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** *–[out]* DNS Server result is written here on success

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**Parameters** **esp\_netif** *–[in]* Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK

- `ESP_FAIL` If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int `esp_netif_get_all_ip6` (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* if\_ip6[])

Get all IPv6 addresses of the specified interface.

**Parameters**

- `esp_netif` **–[in]** Handle to esp-netif instance
- `if_ip6` **–[out]** Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

void `esp_netif_set_ip4_addr` (*esp\_ip4\_addr\_t* \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

**Parameters**

- `addr` **–[out]** IP address to be set
- `a` **–**the first octet (127 for IP 127.0.0.1)
- `b` **–**
- `c` **–**
- `d` **–**

char \*`esp_ip4addr_ntoa` (const *esp\_ip4\_addr\_t* \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**

- `addr` **–**ip address in network order to convert
- `buf` **–**target buffer where the string is stored
- `buflen` **–**length of buf

**Returns** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32\_t `esp_ip4addr_aton` (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Parameters** `addr` **–**IP address in ascii representation (e.g. “127.0.0.1” )

**Returns** ip address in network order

*esp\_err\_t* `esp_netif_str_to_ip4` (const char \*src, *esp\_ip4\_addr\_t* \*dst)

Converts Ascii internet IPv4 address into *esp\_ip4\_addr\_t*.

**Parameters**

- `src` **–[in]** IPv4 address in ascii representation (e.g. “127.0.0.1” )
- `dst` **–[out]** Address of the target *esp\_ip4\_addr\_t* structure to receive converted address

**Returns**

- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

*esp\_err\_t* `esp_netif_str_to_ip6` (const char \*src, *esp\_ip6\_addr\_t* \*dst)

Converts Ascii internet IPv6 address into *esp\_ip4\_addr\_t* Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1” )

**Parameters**

- `src` **–[in]** IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001” )
- `dst` **–[out]** Address of the target *esp\_ip6\_addr\_t* structure to receive converted address

**Returns**

- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

*esp\_netif\_io\_driver\_handle* `esp_netif_get_io_driver` (*esp\_netif\_t* \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** opaque pointer of related IO driver

`esp_netif_t *esp_netif_get_handle_from_ifkey` (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters** `if_key` –Textual description of network interface

**Returns** Handle to esp-netif instance

`esp_netif_flags_t esp_netif_get_flags` (`esp_netif_t *esp_netif`)

Returns configured flags for this interface.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Configuration flags

const char \*`esp_netif_get_ifkey` (`esp_netif_t *esp_netif`)

Returns configured interface key for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Textual description of related interface

const char \*`esp_netif_get_desc` (`esp_netif_t *esp_netif`)

Returns configured interface type for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

int `esp_netif_get_route_prio` (`esp_netif_t *esp_netif`)

Returns configured routing priority number.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Integer representing the instance's route-prio, or -1 if invalid parameters

int32\_t `esp_netif_get_event_id` (`esp_netif_t *esp_netif`, `esp_netif_ip_event_type_t event_type`)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**

- `esp_netif` –[in] Handle to esp-netif instance
- `event_type` –(either get or lost IP)

**Returns** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

`esp_netif_t *esp_netif_next` (`esp_netif_t *esp_netif`)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

size\_t `esp_netif_get_nr_of_ifs` (void)

Returns number of registered esp\_netif objects.

**Returns** Number of esp\_netifs

void `esp_netif_netstack_buf_ref` (void \*netstack\_buf)

increase the reference counter of net stack buffer

**Parameters** `netstack_buf` –[in] the net stack buffer

void `esp_netif_netstack_buf_free` (void \*netstack\_buf)

free the netstack buffer

**Parameters** `netstack_buf` –[in] the net stack buffer

*esp\_err\_t* **esp\_netif\_tcpip\_exec** (*esp\_netif\_callback\_fn* fn, void \*ctx)

Utility to execute the supplied callback in TCP/IP context.

#### Parameters

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

**Returns** The error code (*esp\_err\_t*) returned by the callback

### Type Definitions

typedef *esp\_err\_t* (\***esp\_netif\_callback\_fn**)(void \*ctx)

TCP/IP thread safe callback used with *esp\_netif\_tcpip\_exec()*

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_types.h](#)

### Structures

struct **esp\_netif\_dns\_info\_t**

DNS server info.

#### Public Members

*esp\_ip\_addr\_t* **ip**

IPV4 address of DNS server

struct **esp\_netif\_ip\_info\_t**

Event structure for IP\_EVENT\_STA\_GOT\_IP, IP\_EVENT\_ETH\_GOT\_IP events

#### Public Members

*esp\_ip4\_addr\_t* **ip**

Interface IPV4 address

*esp\_ip4\_addr\_t* **netmask**

Interface IPV4 netmask

*esp\_ip4\_addr\_t* **gw**

Interface IPV4 gateway address

struct **esp\_netif\_ip6\_info\_t**

IPV6 IP address information.

#### Public Members

*esp\_ip6\_addr\_t* **ip**

Interface IPV6 address

struct **ip\_event\_got\_ip\_t**  
Event structure for IP\_EVENT\_GOT\_IP event.

### Public Members

*esp\_netif\_t* \***esp\_netif**  
Pointer to corresponding esp-netif object

*esp\_netif\_ip\_info\_t* **ip\_info**  
IP address, netmask, gateway IP address

bool **ip\_changed**  
Whether the assigned IP has changed or not

struct **ip\_event\_got\_ip6\_t**  
Event structure for IP\_EVENT\_GOT\_IP6 event

### Public Members

*esp\_netif\_t* \***esp\_netif**  
Pointer to corresponding esp-netif object

*esp\_netif\_ip6\_info\_t* **ip6\_info**  
IPv6 address of the interface

int **ip\_index**  
IPv6 address index

struct **ip\_event\_add\_ip6\_t**  
Event structure for ADD\_IP6 event

### Public Members

*esp\_ip6\_addr\_t* **addr**  
The address to be added to the interface

bool **preferred**  
The default preference of the address

struct **ip\_event\_ap\_staipassigned\_t**  
Event structure for IP\_EVENT\_AP\_STAIPASSIGNED event

### Public Members

*esp\_netif\_t* \***esp\_netif**  
Pointer to the associated netif handle

*esp\_ip4\_addr\_t* **ip**

IP address which was assigned to the station

uint8\_t **mac**[6]

MAC address of the connected client

struct **bridgeif\_config**

LwIP bridge configuration

### Public Members

uint16\_t **max\_fdb\_dyn\_entries**

maximum number of entries in dynamic forwarding database

uint16\_t **max\_fdb\_sta\_entries**

maximum number of entries in static forwarding database

uint8\_t **max\_ports**

maximum number of ports the bridge can consist of

struct **esp\_netif\_inherent\_config**

ESP-netif inherent config parameters.

### Public Members

*esp\_netif\_flags\_t* **flags**

flags that define esp-netif behavior

uint8\_t **mac**[6]

initial mac address for this interface

const *esp\_netif\_ip\_info\_t* \***ip\_info**

initial ip address for this interface

uint32\_t **get\_ip\_event**

event id to be raised when interface gets an IP

uint32\_t **lost\_ip\_event**

event id to be raised when interface loses its IP

const char \***if\_key**

string identifier of the interface

const char \***if\_desc**

textual description of the interface

int **route\_prio**

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route\_prio indicates a higher priority

*bridgeif\_config\_t* \***bridge\_info**

LwIP bridge configuration

struct **esp\_netif\_driver\_base\_s**

ESP-netif driver base handle.

### Public Members

*esp\_err\_t* (\***post\_attach**)(*esp\_netif\_t* \*netif, *esp\_netif\_io\_driver\_handle* h)

post attach function pointer

*esp\_netif\_t* \***netif**

netif handle

struct **esp\_netif\_driver\_ifconfig**

Specific IO driver configuration.

### Public Members

*esp\_netif\_io\_driver\_handle* **handle**

io-driver handle

*esp\_err\_t* (\***transmit**)(void \*h, void \*buffer, size\_t len)

transmit function pointer

*esp\_err\_t* (\***transmit\_wrap**)(void \*h, void \*buffer, size\_t len, void \*netstack\_buffer)

transmit wrap function pointer

void (\***driver\_free\_rx\_buffer**)(void \*h, void \*buffer)

free rx buffer function pointer

struct **esp\_netif\_config**

Generic esp\_netif configuration.

### Public Members

const *esp\_netif\_inherent\_config\_t* \***base**

base config

const *esp\_netif\_driver\_ifconfig\_t* \***driver**

driver config

```
const esp_netif_netstack_config_t *stack
    stack config
```

```
struct esp_netif_pair_mac_ip_t
    DHCP client' s addr info (pair of MAC and IP address)
```

### Public Members

```
uint8_t mac[6]
    Clients MAC address
```

```
esp_ip4_addr_t ip
    Clients IP address
```

### Macros

```
ESP_ERR_ESP_NETIF_BASE
    Definition of ESP-NETIF based errors.
```

```
ESP_ERR_ESP_NETIF_INVALID_PARAMS
```

```
ESP_ERR_ESP_NETIF_IF_NOT_READY
```

```
ESP_ERR_ESP_NETIF_DHCP_START_FAILED
```

```
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
```

```
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
```

```
ESP_ERR_ESP_NETIF_NO_MEM
```

```
ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED
```

```
ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED
```

```
ESP_ERR_ESP_NETIF_INIT_FAILED
```

```
ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED
```

```
ESP_ERR_ESP_NETIF_MLD6_FAILED
```

```
ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
```

```
ESP_ERR_ESP_NETIF_DHCP_START_FAILED
```

```
ESP_NETIF_BR_FLOOD
    Definition of ESP-NETIF bridge controll.
```

**ESP\_NETIF\_BR\_DROP**

**ESP\_NETIF\_BR\_FDW\_CPU**

### Type Definitions

typedef struct esp\_netif\_obj **esp\_netif\_t**

typedef enum *esp\_netif\_flags* **esp\_netif\_flags\_t**

typedef enum *esp\_netif\_ip\_event\_type* **esp\_netif\_ip\_event\_type\_t**

typedef struct *bridgeif\_config* **bridgeif\_config\_t**

LwIP bridge configuration

typedef struct *esp\_netif\_inherent\_config* **esp\_netif\_inherent\_config\_t**

ESP-netif inherent config parameters.

typedef struct *esp\_netif\_config* **esp\_netif\_config\_t**

typedef void \***esp\_netif\_iodriver\_handle**

IO driver handle type.

typedef struct *esp\_netif\_driver\_base\_s* **esp\_netif\_driver\_base\_t**

ESP-netif driver base handle.

typedef struct *esp\_netif\_driver\_ifconfig* **esp\_netif\_driver\_ifconfig\_t**

typedef struct esp\_netif\_netstack\_config **esp\_netif\_netstack\_config\_t**

Specific L3 network stack configuration.

typedef *esp\_err\_t* (\***esp\_netif\_receive\_t**)(*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

ESP-NETIF Receive function type.

### Enumerations

enum **esp\_netif\_dns\_type\_t**

Type of DNS server.

*Values:*

enumerator **ESP\_NETIF\_DNS\_MAIN**

DNS main server address

enumerator **ESP\_NETIF\_DNS\_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_MAX**

enum **esp\_netif\_dhcp\_status\_t**

Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_DHCP\_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP\_NETIF\_DHCP\_STARTED**

DHCP client/server has been started

enumerator **ESP\_NETIF\_DHCP\_STOPPED**

DHCP client/server has been stopped

enumerator **ESP\_NETIF\_DHCP\_STATUS\_MAX**

enum **esp\_netif\_dhcp\_option\_mode\_t**

Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP\_NETIF\_OP\_START**

enumerator **ESP\_NETIF\_OP\_SET**

Set option

enumerator **ESP\_NETIF\_OP\_GET**

Get option

enumerator **ESP\_NETIF\_OP\_MAX**

enum **esp\_netif\_dhcp\_option\_id\_t**

Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_SUBNET\_MASK**

Network mask

enumerator **ESP\_NETIF\_DOMAIN\_NAME\_SERVER**

Domain name server

enumerator **ESP\_NETIF\_ROUTER\_SOLICITATION\_ADDRESS**

Solicitation router address

enumerator **ESP\_NETIF\_REQUESTED\_IP\_ADDRESS**

Request specific IP address

enumerator **ESP\_NETIF\_IP\_ADDRESS\_LEASE\_TIME**

Request IP address lease time

enumerator **ESP\_NETIF\_IP\_REQUEST\_RETRY\_TIME**

Request IP address retry counter

enumerator **ESP\_NETIF\_VENDOR\_CLASS\_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP\_NETIF\_VENDOR\_SPECIFIC\_INFO**

Vendor Specific Information of a DHCP server

enum **ip\_event\_t**

IP event declarations

*Values:*

enumerator **IP\_EVENT\_STA\_GOT\_IP**

station got IP from connected AP

enumerator **IP\_EVENT\_STA\_LOST\_IP**

station lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_AP\_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP\_EVENT\_GOT\_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP\_EVENT\_ETH\_GOT\_IP**

ethernet got IP from connected AP

enumerator **IP\_EVENT\_ETH\_LOST\_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_PPP\_GOT\_IP**

PPP interface got IP

enumerator **IP\_EVENT\_PPP\_LOST\_IP**

PPP interface lost IP

enum **esp\_netif\_flags**

*Values:*

enumerator **ESP\_NETIF\_DHCP\_CLIENT**

enumerator **ESP\_NETIF\_DHCP\_SERVER**

enumerator **ESP\_NETIF\_FLAG\_AUTOUP**

enumerator **ESP\_NETIF\_FLAG\_GARP**

enumerator **ESP\_NETIF\_FLAG\_EVENT\_IP\_MODIFIED**

enumerator **ESP\_NETIF\_FLAG\_IS\_PPP**

enumerator **ESP\_NETIF\_FLAG\_IS\_BRIDGE**

enumerator **ESP\_NETIF\_FLAG\_MLDV6\_REPORT**

enum **esp\_netif\_ip\_event\_type**

*Values:*

enumerator **ESP\_NETIF\_IP\_EVENT\_GOT\_IP**

enumerator **ESP\_NETIF\_IP\_EVENT\_LOST\_IP**

### Functions

*esp\_ip6\_addr\_type\_t* **esp\_netif\_ip6\_get\_addr\_type** (*esp\_ip6\_addr\_t* \*ip6\_addr)

Get the IPv6 address type.

**Parameters** **ip6\_addr** –[in] IPv6 type

**Returns** IPv6 type in form of enum `esp_ip6_addr_type_t`

static inline void **esp\_netif\_ip\_addr\_copy** (*esp\_ip\_addr\_t* \*dest, const *esp\_ip\_addr\_t* \*src)

Copy IP addresses.

**Parameters**

- **dest** –[out] destination IP
- **src** –[in] source IP

### Structures

struct **esp\_ip6\_addr**

IPv6 address.

#### Public Members

uint32\_t **addr**[4]

IPv6 address

uint8\_t **zone**

zone ID

struct **esp\_ip4\_addr**

IPv4 address.

### Public Members

## Header File

- `components/esp_netif/include/esp_vfs_l2tap.h`

## Functions

`esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)`

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters** `config` –L2 TAP virtual filesystem driver configuration. Default base path `/dev/net/tap` is used when this parameter is NULL.

**Returns** `esp_err_t`

- ESP\_OK on success

`esp_err_t esp_vfs_l2tap_intf_unregister (const char *base_path)`

Removes L2 TAP virtual filesystem driver.

**Parameters** `base_path` –Base path to the L2 TAP virtual filesystem driver. Default path `/dev/net/tap` is used when this parameter is NULL.

**Returns** `esp_err_t`

- ESP\_OK on success

`esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void *buff, size_t *size)`

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- `driver_handle` –handle of driver at which the frame was received
- `buff` –received L2 frame
- `size` –input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** `esp_err_t`

- ESP\_OK is always returned

## Structures

struct `l2tap_vfs_config_t`

L2Tap VFS config parameters.

## Public Members

const char \*`base_path`

vfs base path

## Macros

`L2TAP_VFS_DEFAULT_PATH`

`L2TAP_VFS_CONFIG_DEFAULT ()`

## Type Definitions

typedef void \*`l2tap_iodriver_handle`

## Enumerations

enum **l2tap\_ioctl\_opt\_t**

Values:

enumerator **L2TAP\_S\_RCV\_FILTER**

enumerator **L2TAP\_G\_RCV\_FILTER**

enumerator **L2TAP\_S\_INTF\_DEVICE**

enumerator **L2TAP\_G\_INTF\_DEVICE**

enumerator **L2TAP\_S\_DEVICE\_DRV\_HNDL**

enumerator **L2TAP\_G\_DEVICE\_DRV\_HNDL**

## WiFi default API reference

### Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_default.h](#)

### Functions

*esp\_err\_t* **esp\_netif\_attach\_wifi\_station** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi station interface to supplied netif.

**Parameters** **esp\_netif** –instance to attach the wifi station to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi soft AP interface to supplied netif.

**Parameters** **esp\_netif** –instance to attach the wifi AP to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \*esp\_netif)

Clears default wifi event handlers for supplied network interface.

**Parameters** **esp\_netif** –instance of corresponding if object

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

---

**Note:** The API creates `esp_netif` object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

---

**Note:** The API creates `esp_netif` object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

void **esp\_netif\_destroy\_default\_wifi** (void \*esp\_netif)

Destroys default WIFI netif created with `esp_netif_create_default_wifi_...` API.

---

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if `esp_netif` is NULL)

---

**Parameters** `esp_netif` –[in] object to detach from WiFi and destroy

*esp\_netif\_t* \***esp\_netif\_create\_wifi** (*wifi\_interface\_t* wifi\_if, *esp\_netif\_inherent\_config\_t* \*esp\_netif\_config)

Creates `esp_netif` WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**

- `wifi_if` –[in] type of wifi interface
- `esp_netif_config` –inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

*esp\_err\_t* **esp\_netif\_create\_default\_wifi\_mesh\_netifs** (*esp\_netif\_t* \*\*p\_netif\_sta, *esp\_netif\_t* \*\*p\_netif\_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Parameters**

- `p_netif_sta` –[out] pointer where the resultant STA interface is saved (if non NULL)
- `p_netif_ap` –[out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP\_OK on success

## 2.4.5 IP Network Layer

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳ driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as
↳ esp-netif driver */
    driver_impl_t *h;                       /*!< handle of driver
↳ implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
```

(continues on next page)

(continued from previous page)

```

my_driver_start (driver->driver_impl);
return ESP_OK;
}

```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in [esp\\_netif/include/esp\\_netif\\_defaults.h](#) and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

### Functions

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_netif\_impl** (void \*dev)

Returns esp-netif handle.

**Parameters** *dev* –[in] opaque ptr to network interface of specific TCP/IP stack

**Returns** handle to related esp-netif instance

void \***esp\_netif\_get\_netif\_impl** (*esp\_netif\_t* \*esp\_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Parameters** *esp\_netif* –[in] Handle to esp-netif instance

**Returns** handle to related network stack netif handle

*esp\_err\_t* **esp\_netif\_set\_link\_speed** (*esp\_netif\_t* \*esp\_netif, uint32\_t speed)

Set link-speed for the specified network interface.

**Parameters**

- *esp\_netif* –[in] Handle to esp-netif instance
- *speed* –[in] Link speed in bit/s

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_transmit** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

*esp\_err\_t* **esp\_netif\_transmit\_wrap** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame
- **netstack\_buf** –[in] net stack buffer

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

void **esp\_netif\_free\_rx\_buffer** (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

## 2.4.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.5 Peripherals API

### 2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

#### Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32-S2 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.

## Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- [Resource Allocation](#) - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- [Unit Configuration](#) - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- [Read Conversion Result](#) - covers how to get ADC conversion raw result.
- [Hardware Limitations](#) - describes the ADC related hardware limitations.
- [Power Management](#) - covers power management related.
- [IRAM Safe](#) - describes tips on how to read ADC conversion raw result when cache is disabled.
- [Thread Safety](#) - lists which APIs are guaranteed to be thread safe by the driver.
- [Kconfig Options](#) - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The ADC oneshot mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the [datasheet](#) to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under super low power mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

### Create an ADC Unit Handle under Normal Oneshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IO to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in [TRM](#).
- `adc_oneshot_chan_cfg_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number. Check [datasheet](#) to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. Especially, this `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. Driver will save these per channel configurations internally.

### Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .channel = EXAMPLE_ADC1_CHAN0,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));

config.channel = EXAMPLE_ADC1_CHAN1;
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safer. ADC(s) are shared by some other drivers / peripherals, see [Hardware Limitations](#). This function takes some mutexes, to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in <a href="#">TRM</a> .
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>adc_oneshot_chan_cfg_t.bitwidth</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

### Hardware Limitations

- Random Number Generator uses ADC as a input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.
- ADC2 is also used by the Wi-Fi. `adc_oneshot_read()` has provided the protection between Wi-Fi driver and ADC oneshot mode driver.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won't be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

### Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in thread-safe APIs fail.

### Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

### Application Examples

- ADC oneshot mode example: [peripherals/adc/oneshot\\_read](#).

### API Reference

#### Header File

- `components/hal/include/hal/adc_types.h`

#### Structures

struct `adc_digi_pattern_config_t`

ADC digital controller pattern configuration.

### Public Members

`uint8_t atten`

Attenuation of this ADC channel.

`uint8_t channel`

ADC channel.

`uint8_t unit`

ADC unit.

`uint8_t bit_width`

ADC output bit width.

struct `adc_digi_output_data_t`

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

---

**Note:** ESP32: Only `type1` is valid. ADC2 does not support DMA mode.

---

---

**Note:** ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

---

### Public Members

`uint16_t data`

ADC real output data info. Resolution: 12 bit.

ADC real output data info. Resolution: 11 bit.

`uint16_t channel`

ADC channel index info.

ADC channel index info. For ESP32-S2: If (`channel < ADC_CHANNEL_MAX`), The data is valid. If (`channel > ADC_CHANNEL_MAX`), The data is invalid.

struct `adc_digi_output_data_t::[anonymous]::[anonymous] type1`

ADC type1

`uint16_t unit`

ADC unit index info. 0: ADC1; 1: ADC2.

struct `adc_digi_output_data_t::[anonymous]::[anonymous] type2`

When the configured output format is 11bit.

`uint16_t val`

Raw data value

struct **adc\_digi\_clk\_t**

ADC digital controller (DMA mode) clock system setting. Calculation formula:  $\text{controller\_clk} = (\text{APLL or APB}) / (\text{div\_num} + \text{div\_a} / \text{div\_b} + 1)$ .

---

**Note:** : The clocks of the DAC digital controller use the ADC digital controller clock divider.

---

### Public Members

bool **use\_apll**

true: use APLL clock; false: use APB clock.

uint32\_t **div\_num**

Division factor. Range: 0 ~ 255. Note: When a higher frequency clock is used (the division factor is less than 9), the ADC reading value will be slightly offset.

uint32\_t **div\_b**

Division factor. Range: 1 ~ 63.

uint32\_t **div\_a**

Division factor. Range: 0 ~ 63.

### Enumerations

enum **adc\_unit\_t**

ADC unit.

*Values:*

enumerator **ADC\_UNIT\_1**

SAR ADC 1.

enumerator **ADC\_UNIT\_2**

SAR ADC 2.

enum **adc\_channel\_t**

ADC channels.

*Values:*

enumerator **ADC\_CHANNEL\_0**

ADC channel.

enumerator **ADC\_CHANNEL\_1**

ADC channel.

enumerator **ADC\_CHANNEL\_2**

ADC channel.

enumerator **ADC\_CHANNEL\_3**

ADC channel.

enumerator **ADC\_CHANNEL\_4**

ADC channel.

enumerator **ADC\_CHANNEL\_5**

ADC channel.

enumerator **ADC\_CHANNEL\_6**

ADC channel.

enumerator **ADC\_CHANNEL\_7**

ADC channel.

enumerator **ADC\_CHANNEL\_8**

ADC channel.

enumerator **ADC\_CHANNEL\_9**

ADC channel.

enum **adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

*Values:*

enumerator **ADC\_ATTEN\_DB\_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC\_ATTEN\_DB\_2\_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator **ADC\_ATTEN\_DB\_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator **ADC\_ATTEN\_DB\_11**

The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum **adc\_bitwidth\_t**

*Values:*

enumerator **ADC\_BITWIDTH\_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC\_BITWIDTH\_9**

ADC output width is 9Bit.

enumerator **ADC\_BITWIDTH\_10**

ADC output width is 10Bit.

enumerator **ADC\_BITWIDTH\_11**

ADC output width is 11Bit.

enumerator **ADC\_BITWIDTH\_12**

ADC output width is 12Bit.

enumerator **ADC\_BITWIDTH\_13**

ADC output width is 13Bit.

enum **adc\_ulp\_mode\_t**

*Values:*

enumerator **ADC\_ULP\_MODE\_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC\_ULP\_MODE\_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC\_ULP\_MODE\_RISCV**

ADC is controlled by ULP RISCV.

enum **adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

*Values:*

enumerator **ADC\_CONV\_SINGLE\_UNIT\_1**

Only use ADC1 for conversion.

enumerator **ADC\_CONV\_SINGLE\_UNIT\_2**

Only use ADC2 for conversion.

enumerator **ADC\_CONV\_BOTH\_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC\_CONV\_ALTER\_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum **adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE1**

See [adc\\_digi\\_output\\_data\\_t.type1](#)

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE2**

See [adc\\_digi\\_output\\_data\\_t.type2](#)

## Header File

- `components/esp_adc/include/esp_adc/adc_oneshot.h`

## Functions

`esp_err_t adc_oneshot_new_unit` (`const adc_oneshot_unit_init_cfg_t *init_config`,  
`adc_oneshot_unit_handle_t *ret_unit`)

Create a handle to a specific ADC unit.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

### Parameters

- **init\_config** –[in] Driver initial configurations
- **ret\_unit** –[out] ADC unit handle

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NO\_MEM: No memory
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be claimed is already in use

`esp_err_t adc_oneshot_config_channel` (`adc_oneshot_unit_handle_t handle`, `adc_channel_t channel`,  
`const adc_oneshot_chan_cfg_t *config`)

Set ADC oneshot mode required configurations.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

### Parameters

- **handle** –[in] ADC handle
- **channel** –[in] ADC channel to be configured
- **config** –[in] ADC configurations

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments

`esp_err_t adc_oneshot_read` (`adc_oneshot_unit_handle_t handle`, `adc_channel_t chan`, `int *out_raw`)

Get one ADC conversion raw result.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

---

**Note:** This API should NOT be called in an ISR context

---

### Parameters

- **handle** –[in] ADC handle
- **chan** –[in] ADC channel
- **out\_raw** –[out] ADC conversion raw result

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_TIMEOUT: Timeout, the ADC result is invalid

*esp\_err\_t* **adc\_oneshot\_del\_unit** (*adc\_oneshot\_unit\_handle\_t* handle)

Delete the ADC unit handle.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters** **handle** –[in] ADC handle

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be disclaimed isn't in use

*esp\_err\_t* **adc\_oneshot\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*unit\_id, *adc\_channel\_t* \*channel)

Get ADC channel from the given GPIO number.

**Parameters**

- **io\_num** –[in] GPIO number
- **unit\_id** –[out] ADC unit
- **channel** –[out] ADC channel

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_oneshot\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*io\_num)

Get GPIO number from the given ADC channel.

**Parameters**

- **unit\_id** –[in] ADC unit
- **channel** –[in] ADC channel
- **io\_num** –[out] GPIO number
- –ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

## Structures

struct **adc\_oneshot\_unit\_init\_cfg\_t**

ADC oneshot driver initial configurations.

## Public Members

*adc\_unit\_t* **unit\_id**

ADC unit.

*adc\_ulp\_mode\_t* **ulp\_mode**

ADC controlled by ULP, see *adc\_ulp\_mode\_t*

struct **adc\_oneshot\_chan\_cfg\_t**

ADC channel configurations.

## Public Members

`adc_atten_t` **atten**

ADC attenuation.

`adc_bitwidth_t` **bitwidth**

ADC conversion result bits.

### Type Definitions

```
typedef struct adc_oneshot_unit_ctx_t *adc_oneshot_unit_handle_t
```

Type of ADC unit handle for oneshot mode.

## 2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver

### Introduction

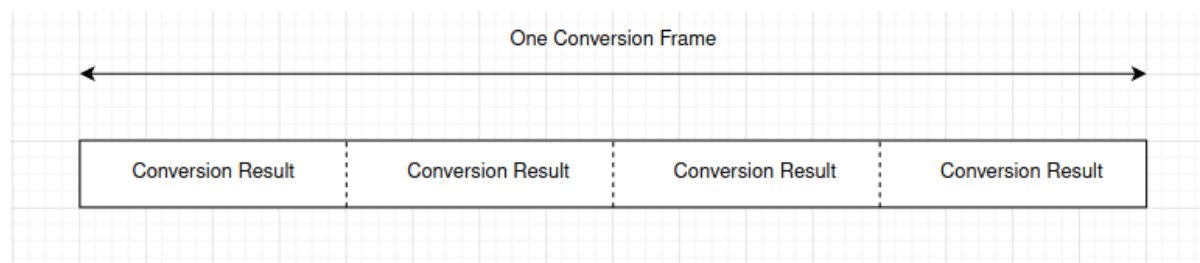

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

The ADC on ESP32-S2 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

**Driver Concepts** ADC continuous mode conversion is made up with multiple Conversion Frames. - Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes. - Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

### Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- *Resource Allocation* - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- *ADC Configurations* - describes how to configure the ADC(s) to make it work under continuous mode.
- *ADC Control* - describes ADC control functions.
- *Register Event Callbacks* - describes how to hook user specific code to an ADC continuous mode event callback function.
- *Read Conversion Result* - covers how to get ADC conversion result.
- *Hardware Limitations* - describes the ADC related hardware limitations.
- *Power Management* - covers power management related.
- *IRAM Safe* - covers the IRAM safe functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation** The ADC continuous mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the SPI3 peripheral is in use. See [Hardware Limitations](#) for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

### Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

**ADC Configurations** After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number. Check [datasheet](#) to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't call this API at this moment.

See ADC continuous mode example [peripherals/adc/continuous\\_read](#) to see configuration codes.

## ADC Control

**Start and Stop** Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t` - `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes. - `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren't in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't add callback at this moment.

**Conversion Done Event** The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

---

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

---

---

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

---

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won't fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn't reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.

- If there is no conversion result generated in the internal pool, the function will block for *timeout\_ms* until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in <a href="#">TRM</a> .
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>:cpp:member::adc_digi_pattern_config_t:bit_width</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by the Wi-Fi. `adc_continuous_start()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses SPI3 peripheral as hardware DMA fifo. Therefore, if SPI3 is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe** All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety** ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See [Hardware Limitations](#) for more details.

## Application Examples

- ADC continuous mode example: [peripherals/adc/continuous\\_read](#).

## API Reference

### Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_continuous.h](#)

### Functions

*esp\_err\_t* **adc\_continuous\_new\_handle** (const *adc\_continuous\_handle\_cfg\_t* \*hdl\_config,  
*adc\_continuous\_handle\_t* \*ret\_handle)

Initialize ADC continuous driver and get a handle to it.

#### Parameters

- **hdl\_config** **–[in]** Pointer to ADC initialization config. Refer to [adc\\_continuous\\_handle\\_cfg\\_t](#).
- **ret\_handle** **–[out]** ADC continuous mode driver handle

#### Returns

- **ESP\_ERR\_INVALID\_ARG** If the combination of arguments is invalid.
- **ESP\_ERR\_NOT\_FOUND** No free interrupt found with the specified flags
- **ESP\_ERR\_NO\_MEM** If out of memory
- **ESP\_OK** On success

*esp\_err\_t* **adc\_continuous\_config** (*adc\_continuous\_handle\_t* handle, const *adc\_continuous\_config\_t*  
\*config)

Set ADC continuous mode required configurations.

#### Parameters

- **handle** **–[in]** ADC continuous mode driver handle
- **config** **–[in]** Refer to [adc\\_digi\\_config\\_t](#).

#### Returns

- **ESP\_ERR\_INVALID\_STATE**: Driver state is invalid, you shouldn't call this API at this moment
- **ESP\_ERR\_INVALID\_ARG**: If the combination of arguments is invalid.
- **ESP\_OK**: On success

*esp\_err\_t* **adc\_continuous\_register\_event\_callbacks** (*adc\_continuous\_handle\_t* handle, const  
*adc\_continuous\_evt\_cbs\_t* \*cbs, void  
\*user\_data)

Register callbacks.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the *cbs* structure to NULL.

---

---

**Note:** When **CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE** is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including *user\_data*) should be in internal RAM as well.

---

---

**Note:** You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

---

#### Parameters

- **handle** –[in] ADC continuous mode driver handle
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be delivered to the callback functions directly

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_INVALID\_STATE: Driver state is invalid, you shouldn't call this API at this moment

*esp\_err\_t* **adc\_continuous\_start** (*adc\_continuous\_handle\_t* handle)

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_read** (*adc\_continuous\_handle\_t* handle, uint8\_t \*buf, uint32\_t length\_max, uint32\_t \*out\_length, uint32\_t timeout\_ms)

Read bytes from ADC under continuous mode.

**Parameters**

- **handle** –[in] ADC continuous mode driver handle
- **buf** –[out] Conversion result buffer to read from ADC. Suggest convert to *adc\_digi\_output\_data\_t* for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.
- **length\_max** –[in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out\_length** –[out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout\_ms** –[in] Time to wait for data via this API, in millisecond.

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP\_ERR\_TIMEOUT Operation timed out
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_stop** (*adc\_continuous\_handle\_t* handle)

Stop the ADC. After this, the hardware stops working.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_deinit** (*adc\_continuous\_handle\_t* handle)

Deinitialize the ADC continuous driver.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*unit\_id, *adc\_channel\_t* \*channel)

Get ADC channel from the given GPIO number.

**Parameters**

- **io\_num** –[in] GPIO number
- **unit\_id** –[out] ADC unit
- **channel** –[out] ADC channel

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: The IO is not a valid ADC pad

`esp_err_t adc_continuous_channel_to_io` (`adc_unit_t` unit\_id, `adc_channel_t` channel, int \*io\_num)

Get GPIO number from the given ADC channel.

#### Parameters

- `unit_id` –[in] ADC unit
- `channel` –[in] ADC channel
- `io_num` –[out] GPIO number
- – `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

## Structures

struct `adc_continuous_handle_cfg_t`

ADC continuous mode driver initial configurations.

### Public Members

uint32\_t `max_store_buf_size`

Max length of the conversion Results that driver can store, in bytes.

uint32\_t `conv_frame_size`

Conversion frame size, in bytes. This should be in multiples of `SOC_ADC_DIGI_DATA_BYTES_PER_CONV`.

struct `adc_continuous_config_t`

ADC continuous mode driver configurations.

### Public Members

uint32\_t `pattern_num`

Number of ADC channels that will be used.

`adc_digi_pattern_config_t` \*`adc_pattern`

List of configs for each ADC channel that will be used.

uint32\_t `sample_freq_hz`

The expected ADC sampling frequency in Hz. Please refer to `soc/soc_caps.h` to know available sampling frequency range

`adc_digi_convert_mode_t` `conv_mode`

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

`adc_digi_output_format_t` `format`

ADC DMA conversion output format, see `adc_digi_output_format_t`.

struct **adc\_continuous\_evt\_data\_t**

Event data structure.

---

**Note:** The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

---

### Public Members

uint8\_t \***conv\_frame\_buffer**

Pointer to conversion result buffer for one conversion frame.

uint32\_t **size**

Conversion frame size.

struct **adc\_continuous\_evt\_cbs\_t**

Group of ADC continuous mode callbacks.

---

**Note:** These callbacks are all running in an ISR environment.

---

---

**Note:** When `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

---

### Public Members

[\*adc\\_continuous\\_callback\\_t on\\_conv\\_done\*](#)

Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

[\*adc\\_continuous\\_callback\\_t on\\_pool\\_ovf\*](#)

Event callback, invoked when the internal pool is full.

### Macros

**ADC\_MAX\_DELAY**

Driver Backgrounds.

### Type Definitions

typedef struct adc\_continuous\_ctx\_t \***adc\_continuous\_handle\_t**

Type of adc continuous mode driver handle.

typedef bool (\***adc\_continuous\_callback\_t**)([\*adc\\_continuous\\_handle\\_t\*](#) handle, const [\*adc\\_continuous\\_evt\\_data\\_t\*](#) \*edata, void \*user\_data)

Prototype of ADC continuous mode event callback.

**Param handle** [in] ADC continuous mode driver handle

**Param edata** [in] Pointer to ADC continuous mode event data

**Param** `user_data` [in] User registered context, registered when in `adc_continuous_register_event_callbacks()`  
**Return** Whether a high priority task is woken up by this function

### 2.5.3 Analog to Digital Converter (ADC) Calibration Driver

#### Introduction

Based on series of comparisons with the reference voltage, ESP32-S2 ADC determines each bit of the output digital result. Per design the ESP32-S2 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

#### Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Calibration Configuration* - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
- *Result Conversion* - covers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From calibration driver's point of view, an ADC calibration scheme is created to an ADC calibration handle `adc_cali_handle_t`. `adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32-S2 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function return `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burnt on your board.

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

### Delete Line Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

**Note:** For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table *adc\_cali\_scheme\_t* in *components/esp\_adc/interface/adc\_cali\_interface.h* to know the ESP ADC calibration interface.

**Result Conversion** After setting up the calibration characteristics, you can call *adc\_cali\_raw\_to\_voltage()* to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns *ESP\_ERR\_INVALID\_STATE*, this means the calibration scheme isn't created. You need to create a calibration scheme handle, use *adc\_cali\_check\_scheme()* to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

### Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↪voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↪ADC1_CHAN0, voltage[0][0]);
```

**Thread Safety** The factory function *esp\_adc\_cali\_new\_scheme()* is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the *adc\_cali\_handle\_t* as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

**Minimize Noise** The ESP32-S2 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

## API Reference

### Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_cali.h](#)

### Functions

*esp\_err\_t* **adc\_cali\_check\_scheme** (*adc\_cali\_scheme\_ver\_t* \*scheme\_mask)

Check the supported ADC calibration scheme.

**Parameters** *scheme\_mask* –[out] Supported ADC calibration scheme(s)

#### Returns

- *ESP\_OK*: On success
- *ESP\_ERR\_INVALID\_ARG*: Invalid argument
- *ESP\_ERR\_NOT\_SUPPORTED*: No supported calibration scheme

*esp\_err\_t* **adc\_cali\_raw\_to\_voltage** (*adc\_cali\_handle\_t* handle, int raw, int \*voltage)

Convert ADC raw data to calibrated voltage.

#### Parameters

- **handle** –[in] ADC calibration handle

- **raw** `–[in]` ADC raw data
- **voltage** `–[out]` Calibrated ADC voltage (in mV)

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_STATE`: Invalid state, scheme didn't registered

**Type Definitions**

```
typedef struct adc_cali_scheme_t *adc_cali_handle_t  
ADC calibration handle.
```

**Enumerations**

```
enum adc_cali_scheme_ver_t  
ADC calibration scheme.
```

*Values:*

```
enumerator ADC_CALI_SCHEME_VER_LINE_FITTING  
Line fitting scheme.
```

```
enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING  
Curve fitting scheme.
```

**Header File**

- `components/esp_adc/include/esp_adc/adc_cali_scheme.h`

## 2.5.4 Clock Tree

This section lists definitions of the ESP32-S2's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

**Root Clocks**

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32-S2's root clocks are listed in `soc_root_clk_t`:

- Internal 8MHz RC Oscillator (`RC_FAST`)  
This RC oscillator generates a ~8.5MHz clock signal output as the `RC_FAST_CLK`.  
The ~8.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`.  
The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.
- External 40MHz Crystal (`XTAL`)
- Internal 90kHz RC Oscillator (`RC_SLOW`)  
This RC oscillator generates a ~90kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.
- External 32kHz Crystal - optional (`XTAL32K`)

The clock source for this XTAL32K\_CLK can be either a 32kHz crystal connecting to the XTAL\_32K\_P and XTAL\_32K\_N pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the XTAL\_32K\_P pin. XTAL32K\_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32-S2 provides several clock source options for the RTC\_SLOW\_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to *RTC Timer Clock Sources* for more details).

## Module Clocks

ESP32-S2's available module clocks are listed in *soc\_module\_clk\_t*. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

## API Reference

### Header File

- `components/soc/esp32s2/include/soc/clk_tree_defs.h`

### Macros

#### **SOC\_CLK\_RC\_FAST\_FREQ\_APPROX**

Approximate RC\_FAST\_CLK frequency in Hz

#### **SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX**

Approximate RC\_SLOW\_CLK frequency in Hz

#### **SOC\_CLK\_RC\_FAST\_D256\_FREQ\_APPROX**

Approximate RC\_FAST\_D256\_CLK frequency in Hz

#### **SOC\_CLK\_XTAL32K\_FREQ\_APPROX**

Approximate XTAL32K\_CLK frequency in Hz

#### **SOC\_GPTIMER\_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

#### **SOC\_LCD\_CLKS**

Array initializer for all supported clock sources of LCD.

#### **SOC\_RMT\_CLKS**

Array initializer for all supported clock sources of RMT.

**SOC\_TEMP\_SENSOR\_CLKS**

Array initializer for all supported clock sources of Temperature Sensor.

**SOC\_I2S\_CLKS**

Array initializer for all supported clock sources of I2S.

**SOC\_I2C\_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC\_SDM\_CLKS**

Array initializer for all supported clock sources of SDM.

**Enumerations**enum **soc\_root\_clk\_t**

Root clock.

*Values:*

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_FAST**

Internal 8MHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_SLOW**

Internal 90kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL**

External 40MHz crystal

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL32K**

External 32kHz crystal/clock signal

enum **soc\_cpu\_clk\_src\_t**

CPU\_CLK mux inputs, which are the supported clock sources for the CPU\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_CPU\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_PLL**

Select PLL\_CLK as CPU\_CLK source (PLL\_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

enumerator **SOC\_CPU\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_APLL**

Select APLL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_INVALID**

Invalid CPU\_CLK source

enum **soc\_rtc\_slow\_clk\_src\_t**

RTC\_SLOW\_CLK mux inputs, which are the supported clock sources for the RTC\_SLOW\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_SLOW**

Select RC\_SLOW\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_XTAL32K**

Select XTAL32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_FAST\_D256**

Select RC\_FAST\_D256\_CLK (referred as FOSC\_DIV or 8m\_d256/8md256 in TRM and reg. description) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_INVALID**

Invalid RTC\_SLOW\_CLK source

enum **soc\_rtc\_fast\_clk\_src\_t**

RTC\_FAST\_CLK mux inputs, which are the supported clock sources for the RTC\_FAST\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D4**

Select XTAL\_D4\_CLK (may referred as XTAL\_CLK\_DIV\_4) as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_DIV**

Alias name for SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D4

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_INVALID**

Invalid RTC\_FAST\_CLK source

enum **soc\_module\_clk\_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

*Values:*

enumerator **SOC\_MOD\_CLK\_CPU**

CPU\_CLK can be sourced from XTAL, PLL, RC\_FAST, or APLL by configuring `soc_cpu_clk_src_t`

enumerator **SOC\_MOD\_CLK\_RTC\_FAST**

RTC\_FAST\_CLK can be sourced from XTAL\_D4 or RC\_FAST by configuring `soc_rtc_fast_clk_src_t`

enumerator **SOC\_MOD\_CLK\_RTC\_SLOW**

RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, or RC\_FAST\_D256 by configuring `soc_rtc_slow_clk_src_t`

enumerator **SOC\_MOD\_CLK\_APB**

APB\_CLK is highly dependent on the CPU\_CLK source

enumerator **SOC\_MOD\_CLK\_PLL\_F160M**

PLL\_F160M\_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator **SOC\_MOD\_CLK\_XTAL32K**

XTAL32K\_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST**

RC\_FAST\_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST\_D256**

RC\_FAST\_D256\_CLK is derived from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_XTAL**

XTAL\_CLK comes from the external 40MHz crystal

enumerator **SOC\_MOD\_CLK\_REF\_TICK**

REF\_TICK is derived from XTAL or RC\_FAST via a divider, it has a fixed frequency of 1MHz by default

enumerator **SOC\_MOD\_CLK\_APLL**

APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enumerator **SOC\_MOD\_CLK\_TEMP\_SENSOR**

TEMP\_SENSOR\_CLK comes directly from the internal 8MHz rc oscillator

enum **soc\_periph\_gptimer\_clk\_src\_t**

Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **GPTIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER\_CLK\_SRC\_DEFAULT**

Select APB as the default choice

enum **soc\_periph\_tg\_clk\_src\_legacy\_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER\_SRC\_CLK\_APB**

Timer group source clock is APB

enumerator **TIMER\_SRC\_CLK\_XTAL**

Timer group source clock is XTAL

enumerator **TIMER\_SRC\_CLK\_DEFAULT**

Timer group source clock default choice is APB

enum **soc\_periph\_lcd\_clk\_src\_t**

Type of LCD clock source.

*Values:*

enumerator **LCD\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **LCD\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default choice

enum **soc\_periph\_rmt\_clk\_src\_t**

Type of RMT clock source.

*Values:*

enumerator **RMT\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **RMT\_CLK\_SRC\_REF\_TICK**

Select REF\_TICK as the source clock

enumerator **RMT\_CLK\_SRC\_DEFAULT**

Select APB as the default choice

enum **soc\_periph\_rmt\_clk\_src\_legacy\_t**

Type of RMT clock source, reserved for the legacy RMT driver.

*Values:*

enumerator **RMT\_BASECLK\_APB**

RMT source clock is APB CLK

enumerator **RMT\_BASECLK\_REF**

RMT source clock is REF\_TICK

enumerator **RMT\_BASECLK\_DEFAULT**

RMT source clock default choice is APB

enum **soc\_periph\_temperature\_sensor\_clk\_src\_t**

Type of Temp Sensor clock source.

*Values:*

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_DEFAULT**

Select RC\_FAST as the default choice

enum **soc\_periph\_uart\_clk\_src\_legacy\_t**

Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator **UART\_SCLK\_APB**

UART source clock is APB CLK

enumerator **UART\_SCLK\_REF\_TICK**

UART source clock is REF\_TICK

enumerator **UART\_SCLK\_DEFAULT**

UART source clock default choice is APB

enum **soc\_periph\_i2s\_clk\_src\_t**

I2S clock source enum.

*Values:*

enumerator **I2S\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default source clock

enumerator **I2S\_CLK\_SRC\_PLL\_160M**

Select PLL\_F160M as the source clock

enumerator **I2S\_CLK\_SRC\_APLL**

Select APLL as the source clock

enum **soc\_periph\_i2c\_clk\_src\_t**

Type of I2C clock source.

*Values:*

enumerator **I2C\_CLK\_SRC\_APB**

enumerator **I2C\_CLK\_SRC\_REF\_TICK**

enumerator **I2C\_CLK\_SRC\_DEFAULT**

enum **soc\_periph\_sdm\_clk\_src\_t**

Sigma Delta Modulator clock source.

*Values:*

enumerator **SDM\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **SDM\_CLK\_SRC\_DEFAULT**

Select APB as the default clock choice

## 2.5.5 Digital To Analog Converter (DAC)

### Overview

ESP32-S2 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO17 (Channel 1) and GPIO18 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, however the driver does not supported this yet.

For other analog output options, see the *Sigma-delta Modulation module* and the *LED Control module*. Both these modules produce high frequency PDM/PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

### Application Example

Setting DAC channel 1 (GPIO17) voltage to approx 0.78 of VDD\_A voltage ( $VDD * 200 / 255$ ). For VDD\_A 3.3V, this is 2.59V.

```
#include <driver/dac.h>

...

dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

### API Reference

#### Header File

- [components/driver/esp32s2/include/driver/dac.h](#)

#### Functions

*esp\_err\_t* **dac\_digi\_init** (void)

DAC digital controller initialization.

#### Returns

- ESP\_OK success

*esp\_err\_t* **dac\_digi\_deinit** (void)

DAC digital controller deinitialization.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_digi\_controller\_config** (const *dac\_digi\_config\_t* \*cfg)

Setting the DAC digital controller.

**Parameters** **cfg** –Pointer to digital controller paramter. See *dac\_digi\_config\_t*.

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **dac\_digi\_start** (void)

DAC digital controller start output voltage.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_digi\_stop** (void)

DAC digital controller stop output voltage.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_digi\_fifo\_reset** (void)

Reset DAC digital controller FIFO.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_digi\_reset** (void)

Reset DAC digital controller.

**Returns**

- ESP\_OK success

## Header File

- [components/driver/include/driver/dac\\_common.h](#)

## Functions

*esp\_err\_t* **dac\_pad\_get\_io\_num** (*dac\_channel\_t* channel, *gpio\_num\_t* \*gpio\_num)

Get the GPIO number of a specific DAC channel.

**Parameters**

- **channel** –Channel to get the gpio number
- **gpio\_num** –output buffer to hold the gpio number

**Returns**

- ESP\_OK if success

*esp\_err\_t* **dac\_output\_voltage** (*dac\_channel\_t* channel, uint8\_t dac\_value)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3\_RTC.

---

**Note:** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

---

**Parameters**

- **channel** –DAC channel
- **dac\_value** –DAC output value

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_output\_enable** (*dac\_channel\_t* channel)

DAC pad output enable.

---

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

---

**Parameters** **channel** –DAC channel

*esp\_err\_t* **dac\_output\_disable** (*dac\_channel\_t* channel)

DAC pad output disable.

---

**Note:** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

---

**Parameters** **channel** –DAC channel

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_enable** (void)

Enable cosine wave generator output.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_disable** (void)

Disable cosine wave generator output.

**Returns**

- ESP\_OK success

*esp\_err\_t* **dac\_cw\_generator\_config** (*dac\_cw\_config\_t* \*cw)

Config the cosine wave generator function in DAC module.

**Parameters** **cw** –Configuration.

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG The parameter is NULL.

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. DAC\_CHANNEL\_1\_GPIO\_NUM is the GPIO number of channel 1 (GPIO17);
2. DAC\_GPIO18\_CHANNEL is the channel number of GPIO 26 (channel 2).

**Header File**

- [components/soc/esp32s2/include/soc/dac\\_channel.h](#)

**Macros**

**DAC\_GPIO17\_CHANNEL**

**DAC\_CHANNEL\_1\_GPIO\_NUM**

DAC\_GPIO18\_CHANNEL

DAC\_CHANNEL\_2\_GPIO\_NUM

### Header File

- [components/hal/include/hal/dac\\_types.h](#)

### Structures

struct **dac\_cw\_config\_t**

Config the cosine wave generator function in DAC module.

#### Public Members

*dac\_channel\_t* **en\_ch**

Enable the cosine wave generator of DAC channel.

*dac\_cw\_scale\_t* **scale**

Set the amplitude of the cosine wave generator output.

*dac\_cw\_phase\_t* **phase**

Set the phase of the cosine wave generator output.

uint32\_t **freq**

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).

int8\_t **offset**

Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

struct **dac\_digi\_config\_t**

DAC digital controller (DMA mode) configuration parameters.

#### Public Members

*dac\_digi\_convert\_mode\_t* **mode**

DAC digital controller (DMA mode) work mode. See *dac\_digi\_convert\_mode\_t*.

uint32\_t **interval**

The number of interval clock cycles for the DAC digital controller to output voltage. The unit is the divided clock. Range: 1 ~ 4095. Expression:  $\text{dac\_output\_freq} = \text{controller\_clk} / \text{interval}$ . Refer to *adc\_digi\_clk\_t*. Note: The sampling rate of each channel is also related to the conversion mode (See *dac\_digi\_convert\_mode\_t*) and pattern table settings.

*adc\_digi\_clk\_t* **dig\_clk**

DAC digital controller clock divider settings. Refer to *adc\_digi\_clk\_t*. Note: The clocks of the DAC digital controller use the ADC digital controller clock divider.

## Enumerations

enum **dac\_channel\_t**

*Values:*

enumerator **DAC\_CHANNEL\_1**

DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC\_CHANNEL\_2**

DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC\_CHANNEL\_MAX**

enum **dac\_cw\_scale\_t**

The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3\_RTC.

*Values:*

enumerator **DAC\_CW\_SCALE\_1**

1/1. Default.

enumerator **DAC\_CW\_SCALE\_2**

1/2.

enumerator **DAC\_CW\_SCALE\_4**

1/4.

enumerator **DAC\_CW\_SCALE\_8**

1/8.

enum **dac\_cw\_phase\_t**

Set the phase of the cosine wave generator output.

*Values:*

enumerator **DAC\_CW\_PHASE\_0**

Phase shift +0°

enumerator **DAC\_CW\_PHASE\_180**

Phase shift +180°

enum **dac\_digi\_convert\_mode\_t**

DAC digital controller (DMA mode) work mode.

*Values:*

enumerator **DAC\_CONV\_NORMAL**

The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator **DAC\_CONV\_ALTER**

The data in the DMA buffer is alternately output to the enable channel of the DAC.

enumerator **DAC\_CONV\_MAX**

## 2.5.6 GPIO & RTC GPIO

### Overview

The ESP32-S2 chip features 43 physical GPIO pins (GPIO0 ~ GPIO21 and GPIO26 ~ GPIO46). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comment
GPIO0		RTC_GPIO0	Strapping pin
GPIO1	ADC1_CH0	RTC_GPIO1	
GPIO2	ADC1_CH1	RTC_GPIO2

continues on next page

Table 2 – continued from previous page

GPIO	Analog Function	RTC GPIO	Comment
GPIO43			
GPIO44			
GPIO45			Strapping pin
GPIO46			GPI; Strapping pin

**Note:**

- Strapping pin: GPIO0, GPIO45 and GPIO46 are strapping pins. For more information, please refer to [ESP32-S2 datasheet](#)
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses.
- JTAG: GPIO39-42 are usually used for inline debug.
- GPI: GPIO46 is fixed to pull-down and is input only.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

**Application Example**

GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

**API Reference - Normal GPIO****Header File**

- [components/driver/include/driver/gpio.h](#)

**Functions**

`esp_err_t gpio_config` (const `gpio_config_t` \*pGPIOConfig)

GPIO common configuration.

```
Configure GPIO's Mode, pull-up, PullDown, IntrType
```

**Parameters** `pGPIOConfig` –Pointer to GPIO configure struct

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t gpio_reset_pin` (`gpio_num_t` gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Parameters** `gpio_num` –GPIO number.

**Returns** Always return ESP\_OK.

*esp\_err\_t* **gpio\_set\_intr\_type** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- **gpio\_num** –GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **intr\_type** –Interrupt type, select from gpio\_int\_type\_t

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_enable** (*gpio\_num\_t* gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

---

**Parameters** **gpio\_num** –GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** **gpio\_num** –GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* gpio\_num, uint32\_t level)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters**

- **gpio\_num** –GPIO number. If you want to set the output level of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **level** –Output level. 0: low ; 1: high

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

int **gpio\_get\_level** (*gpio\_num\_t* gpio\_num)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters** **gpio\_num** –GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction.

Configure GPIO direction, such as output\_only, input\_only, output\_and\_input

**Parameters**

- **gpio\_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** –GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Parameters**

- **gpio\_num** –GPIO number.
- **intr\_type** –GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

**Parameters** **gpio\_num** –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

***esp\_err\_t* gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

#### Parameters

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### Returns

- `ESP_OK` Success ;
- `ESP_ERR_INVALID_ARG` GPIO error
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags

***esp\_err\_t* gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

**Parameters** `gpio_num` –GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp\_err\_t* gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-up on GPIO.

**Parameters** `gpio_num` –GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp\_err\_t* gpio\_pulldown\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-down on GPIO.

**Parameters** `gpio_num` –GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp\_err\_t* gpio\_pulldown\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-down on GPIO.

**Parameters** `gpio_num` –GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

***esp\_err\_t* gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's `ETS_GPIO_INTR_SOURCE` ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters** `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_INVALID_ARG` GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

#### Parameters

- **gpio\_num** –GPIO number
- **isr\_handler** –ISR handler function for the corresponding GPIO number.
- **args** –parameter for ISR handler.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** **gpio\_num** –GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

#### Parameters

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

#### Parameters

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable gpio pad hold function.

When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified (including input enable, output enable,

output value, function, and drive strength values). It can be used to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: input read value can still reflect the changes of the input signal.

The state of the digital gpio cannot be held during Deep-sleep, and it will resume to hold at its default pin state when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** `gpio_num` –GPIO number, only support output-capable GPIOs

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

*esp\_err\_t* `gpio_hold_dis` (*gpio\_num\_t* gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** `gpio_num` –GPIO number, only support output-capable GPIOs

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

void `gpio_deep_sleep_hold_en` (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void `gpio_deep_sleep_hold_dis` (void)

Disable all digital gpio pads hold function during Deep-sleep.

void `gpio_iomux_in` (uint32\_t gpio\_num, uint32\_t signal\_idx)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- `gpio_num` –GPIO number of the pad.
- `signal_idx` –Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void `gpio_iomux_out` (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- `gpio_num` –gpio\_num GPIO number of the pad.
- `func` –The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- `oen_inv` –True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:** This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Force unhold all digital and rtc gpio pads.

*esp\_err\_t* **gpio\_sleep\_sel\_en** (*gpio\_num\_t* gpio\_num)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** `gpio_num` –GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (*gpio\_num\_t* gpio\_num)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** `gpio_num` –GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Parameters**

- `gpio_num` –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- `gpio_num` –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` –GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for `gpio_config` function.

### Public Members

uint64\_t **pin\_bit\_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

*gpio\_mode\_t* **mode**

GPIO mode: set input/output mode

*gpio\_pullup\_t* **pull\_up\_en**

GPIO pull-up

*gpio\_pulldown\_t* **pull\_down\_en**

GPIO pull-down

*gpio\_int\_type\_t* **intr\_type**

GPIO interrupt type

## Macros

**GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (gpio\_num)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

**GPIO\_IS\_VALID\_DIGITAL\_IO\_PAD** (gpio\_num)

Check whether it can be a valid digital I/O pad.

## Type Definitions

typedef *intr\_handle\_t* **gpio\_isr\_handle\_t**

typedef void (\***gpio\_isr\_t**)(void \*arg)

GPIO interrupt handler.

## API Reference - RTC GPIO

### Header File

- `components/driver/include/driver/rtc_io.h`

### Functions

`bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)`

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters** `gpio_num` –GPIO number

**Returns** true if GPIO is valid for RTC GPIO use. false otherwise.

`int rtc_io_number_get (gpio_num_t gpio_num)`

Get RTC IO index number by gpio number.

**Parameters** `gpio_num` –GPIO number

**Returns**  $\geq 0$ : Index of rtcio. -1 : The gpio is not rtcio.

`esp_err_t rtc_gpio_init (gpio_num_t gpio_num)`

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)`

Init a GPIO as digital GPIO.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)`

Get the RTC IO input level.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

Set the RTC IO output level.

**Parameters**

- `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)
- `level` –output level

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)`

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**

- `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)
- `mode` –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction\_in\_sleep** (*gpio\_num\_t* gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Parameters**

- **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)
- **mode** –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_isolate** (*gpio\_num\_t* gpio\_num)

Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call `rtc_gpio_isolate(GPIO_NUM_12)` before entering deep sleep, to reduce deep sleep current.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12).

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_force\_hold\_en\_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio\_num** –GPIO number
- **intr\_type** –Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters** **gpio\_num** –GPIO number

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO

### Macros

**RTC\_GPIO\_IS\_VALID\_GPIO** (gpio\_num)

### Header File

- [components/hal/include/hal/rtc\\_io\\_types.h](#)

### Enumerations

enum **rtc\_gpio\_mode\_t**

RTCIO output/input mode type.

*Values:*

enumerator **RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

enumerator **RTC\_GPIO\_MODE\_DISABLED**

Pad (output + input) disable

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_OD**

Pad open-drain output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT\_OD**

Pad input + open-drain output

## 2.5.7 General Purpose Timer (GPTimer)

### Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-S2 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- *Resource Allocation* - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- *Set and Get Count Value* - covers how to force the timer counting from a start point and how to get the count value at anytime.
- *Set up Alarm Action* - covers the parameters that should be set up to enable the alarm event.
- *Register Event Callbacks* - covers how to hook user specific code to the alarm event callback function.
- *Enable and Disable Timer* - covers how to enable and disable the timer.
- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to **1 / resolution\_hz** seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to *ESP32-S2 Technical Reference Manual > Chapter Timer Group (TIMG)* [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to `NULL`, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g. the “Alarm Event”) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from **init** to **enable**.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event. Calling `gptimer_start()` will transit the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the “start protection” state (i.e. `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
```

(continues on next page)

(continued from previous page)

```

    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

```

(continues on next page)

(continued from previous page)

```

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

**Power Management** There're some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver will increase the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
- Place all functions that used by the ISR into IRAM<sup>2</sup>
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash), see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).

### API Reference

#### Header File

- `components/driver/include/driver/gptimer.h`

#### Functions

`esp_err_t gptimer_new_timer` (const `gptimer_config_t` \*config, `gptimer_handle_t` \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the “init” state.

---

#### Parameters

- **config** –[in] GPTimer configuration
- **ret\_timer** –[out] Returned timer handle

#### Returns

- `ESP_OK`: Create GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Create GPTimer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create GPTimer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create GPTimer failed because all hardware timers are used up and no more free one
- `ESP_FAIL`: Create GPTimer failed because of other error

*esp\_err\_t* **gptimer\_del\_timer** (*gptimer\_handle\_t* timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the “init” state before it can be deleted.

---

**Parameters** **timer** –[in] Timer handle created by `gptimer_new_timer()`

**Returns**

- **ESP\_OK:** Delete GPTimer successfully
- **ESP\_ERR\_INVALID\_ARG:** Delete GPTimer failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE:** Delete GPTimer failed because the timer is not in init state
- **ESP\_FAIL:** Delete GPTimer failed because of other error

*esp\_err\_t* **gptimer\_set\_raw\_count** (*gptimer\_handle\_t* timer, `uint64_t` value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **value** –[in] Count value to be set

**Returns**

- **ESP\_OK:** Set GPTimer raw count value successfully
- **ESP\_ERR\_INVALID\_ARG:** Set GPTimer raw count value failed because of invalid argument
- **ESP\_FAIL:** Set GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_raw\_count** (*gptimer\_handle\_t* timer, `uint64_t *`value)

Get GPTimer raw count value.

---

**Note:** With the raw count value and the resolution set in the `gptimer_config_t`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **value** –[out] Returned GPTimer count value

**Returns**

- ESP\_OK: Get GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Get GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_register\_event\_callbacks** (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set event callbacks failed because the timer is not in init state
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **gptimer\_set\_alarm\_action** (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **config** –[in] Alarm configuration, especially, set `config` to NULL means disabling the alarm function

**Returns**

- ESP\_OK: Set alarm action for GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP\_FAIL: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from “init” to “enable” .

---

---

**Note:** This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

---

**Note:** Enable a timer doesn’t mean to start it. See also `gptimer_start()` for how to make the timer start counting.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer()`

**Returns**

- `ESP_OK`: Enable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Enable GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable GPTimer failed because the timer is already enabled
- `ESP_FAIL`: Enable GPTimer failed because of other error

*esp\_err\_t* `gptimer_disable(gptimer_handle_t timer)`

Disable GPTimer.

---

**Note:** This function will transit the timer state from “enable” to “init” .

---

---

**Note:** This function will disable the interrupt service if it’s installed.

---

---

**Note:** This function will release the PM lock if it’s acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn’t mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer()`

**Returns**

- `ESP_OK`: Disable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Disable GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable GPTimer failed because the timer is not enabled yet
- `ESP_FAIL`: Disable GPTimer failed because of other error

*esp\_err\_t* `gptimer_start(gptimer_handle_t timer)`

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from “enable” to “run” .

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer()`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* `gptimer_stop(gptimer_handle_t timer)`

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from “run” to “enable” .

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer()`

**Returns**

- `ESP_OK`: Stop GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Stop GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop GPTimer failed because the timer is not in running.
- `ESP_FAIL`: Stop GPTimer failed because of other error

## Structures

struct `gptimer_alarm_event_data_t`

GPTimer alarm event data.

### Public Members

`uint64_t count_value`

Current count value

`uint64_t alarm_value`

Current alarm value

struct `gptimer_event_callbacks_t`

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_config\_t**

General Purpose Timer configuration.

### Public Members

*gptimer\_clock\_source\_t* **clk\_src**

GPTimer clock source

*gptimer\_count\_direction\_t* **direction**

Count direction

uint32\_t **resolution\_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution\_hz) seconds

int **intr\_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **intr\_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer\_config\_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

### Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

### Type Definitions

typedef struct gptimer\_t **\*gptimer\_handle\_t**

Type of General Purpose Timer handle.

typedef bool (**\*gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer [in]** Timer handle created by `gptimer_new_timer()`

**Param edata [in]** Alarm event data, fed by driver

**Param user\_ctx [in]** User data, passed from `gptimer_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/timer\\_types.h](#)

### Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**

GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **gptimer\_count\_direction\_t**

GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**

Decrease count value

enumerator **GPTIMER\_COUNT\_UP**

Increase count value

## 2.5.8 Dedicated GPIO

## Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

## Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’ s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

---

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’ s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’ s impossible to control GPIOA.

---

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

---

**Note:** `dedic_gpio_new_bundle()` doesn’ t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

---

## GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that output from the given GPIO bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that input to the given GPIO bundle	<code>dedic_gpio_bundle_read_in()</code>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try *Manipulate GPIOs by Writing Assembly Code* instead to reduce the overhead but should take care of the thread safety by themselves.

## Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fasted way of toggling IO is to use the dedicated “set/clear” instructions:
  - Set bits of GPIO: `set_bit_gpio_out imm[7:0]`
  - Clear bits of GPIO: `clr_bit_gpio_out imm[7:0]`
  - Note: Immediate value width depends on the number of dedicated GPIO channels

For details of supported dedicated GPIO instructions, please refer to *ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

## Interrupt Handling

Dedicated GPIO can also trigger interrupt on specific input event. All supported events are defined in `dedic_gpio_intr_type_t`.

One can enable and register interrupt callback by calling `dedic_gpio_bundle_set_interrupt_and_callback()`. The prototype of the callback function is defined in `dedic_gpio_isr_callback_t`. Keep in mind, the callback should return true if there's some high priority task woken up.

```
// user defined ISR callback
IRAM_ATTR bool dedic_gpio_isr_callback(dedic_gpio_bundle_handle_t bundle, uint32_t
↪index, void *args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(sem, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

// enable positive edge interrupt on the second GPIO in the bundle (i.e. index 1)
```

(continues on next page)

(continued from previous page)

```

ESP_ERROR_CHECK(dedic_gpio_bundle_set_interrupt_and_callback(bundle, BIT(1), DEDIC_
↳GPIO_INTR_POS_EDGE, dedic_gpio_isr_callback, sem));

// wait for done semaphore
xSemaphoreTake(sem, portMAX_DELAY);

```

### Application Example

Matrix keyboard example based on dedicated GPIO: [peripherals/gpio/matrix\\_keyboard](#).

### API Reference

#### Header File

- [components/driver/include/driver/dedic\\_gpio.h](#)

#### Functions

*esp\_err\_t* **dedic\_gpio\_get\_out\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

Get allocated channel mask.

---

**Note:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

---

---

**Note:** With the returned mask, user can directly invoke LL function like “dedic\_gpio\_cpu\_ll\_write\_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

---

#### Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[out] Returned mask value for on specific direction (in or out)

#### Returns

- ESP\_OK: Get channel mask successfully
- ESP\_ERR\_INVALID\_ARG: Get channel mask failed because of invalid argument
- ESP\_FAIL: Get channel mask failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

*esp\_err\_t* **dedic\_gpio\_new\_bundle** (const *dedic\_gpio\_bundle\_config\_t* \*config, *dedic\_gpio\_bundle\_handle\_t* \*ret\_bundle)

Create GPIO bundle and return the handle.

---

**Note:** One has to enable at least input or output mode in “config” parameter.

---

#### Parameters

- **config** –[in] Configuration of GPIO bundle
- **ret\_bundle** –[out] Returned handle of the new created GPIO bundle

#### Returns

- ESP\_OK: Create GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Create GPIO bundle failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPIO bundle failed because of no capable memory
- ESP\_ERR\_NOT\_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP\_FAIL: Create GPIO bundle failed because of other error

*esp\_err\_t* **dedic\_gpio\_del\_bundle** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Destory GPIO bundle.

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns**

- ESP\_OK: Destory GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Destory GPIO bundle failed because of invalid argument
- ESP\_FAIL: Destory GPIO bundle failed because of other error

void **dedic\_gpio\_bundle\_write** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, uint32\_t value)

Write value to GPIO bundle.

---

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters**

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[in] Mask of the GPIOs to be written in the given bundle
- **value** –[in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_out** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that output from the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_in** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that input to the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns** Value that input to the GPIO bundle, low bit represents low member in the bundle

*esp\_err\_t* **dedic\_gpio\_bundle\_set\_interrupt\_and\_callback** (*dedic\_gpio\_bundle\_handle\_t* bundle,  
uint32\_t mask,  
*dedic\_gpio\_intr\_type\_t* intr\_type,  
*dedic\_gpio\_isr\_callback\_t* cb\_isr,  
void \*cb\_args)

Set interrupt and callback function for GPIO bundle.

---

**Note:** This function is only valid for bundle with input mode enabled. See “dedic\_gpio\_bundle\_config\_t”

---

**Note:** The mask is seen from the view of GPIO Bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

#### Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[in] Mask of the GPIOs in the given bundle
- **intr\_type** –[in] Interrupt type, set to DEDIC\_GPIO\_INTR\_NONE can disable interrupt
- **cb\_isr** –[in] Callback function, which got invoked in ISR context. A NULL pointer here will bypass the callback
- **cb\_args** –[in] User defined argument to be passed to the callback function

#### Returns

- ESP\_OK: Set GPIO interrupt and callback function successfully
- ESP\_ERR\_INVALID\_ARG: Set GPIO interrupt and callback function failed because of invalid argument
- ESP\_FAIL: Set GPIO interrupt and callback function failed because of other error

### Structures

struct **dedic\_gpio\_bundle\_config\_t**

Type of Dedicated GPIO bundle configuration.

#### Public Members

const int \***gpio\_array**

Array of GPIO numbers, gpio\_array[0] ~ gpio\_array[size-1] <=> low\_dedic\_channel\_num ~ high\_dedic\_channel\_num

size\_t **array\_size**

Number of GPIOs in gpio\_array

unsigned int **in\_en**

Enable input

unsigned int **in\_invert**

Invert input signal

unsigned int **out\_en**

Enable output

unsigned int **out\_invert**

Invert output signal

struct *dedic\_gpio\_bundle\_config\_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

### Type Definitions

typedef struct *dedic\_gpio\_bundle\_t* \***dedic\_gpio\_bundle\_handle\_t**

Type of Dedicated GPIO bundle.

```
typedef bool (*dedic_gpio_isr_callback_t)(dedic_gpio_bundle_handle_t bundle, uint32_t index, void *args)
```

Type of dedicated GPIO ISR callback function.

**Param bundle** Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Param index** Index of the GPIO in its corresponding bundle (count from 0)

**Param args** User defined arguments for the callback function. It’s passed through `dedic_gpio_bundle_set_interrupt_and_callback`

**Return** If a high priority task is woken up by the callback function

## Enumerations

```
enum dedic_gpio_intr_type_t
```

Supported type of dedicated GPIO interrupt.

*Values:*

```
enumerator DEDIC_GPIO_INTR_NONE
```

No interrupt

```
enumerator DEDIC_GPIO_INTR_LOW_LEVEL
```

Interrupt on low level

```
enumerator DEDIC_GPIO_INTR_HIGH_LEVEL
```

Interrupt on high level

```
enumerator DEDIC_GPIO_INTR_NEG_EDGE
```

Interrupt on negedge

```
enumerator DEDIC_GPIO_INTR_POS_EDGE
```

Interrupt on posedge

```
enumerator DEDIC_GPIO_INTR_BOTH_EDGE
```

Interrupt on both negedge and posedge

## 2.5.9 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-S2 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

### HMAC on the ESP32-S2

On the ESP32-S2, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-S2 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called *Upstream* mode, while the last two modes are called *Downstream* modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter `key_purpose` determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the `key_purpose` (see *ESP32-S2 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

#### HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length and the eFuse key block ID which contains the secret and has eFuse key purpose set to Upstream mode.

#### HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC\_DOWN\_ALL (5) or HMAC\_DOWN\_JTAG (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit/bits on ESP32-S2. This will permanently disable JTAG unless the correct key value is provided by software.

---

**Note:** The API `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)` can be used to burn “soft JTAG disable” bit on ESP32-S2.

---

---

**Note:** If `HARD_DIS_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

---

### JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-S2 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp32s2/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
    ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
    key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
}
```

(continues on next page)

(continued from previous page)

```

} else {
    // failure calculating HMAC
}

```

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/soc/esp32s2/esp\\_hmac.h](#)

### Functions

***esp\_err\_t* esp\_hmac\_calculate** (*hmac\_key\_id\_t* key\_id, const void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message\_len*. SHA256 is used for the calculation (fixed on ESP32S2).

---

**Note:** Uses the HMAC peripheral in “upstream” mode.

---

#### Parameters

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message\_len** –message length return ESP\_ERR\_INVALID\_STATE if unsuccessful
- **hmac** –[out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

#### Returns

- ESP\_OK, if the calculation was successful,
- ESP\_ERR\_INVALID\_ARG if message or hmac is a nullptr or if key\_id out of range
- ESP\_FAIL, if the hmac calculation failed

***esp\_err\_t* esp\_hmac\_jtag\_enable** (*hmac\_key\_id\_t* key\_id, const uint8\_t \*token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disable by HW. In downstream mode HMAC calculations performed by peripheral used internally and not provided back to user.

---

**Note:** Return value of the API does not indicate the JTAG status.

---

#### Parameters

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

#### Returns

- ESP\_OK, if the key\_purpose of the key\_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.

- ESP\_FAIL, if the key\_purpose of the key\_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE\_HARD\_DIS\_JTAG eFuse parameter.
- ESP\_ERR\_INVALID\_ARG, invalid input arguments

*esp\_err\_t* **esp\_hmac\_jtag\_disable** (void)

Disable the JTAG which might be enable using the HMAC downstream mode. This function just clear the result generated by JTAG key by calling esp\_hmac\_jtag\_enable() API.

#### Returns

- ESP\_OK return ESP\_OK after writing the HMAC\_SET\_INVALIDATE\_JTAG\_REG with value 1.

### Enumerations

enum **hmac\_key\_id\_t**

The possible efuse keys for the HMAC peripheral

*Values:*

enumerator **HMAC\_KEY0**

enumerator **HMAC\_KEY1**

enumerator **HMAC\_KEY2**

enumerator **HMAC\_KEY3**

enumerator **HMAC\_KEY4**

enumerator **HMAC\_KEY5**

enumerator **HMAC\_KEY\_MAX**

## 2.5.10 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [\[PDF\]](#).

### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

## Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S2 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [PDF].

## Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

---

**Note:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

## Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-S2 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC\_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC\_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-S2 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the [esp-secure-cert-tool](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the `esp_secure_cert_mgr` component. Please refer the [component/README](#). for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls`

context (as *ds\_data*), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

### Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through `ESP-MQTT`) to connect to broker `test.mosquitto.org` using `ssl` transport with mutual authentication. The `ssl` part is internally performed with `ESP-TLS`. See [example README](#) for more details.

## API Reference

### Header File

- `components/esp_hw_support/include/soc/esp32s2/esp_ds.h`

### Functions

`esp_err_t esp_ds_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, void \*signature)

Sign the message.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where,  $Z$  is the signature,  $X$  is the input message,  $Y$  and  $M$  are the RSA private key parameters.

---

**Note:** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

---

### Parameters

- **message** –the message to be signed; its length should be  $(\text{data->rsa\_length} + 1) * 4$  bytes
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** –the destination of the signature, should be  $(\text{data->rsa\_length} + 1) * 4$  bytes long

### Returns

- `ESP_OK` if successful, the signature was written to the parameter `signature`.
- `ESP_ERR_INVALID_ARG` if one of the parameters is `NULL` or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

`esp_err_t esp_ds_start_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, `esp_ds_context_t` \*\*esp\_ds\_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where,  $Z$  is the signature,  $X$  is the input message,  $Y$  and  $M$  are the RSA private key parameters.

---

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

---

#### Parameters

- **message** –the message to be signed; its length should be  $(\text{data} \rightarrow \text{rsa\_length} + 1) * 4$  bytes
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp\_ds\_ctx** –the context object which is needed for finishing the signing process later

#### Returns

- ESP\_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP\_ERR\_NO\_MEM if there hasn't been enough memory to allocate the context object
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp\_ds\_is\_busy**(void)

Return true if the DS peripheral is busy, otherwise false.

---

**Note:** Only valid if `esp_ds_start_sign()` was called before.

---

*esp\_err\_t* **esp\_ds\_finish\_sign**(void \*signature, *esp\_ds\_context\_t* \*esp\_ds\_ctx)

Finish the signing process.

#### Parameters

- **signature** –the destination of the signature, should be  $(\text{data} \rightarrow \text{rsa\_length} + 1) * 4$  bytes long
- **esp\_ds\_ctx** –the context object retrieved by `esp_ds_start_sign()`

#### Returns

- ESP\_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST if the message digest didn't match; the signature is invalid.
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

*esp\_err\_t* **esp\_ds\_encrypt\_params**(*esp\_ds\_data\_t* \*data, const void \*iv, const *esp\_ds\_p\_data\_t* \*p\_data, const void \*key)

Encrypt the private key parameters.

#### Parameters

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- **iv** –Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.

- **p\_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by key\_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

**Returns**

- ESP\_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or p\_data->rsa\_length is too long

**Structures**

struct **esp\_digital\_signature\_data**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

**Public Members**

*esp\_digital\_signature\_length\_t* **rsa\_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

---

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct ets\_ds\_data\_t.

---

uint8\_t **iv**[ESP\_DS\_IV\_LEN]

IV value used to encrypt ‘c’

uint8\_t **c**[ESP\_DS\_C\_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

Not used for signing with DS peripheral, but can be encrypted in-device by calling esp\_ds\_encrypt\_params()

---

**Note:** This documentation is mostly taken from the ROM code.

---

**Public Members**

uint32\_t **Y**[4096 / 32]

RSA exponent.

uint32\_t **M**[4096 / 32]

RSA modulus.

uint32\_t **Rb**[4096 / 32]

RSA r inverse operand.

uint32\_t **M\_prime**

RSA M prime operand.

*esp\_digital\_signature\_length\_t* **length**

RSA length.

### Macros

**ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL**

HMAC peripheral problem

**ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY**

given HMAC key isn't correct, HMAC peripheral problem

**ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST**

message digest check failed, result is invalid

**ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING**

padding check failed, but result is produced anyway and can be read

**ESP\_DS\_IV\_LEN**

**ESP\_DS\_C\_LEN**

### Type Definitions

typedef struct esp\_ds\_context **esp\_ds\_context\_t**

typedef struct *esp\_digital\_signature\_data* **esp\_ds\_data\_t**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

### Enumerations

enum **esp\_digital\_signature\_length\_t**

*Values:*

enumerator **ESP\_DS\_RSA\_1024**

enumerator **ESP\_DS\_RSA\_2048**

enumerator **ESP\_DS\_RSA\_3072**

enumerator **ESP\_DS\_RSA\_4096**

## 2.5.11 Inter-Integrated Circuit (I2C)

### Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-S2 has 2 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

### Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

### Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
  - a) *Communication as Master* - handle communications (master)
  - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver*- release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master or slave from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-S2's internal pull-ups
- (Master only) Set I2C **clock speed**

- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,   // select frequency specific to your_
↳project
    .clk_flags = 0,                            // you can use I2C_SCLK_SRC_FLAG_*_
↳flags to choose i2c source clock here
};
```

Configuration example (slave):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // address of your project
    .clk_flags = 0,
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

**Source Clock Configuration** **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

---

**Note:** A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

---

Table 3: Characteristics of ESP32-S2 clock sources

Clock name	MAX freq for SCL	Clock capabilities
APB0 clock	4 MHz	/
REF_TICK	10 MHz	<i>I2C_SCLK_SRC_FLAG_AWARE_DFS</i> , <i>I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</i>

Explanations for `i2c_config_t::clk_flags` are as follows: 1. *I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS*: Clock's baud rate will not change while APB clock is changing. 2. *I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP*: It supports Light-sleep mode, which APB clock cannot do.

Explanations for `i2c_config_t::clk_flags` are as follows:

1. *I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS*: Clock's baud rate will not change while APB clock is changing.
2. *I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP*: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-S2, reading technical reference manual before using it.

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32-S2 is ready to communicate with other I2C devices.

ESP32-S2's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a "command link", that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send  $n$  bytes to a slave.

Fig. 4: I2C command link - master write example

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`
  - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
  - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
  - d) **Stop bit** - `i2c_master_stop()`
 Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read  $n$  bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

Fig. 5: I2C command link - master read example

**Communication as Slave** After installing the I2C driver, ESP32-S2 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`

Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`

The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

**Interrupt Handling** During driver installation, an interrupt handler is installed by default.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

Table 4: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of <b>start</b> signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

---

**Note:** ESP32-S2's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see [TI Application Note](#)

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

### Application Example

I2C examples: [peripherals/i2c](#).

### API Reference

#### Header File

- `components/driver/include/driver/i2c.h`

## Functions

*esp\_err\_t* **i2c\_driver\_install** (*i2c\_port\_t* i2c\_num, *i2c\_mode\_t* mode, size\_t slv\_rx\_buf\_len, size\_t slv\_tx\_buf\_len, int intr\_alloc\_flags)

Install an I2C driver.

---

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

---

---

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

---

### Parameters

- **i2c\_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv\_rx\_buf\_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv\_tx\_buf\_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr\_alloc\_flags** – Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

*esp\_err\_t* **i2c\_driver\_delete** (*i2c\_port\_t* i2c\_num)

Delete I2C driver.

---

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

---

**Parameters** **i2c\_num** – I2C port to delete

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_param\_config** (*i2c\_port\_t* i2c\_num, const *i2c\_config\_t* \*i2c\_conf)

Configure an I2C bus with the given configuration.

### Parameters

- **i2c\_num** – I2C port to configure
- **i2c\_conf** – Pointer to the I2C configuration

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_tx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C tx hardware fifo

**Parameters** **i2c\_num** – I2C port number

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_rx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C rx fifo

**Parameters** **i2c\_num** –I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* i2c\_num, int sda\_io\_num, int scl\_io\_num, bool sda\_pullup\_en, bool scl\_pullup\_en, *i2c\_mode\_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

**Parameters**

- **i2c\_num** –I2C port number
- **sda\_io\_num** –GPIO number for I2C SDA signal
- **scl\_io\_num** –GPIO number for I2C SCL signal
- **sda\_pullup\_en** –Enable the internal pullup for SDA pin
- **scl\_pullup\_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_master\_write\_to\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, TickType\_t ticks\_to\_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **write\_buffer** –Bytes to send on the bus
- **write\_size** –Size, in bytes, of the write buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_read\_from\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **read\_buffer** –Buffer to store the bytes received on the bus
- **read\_size** –Size, in bytes, of the read buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_write\_read\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

#### Parameters

- **i2c\_num** – I2C port number to perform the transfer on
- **device\_address** – I2C device's 7-bit address
- **write\_buffer** – Bytes to send on the bus
- **write\_size** – Size, in bytes, of the write buffer
- **read\_buffer** – Buffer to store the bytes received on the bus
- **read\_size** – Size, in bytes, of the read buffer
- **ticks\_to\_wait** – Maximum ticks to wait before issuing a timeout.

#### Returns

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_FAIL** Sending command error, slave hasn't ACK the transfer.
- **ESP\_ERR\_INVALID\_STATE** I2C driver not installed or not in master mode.
- **ESP\_ERR\_TIMEOUT** Operation timeout because the bus is busy.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create\_static** (uint8\_t \*buffer, uint32\_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

---

**Note:** It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

---

#### Parameters

- **buffer** – Buffer to use for commands allocations
- **size** – Size in bytes of the buffer

**Returns** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**Returns** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void **i2c\_cmd\_link\_delete\_static** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

**Parameters** **cmd\_handle** – I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list.

**Parameters** **cmd\_handle** – I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** **cmd\_handle** –I2C commands list

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t data, bool ack\_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Byte to send on the port
- **ack\_en** –Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write** (*i2c\_cmd\_handle\_t* cmd\_handle, const uint8\_t \*data, size\_t data\_len, bool ack\_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data\_len** –Length, in bytes, of the data buffer
- **ack\_en** –Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, *i2c\_ack\_type\_t* ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, size\_t data\_len, *i2c\_ack\_type\_t* ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C

bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

#### Parameters

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data\_len** –Size, in bytes, of the `data` buffer
- **ack** –ACK signal

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** `cmd_handle` –I2C commands list

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

#### Parameters

- **i2c\_num** –I2C port number
- **cmd\_handle** –I2C commands list
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave hasn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**Note:** This function shall only be called in I2C slave mode.

---

#### Parameters

- **i2c\_num** –I2C port number
- **data** –Bytes to write into internal buffer
- **size** –Size, in bytes, of `data` buffer
- **ticks\_to\_wait** –Maximum ticks to wait.

#### Returns

- `ESP_FAIL` (-1) Parameter error
- Other ( $\geq 0$ ) The number of data bytes pushed to the I2C slave buffer.

```
int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
```

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

---

**Note:** This function shall only be called in I2C slave mode.

---

#### Parameters

- **i2c\_num** –I2C port number
- **data** –Buffer to fill with ringbuffer' s bytes
- **max\_size** –Maximum bytes to read
- **ticks\_to\_wait** –Maximum waiting ticks

#### Returns

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

```
esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)
```

Set I2C master clock period.

#### Parameters

- **i2c\_num** –I2C port number
- **high\_period** –Clock cycle number during SCL is high level, high\_period is a 14 bit value
- **low\_period** –Clock cycle number during SCL is low level, low\_period is a 14 bit value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

```
esp_err_t i2c_get_period (i2c_port_t i2c_num, int *high_period, int *low_period)
```

Get I2C master clock period.

#### Parameters

- **i2c\_num** –I2C port number
- **high\_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low\_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

```
esp_err_t i2c_filter_enable (i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

---

**Note:** Enable filter will slow down the SCL clock.

---

#### Parameters

- **i2c\_num** –I2C port number to filter
- **cyc\_num** –the APB cycles need to be filtered (0<= cyc\_num <=7). When the period of a pulse is less than cyc\_num \* APB\_cycle, the I2C controller will ignore this pulse.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_disable** (*i2c\_port\_t* i2c\_num)

Disable filter on I2C bus.

**Parameters** **i2c\_num** –I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_start\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master start signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold\_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_start\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master start signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time
- **hold\_time** –pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_stop\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master stop signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold\_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_stop\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master stop signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time.
- **hold\_time** –pointer to get hold time.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_timing** (*i2c\_port\_t* i2c\_num, int sample\_time, int hold\_time)

set I2C data signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **sample\_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value

- **hold\_time** –clock number I2C used to hold the data after the falling-edge of SCL, it's a 10-bit value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_timing** (*i2c\_port\_t* i2c\_num, int \*sample\_time, int \*hold\_time)

get I2C data signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **sample\_time** –pointer to get sample time
- **hold\_time** –pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_timeout** (*i2c\_port\_t* i2c\_num, int timeout)

set I2C timeout value

**Parameters**

- **i2c\_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_timeout** (*i2c\_port\_t* i2c\_num, int \*timeout)

get I2C timeout value

**Parameters**

- **i2c\_num** –I2C port number
- **timeout** –pointer to get timeout value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* tx\_trans\_mode, *i2c\_trans\_mode\_t* rx\_trans\_mode)

set I2C data transfer mode

**Parameters**

- **i2c\_num** –I2C port number
- **tx\_trans\_mode** –I2C sending data mode
- **rx\_trans\_mode** –I2C receiving data mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* \*tx\_trans\_mode, *i2c\_trans\_mode\_t* \*rx\_trans\_mode)

get I2C data transfer mode

**Parameters**

- **i2c\_num** –I2C port number
- **tx\_trans\_mode** –pointer to get I2C sending data mode
- **rx\_trans\_mode** –pointer to get I2C receiving data mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **i2c\_config\_t**

I2C initialization parameters.

### Public Members

*i2c\_mode\_t* **mode**

I2C mode

int **sda\_io\_num**

GPIO number for I2C sda signal

int **scl\_io\_num**

GPIO number for I2C scl signal

bool **sda\_pullup\_en**

Internal GPIO pull mode for I2C sda signal

bool **scl\_pullup\_en**

Internal GPIO pull mode for I2C scl signal

uint32\_t **clk\_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c\_config\_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8\_t **addr\_10bit\_en**

I2C 10bit address mode enable for slave mode

uint16\_t **slave\_addr**

I2C address for slave mode

uint32\_t **maximum\_speed**

I2C expected clock speed from SCL.

struct *i2c\_config\_t*::[anonymous]::[anonymous] **slave**

I2C slave config

uint32\_t **clk\_flags**

Bitwise of `I2C_SCLK_SRC_FLAG_**FOR_DFS**` for clk source choice

## Macros

**I2C\_APB\_CLK\_FREQ**

I2C source clock is APB clock, 80MHz

**I2C\_NUM\_MAX**

I2C port max

**I2C\_NUM\_0**

I2C port 0

**I2C\_NUM\_1**

I2C port 1

**I2C\_SCLK\_SRC\_FLAG\_FOR\_NOMAL**

Any one clock source that is available for the specified frequency may be choosen

**I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS**

For REF tick clock, it won't change with APB.

**I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP**

For light sleep mode.

**I2C\_INTERNAL\_STRUCT\_SIZE**

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C\_LINK\_RECOMMENDED\_SIZE (TRANSACTIONS)**

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

**Type Definitions**

```
typedef void *i2c_cmd_handle_t
```

I2C command handle

**Header File**

- [components/hal/include/hal/i2c\\_types.h](#)

**Type Definitions**

```
typedef int i2c_port_t
```

I2C port number, can be `I2C_NUM_0` ~ `(I2C_NUM_MAX-1)`.

```
typedef soc_periph_i2c_clk_src_t i2c_clock_source_t
```

I2C group clock source.

**Enumerations**

```
enum i2c_mode_t
```

*Values:*

enumerator **I2C\_MODE\_SLAVE**

I2C slave mode

enumerator **I2C\_MODE\_MASTER**

I2C master mode

enumerator **I2C\_MODE\_MAX**

enum **i2c\_rw\_t**

*Values:*

enumerator **I2C\_MASTER\_WRITE**

I2C write data

enumerator **I2C\_MASTER\_READ**

I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**

I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**

I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum **i2c\_addr\_mode\_t**

*Values:*

enumerator **I2C\_ADDR\_BIT\_7**

I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**

I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**

I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**

I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**

I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

## 2.5.12 Inter-IC Sound (I2S)

### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-S2 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller supports single RX or TX simplex communication. As RX and TX channels share a clock, they can only be combined with the same configuration to establish a full-duplex communication.

### I2S File Structure

**Public headers that need to be included in the I2S application are as follows:**

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

---

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

---

**Public headers that have been included in the headers above are as follows:**

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

Fig. 6: I2S File Structure

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, which is more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

### Clock Terminology

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

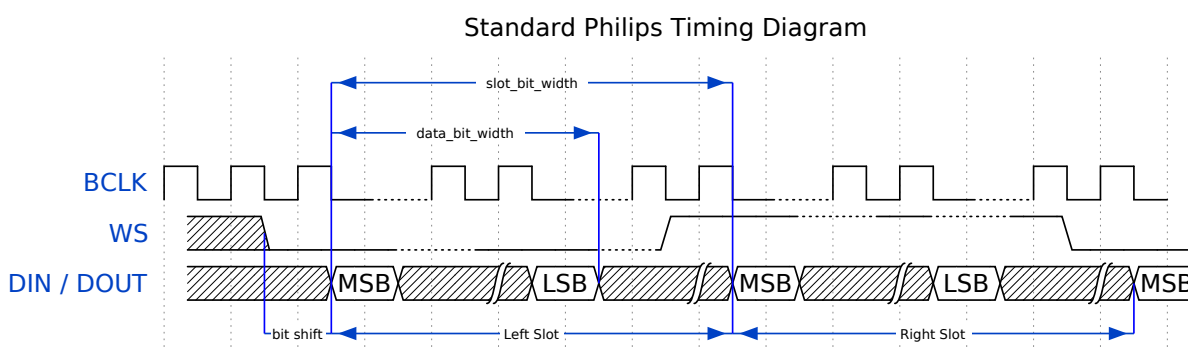

## I2S Communication Mode

### Overview of All Modes

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP-32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called “slots”. These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

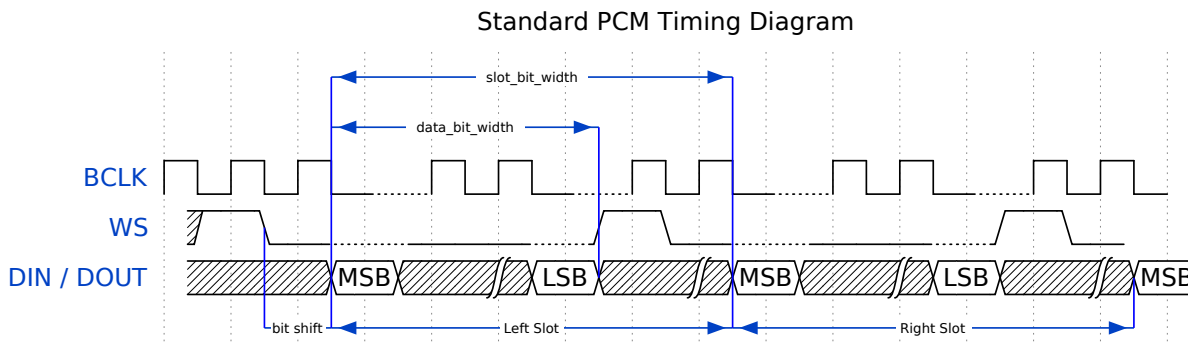

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format:** Basically the same as Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

## Functional Overview

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:

- `platform` level: Resources of all I2S controllers in the current target.
- `controller` level: Resources in one I2S controller.
- `channel` level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, `registered`, `ready`, and `running`. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keeps waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding 'reconfig'

Fig. 7: I2S Finite State Machine

functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Keep the interrupt being serviced even when the cache is disabled.
2. Place driver object into DRAM (in case it is linked to PSRAM by accident).

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to `driver/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left		0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		right		0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		both		0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	stereo	left		0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007
		right		0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		both		0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in 'i2s_common.h' and shared by all the I2S_
↳communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate a new TX channel and get the handle of this channel */

↳STD mode.
 * They can help to specify the slot and clock configurations for initialization_
↳or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↳wait);
```

(continues on next page)

(continued from previous page)

```

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↳resources */
i2s_del_channel(tx_handle);

```

**STD RX Mode** Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit		mono	left	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
			right	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
		stereo	any	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** 8-bit, 24-bit, and 32-bit are similar as 16-bit, where the data bit-width in the receiving buffer is equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

            .invert_flags = {
                .mclk_inv = false,
                .bclk_inv = false,
                .ws_inv = false,
            },
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before reading data, start the RX channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↪resources */
i2s_del_channel(rx_handle);

```

**Full-duplex** Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↪duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to_
↪be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↪SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
    },
};

```

(continues on next page)

(continued from previous page)

```

        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

**Simplex Mode** To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-S2 are not independent, so the TX and RX channel cannot coexist on the same I2S port in simplex mode.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit_
↳found
 * it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {

```

(continues on next page)

(continued from previous page)

```

        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

## Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t
↪handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

```

dma_desc_num > polling_cycle / interrupt_interval

```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

```

recv_buffer_size > dma_desc_num * dma_buffer_size

```

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↳ 549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↳ = 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

## API Reference

### Standard Mode

#### Header File

- [components/driver/include/driver/i2s\\_std.h](#)

#### Functions

`esp_err_t i2s_channel_init_std_mode` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_config\_t* \*std\_cfg)

Initialize i2s channel to standard mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

#### Parameters

- **handle** `–[in]` I2S channel handler
- **std\_cfg** `–[in]` Configurations for standard mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

#### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_std_clock` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won't change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **clk\_cfg** –[in] Standard mode clock configuration, can be generated by I2S\_STD\_CLK\_DEFAULT\_CONFIG

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **slot\_cfg** –[in] Standard mode slot configuration, can be generated by I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG, I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG and I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG.

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_NO\_MEM No memory for DMA buffer
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S gpio for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **gpio\_cfg** –[in] Standard mode gpio configuration, specified by user

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

## Structures

struct **i2s\_std\_slot\_config\_t**

I2S slot configuration for standard mode.

### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample)

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot)

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

*i2s\_std\_slot\_mask\_t* **slot\_mask**

Select the left, right or both slot

uint32\_t **ws\_width**

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool **ws\_pol**

WS signal polarity, set true to enable high lever first

bool **bit\_shift**

Set to enable bit shift in Philips mode

bool **msb\_right**

Set to place right channel data at the MSB in the FIFO

struct **i2s\_std\_clk\_config\_t**

I2S clock configuration for standard mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

***i2s\_mclk\_multiple\_t* mclk\_multiple**

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of '3' (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s\_std\_gpio\_config\_t**

I2S standard mode GPIO pins configuration.

**Public Members*****gpio\_num\_t* mclk**

MCK pin, output

***gpio\_num\_t* bclk**

BCK pin, input in slave role, output in master role

***gpio\_num\_t* ws**

WS pin, input in slave role, output in master role

***gpio\_num\_t* dout**

DATA pin, output

***gpio\_num\_t* din**

DATA pin, input

**uint32\_t mclk\_inv**

Set 1 to invert the mclk output

**uint32\_t bclk\_inv**

Set 1 to invert the bclk input/output

**uint32\_t ws\_inv**

Set 1 to invert the ws input/output

struct ***i2s\_std\_gpio\_config\_t*::[anonymous] invert\_flags**

GPIO pin invert flags

struct **i2s\_std\_config\_t**

I2S standard mode major configuration that including clock/slot/gpio configuration.

**Public Members*****i2s\_std\_clk\_config\_t* clk\_cfg**

Standard mode clock configuration, can be generated by macro I2S\_STD\_CLK\_DEFAULT\_CONFIG

***i2s\_std\_slot\_config\_t* slot\_cfg**

Standard mode slot configuration, can be generated by macros I2S\_STD\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

*i2s\_std\_gpio\_config\_t* **gpio\_cfg**

Standard mode gpio configuration, specified by user

### Macros

**I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PCM(short) format in 2 slots.

---

**Note:** PCM(long) is same as philips in 2 slots

---

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

MSB format in 2 slots.

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_CLK\_DEFAULT\_CONFIG** (rate)

i2s default standard clock configuration

---

**Note:** Please set the mclk\_multiple to I2S\_MCLK\_MULTIPLE\_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

---

#### Parameters

- **rate** –sample rate

### I2S Driver

#### Header File

- [components/driver/include/driver/i2s\\_common.h](#)

#### Functions

*esp\_err\_t* **i2s\_new\_channel** (const *i2s\_chan\_config\_t* \*chan\_cfg, *i2s\_chan\_handle\_t* \*ret\_tx\_handle, *i2s\_chan\_handle\_t* \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**Note:** When the port id in channel configuration is I2S\_NUM\_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**Note:** If both tx\_handle and rx\_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

---

---

**Note:** If tx\_handle OR rx\_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

---

#### Parameters

- **chan\_cfg** –[in] I2S controller channel configurations
- **ret\_tx\_handle** –[out] I2S channel handler used for managing the sending channel(optional)
- **ret\_rx\_handle** –[out] I2S channel handler used for managing the receiving channel(optional)

#### Returns

- ESP\_OK Allocate new channel(s) success
- ESP\_ERR\_NOT\_SUPPORTED The communication mode is not supported on the current chip
- ESP\_ERR\_INVALID\_ARG NULL pointer or illegal parameter in *i2s\_chan\_config\_t*
- ESP\_ERR\_NOT\_FOUND No available I2S channel found

*esp\_err\_t* **i2s\_del\_channel** (*i2s\_chan\_handle\_t* handle)

Delete the i2s channel.

---

**Note:** Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

---

---

**Note:** Resource will be free automatically if all channels in one port are deleted

---

#### Parameters **handle** –[in] I2S channel handler

- ESP\_OK Delete successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer

*esp\_err\_t* **i2s\_channel\_get\_info** (*i2s\_chan\_handle\_t* handle, *i2s\_chan\_info\_t* \*chan\_info)

Get I2S channel information.

#### Parameters

- **handle** –[in] I2S channel handler
- **chan\_info** –[out] I2S channel basic information

**Returns**

- ESP\_OK Get i2s channel information success
- ESP\_ERR\_NOT\_FOUND The input handle doesn't match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP\_ERR\_INVALID\_ARG The input handle or chan\_info pointer is NULL

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the i2s channel.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

---

---

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

---

**Parameters** **handle** –[in] I2S channel handler

- ESP\_OK Start successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not initialized or already started

*esp\_err\_t* **i2s\_channel\_disable** (*i2s\_chan\_handle\_t* handle)

Disable the i2s channel.

---

**Note:** Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

---

---

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

---

**Parameters** **handle** –[in] I2S channel handler**Returns**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_write** (*i2s\_chan\_handle\_t* handle, const void \*src, size\_t size, size\_t \*bytes\_written, uint32\_t timeout\_ms)

I2S write data.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**Parameters**

- **handle** –[in] I2S channel handler
- **src** –[in] The pointer of sent data buffer
- **size** –[in] Max data buffer length
- **bytes\_written** –[out] Byte number that actually be sent
- **timeout\_ms** –[in] Max block time

**Returns**

- **ESP\_OK** Write successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer or this handle is not tx handle
- **ESP\_ERR\_TIMEOUT** Writing timeout, no writing event received from ISR within `ticks_to_wait`
- **ESP\_ERR\_INVALID\_STATE** I2S is not ready to write

`esp_err_t i2s_channel_read` (*i2s\_chan\_handle\_t* handle, void \*dest, size\_t size, size\_t \*bytes\_read, uint32\_t timeout\_ms)

I2S read data.

---

**Note:** Only allowed to be called when the channel state is **RUNNING** but the **RUNNING** only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

#### Parameters

- **handle** –[in] I2S channel handler
- **dest** –[in] The pointer of receiving data buffer
- **size** –[in] Max data buffer length
- **bytes\_read** –[out] Byte number that actually be read
- **timeout\_ms** –[in] Max block time

#### Returns

- **ESP\_OK** Read successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer or this handle is not rx handle
- **ESP\_ERR\_TIMEOUT** Reading timeout, no reading event received from ISR within `ticks_to_wait`
- **ESP\_ERR\_INVALID\_STATE** I2S is not ready to read

`esp_err_t i2s_channel_register_event_callback` (*i2s\_chan\_handle\_t* handle, const *i2s\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for I2S channel.

---

**Note:** Only allowed to be called when the channel state is **REGISTARED / READY**, (i.e., before channel starts)

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to **NULL**.

---

---

**Note:** When **CONFIG\_I2S\_ISR\_IRAM\_SAFE** is enabled, the callback itself and functions called by it should be placed in **IRAM**. The variables used in the function should be in the **SRAM** as well. The `user_data` should also reside in **SRAM** or **internal RAM** as well.

---

#### Parameters

- **handle** –[in] I2S channel handler
- **callbacks** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

#### Returns

- **ESP\_OK** Set event callbacks successfully
- **ESP\_ERR\_INVALID\_ARG** Set event callbacks failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE** Set event callbacks failed because the current channel state is not **REGISTARED** or **READY**

## Structures

struct **i2s\_event\_callbacks\_t**

Group of I2S callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

*i2s\_isr\_callback\_t* **on\_recv**

Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data

*i2s\_isr\_callback\_t* **on\_recv\_q\_ovf**

Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten

*i2s\_isr\_callback\_t* **on\_sent**

Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data

*i2s\_isr\_callback\_t* **on\_send\_q\_ovf**

Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten

struct **i2s\_chan\_config\_t**

I2S controller channel configuration.

## Public Members

*i2s\_port\_t* **id**

I2S port id

*i2s\_role\_t* **role**

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

uint32\_t **dma\_desc\_num**

I2S DMA buffer number, it is also the number of DMA descriptor

uint32\_t **dma\_frame\_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of '3' when the data bit width is 24.

bool **auto\_clear**

Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct **i2s\_chan\_info\_t**  
I2S channel information.

### Public Members

*i2s\_port\_t* **id**  
I2S port id

*i2s\_role\_t* **role**  
I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

*i2s\_dir\_t* **dir**  
I2S channel direction

*i2s\_comm\_mode\_t* **mode**  
I2S channel communication mode

*i2s\_chan\_handle\_t* **pair\_chan**  
I2S pair channel handle in duplex mode, always NULL in simplex mode

### Macros

**I2S\_CHANNEL\_DEFAULT\_CONFIG** (i2s\_num, i2s\_role)  
get default I2S property

**I2S\_GPIO\_UNUSED**  
Used in *i2s\_gpio\_config\_t* for signals which are not used

### I2S Types

#### Header File

- [components/driver/include/driver/i2s\\_types.h](#)

### Structures

struct **i2s\_event\_data\_t**  
Event structure used in I2S event queue.

### Public Members

void \***data**  
The pointer of DMA buffer that just finished sending or receiving for *on\_recv* and *on\_sent* callback  
NULL for *on\_recv\_q\_ovf* and *on\_send\_q\_ovf* callback

size\_t **size**  
The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the *dma\_frame\_num* and *data\_bit\_width*, typically it is fixed when *data\_bit\_width* is not changed.

## Type Definitions

typedef struct i2s\_channel\_obj\_t \***i2s\_chan\_handle\_t**

i2s channel object handle, the control unit of the i2s driver

typedef bool (\***i2s\_isr\_callback\_t**)(*i2s\_chan\_handle\_t* handle, *i2s\_event\_data\_t* \*event, void \*user\_ctx)

I2S event callback.

**Param handle [in]** I2S channel handle, created from `i2s_new_channel()`

**Param event [in]** I2S event data

**Param user\_ctx [in]** User registered context, passed from `i2s_channel_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

enum **i2s\_port\_t**

I2S controller port number, the max port number is (SOC\_I2S\_NUM -1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S controller port 0

enumerator **I2S\_NUM\_AUTO**

Select whichever port is available

enum **i2s\_comm\_mode\_t**

I2S controller communication mode.

*Values:*

enumerator **I2S\_COMM\_MODE\_STD**

I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator **I2S\_COMM\_MODE\_NONE**

Unspecified I2S controller mode

enum **i2s\_mclk\_multiple\_t**

The multiple of mclk to sample rate.

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_128**

mclk = sample\_rate \* 128

enumerator **I2S\_MCLK\_MULTIPLE\_256**

mclk = sample\_rate \* 256

enumerator **I2S\_MCLK\_MULTIPLE\_384**

mclk = sample\_rate \* 384

enumerator **I2S\_MCLK\_MULTIPLE\_512**

mclk = sample\_rate \* 512

## Header File

- [components/hal/include/hal/i2s\\_types.h](#)

## Type Definitions

typedef *soc\_periph\_i2s\_clk\_src\_t* **i2s\_clock\_src\_t**

I2S clock source

## Enumerations

enum **i2s\_slot\_mode\_t**

I2S channel slot mode.

*Values:*

enumerator **I2S\_SLOT\_MODE\_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S\_SLOT\_MODE\_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s\_dir\_t**

I2S channel direction.

*Values:*

enumerator **I2S\_DIR\_RX**

I2S channel direction RX

enumerator **I2S\_DIR\_TX**

I2S channel direction TX

enum **i2s\_role\_t**

I2S controller role.

*Values:*

enumerator **I2S\_ROLE\_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S\_ROLE\_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s\_data\_bit\_width\_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S\_DATA\_BIT\_WIDTH\_8BIT**

I2S channel data bit-width: 8

enumerator **I2S\_DATA\_BIT\_WIDTH\_16BIT**

I2S channel data bit-width: 16

enumerator **I2S\_DATA\_BIT\_WIDTH\_24BIT**

I2S channel data bit-width: 24

enumerator **I2S\_DATA\_BIT\_WIDTH\_32BIT**

I2S channel data bit-width: 32

enum **i2s\_slot\_bit\_width\_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S\_SLOT\_BIT\_WIDTH\_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S\_SLOT\_BIT\_WIDTH\_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S\_SLOT\_BIT\_WIDTH\_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S\_SLOT\_BIT\_WIDTH\_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S\_SLOT\_BIT\_WIDTH\_32BIT**

I2S channel slot bit-width: 32

enum **i2s\_std\_slot\_mask\_t**

I2S slot select in standard mode.

---

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference.

---

*Values:*

enumerator **I2S\_STD\_SLOT\_LEFT**

I2S transmits or receives left slot

enumerator **I2S\_STD\_SLOT\_RIGHT**

I2S transmits or receives right slot

enumerator **I2S\_STD\_SLOT\_BOTH**

I2S transmits or receives both left and right slot

enum **i2s\_pdm\_slot\_mask\_t**

I2S slot select in PDM mode.

*Values:*

enumerator **I2S\_PDM\_SLOT\_RIGHT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S\_PDM\_SLOT\_LEFT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S\_PDM\_SLOT\_BOTH**

I2S PDM transmits or receives both two slots

## 2.5.13 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller’s internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g. ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the *Espressif Component Registry* <<https://components.espressif.com/>>.
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *I80 Interfaced LCD* describes the steps to install the I80 LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

### SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver will use this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to `-1` to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↳HOST, &io_config, &io_handle));

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_endian` sets the endian of the RGB color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```

esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_endian = LCD_RGB_ENDIAN_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↳panel_handle));

```

## I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0,
↳0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t) I2C_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↳panel_handle));
```

## I80 Interfaced LCD

1. Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:

- `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the I80 bus. Note, the default clock source may be different between ESP targets.
- `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec)
- `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec)

- `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16)
- `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
- `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```

esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
    .clk_src = LCD_CLK_SRC_DEFAULT,
    .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
    .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
    .data_gpio_nums = {
        EXAMPLE_PIN_NUM_DATA0,
        EXAMPLE_PIN_NUM_DATA1,
        EXAMPLE_PIN_NUM_DATA2,
        EXAMPLE_PIN_NUM_DATA3,
        EXAMPLE_PIN_NUM_DATA4,
        EXAMPLE_PIN_NUM_DATA5,
        EXAMPLE_PIN_NUM_DATA6,
        EXAMPLE_PIN_NUM_DATA7,
    },
    .bus_width = 8,
    .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /*
↳/ transfer 100 lines of pixels (assume pixel is RGB565) at most in
↳one transaction
    .psram_trans_align = EXAMPLE_PSRAM_DATA_ALIGNMENT,
    .sram_trans_align = 4,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));

```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
- `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency will result in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
- `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
    .cs_gpio_num = EXAMPLE_PIN_NUM_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .trans_queue_depth = 10,
    .dc_levels = {
        .dc_idle_level = 0,
        .dc_cmd_level = 0,
        .dc_dummy_level = 0,
        .dc_data_level = 1,
    },
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
};

```

(continues on next page)

(continued from previous page)

```
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i80(i80_bus, &io_config, &io_
↪handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I80 IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_endian` sets the endian of the pixel color data.

```
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_endian = LCD_RGB_ENDIAN_RGB,
    .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

### LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- Use `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen (different from LCD backlight).
- `esp_lcd_panel_draw_bitmap()` is the most significant function, that will do the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

### Application Example

LCD examples are located under: [peripherals/lcd](#):

- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi\\_lcd\\_touch](#)
- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- i80 controller based LCD and LVGL animation UI - [peripherals/lcd/i80\\_controller](#)
- RGB panel example with scatter chart UI - [peripherals/lcd/rgb\\_panel](#)
- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c\\_oled](#)

## API Reference

### Header File

- [components/hal/include/hal/lcd\\_types.h](#)

### Type Definitions

```
typedef soc\_periph\_lcd\_clk\_src\_t lcd_clock_source_t
```

LCD clock source.

## Enumerations

enum **lcd\_color\_rgb\_endian\_t**

RGB color endian.

*Values:*

enumerator **LCD\_RGB\_ENDIAN\_RGB**

RGB data endian: RGB

enumerator **LCD\_RGB\_ENDIAN\_BGR**

RGB data endian: BGR

enum **lcd\_color\_space\_t**

LCD color space.

*Values:*

enumerator **LCD\_COLOR\_SPACE\_RGB**

Color space: RGB

enumerator **LCD\_COLOR\_SPACE\_YUV**

Color space: YUV

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)

### Type Definitions

```
typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
```

Type of LCD panel IO handle

```
typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
```

Type of LCD panel handle

### Header File

### Functions

```
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)
```

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

#### Parameters

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **param** **-[out]** Buffer for the command data
- **param\_size** **-[in]** Size of `param` buffer

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

```
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**Parameters**

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **param** **-[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** **-[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_tx_color` (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*color, size\_t color\_size)

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**Parameters**

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **color** **-[in]** Buffer that holds the RGB color data
- **color\_size** **-[in]** Size of `color` in memory, in bytes

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_del` (*esp\_lcd\_panel\_io\_handle\_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_register_event_callbacks` (*esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_io\_callbacks\_t* \*cbs, void \*user\_ctx)

Register LCD panel IO callbacks.

**Parameters**

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** **-[in]** structure with all LCD panel IO callbacks
- **user\_ctx** **-[in]** User private data, passed directly to callback's `user_ctx`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_new_panel_io_spi` (*esp\_lcd\_spi\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_spi\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for SPI interface.

**Parameters**

- **bus** –[in] SPI bus handle
- **io\_config** –[in] IO configuration, for SPI interface
- **ret\_io** –[out] Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

```
esp_err_t esp_lcd_new_panel_io_i2c (esp_lcd_i2c_bus_handle_t bus, const
                                     esp_lcd_panel_io_i2c_config_t *io_config,
                                     esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

**Parameters**

- **bus** –[in] I2C bus handle
- **io\_config** –[in] IO configuration, for I2C interface
- **ret\_io** –[out] Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

```
esp_err_t esp_lcd_new_i80_bus (const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t
                                 *ret_bus)
```

Create Intel 8080 bus handle.

**Parameters**

- **bus\_config** –[in] Bus configuration
- **ret\_bus** –[out] Returned bus handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_NOT\_FOUND if no free bus is available
- ESP\_OK on success

```
esp_err_t esp_lcd_del_i80_bus (esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

**Parameters** **bus** –[in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if there still be some device attached to the bus
- ESP\_OK on success

```
esp_err_t esp_lcd_new_panel_io_i80 (esp_lcd_i80_bus_handle_t bus, const
                                     esp_lcd_panel_io_i80_config_t *io_config,
                                     esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

**Parameters**

- **bus** –[in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io\_config** –[in] IO configuration, for i80 interface
- **ret\_io** –[out] Returned panel IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if some configuration can't be satisfied, e.g. pixel clock out of the range
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_callbacks\_t**

Type of LCD panel IO callbacks.

## Public Members

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

struct **esp\_lcd\_panel\_io\_spi\_config\_t**

Panel IO configuration structure, for SPI interface.

## Public Members

int **cs\_gpio\_num**

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void **\*user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to *on\_color\_trans\_done*'s `user_ctx`

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

struct *esp\_lcd\_panel\_io\_i2c\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

struct **esp\_lcd\_i80\_bus\_config\_t**

LCD Intel 8080 bus configuration structure.

### Public Members

int **dc\_gpio\_num**

GPIO used for D/C line

int **wr\_gpio\_num**

GPIO used for WR line

*lcd\_clock\_source\_t* **clk\_src**

Clock source for the I80 LCD peripheral

int **data\_gpio\_nums**[(24)]

GPIOs used for data lines

size\_t **bus\_width**

Number of data lines, 8 or 16

size\_t **max\_transfer\_bytes**

Maximum transfer size, this determines the length of internal DMA link

size\_t **psram\_trans\_align**

DMA transfer alignment for data allocated from PSRAM

size\_t **sram\_trans\_align**

DMA transfer alignment for data allocated from SRAM

struct **esp\_lcd\_panel\_io\_i80\_config\_t**

Panel IO configuration structure, for intel 8080 interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

uint32\_t **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Transaction queue size, larger queue, higher throughput

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data was transferred done

void **\*user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_idle\_level**

Level of DC line in IDLE phase

unsigned int **dc\_cmd\_level**

Level of DC line in CMD phase

unsigned int **dc\_dummy\_level**

Level of DC line in DUMMY phase

unsigned int **dc\_data\_level**

Level of DC line in DATA phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **dc\_levels**

Each i80 device might have its own D/C control logic

unsigned int **cs\_active\_high**

If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse\_color\_bits**

Reverse the data bits,  $D[N:0] \rightarrow D[0:N]$

unsigned int **swap\_color\_bytes**

Swap adjacent two color bytes

unsigned int **pclk\_active\_neg**

The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk\_idle\_low**

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **flags**

Panel IO config flags

### Type Definitions

typedef void **\*esp\_lcd\_spi\_bus\_handle\_t**

Type of LCD SPI bus handle

```
typedef void *esp_lcd_i2c_bus_handle_t
```

Type of LCD I2C bus handle

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,  
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_XXX_config_t`

**Return** Whether a high priority task has been waken up by this function

### Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

### Functions

```
esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
```

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters panel [in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
```

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

---

**Parameters panel [in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)
```

Deinitialize the LCD panel.

**Parameters panel [in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end,  
int y_end, const void *color_data)
```

Draw bitmap on LCD panel.

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** **-[in]** Start index on x-axis (x\_start included)
- **y\_start** **-[in]** Start index on y-axis (y\_start included)
- **x\_end** **-[in]** End index on x-axis (x\_end not included)
- **y\_end** **-[in]** End index on y-axis (y\_end not included)
- **color\_data** **-[in]** RGB color data that will be dumped to the specific window range

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** **-[in]** Whether the panel will be mirrored about the x axis
- **mirror\_y** **-[in]** Whether the panel will be mirrored about the y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** **-[in]** Whether to swap the x and y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** **-[in]** Extra gap on x axis, in pixels
- **y\_gap** **-[in]** Extra gap on y axis, in pixels

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

#### Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** **–[in]** Whether to invert the color data

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_on\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

#### Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** **–[in]** True to turns on display, False to turns off display

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

#### Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** **–[in]** Whether to turn off the screen

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

### Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

### Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

### Functions

*esp\_err\_t* **esp\_lcd\_new\_panel\_st7789** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model ST7789.

#### Parameters

- **io** **–[in]** LCD panel IO handle
- **panel\_dev\_config** **–[in]** general panel device configuration
- **ret\_panel** **–[out]** Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_nt35510** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model NT35510.

**Parameters**

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_ssd1306** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model SSD1306.

**Parameters**

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Structures**

struct **esp\_lcd\_panel\_dev\_config\_t**

Configuration structure for panel device.

**Public Members**

int **reset\_gpio\_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

*lcd\_color\_rgb\_endian\_t* **color\_space**

*Deprecated:*

Set RGB color space, please use `rgb_endian` instead

*lcd\_color\_rgb\_endian\_t* **rgb\_endian**

Set RGB data endian: RGB or BGR

unsigned int **bits\_per\_pixel**

Color depth, in bpp

unsigned int **reset\_active\_high**

Setting this if the panel reset is high level active

struct *esp\_lcd\_panel\_dev\_config\_t*::[anonymous] **flags**

LCD panel config flags

void \***vendor\_config**

vendor specific configuration, optional, left as NULL if not used

## 2.5.14 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-S2 only supports configuring channels in “low speed” mode.

1. *Timer Configuration* by specifying the PWM signal’s frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 8: Key Settings of LED PWM Controller’s API

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 5: Characteristics of ESP32-S2 LEDC source clocks

Clock name	Clock freq	Clock capabilities
APB_CLK	80 MHz	/
REF_TICK	1 MHz	Dynamic Frequency Scaling compatible
RTC8M_CLK	~8 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
XTAL_CLK	40 MHz	Dynamic Frequency Scaling compatible

**Note:**

1. On ESP32-S2, if RTCxM\_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

**Note:** All the timers and channels in the ESP32-S2's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2 \times \text{duty\_resolution}) - 1$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the [ESP32-S2 Technical Reference Manual > LED PWM Controller \(LEDC\) \[PDF\]](#)).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

## API Reference

### Header File

- `components/driver/include/driver/ledc.h`

### Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Parameters** `ledc_conf` –Pointer of LEDC channel configure struct

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** `timer_conf` –Pointer of LEDC timer configure struct

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

`esp_err_t ledc_update_duty` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

**Parameters**

- **gpio\_num** –The LEDC output gpio
- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** –Set output idle level after LEDC stops.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** –Set the LEDC frequency

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

uint32\_t **ledc\_get\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- 0 error
- Others Current LEDC frequency

*esp\_err\_t* **ledc\_set\_duty\_with\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

LEDC set duty and hpoint value Only after calling *ledc\_update\_duty* will the duty update.

---

**Note:** *ledc\_set\_duty*, *ledc\_set\_duty\_with\_hpoint* and *ledc\_update\_duty* are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is *ledc\_set\_duty\_and\_update*

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

int **ledc\_get\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*

**Returns**

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call *ledc\_set\_duty\_with\_hpoint*. only after calling *ledc\_update\_duty* will the duty update.

---

**Note:** *ledc\_set\_duty*, *ledc\_set\_duty\_with\_hpoint* and *ledc\_update\_duty* are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is *ledc\_set\_duty\_and\_update*.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution) - 1]$

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`uint32_t ledc_get_duty` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### Returns

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

`esp_err_t ledc_set_fade` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` duty, `ledc_duty_direction_t` fade\_direction, `uint32_t` step\_num, `uint32_t` duty\_cycle\_num, `uint32_t` duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is  $[0, (2^{**}duty\_resolution) - 1]$
- **fade\_direction** –Set the direction of the gradient
- **step\_num** –Set the number of the gradient
- **duty\_cycle\_num** –Set how many LEDC tick each time the gradient lasts
- **duty\_scale** –Set gradient change amplitude

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_isr_register` (`void (*fn)(void*)`, `void *arg`, `int` intr\_alloc\_flags, `ledc_isr_handle_t *`handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** –Resolution of duty setting in number of bits. The range of duty values is [0, (2\*\*duty\_resolution)]
- **clk\_src** –Select LEDC source clock.

**Returns**

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every cycle\_num cycles

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API

---

is `ledc_set_fade_step_and_start`

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_fade_func_install` (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function already installed.

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

*esp\_err\_t* `ledc_fade_start` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade\_mode** –Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if LEDC\_FADE\_WAIT\_DONE mode is selected.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.

- ESP\_ERR\_INVALID\_ARG Parameter error.

*esp\_err\_t* **ledc\_fade\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

Stop LEDC fading. Duty of the channel will stay at its present vlaue.

---

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

---

---

**Note:** Call this API will abort the fading operation only if it was started by calling ledc\_fade\_start with LEDC\_FADE\_NO\_WAIT mode.

---

---

**Note:** If a fade was started with LEDC\_FADE\_WAIT\_DONE mode, calling this API afterwards is no use in stopping the fade. Fade will continue until it reaches the target duty.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_ERR\_INVALID\_ARG Parameter error.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

*esp\_err\_t* **ledc\_set\_fade\_time\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call ledc\_fade\_func\_install() once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).
- **fade\_mode** –choose blocking or non-blocking mode

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_set_fade_step_and_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` target\_duty, `uint32_t` scale, `uint32_t` cycle\_num, `ledc_fade_mode_t` fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every cycle\_num cycles
- **fade\_mode** –choose blocking or non-blocking mode

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_cb_register` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_cbs_t` \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** –Group of LEDC callback functions
- **user\_arg** –user registered data for the callback function

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

**Structures**

struct **ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for ledc\_channel\_config function.

**Public Members**

int **gpio\_num**

the LEDC output gpio\_num, if you want to use gpio16, gpio\_num = 16

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - 7)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - 3)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

int **hpoint**

LEDC channel hpoint value, the max value is 0xffff

unsigned int **output\_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC Timer timer for ledc\_timer\_config function.

**Public Members**

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode or low-speed mode

***ledc\_timer\_bit\_t* duty\_resolution**

LEDC channel duty resolution

***ledc\_timer\_t* timer\_num**

The timer source of channel (0 - 3)

**uint32\_t freq\_hz**

LEDC timer frequency (Hz)

***ledc\_clk\_cfg\_t* clk\_cfg**

Configure LEDC source clock from *ledc\_clk\_cfg\_t*. Note that `LEDC_USE_RTC8M_CLK` and `LEDC_USE_XTAL_CLK` are non-timer-specific clock sources. You can not have one LEDC timer uses `RTC8M_CLK` as the clock source and have another LEDC timer uses `XTAL_CLK` as its clock source. All chips except `esp32` and `esp32s2` do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct **ledc\_cb\_param\_t**

LEDC callback parameter.

**Public Members*****ledc\_cb\_event\_t* event**

Event name

**uint32\_t speed\_mode**

Speed mode of the LEDC channel group

**uint32\_t channel**LEDC channel (0 - `LEDC_CHANNEL_MAX-1`)**uint32\_t duty**LEDC current duty of the channel, the range of duty is  $[0, (2^{**}duty\_resolution) - 1]$ struct **ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Public Members*****ledc\_cb\_t* fade\_cb**

LEDC fade\_end callback function

**Macros**

**LEDC\_APB\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, APB\_CLK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_REF\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, REF\_TICK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_ERR\_DUTY****LEDC\_ERR\_VAL****Type Definitions**

```
typedef intr_handle_t ledc_isr_handle_t
```

```
typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
```

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

**Enumerations**

```
enum ledc_cb_event_t
```

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

**Header File**

- [components/hal/include/hal/ledc\\_types.h](#)

**Enumerations**

```
enum ledc_mode_t
```

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC\_SLOW\_CLK\_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enum **ledc\_clk\_cfg\_t**

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_APB\_CLK**

LEDC timer select APB clock as source clock

enumerator **LEDC\_USE\_RTC8M\_CLK**

LEDC timer select RTC8M\_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC\_USE\_REF\_TICK**

LEDC timer select REF\_TICK clock as source clock

enumerator **LEDC\_USE\_XTAL\_CLK**

LEDC timer select XTAL clock as source clock

enum **ledc\_clk\_src\_t**

*Values:*

enumerator **LEDC\_REF\_TICK**

LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC\_APB\_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC\_SCLK**

Selecting this value for LEDC\_TICK\_SEL\_TIMER let the hardware take its source clock from LEDC\_APB\_CLK\_SEL

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_6**

LEDC channel 6

enumerator **LEDC\_CHANNEL\_7**

LEDC channel 7

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator `LEDC_TIMER_10_BIT`

LEDC PWM duty resolution of 10 bits

enumerator `LEDC_TIMER_11_BIT`

LEDC PWM duty resolution of 11 bits

enumerator `LEDC_TIMER_12_BIT`

LEDC PWM duty resolution of 12 bits

enumerator `LEDC_TIMER_13_BIT`

LEDC PWM duty resolution of 13 bits

enumerator `LEDC_TIMER_14_BIT`

LEDC PWM duty resolution of 14 bits

enumerator `LEDC_TIMER_BIT_MAX`

enum `ledc_fade_mode_t`

*Values:*

enumerator `LEDC_FADE_NO_WAIT`

LEDC fade function will return immediately

enumerator `LEDC_FADE_WAIT_DONE`

LEDC fade function will block until fading to the target duty

enumerator `LEDC_FADE_MAX`

## 2.5.15 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-S2 contains multiple pulse counter units in the module.<sup>1</sup> Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

---

<sup>1</sup> Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver won't forbid you from applying for more PCNT units and channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `pcnt_new_unit()`).

## Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.
- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.
- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there's a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e. unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it's recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can be assigned to `-1` if it's not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO will cause that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to `-1`.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e. channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it's recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

**Set Up Channel Actions** The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↪DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
↪counting mode when the control signal is low level (continues on next page)
```

(continued from previous page)

```
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↳KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points** Each PCNT unit can be configured to watch several different values that you're interested in. The value to be watched is also called **Watch Point**. The watch point itself can't exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See [Register Event Callbacks](#) for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly used watch points are: **zero cross**, **maximum / minimum count** and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can't find any free hardware resource to save the watch point. You can't add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function doesn't attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function will result in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
```

(continues on next page)

(continued from previous page)

```

// return whether a high priority task has been waken up by this function
return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));

```

**Set Glitch Filter** The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in [pcnt\\_glitch\\_filter\\_config\\_t](#):

- [pcnt\\_glitch\\_filter\\_config\\_t::max\\_glitch\\_ns](#) sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and won't increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with a *NULL* filter configuration.

This function should be called when the the unit is in the init state. Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

---

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB\_CLK cycle (usually 12.5 ns if APB equals 80MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter won't work as expect in that case. So the driver will install a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see [Power Management](#).

---

```

pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));

```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling [pcnt\\_unit\\_enable\(\)](#). Internally, this function will:

- switch the PCNT driver state from **init** to **enable**.
- enable the interrupt service if it has been lazy installed in [pcnt\\_unit\\_register\\_event\\_callbacks\(\)](#).
- acquire a proper power management lock if it has been lazy installed in [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#). See also [Power Management](#) for more information.

On the contrary, calling [pcnt\\_unit\\_disable\(\)](#) will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

## Unit IO Control

**Start/Stop and Clear** Calling [pcnt\\_unit\\_start\(\)](#) will make the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling [pcnt\\_unit\\_stop\(\)](#) will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling [pcnt\\_unit\\_clear\\_count\(\)](#).

Note, [pcnt\\_unit\\_start\(\)](#) and [pcnt\\_unit\\_stop\(\)](#) should be called when the unit has been enabled by [pcnt\\_unit\\_enable\(\)](#). Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

**Get Count Value** You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

**Note:** `pcnt_unit_clear_count()` will reset the accumulated count value as well.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by `pcnt_unit_set_glitch_filter()`, the driver will guarantee that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

**IRAM Safe** By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM<sup>2</sup>
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There's another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`

<sup>2</sup> `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Decode the quadrature signals from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

### API Reference

#### Header File

- `components/driver/include/driver/pulse_cnt.h`

#### Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` \*config, `pcnt_unit_handle_t` \*ret\_unit)

Create a new PCNT unit, and return the handle.

---

**Note:** The newly created PCNT unit is put in the init state.

---

#### Parameters

- **config** –[in] PCNT unit configuration
- **ret\_unit** –[out] Returned PCNT unit handle

#### Returns

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit` (`pcnt_unit_handle_t` unit)

Delete the PCNT unit handle.

---

**Note:** A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

#### Returns

- `ESP_OK`: Delete the PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT unit failed because of invalid argument

- `ESP_ERR_INVALID_STATE`: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- `ESP_FAIL`: Delete the PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_set_glitch_filter` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_glitch\_filter\_config\_t* \*config)

Set glitch filter for PCNT unit.

---

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

---

---

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

---

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **config** –[in] PCNT filter configuration, set config to NULL means disabling the filter function

#### Returns

- `ESP_OK`: Set glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- `ESP_ERR_INVALID_STATE`: Set glitch filter failed because the unit is not in the init state
- `ESP_FAIL`: Set glitch filter failed because of other error

*esp\_err\_t* `pcnt_unit_enable` (*pcnt\_unit\_handle\_t* unit)

Enable the PCNT unit.

---

**Note:** This function will transit the unit state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

---

---

**Note:** This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

---

---

**Note:** Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

#### Returns

- `ESP_OK`: Enable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Enable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable PCNT unit failed because the unit is already enabled
- `ESP_FAIL`: Enable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_disable** (*pcnt\_unit\_handle\_t* unit)

Disable the PCNT unit.

---

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

---

---

**Note:** Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Disable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Disable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Disable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_start** (*pcnt\_unit\_handle\_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_stop** (*pcnt\_unit\_handle\_t* unit)

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

---

**Note:** This function is allowed to run within ISR context

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters** `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_clear_count` (*pcnt\_unit\_handle\_t* unit)

Clear PCNT pulse count value to zero.

**Note:** It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_get_count` (*pcnt\_unit\_handle\_t* unit, int \*value)

Get PCNT count value.

**Note:** This function is allowed to run within ISR context

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`
- `value` –[out] Returned count value

**Returns**

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_register_event_callbacks` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for PCNT unit.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `pcnt_unit_add_watch_point` (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** –[in] Value to be watched

#### Returns

- `ESP_OK`: Add watch point successfully
- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

*esp\_err\_t* `pcnt_unit_remove_watch_point` (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Remove a watch point for PCNT unit.

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** –[in] Watch point value

#### Returns

- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

*esp\_err\_t* `pcnt_new_channel` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_chan\_config\_t* \*config, *pcnt\_channel\_handle\_t* \*ret\_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

---

**Note:** This function should be called when the unit is in init state (i.e. before calling

`pcnt_unit_enable()`

---

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **config** –[in] PCNT channel configuration
- **ret\_chan** –[out] Returned channel handle

#### Returns

- `ESP_OK`: Create PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create PCNT channel failed because of insufficient memory
- `ESP_ERR_NOT_FOUND`: Create PCNT channel failed because all PCNT channels are used up and no more free one
- `ESP_ERR_INVALID_STATE`: Create PCNT channel failed because the unit is not in the init state
- `ESP_FAIL`: Create PCNT channel failed because of other error

*esp\_err\_t* `pcnt_del_channel` (*pcnt\_channel\_handle\_t* chan)

Delete the PCNT channel.

**Parameters** **chan** –[in] PCNT channel handle created by `pcnt_new_channel()`

#### Returns

- `ESP_OK`: Delete the PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT channel failed because of invalid argument
- `ESP_FAIL`: Delete the PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_edge_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_edge\_action\_t* pos\_act, *pcnt\_channel\_edge\_action\_t* neg\_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

#### Parameters

- **chan** –[in] PCNT channel handle created by `pcnt_new_channel()`
- **pos\_act** –[in] Action on posedge signal
- **neg\_act** –[in] Action on negedge signal

#### Returns

- `ESP_OK`: Set edge action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set edge action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set edge action for PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_level_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_level\_action\_t* high\_act, *pcnt\_channel\_level\_action\_t* low\_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

#### Parameters

- **chan** –[in] PCNT channel handle created by `pcnt_new_channel()`
- **high\_act** –[in] Action on high level signal
- **low\_act** –[in] Action on low level signal

#### Returns

- `ESP_OK`: Set level action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set level action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set level action for PCNT channel failed because of other error

## Structures

struct **pcnt\_watch\_event\_data\_t**

PCNT watch event data.

### Public Members

int **watch\_point\_value**

Watch point value that triggered the event

*pcnt\_unit\_zero\_cross\_mode\_t* **zero\_cross\_mode**

Zero cross mode

struct **pcnt\_event\_callbacks\_t**

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PCNT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*pcnt\_watch\_cb\_t* **on\_reach**

Called when PCNT unit counter reaches any watch point

struct **pcnt\_unit\_config\_t**

PCNT unit configuration.

### Public Members

int **low\_limit**

Low limitation of the count unit, should be lower than 0

int **high\_limit**

High limitation of the count unit, should be higher than 0

uint32\_t **accum\_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt\_unit\_config\_t*::[anonymous] **flags**

Extra flags

struct **pcnt\_chan\_config\_t**

PCNT channel configuration.

### Public Members

int **edge\_gpio\_num**

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level\_gpio\_num**

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32\_t **invert\_edge\_input**

Invert the input edge signal

uint32\_t **invert\_level\_input**

Invert the input level signal

uint32\_t **virt\_edge\_io\_level**

Virtual edge IO level, 0: low, 1: high. Only valid when edge\_gpio\_num is set to -1

uint32\_t **virt\_level\_io\_level**

Virtual level IO level, 0: low, 1: high. Only valid when level\_gpio\_num is set to -1

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_chan\_config\_t*::[anonymous] **flags**

Channel config flags

struct **pcnt\_glitch\_filter\_config\_t**

PCNT glitch filter configuration.

### Public Members

uint32\_t **max\_glitch\_ns**

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

### Type Definitions

typedef struct pcnt\_unit\_t \***pcnt\_unit\_handle\_t**

Type of PCNT unit handle.

typedef struct pcnt\_chan\_t \***pcnt\_channel\_handle\_t**

Type of PCNT channel handle.

typedef bool (\***pcnt\_watch\_cb\_t**)(*pcnt\_unit\_handle\_t* unit, const *pcnt\_watch\_event\_data\_t* \*edata, void \*user\_ctx)

PCNT watch event callback prototype.

---

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

---

**Param unit [in]** PCNT unit handle

**Param edata [in]** PCNT event data, fed by the driver

**Param user\_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- [components/hal/include/hal/pcnt\\_types.h](#)

### Enumerations

enum `pcnt_channel_level_action_t`

PCNT channel action on control level.

*Values:*

enumerator `PCNT_CHANNEL_LEVEL_ACTION_KEEP`

Keep current count mode

enumerator `PCNT_CHANNEL_LEVEL_ACTION_INVERSE`

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator `PCNT_CHANNEL_LEVEL_ACTION_HOLD`

Hold current count value

enum `pcnt_channel_edge_action_t`

PCNT channel action on signal edge.

*Values:*

enumerator `PCNT_CHANNEL_EDGE_ACTION_HOLD`

Hold current count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_INCREASE`

Increase count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`

Decrease count value

enum `pcnt_unit_zero_cross_mode_t`

PCNT unit zero cross mode.

*Values:*

enumerator `PCNT_UNIT_ZERO_CROSS_POS_ZERO`

start from positive value, end to zero, i.e. +N->0

enumerator `PCNT_UNIT_ZERO_CROSS_NEG_ZERO`

start from negative value, end to zero, i.e. -N->0

enumerator `PCNT_UNIT_ZERO_CROSS_NEG_POS`

start from negative value, end to positive value, i.e. -N->+M

enumerator `PCNT_UNIT_ZERO_CROSS_POS_NEG`

start from positive value, end to negative value, i.e. +N->-M

## 2.5.16 Remote Control Transceiver (RMT)

### Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-S2 contains multiple channels in the RMT peripheral<sup>1</sup>. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern –the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

Fig. 9: Structure of RMT symbols (L - signal level)

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

<sup>1</sup> Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation*.

Fig. 10: RMT Transmitter Overview

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

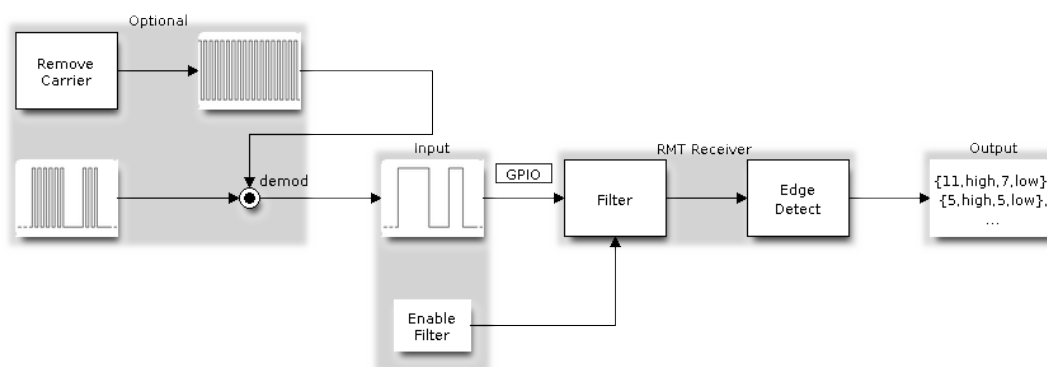

Fig. 11: RMT Receiver Overview

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

### Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks in order to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.

- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, we recommend you set a large value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,           // set the number of transactions that can
    ↪pend in the background
}
```

(continues on next page)

(continued from previous page)

```

    .flags.invert_out = false,           // do not invert output signal
    .flags.with_dma = false,           // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));

```

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```

rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                   // GPIO number
    .flags.invert_in = false,        // do not invert input signal
    .flags.with_dma = false,         // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));

```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

**Uninstall RMT Channel** If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

**Carrier Modulation and Demodulation** The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 38000,      // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
    ↪level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 25000,      // 25 KHz carrier, should be smaller than_
    ↪the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

**Register Event Callbacks** When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

**Enable and Disable Channel** `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction** RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to *RMT Encoder*.

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, we also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

---

**Note:** The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

---

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
- Customize an encoder and construct an infinite loop in the encoding function. See also *RMT Encoder*.

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), we do not want any time drift in between when startup multiple TX channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

Fig. 12: RMT TX Sync

**Install RMT Sync Manager** To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in

`rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        // can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
// num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for
// tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
// num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: `hw buffer too small, received symbols truncated`.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also [Register Event Callbacks](#) for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is_
↳560 µs, 1250 ns < 560 µs, valid signal is not treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is_
↳9000 µs, 12000000 ns > 9000 µs, the receive does not stop early
};

rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a_
↳standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
↳config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);
```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, we utilize a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** in order to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly-used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.

- The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
- If the result contains `RMT_ENCODING_MEM_FULL`, we need to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

Fig. 13: RMT Encoder Chain

**Customize RMT Encoder for NEC Protocol** In this section, we demonstrate how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is  $562.5 \mu\text{s}$  in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5  $\mu$ s pulse burst followed by a 562.5  $\mu$ s space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5  $\mu$ s pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

Fig. 14: IR NEC Frame

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5  $\mu$ s pulse burst to signify the end of message transmission

Then we can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
```

(continues on next page)

(continued from previous page)

```

    case 0: // send leading code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↳encoder->nec_leading_symbol,
                                                    sizeof(rmt_symbol_word_t), &
↳session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 1; // we can only switch to the next state when
↳the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↳artifacts
        }
        // fall-through
    case 1: // send address
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↳code->address, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 2; // we can only switch to the next state when
↳the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↳artifacts
        }
        // fall-through
    case 2: // send command
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↳code->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; // we can only switch to the next state when
↳the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↳artifacts
        }
        // fall-through
    case 3: // send ending code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↳encoder->nec_ending_symbol,
                                                    sizeof(rmt_symbol_word_t), &
↳session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = RMT_ENCODING_RESET; // back to the initial
↳encoding session
            state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding
↳has finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↳artifacts
        }
    }
out:
    *ret_state = state;
    return encoded_symbols;

```

(continues on next page)

```
}

```

A full sample code can be found in [peripherals/rmt/ir\\_nec\\_transceiver](#). In the above snippet, we use a `switch-case` and several `goto` statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the user creates an RMT channel that has selected `RMT_CLK_SRC_APB` as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by `rmt_enable()`. Likewise, the driver releases the lock after `rmt_disable()` is called for the same channel. This also reveals that the `rmt_enable()` and `rmt_disable()` should appear in pairs.

If the channel clock source is selected to others like `RMT_CLK_SRC_XTAL`, then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM<sup>2</sup>
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also [IRAM Safe](#) for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

### Application Examples

- RMT-based RGB LED strip customized encoder: [peripherals/rmt/led\\_strip](#)
- RMT IR NEC protocol encoding and decoding: [peripherals/rmt/ir\\_nec\\_transceiver](#)
- RMT transactions in queue: [peripherals/rmt/musical\\_buzzer](#)
- RMT-based stepper motor with S-curve algorithm: [peripherals/rmt/stepper\\_motor](#)
- RMT infinite loop for driving DShot ESC: [peripherals/rmt/dshot\\_esc](#)

<sup>2</sup> The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

- RMT simulate 1-wire protocol (take DS18B20 as example): [peripherals/rmt/onewire](#)

## FAQ

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes **faster** than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
- Place the encoding function in the IRAM.
- Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

## API Reference

### Header File

- [components/driver/include/driver/rmt\\_tx.h](#)

### Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t` \*config, `rmt_channel_handle_t` \*ret\_chan)

Create a RMT TX channel.

#### Parameters

- **config** –[in] TX channel configurations
- **ret\_chan** –[out] Returned generic RMT channel handle

#### Returns

- ESP\_OK: Create RMT TX channel successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT TX channel failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT TX channel failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP\_ERR\_NOT\_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP\_FAIL: Create RMT TX channel failed because of other error

`esp_err_t rmt_transmit` (`rmt_channel_handle_t` tx\_channel, `rmt_encoder_handle_t` encoder, const void \*payload, size\_t payload\_bytes, const `rmt_transmit_config_t` \*config)

Transmit data by RMT TX channel.

---

**Note:** This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it' s dispatched in the ISR. If there' re too many transactions pending in the queue, this function will block until the queue has free space.

---

---

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific `encoder`.

---

#### Parameters

- **tx\_channel** –[in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** –[in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** –[in] The raw data to be encoded into RMT symbols
- **payload\_bytes** –[in] Size of the `payload` in bytes

- **config** –[in] Transmission specific configuration

**Returns**

- ESP\_OK: Transmit data successfully
- ESP\_ERR\_INVALID\_ARG: Transmit data failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Transmit data failed because channel is not enabled
- ESP\_ERR\_NOT\_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP\_FAIL: Transmit data failed because of other error

*esp\_err\_t* **rmt\_tx\_wait\_all\_done** (*rmt\_channel\_handle\_t* tx\_channel, int timeout\_ms)

Wait for all pending TX transactions done.

---

**Note:** This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

---

**Parameters**

- **tx\_channel** –[in] RMT TX channel that created by `rmt_new_tx_channel()`
- **timeout\_ms** –[in] Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**

- ESP\_OK: Flush transactions successfully
- ESP\_ERR\_INVALID\_ARG: Flush transactions failed because of invalid argument
- ESP\_ERR\_TIMEOUT: Flush transactions failed because of timeout
- ESP\_FAIL: Flush transactions failed because of other error

*esp\_err\_t* **rmt\_tx\_register\_event\_callbacks** (*rmt\_channel\_handle\_t* tx\_channel, const *rmt\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for RMT TX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

**Parameters**

- **tx\_channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **rmt\_new\_sync\_manager** (const *rmt\_sync\_manager\_config\_t* \*config, *rmt\_sync\_manager\_handle\_t* \*ret\_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

---

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

---

**Parameters**

- **config** *–[in]* Synchronization manager configuration
- **ret\_synchro** *–[out]* Returned synchronization manager handle

**Returns**

- ESP\_OK: Create sync manager successfully
- ESP\_ERR\_INVALID\_ARG: Create sync manager failed because of invalid argument
- ESP\_ERR\_NOT\_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP\_ERR\_INVALID\_STATE: Create sync manager failed because not all channels are enabled
- ESP\_ERR\_NO\_MEM: Create sync manager failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP\_FAIL: Create sync manager failed because of other error

*esp\_err\_t* **rmt\_del\_sync\_manager** (*rmt\_sync\_manager\_handle\_t* synchro)

Delete synchronization manager.

**Parameters** **synchro** *–[in]* Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Delete the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Delete the synchronization manager failed because of invalid argument
- ESP\_FAIL: Delete the synchronization manager failed because of other error

*esp\_err\_t* **rmt\_sync\_reset** (*rmt\_sync\_manager\_handle\_t* synchro)

Reset synchronization manager.

**Parameters** **synchro** *–[in]* Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Reset the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Reset the synchronization manager failed because of invalid argument
- ESP\_FAIL: Reset the synchronization manager failed because of other error

**Structures**

struct **rmt\_tx\_event\_callbacks\_t**

Group of RMT TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*rmt\_tx\_done\_callback\_t* **on\_trans\_done**

Event callback, invoked when transmission is finished

struct **rmt\_tx\_channel\_config\_t**

RMT TX channel specific configuration.

## Public Members

*gpio\_num\_t* **gpio\_num**

GPIO number used by RMT TX channel. Set to -1 if unused

*rmt\_clock\_source\_t* **clk\_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32\_t **resolution\_hz**

Channel clock resolution, in Hz

size\_t **mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size\_t **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

uint32\_t **invert\_out**

Whether to invert the RMT channel signal before output to GPIO pad

uint32\_t **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32\_t **io\_loop\_back**

The signal output from the GPIO will be fed to the input path as well

uint32\_t **io\_od\_mode**

Configure the GPIO as open-drain mode

struct *rmt\_tx\_channel\_config\_t*::[anonymous] **flags**

TX channel config flags

struct **rmt\_transmit\_config\_t**

RMT transmit specific configuration.

## Public Members

int **loop\_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32\_t **eot\_level**

Set the output level for the “End Of Transmission”

struct *rmt\_transmit\_config\_t*::[anonymous] **flags**

Transmit config flags

struct **rmt\_sync\_manager\_config\_t**

Synchronous manager configuration.

## Public Members

const *rmt\_channel\_handle\_t* \***tx\_channel\_array**

Array of TX channels that are about to be managed by a synchronous controller

size\_t **array\_size**

Size of the *tx\_channel\_array*

## Header File

- `components/driver/include/driver/rmt_rx.h`

## Functions

*esp\_err\_t* **rmt\_new\_rx\_channel** (const *rmt\_rx\_channel\_config\_t* \*config, *rmt\_channel\_handle\_t* \*ret\_chan)

Create a RMT RX channel.

### Parameters

- **config** –[in] RX channel configurations
- **ret\_chan** –[out] Returned generic RMT channel handle

### Returns

- ESP\_OK: Create RMT RX channel successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT RX channel failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT RX channel failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP\_ERR\_NOT\_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP\_FAIL: Create RMT RX channel failed because of other error

*esp\_err\_t* **rmt\_receive** (*rmt\_channel\_handle\_t* rx\_channel, void \*buffer, size\_t buffer\_size, const *rmt\_receive\_config\_t* \*config)

Initiate a receive job for RMT RX channel.

---

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

---

### Parameters

- **rx\_channel** –[in] RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** –[in] The buffer to store the received RMT symbols
- **buffer\_size** –[in] size of the `buffer`, in bytes
- **config** –[in] Receive specific configurations

### Returns

- ESP\_OK: Initiate receive job successfully
- ESP\_ERR\_INVALID\_ARG: Initiate receive job failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Initiate receive job failed because channel is not enabled
- ESP\_FAIL: Initiate receive job failed because of other error

*esp\_err\_t* **rmt\_rx\_register\_event\_callbacks** (*rmt\_channel\_handle\_t* rx\_channel, const *rmt\_rx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for RMT RX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- **rx\_channel** –[in] RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

### Structures

struct **rmt\_rx\_event\_callbacks\_t**

Group of RMT RX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

#### Public Members

*rmt\_rx\_done\_callback\_t* **on\_recv\_done**

Event callback, invoked when one RMT channel receiving transaction completes

struct **rmt\_rx\_channel\_config\_t**

RMT RX channel specific configuration.

#### Public Members

*gpio\_num\_t* **gpio\_num**

GPIO number used by RMT RX channel. Set to -1 if unused

*rmt\_clock\_source\_t* **clk\_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32\_t **resolution\_hz**

Channel clock resolution, in Hz

size\_t **mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

uint32\_t **invert\_in**

Whether to invert the incoming RMT channel signal

uint32\_t **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *rmt\_rx\_channel\_config\_t*::[anonymous] **flags**

RX channel config flags

struct **rmt\_receive\_config\_t**

RMT receive specific configuration.

### Public Members

uint32\_t **signal\_range\_min\_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32\_t **signal\_range\_max\_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

### Header File

- `components/driver/include/driver/rmt_common.h`

### Functions

*esp\_err\_t* **rmt\_del\_channel** (*rmt\_channel\_handle\_t* channel)

Delete an RMT channel.

**Parameters** **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

#### Returns

- `ESP_OK`: Delete RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete RMT channel failed because it is still in working
- `ESP_FAIL`: Delete RMT channel failed because of other error

*esp\_err\_t* **rmt\_apply\_carrier** (*rmt\_channel\_handle\_t* channel, const *rmt\_carrier\_config\_t* \*config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

#### Parameters

- **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** –[in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

#### Returns

- `ESP_OK`: Apply carrier configuration successfully
- `ESP_ERR_INVALID_ARG`: Apply carrier configuration failed because of invalid argument
- `ESP_FAIL`: Apply carrier configuration failed because of other error

*esp\_err\_t* **rmt\_enable** (*rmt\_channel\_handle\_t* channel)

Enable the RMT channel.

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

**Parameters** **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- `ESP_OK`: Enable RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Enable RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable RMT channel failed because it's enabled already
- `ESP_FAIL`: Enable RMT channel failed because of other error

*esp\_err\_t* **rmt\_disable** (*rmt\_channel\_handle\_t* channel)

Disable the RMT channel.

---

**Note:** This function will release a PM lock that might be installed during channel allocation

---

**Parameters** **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- `ESP_OK`: Disable RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Disable RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable RMT channel failed because it's not enabled yet
- `ESP_FAIL`: Disable RMT channel failed because of other error

## Structures

struct **rmt\_carrier\_config\_t**

RMT carrier wave configuration (for either modulation or demodulation)

### Public Members

uint32\_t **frequency\_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty\_cycle**

Carrier wave duty cycle (0~100%)

uint32\_t **polarity\_active\_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32\_t **always\_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt\_carrier\_config\_t*::[anonymous] **flags**

Carrier config flags

## Header File

- `components/driver/include/driver/rmt_encoder.h`

## Functions

*esp\_err\_t* **rmt\_new\_bytes\_encoder** (const *rmt\_bytes\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

### Parameters

- **config** `–[in]` Bytes encoder configuration
- **ret\_encoder** `–[out]` Returned encoder handle

### Returns

- **ESP\_OK**: Create RMT bytes encoder successfully
- **ESP\_ERR\_INVALID\_ARG**: Create RMT bytes encoder failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create RMT bytes encoder failed because out of memory
- **ESP\_FAIL**: Create RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_new\_copy\_encoder** (const *rmt\_copy\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

### Parameters

- **config** `–[in]` Copy encoder configuration
- **ret\_encoder** `–[out]` Returned encoder handle

### Returns

- **ESP\_OK**: Create RMT copy encoder successfully
- **ESP\_ERR\_INVALID\_ARG**: Create RMT copy encoder failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create RMT copy encoder failed because out of memory
- **ESP\_FAIL**: Create RMT copy encoder failed because of other error

*esp\_err\_t* **rmt\_del\_encoder** (*rmt\_encoder\_handle\_t* encoder)

Delete RMT encoder.

**Parameters** **encoder** `–[in]` RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

### Returns

- **ESP\_OK**: Delete RMT encoder successfully
- **ESP\_ERR\_INVALID\_ARG**: Delete RMT encoder failed because of invalid argument
- **ESP\_FAIL**: Delete RMT encoder failed because of other error

*esp\_err\_t* **rmt\_encoder\_reset** (*rmt\_encoder\_handle\_t* encoder)

Reset RMT encoder.

**Parameters** **encoder** `–[in]` RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

### Returns

- **ESP\_OK**: Reset RMT encoder successfully
- **ESP\_ERR\_INVALID\_ARG**: Reset RMT encoder failed because of invalid argument
- **ESP\_FAIL**: Reset RMT encoder failed because of other error

## Structures

struct **rmt\_encoder\_t**

Interface of RMT encoder.

## Public Members

`size_t (*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)`

Encode the user data into RMT symbols and write into RMT memory.

---

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

---

---

**Note:** It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

---

**Param encoder [in]** Encoder handle

**Param tx\_channel [in]** RMT TX channel handle, returned from `rmt_new_tx_channel()`

**Param primary\_data [in]** App data to be encoded into RMT symbols

**Param data\_size [in]** Size of `primary_data`, in bytes

**Param ret\_state [out]** Returned current encoder's state

**Return** Number of RMT symbols that the primary data has been encoded into

`esp_err_t (*reset)(rmt_encoder_t *encoder)`

Reset encoding state.

**Param encoder [in]** Encoder handle

**Return**

- ESP\_OK: reset encoder successfully
- ESP\_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`

Delete encoder object.

**Param encoder [in]** Encoder handle

**Return**

- ESP\_OK: delete encoder successfully
- ESP\_FAIL: delete encoder failed

struct **rmt\_bytes\_encoder\_config\_t**

Bytes encoder configuration.

## Public Members

`rmt_symbol_word_t bit0`

How to represent BIT0 in RMT symbol

`rmt_symbol_word_t bit1`

How to represent BIT1 in RMT symbol

`uint32_t msb_first`

Whether to encode MSB bit first

```
struct rmt_bytes_encoder_config_t::[anonymous] flags
```

Encoder config flag

```
struct rmt_copy_encoder_config_t
```

Copy encoder configuration.

### Type Definitions

```
typedef struct rmt_encoder_t rmt_encoder_t
```

Type of RMT encoder.

### Enumerations

```
enum rmt_encode_state_t
```

RMT encoding state.

*Values:*

```
enumerator RMT_ENCODING_RESET
```

The encoding session is in reset state

```
enumerator RMT_ENCODING_COMPLETE
```

The encoding session is finished, the caller can continue with subsequent encoding

```
enumerator RMT_ENCODING_MEM_FULL
```

The encoding artifact memory is full, the caller should return from current encoding session

### Header File

- [components/driver/include/driver/rmt\\_types.h](#)

### Structures

```
struct rmt_tx_done_event_data_t
```

Type of RMT TX done event data.

### Public Members

```
size_t num_symbols
```

The number of transmitted RMT symbols (only one round is counted if it's a loop transmission)

```
struct rmt_rx_done_event_data_t
```

Type of RMT RX done event data.

### Public Members

```
rmt_symbol_word_t *received_symbols
```

Point to the received RMT symbols

size\_t **num\_symbols**

The number of received RMT symbols

### Type Definitions

typedef struct rmt\_channel\_t \***rmt\_channel\_handle\_t**

Type of RMT channel handle.

typedef struct rmt\_sync\_manager\_t \***rmt\_sync\_manager\_handle\_t**

Type of RMT synchronization manager handle.

typedef struct *rmt\_encoder\_t* \***rmt\_encoder\_handle\_t**

Type of RMT encoder handle.

typedef bool (\***rmt\_tx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* tx\_chan, const *rmt\_tx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param tx\_chan [in]** RMT channel handle, created from `rmt_new_tx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_tx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this callback function

typedef bool (\***rmt\_rx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* rx\_chan, const *rmt\_rx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param rx\_chan [in]** RMT channel handle, created from `rmt_new_rx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_rx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

### Header File

- `components/hal/include/hal/rmt_types.h`

### Unions

union **rmt\_symbol\_word\_t**

`#include <rmt_types.h>` The layout of RMT symbol stored in memory, which is decided by the hardware design.

### Public Members

uint16\_t **duration0**

Duration of level0

uint16\_t **level0**

Level of the first part

uint16\_t **duration1**

Duration of level1

uint16\_t **level11**

Level of the second part

struct *rmt\_symbol\_word\_t*::[anonymous] [**anonymous**]

uint32\_t **val**

Equivalent unsigned value for the RMT symbol

### Type Definitions

typedef *soc\_periph\_rmt\_clk\_src\_t* **rmt\_clock\_source\_t**

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## 2.5.17 SD SPI Host Driver

### Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi\_dev\_handle\_t* spi\_handle returned when attaching the device to an SPI bus by calling *sdspi\_host\_init\_device*. The bus should be already initialized before (by *spi\_bus\_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro *SDSPI\_DEVICE\_CONFIG\_DEFAULT* to initialize a structure *sdmmc\_slot\_config\_t*, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi\_host\_init\_device* to initialize the SD SPI device and attach to its bus.

Then use *SDSPI\_HOST\_DEFAULT* macro to initialize a *sdmmc\_host\_t* structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the *slot* parameter of the structure to the SD SPI device *spi\_handle* just returned from *sdspi\_host\_init\_device*. Call *sdmmc\_card\_init* with the *sdmmc\_host\_t* to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

### Other Details

Only the following driver's API functions are normally used by most applications:

- *sdspi\_host\_init()*
- *sdspi\_host\_init\_device()*
- *sdspi\_host\_remove\_device()*

- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [the SD/SDIO/MMC Driver](#).

---

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see [Sharing the SPI bus among SD card and other SPI devices](#).

## Related Docs

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it's the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it's not as obvious as with an oscilloscope.

2. Try to use slower clock frequency.

If the lower frequency can work while the higher frequency can't, it's an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

### Initialization sequence

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (`SDMMC_FREQ_PROBING = 400 KHz` for SD card) to avoid the influence of pin AC loading (see above section).

---

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also [storage/sd\\_card](#))

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.  
This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.  
If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

## API Reference

### Header File

- `components/driver/include/driver/sdspi_host.h`

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

---

**Note:** This function is not thread safe

---

#### Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` \*dev\_config, `sdspi_dev_handle_t` \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**Note:** This function is not thread safe

---

---

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

**Parameters**

- **dev\_config** –pointer to device configuration structure
- **out\_handle** –Output of the handle to the sdspi device.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_host_init_device` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**Parameters** **handle** –Handle of the SD SPI device

**Returns** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

---

**Parameters**

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

**Returns**

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, *uint32\_t* freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

**Parameters**

- **host** –Handle of the sdspi device
- **freq\_khz** –card clock frequency, in kHz

**Returns**

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

---

**Note:** This function is not thread safe

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Parameters** `handle` –Handle of the sdspi device

**Returns**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

**Parameters**

- `handle` –Handle of the sdspi device
- `timeout_ticks` –Ticks to wait before timeout.

**Returns**

- ESP\_OK on success

**Structures**

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

**Public Members**

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see `spi_types.h`).

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

**Macros**

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA**

**SDSPI\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

**SDSPI\_SLOT\_NO\_CS**

indicates that card select line is not used

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_DEVICE\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SD SPI device.

**Type Definitions**

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

## 2.5.18 Sigma-Delta Modulation (SDM)

### Introduction

ESP32-S2 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.<sup>1</sup>

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

### Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- *Resource Allocation* - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.
- *Set Equivalent Duty Cycle* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

---

<sup>1</sup> Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter [GPIO and IOMUX](#) in ESP32-S2 Technical Reference Manual for more details. The driver won't forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `sdm_new_channel()`).

**Resource Allocation** A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don't need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

### Creating a SDM Channel with Sample Rate of 1MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

**Enable and Disable Channel** Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from **init** to **enable**
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the **init** state and release the power management lock.

**Set Equivalent Duty Cycle** For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by  $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$ . Thus the range of the `duty` input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal's duty will be about 50%.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There's a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Fig. 15: Sallen-Key Low Pass Filter

## Application Example

- LED driven by a GPIO that is modulated with Sigma-Delta: [peripherals/sigma\\_delta](#).

## API Reference

### Header File

- [components/driver/include/driver/sdm.h](#)

### Functions

*esp\_err\_t* **sdm\_new\_channel** (const *sdm\_config\_t* \*config, *sdm\_channel\_handle\_t* \*ret\_chan)

Create a new Sigma Delta channel.

#### Parameters

- **config** –[in] SDM configuration
- **ret\_chan** –[out] Returned SDM channel handle

#### Returns

- ESP\_OK: Create SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Create SDM channel failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create SDM channel failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP\_FAIL: Create SDM channel failed because of other error

*esp\_err\_t* **sdm\_del\_channel** (*sdm\_channel\_handle\_t* chan)

Delete the Sigma Delta channel.

**Parameters** **chan** –[in] SDM channel created by `sdm_new_channel`

#### Returns

- ESP\_OK: Delete the SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Delete the SDM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP\_FAIL: Delete the SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_enable** (*sdm\_channel\_handle\_t* chan)

Enable the Sigma Delta channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *sdm\_config\_t*, while `CONFIG_PM_ENABLE` is enabled.

---

**Parameters** **chan** –[in] SDM channel created by `sdm_new_channel`

#### Returns

- ESP\_OK: Enable SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable SDM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable SDM channel failed because the channel is already enabled
- ESP\_FAIL: Enable SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_disable** (*sdm\_channel\_handle\_t* chan)

Disable the Sigma Delta channel.

---

**Note:** This function will do the opposite work to the `sdm_channel_enable()`

---

**Parameters** `chan` –[in] SDM channel created by `sdm_new_channel`

**Returns**

- `ESP_OK`: Disable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable SDM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable SDM channel failed because of other error

*esp\_err\_t* `sdm_channel_set_duty` (*sdm\_channel\_handle\_t* chan, int8\_t duty)

Set the duty cycle of the PDM output signal.

---

**Note:** For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be  $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$

---

---

**Note:** If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around  $(sample\_rate\_hz / 4)$ .

---

---

**Note:** The duty is proportional to the equivalent output voltage after a low-pass-filter.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- `chan` –[in] SDM channel created by `sdm_new_channel`
- `duty` –[in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

**Returns**

- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

## Structures

struct `sdm_config_t`

Sigma Delta channel configuration.

## Public Members

int `gpio_num`

GPIO number

*sdm\_clock\_source\_t* **clk\_src**

Clock source

uint32\_t **sample\_rate\_hz**

Sample rate in Hz, it determines how frequent the modulator outputs a pulse

uint32\_t **invert\_out**

Whether to invert the output signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *sdm\_config\_t*::[anonymous] **flags**

Extra flags

### Type Definitions

```
typedef struct sdm_channel_t *sdm_channel_handle_t
```

Type of Sigma Delta channel handle.

### Header File

- [components/hal/include/hal/sdm\\_types.h](#)

### Type Definitions

```
typedef soc_periph_sdm_clk_src_t sdm_clock_source_t
```

## 2.5.19 SPI Master Driver

SPI Master driver is a program that controls ESP32-S2's SPI peripherals while they function as masters.

### Overview of ESP32-S2's SPI peripherals

ESP32-S2 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-S2's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 and SPI3 are general purpose SPI controllers. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. SPI2 has 6 CS lines. SPI3 has 3 CS lines. Each CS line can be used to drive one SPI slave.

### Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32-S2 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>De-vice</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device' s individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
<b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
<b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
<b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
<b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
<b>QUADWP</b>	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
<b>QUADHD</b>	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
<b>DATA4</b>	Data4 signal in Octal/OPI mode.
<b>DATA5</b>	Data5 signal in Octal/OPI mode.
<b>DATA6</b>	Data6 signal in Octal/OPI mode.
<b>DATA7</b>	Data7 signal in Octal/OPI mode.
<b>As- ser- tion</b>	The action of activating a line.
<b>De- asser- tion</b>	The action of returning the line back to inactive (back to idle) status.
<b>Trans- ac- tion</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launch- edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch- edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-S2 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using [xSemaphoreCreateMutex](#).

## SPI Features

## SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver hasn't supported SPI1 bus. Only SPI Flash driver can attach to the bus.
- For other buses, the driver may register its ISR as the BG. When a device task requests for exclusive use of the bus, the bus lock will block the task and try to disable ISR. After ISR is successfully disabled, the bus lock will then unblock the device task and allow it to exclusively use the bus. When the task releases the lock, the lock will also try to resume ISR if there are pending transactions in ISR.

## SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Command</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Address</b>	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Transaction Line Mode** Supported line modes for ESP32-S2 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO SPI_TRANS_MULTILINE_ADDR	
Octal Output	1	1	8	SPI_TRANS_MODE_OCT	SPICOMMON_BUSFLAG_OCTAL
OPI	8	8	8	SPI_TRANS_MODE_OCT SPI_TRANS_MULTILINE_ADDR SPI_TRANS_MULTILINE_CMD	

**Command and Address Phases** During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and

`SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

## Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S2 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 23 μs.
- Interrupt Transaction via CPU: 22 μs.
- Polling Transaction via DMA: 9 μs.
- Polling Transaction via CPU: 8 μs.

**SPI Clock Frequency** Transferring each byte takes eight times the clock period  $8/f_{spi}$ .

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is  $20+8n/f_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/f_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see *IRAM-Safe Interrupt Handlers*.

### Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

### API Reference - SPI Common

#### Header File

- [components/hal/include/hal/spi\\_types.h](#)

## Structures

struct **spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

### Public Members

uint8\_t **cmd\_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t **addr\_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t **data\_lines**

The line width of data phase, e.g. 4-line-data-phase.

## Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI3\_HOST**

SPI3.

enumerator **SPI\_HOST\_MAX**

invalid host value

enum **spi\_clock\_source\_t**

*Values:*

enumerator **SPI\_CLK\_APB**

Select APB as the source clock.

enumerator **SPI\_CLK\_XTAL**

Select XTAL as the source clock.

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

enum **spi\_command\_t**

SPI command.

*Values:*

enumerator **SPI\_CMD\_HD\_WRBUF**

enumerator **SPI\_CMD\_HD\_RDBUF**

enumerator **SPI\_CMD\_HD\_WRDMA**

enumerator **SPI\_CMD\_HD\_RDDMA**

enumerator **SPI\_CMD\_HD\_SEG\_END**

enumerator **SPI\_CMD\_HD\_EN\_QPI**

enumerator **SPI\_CMD\_HD\_WR\_END**

enumerator **SPI\_CMD\_HD\_INT0**

enumerator `SPI_CMD_HD_INT1`

enumerator `SPI_CMD_HD_INT2`

## Header File

- `components/driver/include/driver/spi_common.h`

## Functions

`esp_err_t spi_bus_initialize` (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

### Parameters

- **host\_id** – SPI peripheral that controls this bus
- **bus\_config** – Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **dma\_chan** – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

### Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t spi_bus_free` (*spi\_host\_device\_t* host\_id)

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** **host\_id** – SPI peripheral to free

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

## Structures

struct **spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

---

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi\_bus\_config\_t* referring to these lines will be ignored and can thus safely be left uninitialized.

---

## Public Members

int **mosi\_io\_num**

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int **data0\_io\_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso\_io\_num**

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int **data1\_io\_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk\_io\_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp\_io\_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2\_io\_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd\_io\_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int **intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

**SPI\_MAX\_DMA\_LEN**

**SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

### Parameters

- **DATA** –Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

### Parameters

- **DATA** –Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_GPIO\_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

## API Reference - SPI Master

### Header File

- `components/driver/include/driver/spi_master.h`

### Functions

`esp_err_t spi_bus_add_device` (*spi\_host\_device\_t* host\_id, const *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

---

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

---

#### Parameters

- **host\_id** –SPI peripheral to allocate device on
- **dev\_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_FOUND` if host doesn't have any free CS slots
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t spi_bus_remove_device` (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Parameters** **handle** –Device handle to free

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

`esp_err_t spi_device_queue_trans` (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute
- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; use `port-MAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished

- ESP\_OK on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute
- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)

- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans\_desc** –Description of transaction to execute

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**Note:** The function will wait until all the existing transactions have been sent.

---

#### Parameters

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

#### Returns

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters** **dev** –The device to release the bus.

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- **fapb** –The frequency of apb clock, should be APB\_CLK\_FREQ.
- **hz** –Desired working frequency
- **duty\_cycle** –Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**Note:** If **\*\*dummy\_o\*** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**Parameters**

- **gpio\_is\_used** –True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** –Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** –Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy\_o** –Address of dummy bits used output. Set to NULL if not needed.
- **cycles\_remain\_o** –Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- **gpio\_is\_used** –True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** –Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

*esp\_err\_t* **spi\_bus\_get\_max\_transaction\_len** (*spi\_host\_device\_t* host\_id, size\_t \*max\_bytes)

Get max length (in bytes) of one transaction.

**Parameters**

- **host\_id** –SPI peripheral
- **max\_bytes** –[out] Max length of one transaction, in bytes

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

## Structures

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

### Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when SPI\_TRANS\_VARIABLE\_CMD is not used, otherwise ignored.

**uint8\_t address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

**uint8\_t dummy\_bits**

Amount of dummy bits to insert between address and data phase.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

**uint16\_t duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16\_t cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8\_t cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock\_speed\_hz**

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t* pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t post\_cb***

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct `spi_transaction_t`**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members****`uint32_t flags`**

Bitwise OR of `SPI_TRANS_*` flags.

**`uint16_t cmd`**

Command data, of which the length is set in the `command_bits` of *`spi_device_interface_config_t`*.

**NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**`uint64_t addr`**

Address data, of which the length is set in the `address_bits` of *`spi_device_interface_config_t`*.

**NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**`size_t length`**

Total data length, in bits.

**`size_t rxlength`**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**`void *user`**

User-defined variable. Can be used to store eg transaction ID.

**`const void *tx_buffer`**

Pointer to transmit buffer, or NULL for no MOSI phase.

**`uint8_t tx_data[4]`**

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

**`void *rx_buffer`**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

### Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

### Macros

**SPI\_MASTER\_FREQ\_8M**

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).  
8MHz

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK**

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**Type Definitions**

```
typedef struct spi_transaction_t spi_transaction_t
```

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

**2.5.20 SPI Slave Driver**

SPI Slave driver is a program that controls ESP32-S2's SPI peripherals while they function as slaves.

**Overview of ESP32-S2's SPI peripherals**

ESP32-S2 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master.

SPI2 and SPI3 have independent signal buses with the same respective names.

## Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-S2 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 72 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

## SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

## Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.

If transactions will be longer than 32 bytes, allow a DMA channel by setting the parameter `dma_chan` to the host device. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

## Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

## Speed and Timing Considerations

**Transaction Interval** The ESP32-S2 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

## Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

### API Reference

#### Header File

- [components/driver/include/driver/spi\\_slave.h](#)

#### Functions

*esp\_err\_t* **spi\_slave\_initialize** (*spi\_host\_device\_t* host, const *spi\_bus\_config\_t* \*bus\_config, const *spi\_slave\_interface\_config\_t* \*slave\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Parameters

- **host** –SPI peripheral to use as a SPI slave interface
- **bus\_config** –Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** –Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI\_DMA\_DISABLED limits the size of transactions.
  - Set to SPI\_DMA\_DISABLED if only the SPI flash uses this bus.
  - Set to SPI\_DMA\_CH\_AUTO to let the driver to allocate the DMA channel.

#### Returns

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**Parameters** **host** –SPI peripheral to free

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed

- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

#### Parameters

- **host** –SPI peripheral that is acting as a slave
- **trans\_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** –Ticks to wait until there's room in the queue; use portMAX\_DELAY to never time out.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

#### Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans\_desc** –[out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

#### Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans\_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** –Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

## Structures

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

### Public Members

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

*slave\_transaction\_cb\_t* **post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi\_slave\_transaction\_t**

This structure describes one SPI transaction

### Public Members

size\_t **length**

Total data length, in bits.

size\_t **trans\_len**

Transaction data length, in bits.

const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void **\*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void **\*user**

User-defined variable. Can be used to store eg transaction ID.

## Macros

**SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

## Type Definitions

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
```

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

### 2.5.21 SPI Slave Half Duplex

#### Introduction

The half duplex (HD) mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the full duplex (FD) mode (the mode for general purpose SPI transactions, see [SPI Slave Driver](#)). These services reduce the CPU load and the response time of SPI Slave, but the communication format is determined by the hardware. The communication format is always half duplex, so comes the name of Half Duplex Mode.

There are several different types of transactions, determined by the *command* phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, data. The command phase is mandatory, while the other fields may be determined by the command field. During the command, address, dummy phases, the bus is always controlled by the master, while the direction of the data phase depends on the command. The data phase can be either an in phase, for the master to write data to the slave; or an out phase, for the master to read data from the slave.

About the details of how master should communicate with the SPI Slave, see [ESP SPI Slave HD \(Half Duplex\) Mode Protocol](#).

By these different transactions, the slave provide these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shard between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of slave.

#### Terminology

- Transaction
- Channel

- Sending
- Receiving
- Data Descriptor

### Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received

### Driver usage

**Slave initialization** Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI slave will exclusively use the SPI peripheral, pins of the bus before it's deinitialized. Most configurations of the slave should be done as soon as the slave is being initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

**Deinitialization (optional)** Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, interrupt sources, will be released by the deinit function.

**Send/Receive Data by DMA Channels** To send data to the master through the sending DMA channel, the application should properly wrap the data to send by a `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor, and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data will be sent to the master upon master's RDDMA command in the same order they are put into the queue by `spi_slave_hd_queue_trans()`.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function will block until the transaction with command RDDMA from master successfully completes (or timeout). The `out_trans` argument of the function will output the pointer of the data descriptor which is just finished.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer, before it handles the data in the receiving buffer.

---

**Note:** This driver itself doesn't have internal buffer for the data to send, or just received. The application should provide data descriptors for the data buffer to send to master, or to receive data from the master.

The application will have to properly keep the data descriptor as well as the buffer it points to, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by `spi_slave_hd_get_trans_res()`. During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

---

Please note that the buffer doesn't have to be fully sent or filled before it's terminated. For example, in the segment transaction mode, the master has to send CMD7 to terminate a WRDMA transaction, or send CMD8 to terminate a RDDMA transaction (in segments), no matter the send (receive) buffer is used up (full) or not.

**Using Data Arguments** Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handle the finished data descriptor. For example, you may want to know which round it is for the returned descriptor, when you send the same piece of data for several times.

Set the `arg` member in the data descriptor to an variable indicating the transaction (by force casting), or point it to a structure which wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.

### Using callbacks

**Note:** These callbacks are called in the ISR, so that they are fast enough. However, you may need to be very careful to write the code in the ISR. The callback should return as soon as possible. No delay or blocking operations are allowed.

---

The `spi_slave_hd_intr_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initialize the SPI Slave HD driver, allows you having callbacks for each events you may concern.

The corresponding interrupt for each callbacks that is not `NULL` will enabled, so that the callbacks can be called immediately when the events happen. You don't need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback, or indicate which SPI Slave instance when you are using the same callbacks for several SPI Slave peripherals. Set the `arg` member to an variable indicating the SPI Slave instance (by force casting), or point it to a context structure. All the callbacks will be called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`. The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The *data argument* will be very useful in this case!). The `awoken` argument is an output one, telling the ISR there are tasks are awoken after this callback, and the ISR should call `portYIELD_FROM_ISR()` to do task scheduling. Just pass the `awoken` argument to all FreeRTOS APIs which may unblock tasks, and the `awoken` will be returned to the ISR.

**Writing/Reading Shared Registers** Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

---

**Note:** On ESP32-S2, the shared registers are read/written in words by the application, but read/written in bytes by the master. There's no guarantee four continuous bytes read from the master are from the same word written by the slave's application. It's also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half hasn't been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it will be more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts there may be among read/write from SW (worse if there are multi cores) and master, it is suggested that a word is only used in one direction (only written by master or only written by the slave).

---

**Receiving General Purpose Interrupts From the Master** When the master sends CMD 0x08, 0x09 or 0x0A, the slave corresponding will be triggered. Currently the CMD8 is permanently used to indicate the termination of RDDMA segments. To receiving general purpose interrupts, register callbacks for CMD 0x09 and 0x0A when the slave is initialized, see *Using callbacks*.

### Application Example

The code example for Device/Host communication can be found in the `peripherals/spi_slave_hd` directory of ESP-IDF examples.

## API reference

### Header File

- `components/driver/include/driver/spi_slave_hd.h`

### Functions

*esp\_err\_t* **spi\_slave\_hd\_init** (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, const *spi\_slave\_hd\_slot\_config\_t* \*config)

Initialize the SPI Slave HD driver.

#### Parameters

- **host\_id** –The host to use
- **bus\_config** –Bus configuration for the bus used
- **config** –Configuration for the SPI Slave HD driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: invalid argument given
- ESP\_ERR\_INVALID\_STATE: function called in invalid state, may be some resources are already in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM: memory allocation failed
- or other return value from `esp_intr_alloc`

*esp\_err\_t* **spi\_slave\_hd\_deinit** (*spi\_host\_device\_t* host\_id)

Deinitialize the SPI Slave HD driver.

**Parameters** **host\_id** –The host to deinitialize the driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: if the host\_id is not correct

*esp\_err\_t* **spi\_slave\_hd\_queue\_trans** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*trans, TickType\_t timeout)

Queue transactions (segment mode)

#### Parameters

- **host\_id** –Host to queue the transaction
- **chan** –SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **trans** –Transaction descriptors
- **timeout** –Timeout before the data is queued

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP\_ERR\_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under segment mode.

*esp\_err\_t* **spi\_slave\_hd\_get\_trans\_res** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (segment mode)

---

**Note:** This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

---

#### Parameters

- **host\_id** –Host to queue the transaction
- **chan** –Channel to get the result, SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **out\_trans** –[out] Pointer to the transaction descriptor (*spi\_slave\_hd\_data\_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** –Timeout before the result is got

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: Function is not valid
- ESP\_ERR\_TIMEOUT: There's no transaction done before timeout
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under segment mode.

void **spi\_slave\_hd\_read\_buffer** (*spi\_host\_device\_t* host\_id, int addr, uint8\_t \*out\_data, size\_t len)

Read the shared registers.

**Parameters**

- **host\_id** –Host to read the shared registers
- **addr** –Address of register to read, 0 to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-1
- **out\_data** –[out] Output buffer to store the read data
- **len** –Length to read, not larger than SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-addr

void **spi\_slave\_hd\_write\_buffer** (*spi\_host\_device\_t* host\_id, int addr, uint8\_t \*data, size\_t len)

Write the shared registers.

**Parameters**

- **host\_id** –Host to write the shared registers
- **addr** –Address of register to write, 0 to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-1
- **data** –Buffer holding the data to write
- **len** –Length to write, SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-addr

*esp\_err\_t* **spi\_slave\_hd\_append\_trans** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*trans, TickType\_t timeout)

Load transactions (append mode)

---

**Note:** In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

---

**Parameters**

- **host\_id** –Host to load transactions
- **chan** –SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **trans** –Transaction descriptor
- **timeout** –Timeout before the transaction is loaded

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP\_ERR\_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under append mode.

*esp\_err\_t* **spi\_slave\_hd\_get\_append\_trans\_res** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (append mode)

---

**Note:** This API should be called the same times as the `spi_slave_hd_append_trans`

---

### Parameters

- **host\_id** –Host to load the transaction
- **chan** –SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **out\_trans** –[out] Pointer to the transaction descriptor (*spi\_slave\_hd\_data\_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** –Timeout before the result is got

### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: Function is not valid
- ESP\_ERR\_TIMEOUT: There's no transaction done before timeout
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under append mode.

## Structures

struct **spi\_slave\_hd\_data\_t**

Descriptor of data to send/receive.

### Public Members

uint8\_t \***data**

Buffer to send, must be DMA capable.

size\_t **len**

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

size\_t **trans\_len**

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

void \***arg**

Extra argument indicating this data.

struct **spi\_slave\_hd\_event\_t**

Information of SPI Slave HD event.

### Public Members

*spi\_event\_t* **event**

Event type.

*spi\_slave\_hd\_data\_t* \***trans**

Corresponding transaction for SPI\_EV\_SEND and SPI\_EV\_RECV events.

struct **spi\_slave\_hd\_callback\_config\_t**

Callback configuration structure for SPI Slave HD.

### Public Members

#### *slave\_cb\_t* **cb\_buffer\_tx**

Callback when master reads from shared buffer.

#### *slave\_cb\_t* **cb\_buffer\_rx**

Callback when master writes to shared buffer.

#### *slave\_cb\_t* **cb\_send\_dma\_ready**

Callback when TX data buffer is loaded to the hardware (DMA)

#### *slave\_cb\_t* **cb\_sent**

Callback when data are sent.

#### *slave\_cb\_t* **cb\_recv\_dma\_ready**

Callback when RX data buffer is loaded to the hardware (DMA)

#### *slave\_cb\_t* **cb\_recv**

Callback when data are received.

#### *slave\_cb\_t* **cb\_cmd9**

Callback when CMD9 received.

#### *slave\_cb\_t* **cb\_cmdA**

Callback when CMDA received.

#### void \***arg**

Argument indicating this SPI Slave HD peripheral instance.

#### struct **spi\_slave\_hd\_slot\_config\_t**

Configuration structure for the SPI Slave HD driver.

### Public Members

#### uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

#### uint32\_t **spics\_io\_num**

CS GPIO pin for this device.

#### uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_HD\_\* flags.

uint32\_t **command\_bits**

command field bits, multiples of 8 and at least 8.

uint32\_t **address\_bits**

address field bits, multiples of 8 and at least 8.

uint32\_t **dummy\_bits**

dummy field bits, multiples of 8 and at least 8.

uint32\_t **queue\_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_hd_queue_trans` but not yet finished using `spi_slave_hd_get_trans_result`) at the same time.

*spi\_dma\_chan\_t* **dma\_chan**

DMA channel to used.

*spi\_slave\_hd\_callback\_config\_t* **cb\_config**

Callback configuration.

## Macros

**SPI\_SLAVE\_HD\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_HD\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_HD\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_SLAVE\_HD\_APPEND\_MODE**

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

## Type Definitions

typedef bool (\***slave\_cb\_t**)(void \*arg, *spi\_slave\_hd\_event\_t* \*event, BaseType\_t \*awoken)

Callback for SPI Slave HD.

## Enumerations

enum **spi\_slave\_chan\_t**

Channel of SPI Slave HD to do data transaction.

*Values:*

enumerator **SPI\_SLAVE\_CHAN\_TX**

The output channel (RDDMA)

enumerator **SPI\_SLAVE\_CHAN\_RX**

The input channel (WRDMA)

## 2.5.22 Temperature Sensor

### Introduction

The ESP32-S2 has a built-in sensor used to measure the chip's internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a DAC to compensate for the temperature offset.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

predefined range (°C)	error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

**Note:** The temperature sensor is designed primarily to measure the temperature changes inside the chip. The temperature value depends on factors like microcontroller clock frequency or I/O load. Generally, the chip's internal temperature might be higher than the ambient temperature.

### Functional Overview

- *Resource Allocation* - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when temperature sensor finishes working.
- *Enable and Disable Temperature Sensor* - covers how to enable and disable the temperature sensor.
- *Get Temperature Value* - covers how to get the real-time temperature value.
- *Power Management* - covers how temperature sensor is affected when changing power mode (i.e. light sleep).
- *Thread Safety* - covers how to make the driver to be thread safe.

**Resource Allocation** The ESP32-S2 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. It would always be the parameter of the temperature APIs with the information of hardware and configurations, so user can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment (For example: if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C). Based on that, the following configuration structure should be defined in advance: `temperature_sensor_config_t`:

- `range_min`. The minimum value of testing range you have evaluated.
- `range_max`. The maximum value of testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. The user doesn't need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

### Creating a Temperature Sensor Handle

- Step1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step2: Configure the range and obtain a handle

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

### Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

**Get Temperature Value** After the temperature sensor is enabled by `temperature_sensor_enable()`, user can get the current temperature by calling `temperature_sensor_get_celsius()`.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it's not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

**Power Management** When power management is enabled (i.e. CONFIG\_PM\_ENABLE is on), temperature sensor will still keep working because it uses XTAL clock (on ESP32-C3) or RTC clock (on ESP32-S2/S3).

**Thread Safety** In temperature sensor we don't add any protection to keep the thread safe. Because from the common usage, temperature sensor should only be called in one task. If you must use this driver in different tasks, please add extra locks to protect it.

### Unexpected Behaviors

1. The value user gets from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver gives a 'the boundary you gave cannot meet the range of internal temperature sensor' error feedback. It is because the built-in temperature sensor has testing limit. The error due to setting `temperature_sensor_config_t`:
  - (1) Totally out of range, like 200 °C ~ 300 °C.
  - (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

### Application Example

- Temperature sensor reading example: [peripherals/temp\\_sensor](#).

### API Reference

#### Header File

- `components/driver/include/driver/temperature_sensor.h`

## Functions

*esp\_err\_t* **temperature\_sensor\_install** (const *temperature\_sensor\_config\_t* \*tsens\_config, *temperature\_sensor\_handle\_t* \*ret\_tsens)

Install temperature sensor driver.

### Parameters

- **tsens\_config** –Pointer to config structure.
- **ret\_tsens** –Return the pointer of temperature sensor handle.

### Returns

- ESP\_OK if succeed

*esp\_err\_t* **temperature\_sensor\_uninstall** (*temperature\_sensor\_handle\_t* tsens)

Uninstall the temperature sensor driver.

**Parameters** **tsens** –The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK if succeed.

*esp\_err\_t* **temperature\_sensor\_enable** (*temperature\_sensor\_handle\_t* tsens)

Enable the temperature sensor.

**Parameters** **tsens** –The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is enabled already.

*esp\_err\_t* **temperature\_sensor\_disable** (*temperature\_sensor\_handle\_t* tsens)

Disable temperature sensor.

**Parameters** **tsens** –The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is not enabled yet.

*esp\_err\_t* **temperature\_sensor\_get\_celsius** (*temperature\_sensor\_handle\_t* tsens, float \*out\_celsius)

Read temperature sensor data that is converted to degrees Celsius.

---

**Note:** Should not be called from interrupt.

---

### Parameters

- **tsens** –The handle created by `temperature_sensor_install()`.
- **out\_celsius** –The measure output value.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG invalid arguments
- ESP\_ERR\_INVALID\_STATE Temperature sensor is not enabled yet.
- ESP\_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

## Structures

struct **temperature\_sensor\_config\_t**

Configuration of measurement range for the temperature sensor.

---

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed `doc/api-reference/peripherals/Temperature sensor`.

---

### Public Members

int **range\_min**

the minimum value of the temperature you want to test

int **range\_max**

the maximum value of the temperature you want to test

temperature\_sensor\_clk\_src\_t **clk\_src**

the clock source of the temperature sensor.

### Macros

**TEMPERATURE\_SENSOR\_CONFIG\_DEFAULT** (min, max)

*temperature\_sensor\_config\_t* default constructure

### Type Definitions

typedef struct temperature\_sensor\_obj\_t \***temperature\_sensor\_handle\_t**

Type of temperature sensor driver handle.

## 2.5.23 Touch Sensor

### Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32-S2 can support up to 14 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see *ESP32-S2 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing* [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32-S2 are available in [Touch Sensor Application Note](#).

### Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section [API Reference](#). Practical implementation of this API is covered in Section [Application Examples](#).

**Initialization** Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several `._DEFAULT` driver parameters listed in [API Reference](#) under *Macros*. It also removes the information about which pads have been touched before, if any, and disables interrupts. If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

**Configuration** Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`.

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements** The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#).

**Method of Measurements** The touch sensor will record the period of time (i.e. the number of clock cycles) over a fixed charge/discharge cycles (specified by `touch_pad_set_charge_discharge_times()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor will sleep until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

---

**Note:** If the specified charge and discharge cycles for measurement is too small, the result may be inaccurate, but increasing charge and discharge cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

---

**Optimization of Measurements** A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_charge_discharge_times()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Charge and discharge times of one measurement: `touch_pad_set_charge_discharge_times()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

The last chart *Output* represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

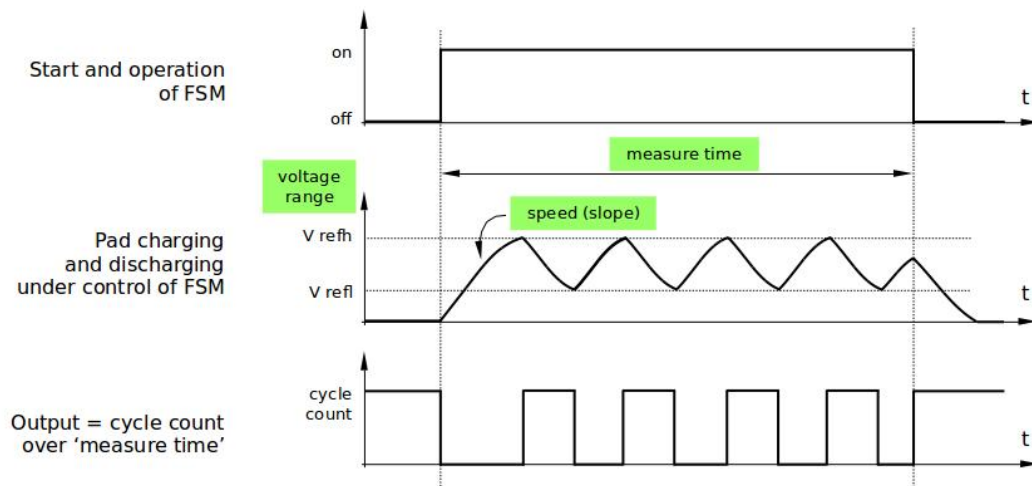

Fig. 16: Touch pad - relationship between measurement parameters

All functions are provided in pairs to *set* a specific parameter and to *get* the current parameter's value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. The ESP32-S2's touch functionality provide two sets of APIs for doing this.

There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filter out interference introduced on all channels, such as noise introduced by the power supply and external EMI. The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`

**Touch Detection** Touch detection is implemented in ESP32's hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see [pe-ripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#).

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in *Touch State Measurements* to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

### Application Examples

- Touch sensor read example: [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#).
- Touch sensor interrupt example: [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#).

### API Reference

#### Header File

- `components/driver/esp32s2/include/driver/touch_sensor.h`

#### Functions

`esp_err_t touch_pad_fsm_start` (void)

Set touch sensor FSM start.

---

**Note:** Start FSM after the touch sensor FSM mode is set.

---

---

**Note:** Call this function will reset benchmark of all touch channels.

---

#### Returns

- ESP\_OK on success

`esp_err_t touch_pad_fsm_stop` (void)

Stop touch sensor FSM.

#### Returns

- ESP\_OK on success

`esp_err_t touch_pad_sw_start` (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

#### Returns

- ESP\_OK on success

`esp_err_t touch_pad_set_charge_discharge_times` (uint16\_t charge\_discharge\_times)

Set charge and discharge times of each measurement.

---

**Note:** This function will specify the charge and discharge times in each measurement period. The clock is sourced from SOC\_MOD\_CLK\_RTC\_FAST, and its default frequency is SOC\_CLK\_RC\_FAST\_FREQ\_APPROX. The touch sensor will record the total clock cycles of all the charge and discharge cycles as the final result (raw value).

---

---

**Note:** If the charge and discharge times is too small, it may lead to inaccurate results.

---

**Parameters** `charge_discharge_times` –Charge and discharge times, range: 0 ~ 0xffff. No exact typical value can be recommended because the capacity is influenced by the hardware

design and how finger touches, but suggest adjusting this value to make the measurement time around 1 ms.

**Returns**

- ESP\_OK Set charge and discharge times success

*esp\_err\_t* **touch\_pad\_get\_charge\_discharge\_times** (uint16\_t \*charge\_discharge\_times)

Get charge and discharge times of each measurement.

**Parameters** **charge\_discharge\_times** –Charge and discharge times

**Returns**

- ESP\_OK Get charge\_discharge\_times success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_measurement\_interval** (uint16\_t interval\_cycle)

Set the interval between two measurements.

---

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC\_MOD\_CLK\_RTC\_SLOW, its default frequency is SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX.

---

**Parameters** **interval\_cycle** –The interval between two measurements  $\text{sleep\_time} = \text{interval\_cycle} / \text{SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX}$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.

**Returns**

- ESP\_OK Set interval cycle success

*esp\_err\_t* **touch\_pad\_get\_measurement\_interval** (uint16\_t \*interval\_cycle)

Get the interval between two measurements.

**Parameters** **interval\_cycle** –The interval between two measurements

**Returns**

- ESP\_OK Get interval cycle success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_meas\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_times)

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**Note:** The touch sensor will measure time of a fixed number of charge/discharge cycles (specified as the second parameter). That means the time (raw value) will increase as the capacity of the touch pad is increasing. The time (raw value) here is the number of clock cycles which is sourced from SOC\_MOD\_CLK\_RTC\_FAST and at (SOC\_CLK\_RC\_FAST\_FREQ\_APPROX) Hz as default.

---

---

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

---

**Parameters**

- **sleep\_cycle** –The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement.  $\text{t\_sleep} = \text{sleep\_cycle} / \text{SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX}$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- **meas\_times** –The times of charge and discharge in each measurement of touch channels. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1 ms.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_meas\_time** (uint16\_t \*sleep\_cycle, uint16\_t \*meas\_times)

Get touch sensor times of charge and discharge and sleep time.

**Parameters**

- **sleep\_cycle** –Pointer to accept sleep cycle number
- **meas\_times** –Pointer to accept measurement times count.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_idle\_channel\_connect** (*touch\_pad\_conn\_type\_t* type)

Set the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The **CONN\_HIGHZ**(high resistance) setting increases the sensitivity of touch channels. The **CONN\_GND**(grounding) setting increases the stability of touch channels.

**Parameters type** –Select idle channel connect to high resistance state or ground.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_idle\_channel\_connect** (*touch\_pad\_conn\_type\_t* \*type)

Get the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The **CONN\_HIGHZ**(high resistance) setting increases the sensitivity of touch channels. The **CONN\_GND**(grounding) setting increases the stability of touch channels.

**Parameters type** –Pointer to connection type.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_thresh** (*touch\_pad\_t* touch\_num, uint32\_t threshold)

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

---

**Note:** If set “TOUCH\_PAD\_THRESHOLD\_MAX” , the touch is never be triggered.

---

**Parameters**

- **touch\_num** –touch pad index
- **threshold** –threshold of touch sensor. Should be less than the max change value of touch.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_thresh** (*touch\_pad\_t* touch\_num, uint32\_t \*threshold)

Get touch sensor trigger threshold.

**Parameters**

- **touch\_num** –touch pad index
- **threshold** –pointer to accept threshold

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_channel\_mask** (uint16\_t enable\_mask)

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

---

**Note:** If set this mask, the FSM timer should be stop firstly.

---

---

**Note:** The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

---

**Parameters** `enable_mask` –bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14  
-> BIT(14)

**Returns**

- ESP\_OK on success

*esp\_err\_t* `touch_pad_get_channel_mask` (uint16\_t \*enable\_mask)

Get the touch sensor scan group bit mask.

**Parameters** `enable_mask` –Pointer to bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14 -> BIT(14)

**Returns**

- ESP\_OK on success

*esp\_err\_t* `touch_pad_clear_channel_mask` (uint16\_t enable\_mask)

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

---

**Note:** If clear all mask, the FSM timer should be stop firstly.

---

**Parameters** `enable_mask` –bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14  
-> BIT(14)

**Returns**

- ESP\_OK on success

*esp\_err\_t* `touch_pad_config` (*touch\_pad\_t* touch\_num)

Configure parameter for each touch channel.

---

**Note:** Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

---

**Parameters** `touch_num` –touch pad index

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG if argument wrong
- ESP\_FAIL if touch pad not initialized

*esp\_err\_t* `touch_pad_reset` (void)

Reset the FSM of touch module.

---

**Note:** Call this function after `touch_pad_fsm_stop`.

---

**Returns**

- ESP\_OK Success

*touch\_pad\_t* **touch\_pad\_get\_current\_meas\_channel** (void)

Get the current measure channel.

---

**Note:** Should be called when touch sensor measurement is in cyclic scan mode.

---

**Returns**

- touch channel number

uint32\_t **touch\_pad\_read\_intr\_status\_mask** (void)

Get the touch sensor interrupt status mask.

**Returns**

- touch interrupt bit

*esp\_err\_t* **touch\_pad\_intr\_enable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Enable touch sensor interrupt by bitmask.

---

**Note:** This API can be called in ISR handler.

---

**Parameters** **int\_mask** –Pad mask to enable interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_disable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Disable touch sensor interrupt by bitmask.

---

**Note:** This API can be called in ISR handler.

---

**Parameters** **int\_mask** –Pad mask to disable interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_clear** (*touch\_pad\_intr\_mask\_t* int\_mask)

Clear touch sensor interrupt by bitmask.

**Parameters** **int\_mask** –Pad mask to clear interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_isr\_register** (*intr\_handler\_t* fn, void \*arg, *touch\_pad\_intr\_mask\_t* intr\_mask)

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** –Pointer to ISR handler
- **arg** –Parameter for ISR
- **intr\_mask** –Enable touch sensor interrupt handler by bitmask.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Arguments error
- ESP\_ERR\_NO\_MEM No memory

*esp\_err\_t* **touch\_pad\_timeout\_set** (bool enable, uint32\_t threshold)

Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

---

**Note:** The threshold compared with touch readings.

---

---

**Note:** In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

---

**Parameters**

- **enable** –true(default): Enable the timeout check; false: Disable the timeout check.
- **threshold** –For all channels, the maximum value that will not be exceeded during normal operation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_timeout\_resume** (void)

Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

---

**Note:** Call this API after finishes the exception handling by user.

---

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_read\_raw\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*raw\_data)

get raw data of touch sensor.

---

**Note:** After the initialization is complete, the “raw\_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.

---

**Parameters**

- **touch\_num** –touch pad index
- **raw\_data** –pointer to accept touch sensor value

**Returns**

- ESP\_OK Success
- ESP\_FAIL Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_read\_benchmark** (*touch\_pad\_t* touch\_num, uint32\_t \*benchmark)

get benchmark of touch sensor.

---

**Note:** After initialization, the benchmark value is the maximum during the first measurement period.

---

**Parameters**

- **touch\_num** –touch pad index
- **benchmark** –pointer to accept touch sensor benchmark value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_filter\_read\_smooth** (*touch\_pad\_t* touch\_num, uint32\_t \*smooth)

Get smoothed data that obtained by filtering the raw data.

**Parameters**

- **touch\_num** –touch pad index
- **smooth** –pointer to smoothed data

*esp\_err\_t* **touch\_pad\_reset\_benchmark** (*touch\_pad\_t* touch\_num)

Force reset benchmark to raw data of touch sensor.

**Parameters** **touch\_num** –touch pad index

- TOUCH\_PAD\_MAX Reset baseline of all channels

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_set\_config** (const *touch\_filter\_config\_t* \*filter\_info)

set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Parameters** **filter\_info** –select filter type and threshold of detection algorithm

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_get\_config** (*touch\_filter\_config\_t* \*filter\_info)

get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Parameters** **filter\_info** –select filter type and threshold of detection algorithm

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_enable** (void)

enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_disable** (void)

disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_set\_config** (const *touch\_pad\_denoise\_t* \*denoise)

set parameter of denoise pad (TOUCH\_PAD\_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Parameters** **denoise** –parameter of denoise

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_get\_config** (*touch\_pad\_denoise\_t* \*denoise)

get parameter of denoise pad (TOUCH\_PAD\_NUM0).

**Parameters** **denoise** –Pointer to parameter of denoise

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_enable** (void)

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_disable** (void)

disable denoise function.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_read\_data** (uint32\_t \*data)

Get denoise measure value (TOUCH\_PAD\_NUM0).

**Parameters** **data** –Pointer to receive denoise value

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_set\_config** (const *touch\_pad\_waterproof\_t* \*waterproof)

set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH\_PAD\_NUM14) **and** a **guard** channel.  
Guard pad **is** used to detect the large area of water covering the touch **panel**.  
Shield pad **is** used to shield the influence of water droplets covering the **touch panel**.  
It **is** generally designed **as** a grid **and is** placed around the touch buttons.

**Parameters** **waterproof** –parameter of waterproof

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_get\_config** (*touch\_pad\_waterproof\_t* \*waterproof)

get parameter of waterproof function.

**Parameters** **waterproof** –parameter of waterproof

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_enable** (void)

Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_disable** (void)

Disable parameter of waterproof function.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_proximity\_enable** (*touch\_pad\_t* touch\_num, bool enabled)

Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** Supports up to three touch channels configured as proximity sensors.

---

**Parameters**

- **touch\_num** –touch pad index

- **enabled** –true: enable the proximity function; false: disable the proximity function

**Returns**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.
- ESP\_ERR\_NOT\_SUPPORTED: Don't support configured.

*esp\_err\_t* **touch\_pad\_proximity\_set\_count** (*touch\_pad\_t* touch\_num, uint32\_t count)

Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

---

**Parameters**

- **touch\_num** –Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- **count** –The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_count** (*touch\_pad\_t* touch\_num, uint32\_t \*count)

Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

---

**Parameters**

- **touch\_num** –Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- **count** –The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*measure\_out)

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

**Parameters**

- **touch\_num** –touch pad index
- **measure\_out** –If the accumulation process does not end, the `measure_out` is the process value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Touch num is not proximity

*esp\_err\_t* **touch\_pad\_sleep\_channel\_get\_info** (*touch\_pad\_sleep\_channel\_t* \*slp\_config)

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

---

**Parameters** **slp\_config** –touch sleep pad config.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** ESP32S2 only support one sleep channel.

---

---

**Note:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

---

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** –true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable\_proximity** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** ESP32S2 only support one sleep channel.

---

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** –true: enable proximity for sleep channel; false: disable proximity for sleep channel;

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_set\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t touch\_thres)

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** –touch sleep pad threshold

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_get\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t \*touch\_thres)

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** –touch sleep pad threshold

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_benchmark** (*touch\_pad\_t* pad\_num, uint32\_t \*benchmark)

Read benchmark of touch sensor sleep channel.

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **benchmark** –pointer to accept touch sensor benchmark value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_smooth** (*touch\_pad\_t* pad\_num, uint32\_t \*smooth\_data)

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **smooth\_data** –pointer to accept touch sensor smoothed data

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_data** (*touch\_pad\_t* pad\_num, uint32\_t \*raw\_data)

Read raw data of touch sensor sleep channel.

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **raw\_data** –pointer to accept touch sensor raw data

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_reset\_benchmark** (void)

Reset benchmark of touch sensor sleep channel.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_proximity\_cnt** (*touch\_pad\_t* pad\_num, uint32\_t \*proximity\_cnt)

Read proximity count of touch sensor sleep channel.

**Parameters**

- **pad\_num** –Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **proximity\_cnt** –pointer to accept touch sensor proximity count value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_set\_work\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_times)

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

#### Parameters

- **sleep\_cycle** –The touch sensor will sleep after each measurement. sleep\_cycle decide the interval between each measurement.  $t_{sleep} = sleep\_cycle / (RTC\_SLOW\_CLK \text{ frequency})$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using rtc\_clk\_slow\_freq\_get\_hz function.
- **meas\_times** –The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

#### Returns

- ESP\_OK Success

#### Header File

- [components/driver/include/driver/touch\\_sensor\\_common.h](#)

#### Functions

*esp\_err\_t* **touch\_pad\_init** (void)

Initialize touch module.

---

**Note:** If default parameter don't match the usage scenario, it can be changed after this function.

---

#### Returns

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Touch pad init error
- ESP\_ERR\_NOT\_SUPPORTED Touch pad is providing current to external XTAL

*esp\_err\_t* **touch\_pad\_deinit** (void)

Un-install touch pad driver.

---

**Note:** After this function is called, other touch functions are prohibited from being called.

---

#### Returns

- ESP\_OK Success
- ESP\_FAIL Touch pad driver not initialized

*esp\_err\_t* **touch\_pad\_io\_init** (*touch\_pad\_t* touch\_num)

Initialize touch pad GPIO.

**Parameters** touch\_num –touch pad index

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_voltage** (*touch\_high\_volt\_t* refh, *touch\_low\_volt\_t* refl, *touch\_volt\_atten\_t* atten)

Set touch sensor high voltage threshold of charge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

#### Parameters

- **refh** –the value of DREFH
- **refl** –the value of DREFL

- **atten** –the attenuation on DREFH

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_voltage** (*touch\_high\_volt\_t* \*refh, *touch\_low\_volt\_t* \*refl, *touch\_volt\_atten\_t* \*atten)

Get touch sensor reference voltage,.

**Parameters**

- **refh** –pointer to accept DREFH value
- **refl** –pointer to accept DREFL value
- **atten** –pointer to accept the attenuation on DREFH

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_cnt\_mode** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* slope, *touch\_tie\_opt\_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

---

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

---

**Parameters**

- **touch\_num** –touch pad index
- **slope** –touch pad charge/discharge speed
- **opt** –the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_cnt\_mode** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* \*slope, *touch\_tie\_opt\_t* \*opt)

Get touch sensor charge/discharge speed for each pad.

**Parameters**

- **touch\_num** –touch pad index
- **slope** –pointer to accept touch pad charge/discharge slope
- **opt** –pointer to accept the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_isr\_deregister** (void (\*fn)(void\*), void \*arg)

Deregister the handler previously registered using touch\_pad\_isr\_handler\_register.

**Parameters**

- **fn** –handler function to call (as passed to touch\_pad\_isr\_handler\_register)
- **arg** –argument of the handler (as passed to touch\_pad\_isr\_handler\_register)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if a handler matching both fn and arg isn't registered

*esp\_err\_t* **touch\_pad\_get\_wakeup\_status** (*touch\_pad\_t* \*pad\_num)

Get the touch pad which caused wakeup from deep sleep.

**Parameters** **pad\_num** –pointer to touch pad which caused wakeup

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_fsm\_mode** (*touch\_fsm\_mode\_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters** mode –FSM mode

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_fsm\_mode** (*touch\_fsm\_mode\_t* \*mode)

Get touch sensor FSM mode.

**Parameters** mode –pointer to accept FSM mode

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_status** (void)

To clear the touch sensor channel active status.

---

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

---

**Returns**

- ESP\_OK on success

uint32\_t **touch\_pad\_get\_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**

- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

bool **touch\_pad\_meas\_is\_done** (void)

Check touch sensor measurement status.

**Returns**

- True measurement is under way
- False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. TOUCH\_PAD\_NUM5\_GPIO\_NUM is the GPIO number of channel 5 (12);
2. TOUCH\_PAD\_GPIO4\_CHANNEL is the channel number of GPIO 4 (channel 0).

### Structures

struct `touch_pad_denoise`

Touch sensor denoise configuration

#### Public Members

*touch\_pad\_denoise\_grade\_t* `grade`

Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

*touch\_pad\_denoise\_cap\_t* `cap_level`

Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct `touch_pad_waterproof`

Touch sensor waterproof configuration

#### Public Members

*touch\_pad\_t* `guard_ring_pad`

Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

*touch\_pad\_shield\_driver\_t* `shield_driver`

Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).

struct `touch_filter_config`

Touch sensor filter configuration

## Public Members

### *touch\_filter\_mode\_t* mode

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

### uint32\_t **debounce\_cnt**

Set debounce count, such as  $n$ . If the measured values continue to exceed the threshold for  $n+1$  times, the touch sensor state changes. Range: 0 ~ 7

### uint32\_t **noise\_thr**

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient \* touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

### uint32\_t **jitter\_step**

Set jitter filter step size. Range: 0 ~ 15

### *touch\_smooth\_mode\_t* smh\_lvl

Level of filter applied on the original data against large noise interference.

### struct **touch\_pad\_sleep\_channel\_t**

Touch sensor channel sleep configuration

## Public Members

### *touch\_pad\_t* touch\_num

Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH\_PAD\_NUM0

### bool **en\_proximity**

enable proximity function for sleep pad

## Macros

**TOUCH\_PAD\_BIT\_MASK\_ALL**

**TOUCH\_PAD\_SLOPE\_DEFAULT**

**TOUCH\_PAD\_TIE\_OPT\_DEFAULT**

**TOUCH\_PAD\_BIT\_MASK\_MAX**

**TOUCH\_PAD\_HIGH\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_LOW\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_ATTEN\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_IDLE\_CH\_CONNECT\_DEFAULT****TOUCH\_PAD\_THRESHOLD\_MAX**

If set touch threshold max value, The touch sensor can't be in touched status

**TOUCH\_PAD\_SLEEP\_CYCLE\_DEFAULT**

Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC\_SLOW\_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff

---

**TOUCH\_PAD\_MEASURE\_CYCLE\_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH\_PAD\_INTR\_MASK\_ALL**

All touch interrupt type enable.

**TOUCH\_PROXIMITY\_MEAS\_NUM\_MAX**

Touch sensor proximity detection configuration

**TOUCH\_DEBOUNCE\_CNT\_MAX****TOUCH\_NOISE\_THR\_MAX****TOUCH\_JITTER\_STEP\_MAX****Type Definitions**

typedef struct *touch\_pad\_denoise* **touch\_pad\_denoise\_t**

Touch sensor denoise configuration

typedef struct *touch\_pad\_waterproof* **touch\_pad\_waterproof\_t**

Touch sensor waterproof configuration

typedef struct *touch\_filter\_config* **touch\_filter\_config\_t**

Touch sensor filter configuration

**Enumerations**

enum **touch\_pad\_t**

Touch pad channel

*Values:*

enumerator **TOUCH\_PAD\_NUM0**

Touch pad channel 0 is GPIO4(ESP32)

enumerator **TOUCH\_PAD\_NUM1**

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM10**

Touch channel 10 is GPIO10(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM11**

Touch channel 11 is GPIO11(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM12**

Touch channel 12 is GPIO12(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM13**

Touch channel 13 is GPIO13(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM14**

Touch channel 14 is GPIO14(ESP32-S2)

enumerator **TOUCH\_PAD\_MAX**

enum **touch\_high\_volt\_t**

Touch sensor high reference voltage

*Values:*

enumerator **TOUCH\_HVOLT\_KEEP**  
Touch sensor high reference voltage, no change

enumerator **TOUCH\_HVOLT\_2V4**  
Touch sensor high reference voltage, 2.4V

enumerator **TOUCH\_HVOLT\_2V5**  
Touch sensor high reference voltage, 2.5V

enumerator **TOUCH\_HVOLT\_2V6**  
Touch sensor high reference voltage, 2.6V

enumerator **TOUCH\_HVOLT\_2V7**  
Touch sensor high reference voltage, 2.7V

enumerator **TOUCH\_HVOLT\_MAX**

enum **touch\_low\_volt\_t**  
Touch sensor low reference voltage

*Values:*

enumerator **TOUCH\_LVOLT\_KEEP**  
Touch sensor low reference voltage, no change

enumerator **TOUCH\_LVOLT\_0V5**  
Touch sensor low reference voltage, 0.5V

enumerator **TOUCH\_LVOLT\_0V6**  
Touch sensor low reference voltage, 0.6V

enumerator **TOUCH\_LVOLT\_0V7**  
Touch sensor low reference voltage, 0.7V

enumerator **TOUCH\_LVOLT\_0V8**  
Touch sensor low reference voltage, 0.8V

enumerator **TOUCH\_LVOLT\_MAX**

enum **touch\_volt\_atten\_t**  
Touch sensor high reference voltage attenuation

*Values:*

enumerator **TOUCH\_HVOLT\_ATTEN\_KEEP**  
Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH\_HVOLT\_ATTEN\_1V5**  
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_1V**

Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V5**

Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V**

Touch sensor high reference voltage attenuation, 0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_MAX**

enum **touch\_cnt\_slope\_t**

Touch sensor charge/discharge speed

*Values:*

enumerator **TOUCH\_PAD\_SLOPE\_0**

Touch sensor charge / discharge speed, always zero

enumerator **TOUCH\_PAD\_SLOPE\_1**

Touch sensor charge / discharge speed, slowest

enumerator **TOUCH\_PAD\_SLOPE\_2**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_3**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_4**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_5**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_6**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_7**

Touch sensor charge / discharge speed, fast

enumerator **TOUCH\_PAD\_SLOPE\_MAX**

enum **touch\_tie\_opt\_t**

Touch sensor initial charge level

*Values:*

enumerator **TOUCH\_PAD\_TIE\_OPT\_LOW**

Initial level of charging voltage, low level

enumerator **TOUCH\_PAD\_TIE\_OPT\_HIGH**  
Initial level of charging voltage, high level

enumerator **TOUCH\_PAD\_TIE\_OPT\_MAX**

enum **touch\_fsm\_mode\_t**

Touch sensor FSM mode

*Values:*

enumerator **TOUCH\_FSM\_MODE\_TIMER**  
To start touch FSM by timer

enumerator **TOUCH\_FSM\_MODE\_SW**  
To start touch FSM by software trigger

enumerator **TOUCH\_FSM\_MODE\_MAX**

enum **touch\_trigger\_mode\_t**

*Values:*

enumerator **TOUCH\_TRIGGER\_BELOW**  
Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH\_TRIGGER\_ABOVE**  
Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH\_TRIGGER\_MAX**

enum **touch\_trigger\_src\_t**

*Values:*

enumerator **TOUCH\_TRIGGER\_SOURCE\_BOTH**  
wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator **TOUCH\_TRIGGER\_SOURCE\_SET1**  
wakeup interrupt is generated if SET1 is “touched”

enumerator **TOUCH\_TRIGGER\_SOURCE\_MAX**

enum **touch\_pad\_intr\_mask\_t**

*Values:*

enumerator **TOUCH\_PAD\_INTR\_MASK\_DONE**  
Measurement done for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_ACTIVE**  
Active for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_INACTIVE**

Inactive for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_SCAN\_DONE**

Measurement done for all the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_TIMEOUT**

Timeout for one of the enabled channels.

enum **touch\_pad\_denoise\_grade\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_BIT12**

Denoise range is 12bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT10**

Denoise range is 10bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT8**

Denoise range is 8bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT4**

Denoise range is 4bit

enumerator **TOUCH\_PAD\_DENOISE\_MAX**

enum **touch\_pad\_denoise\_cap\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L0**

Denoise channel internal reference capacitance is 5pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L1**

Denoise channel internal reference capacitance is 6.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L2**

Denoise channel internal reference capacitance is 7.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L3**

Denoise channel internal reference capacitance is 9.2pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L4**

Denoise channel internal reference capacitance is 10.6pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L5**

Denoise channel internal reference capacitance is 12.0pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L6**

Denoise channel internal reference capacitance is 13.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L7**

Denoise channel internal reference capacitance is 14.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_MAX**

enum **touch\_pad\_shield\_driver\_t**

Touch sensor shield channel drive capability level

*Values:*

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L0**

The max equivalent capacitance in shield channel is 40pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L1**

The max equivalent capacitance in shield channel is 80pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L2**

The max equivalent capacitance in shield channel is 120pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L3**

The max equivalent capacitance in shield channel is 160pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L4**

The max equivalent capacitance in shield channel is 200pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L5**

The max equivalent capacitance in shield channel is 240pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L6**

The max equivalent capacitance in shield channel is 280pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L7**

The max equivalent capacitance in shield channel is 320pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_MAX**

enum **touch\_pad\_conn\_type\_t**

Touch channel idle state configuration

*Values:*

enumerator **TOUCH\_PAD\_CONN\_HIGHZ**

Idle status of touch channel is high resistance state

enumerator **TOUCH\_PAD\_CONN\_GND**

Idle status of touch channel is ground connection

enumerator **TOUCH\_PAD\_CONN\_MAX**

enum **touch\_filter\_mode\_t**

Touch channel IIR filter coefficient configuration.

---

**Note:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_16`.

---

*Values:*

enumerator **TOUCH\_PAD\_FILTER\_IIR\_4**

The filter mode is first-order IIR filter. The coefficient is 4.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_8**

The filter mode is first-order IIR filter. The coefficient is 8.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_16**

The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

enumerator **TOUCH\_PAD\_FILTER\_IIR\_32**

The filter mode is first-order IIR filter. The coefficient is 32.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_64**

The filter mode is first-order IIR filter. The coefficient is 64.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_128**

The filter mode is first-order IIR filter. The coefficient is 128.

enumerator **TOUCH\_PAD\_FILTER\_IIR\_256**

The filter mode is first-order IIR filter. The coefficient is 256.

enumerator **TOUCH\_PAD\_FILTER\_JITTER**

The filter mode is jitter filter

enumerator **TOUCH\_PAD\_FILTER\_MAX**

enum **touch\_smooth\_mode\_t**

Level of filter applied on the original data against large noise interference.

---

**Note:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_2`.

---

*Values:*

enumerator **TOUCH\_PAD\_SMOOTH\_OFF**

No filtering of raw data.

enumerator **TOUCH\_PAD\_SMOOTH\_IIR\_2**

Filter the raw data. The coefficient is 2 (Typical value).

enumerator `TOUCH_PAD_SMOOTH_IIR_4`

Filter the raw data. The coefficient is 4.

enumerator `TOUCH_PAD_SMOOTH_IIR_8`

Filter the raw data. The coefficient is 8.

enumerator `TOUCH_PAD_SMOOTH_MAX`

## 2.5.24 Touch Element

### Overview

Touch Element library provides a high level abstraction for building capacitive touch applications. The library's implementation gives a unified and friendly software interface thus allows for smooth and easy capacitive touch application development. The library is implemented atop the touch sensor driver (please see [Touch sensor driver API Reference](#) for more information regarding low level API usage).

**Architecture** Touch Element library configures touch sensor peripherals via touch sensor driver. While some necessary hardware parameters should be passed to `touch_element_install()` and will be configured automatically only after calling `touch_element_start()`, because it will make great influence on the run-time system.

These parameters include touch channel threshold, waterproof shield sensor driver-level and etc. Touch Element library sets touch sensor interrupt and esp-timer routine up and the hardware information of touch sensor (channel state, channel number) will be obtained in touch sensor interrupt service routine. When the specified channel event occurs, and those hardware information will be passed to the esp-timer callback routine, esp-timer callback routine will dispatch the touch sensor channel information to the touch elements(such as button, slider etc). Then runs the specified algorithm to update touch element's state or calculate its position, dispatch the result to user.

So using Touch Element library, user doesn't need to care about the implementation of touch sensor peripheral, Touch Element library will handle most of the hardware information and pass the more meaningful messages to user event handler routine.

Workflow of Touch Element library is illustrated in the picture below.

The features in relation to the Touch Element library in ESP32-S2 are given in the table below.

Features	ESP32S2
Touch Element waterproof	✓
Touch Element button	✓
Touch Element slider	✓
Touch Element matrix button	✓

**Peripheral** ESP32-S2 integrates one touch sensor peripheral with several physical channels.

- 14 physical capacitive touch channels
- Timer or software FSM trigger mode
- Up to 5 kinds of interrupt(Upper threshold and lower threshold interrupt, measure one channel finish and measure all channels finish interrupt, measurement timeout interrupt)
- Sleep mode wakeup source
- Hardware internal de-noise
- Hardware filter
- Hardware waterproof sensor
- Hardware proximity sensor

Fig. 17: Touch Element architecture

The channels are located as follows:

Channel	ESP32-S2
<b>Channel 0</b>	<b>GPIO 0 (reserved)</b>
<b>Channel 1</b>	<b>GPIO 1</b>
<b>Channel 2</b>	<b>GPIO 2</b>
<b>Channel 3</b>	<b>GPIO 3</b>
<b>Channel 4</b>	<b>GPIO 4</b>
<b>Channel 5</b>	<b>GPIO 5</b>
<b>Channel 6</b>	<b>GPIO 6</b>
<b>Channel 7</b>	<b>GPIO 7</b>
<b>Channel 8</b>	<b>GPIO 8</b>
<b>Channel 9</b>	<b>GPIO 9</b>
<b>Channel 10</b>	<b>GPIO 10</b>
<b>Channel 11</b>	<b>GPIO 11</b>
<b>Channel 12</b>	<b>GPIO 12</b>
<b>Channel 13</b>	<b>GPIO 13</b>
<b>Channel 14</b>	<b>GPIO 14</b>

### Terminology

The terms used in relation to the Touch Element library are given in the below.

Term	Definition
<b>Touch sensor</b>	Touch sensor peripheral inside the chip
<b>Touch channel</b>	Touch sensor channels inside the touch sensor peripheral
<b>Touch pad</b>	Off-chip physical solder pad (Generally inside the PCB)
<b>De-noise channel</b>	Internal de-noise channel (Is always Channel 0 and it is reserved)
<b>Shield sensor</b>	One of the waterproof sensor, use for compensating the influence of water drop
<b>Guard sensor</b>	One of the waterproof sensor, use for detecting the water stream
<b>Shield channel</b>	The channel that waterproof shield sensor connected to (Is always Channel 14)
<b>Guard channel</b>	The channel that waterproof guard sensor connected to
<b>Shield pad</b>	Off-chip physical solder pad (Generally is grids) and is connected to shield sensor
<b>Guard pad</b>	Off-chip physical solder pad (Is usually a ring) and is connected to guard sensor

**Touch Sensor Signal** Each touch sensor is able to provide the following types of signals:

- Raw: The Raw signal is the unfiltered signal from the touch sensor
- Smooth: The Smooth signal is a filtered version of the Raw signal via an internal hardware filter
- Benchmark: The Benchmark signal is also a filtered signal that filters out extremely low-frequency noise.

All of these signals can be obtained using touch sensor driver API.

**Touch Sensor Threshold** The Touch Sensor Threshold value is a configurable threshold value used to determine when a touch sensor is touched or not. When difference between the Smooth signal and the Benchmark signal becomes greater than the threshold value (i.e.,  $(\text{smooth} - \text{benchmark}) > \text{threshold}$ ), the touch channel's state will be changed and a touch interrupt will be triggered simultaneously.

**Sensitivity** Important performance parameter of touch sensor, the larger it is, the better touch sensor will perform. It could be calculated by the format in below:

$$\text{Sensitivity} = \frac{\text{Signal}_{\text{press}} - \text{Signal}_{\text{release}}}{\text{Signal}_{\text{release}}} = \frac{\text{Signal}_{\text{delta}}}{\text{Signal}_{\text{benchmark}}}$$

Fig. 18: Touch sensor application system components

Fig. 19: Touch sensor signals

Fig. 20: Touch sensor signal threshold

**Waterproof** Waterproof is a hardware feature of touch sensor which has guard sensor and shield sensor (Always connect to Channel 14) that has the ability to resist a degree influence of water drop and detect the water stream.

**Touch Button** Touch button consumes one channel of touch sensor, and it looks like as the picture below:

**Touch Slider** Touch slider consumes several channels(at least three channels) of touch sensor, the more channels consumed, the higher resolution and accuracy position it will perform. Touch slider looks like as the picture below:

**Touch Matrix** Touch matrix button consumes several channels(at least  $2 + 2 = 4$  channels), it gives a solution to use fewer channels and get more buttons. ESP32-S2 supports up to 49 buttons. Touch matrix button looks like as the picture below:

### Touch Element Library Usage

Using this library should follow the initialization flow below:

1. To initialize Touch Element library by calling `touch_element_install()`
2. To initialize touch elements(button/slider etc) by calling `touch_xxxx_install()`
3. To create a new element instance by calling `touch_xxxx_create()`
4. To subscribe events by calling `touch_xxxx_subscribe_event()`
5. To choose a dispatch method by calling `touch_xxxx_set_dispatch_method()` that tells the library how to notify you while the subscribed event occur
6. (If dispatch by callback) Call `touch_xxxx_set_callback()` to set the event handler function.
7. To start Touch Element library by calling `touch_element_start()`
8. (If dispatch by callback) The callback will be called by the driver core when event happen, no need to do anything; (If dispatch by event task) create an event task and call `touch_element_message_receive()` to obtain messages in a loop.
9. [Optional] If user wants to suspend the Touch Element run-time system or for some reason that could not obtain the touch element message, `touch_element_stop()` should be called to suspend the Touch Element system and then resume it by calling `touch_element_start()` again.

In code, the flow above may look like as follows:

```
static touch_xxx_handle_t element_handle; //Declare a touch element handle

//Define the subscribed event handler
void event_handler(touch_xxx_handle_t out_handle, touch_xxx_message_t out_message, void *arg)
{
    //Event handler logic
}
```

(continues on next page)

Fig. 21: Touch button

Fig. 22: Touch slider

Fig. 23: Touch matrix

```

void app_main()
{
    //Using the default initializer to config Touch Element library
    touch_elem_global_config_t global_config = TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG();
    touch_element_install(&global_config);

    //Using the default initializer to config Touch elements
    touch_xxx_global_config_t elem_global_config = TOUCH_XXXX_GLOBAL_DEFAULT_
↪CONFIG();
    touch_xxx_install(&elem_global_config);

    //Create a new instance
    touch_xxx_config_t element_config = {
        ...
        ...
    };
    touch_xxx_create(&element_config, &element_handle);

    //Subscribe the specified events by using the event mask
    touch_xxx_subscribe_event(element_handle, TOUCH_ELEM_EVENT_ON_PRESS | TOUCH_
↪ELEM_EVENT_ON_RELEASE, NULL);

    //Choose CALLBACK as the dispatch method
    touch_xxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK);

    //Register the callback routine
    touch_xxx_set_callback(element_handle, event_handler);

    //Start Touch Element library processing
    touch_element_start();
}

```

## Initialization

1. To initialize Touch Element library, user has to configure touch sensor peripheral and Touch Element library by calling `touch_element_install()` with `touch_elem_global_config_t`, the default initializer is available in `TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG()` and this default configuration is suitable for the most general application scene, and users are suggested not to change the default configuration before fully understanding Touch Sensor peripheral, because some changes might bring several impacts to the system.
2. To initialize the specified element, all the elements will not work before its constructor (`touch_xxxx_install()`) is called so as to save memory, so user has to call the constructor of each used touch element respectively, to set up the specified element.

## Touch Element Instance Startup

1. To create a new touch element instance by calling `touch_xxxx_create()`, selects channel and passes its *Sensitivity* for the new element instance.
2. To subscribe events by calling `touch_xxxx_subscribe_event()`, there several events in Touch Element library and the event mask is available on [components/touch\\_element/include/touch\\_element/touch\\_element.h](#), user could use those events mask to subscribe specified event or combine them to subscribe multiple events.
3. To configure dispatch method by calling `touch_xxxx_subscribe_event()`, there are two dispatch methods in Touch Element library, one is `TOUCH_ELEM_DISP_EVENT`, the other one is `TOUCH_ELEM_DISP_CALLBACK`, it means that user could use two methods to obtain the touch element message and handle it.

**Events Processing** If `TOUCH_ELEM_DISP_EVENT` dispatch method is configured, user need to startup an event handler task to obtain the touch element message, all the elements raw message could be obtained by calling `touch_element_message_receive()`, then extract the element-class-specific message by calling the corresponding message decoder (`touch_xxxx_get_message()`) to get the touch element's extracted message; If `TOUCH_ELEM_DISP_CALLBACK` dispatch method is configured, user need to pass an event handler by calling `touch_xxxx_set_callback()` before the touch elem starts working, all the element's extracted message will be passed to the event handler function.

**Warning:** Since the event handler function runs on the library driver core(The context located in esp-timer callback routine), user should not do something that attempts to block or delay, such as call `vTaskDelay()`.

In code, the events handle procedure may look like as follows:

```

/* ----- TOUCH_ELEM_DISP_EVENT -----
↳----- */
void element_handler_task(void *arg)
{
    touch_elem_message_t element_message;
    while(1) {
        if (touch_element_message_receive(&element_message, Timeout) == ESP_OK) {
            const touch_xxxx_message_t *extracted_message = touch_xxxx_get_
↳message(&element_message); //Decode message
            ... //Event handler logic
        }
    }
}

void app_main()
{
    ...

    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_EVENT); //Set_
↳TOUCH_ELEM_DISP_EVENT as the dispatch method
    xTaskCreate(&element_handler_task, "element_handler_task", 2048, NULL, 5, _
↳NULL); //Create a handler task

    ...
}

/* ----- TOUCH_ELEM_DISP_CALLBACK -----
↳----- */

...
/* ----- TOUCH_ELEM_DISP_CALLBACK -----
↳----- */
void element_handler(touch_xxxx_handle_t out_handle, touch_xxxx_message_t out_
↳message, void *arg)
{
    //Event handler logic
}

void app_main()
{
    ...

    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK); //
↳Set TOUCH_ELEM_DISP_CALLBACK as the dispatch method
    touch_xxxx_set_callback(element_handle, element_handler); //Register an event_
↳handler function

    ...
}

```

(continues on next page)

(continued from previous page)

```

/* -----
↔----- */

```

### Waterproof Usage

1. To initialize Touch Element waterproof, the waterproof shield sensor is always-on after Touch Element waterproof is initialized, however the waterproof guard sensor is optional, hence if user doesn't need the guard sensor, `TOUCH_WATERPROOF_GUARD_NOUSE` has to be passed to `touch_element_waterproof_install()` by the configuration struct.
2. To associate the touch element with the guard sensor, pass the touch element's handle to the Touch Element waterproof's masked list by calling `touch_element_waterproof_add()`. By associating a touch element with the Guard sensor, the touch element will be disabled when the guard sensor is triggered by a stream of water so as to protect the touch element.

The Touch Element Waterproof example is available in `peripherals/touch_element/touch_element_waterproof` directory.

In code, the waterproof configuration may look like as follows:

```

void app_main()
{
    ...

    touch_xxxx_install();           //Initialize instance (button, slider, ↵
↔etc)
    touch_xxxx_create(&element_handle); //Create a new Touch element

    ...

    touch_element_waterproof_install(); //Initialize Touch Element ↵
↔waterproof
    touch_element_waterproof_add(element_handle); //Let a element associates ↵
↔with guard sensor

    ...
}

```

### Application Example

All the Touch Element library examples could be found in the `peripherals/touch_element` directory of ESP-IDF examples.

### API Reference - Touch Element core

#### Header File

- `components/touch_element/include/touch_element/touch_element.h`

#### Functions

`esp_err_t touch_element_install` (const `touch_elem_global_config_t` \*global\_config)

Touch element processing initialization.

---

**Note:** To reinitialize the touch element object, call `touch_element_uninstall()` first

---

**Parameters** `global_config` – [in] Global initialization configuration structure

**Returns**

- ESP\_OK: Successfully initialized
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Touch element is already initialized
- Others: Unknown touch driver layer or lower layer error

*esp\_err\_t* **touch\_element\_start** (void)

Touch element processing start.

This function starts the touch element processing system

---

**Note:** This function must only be called after all the touch element instances finished creating

---

**Returns**

- ESP\_OK: Successfully started to process
- Others: Unknown touch driver layer or lower layer error

*esp\_err\_t* **touch\_element\_stop** (void)

Touch element processing stop.

This function stops the touch element processing system

---

**Note:** This function must be called before changing the system (hardware, software) parameters

---

**Returns**

- ESP\_OK: Successfully stopped to process
- Others: Unknown touch driver layer or lower layer error

void **touch\_element\_uninstall** (void)

Release resources allocated using touch\_element\_install.

*esp\_err\_t* **touch\_element\_message\_receive** (*touch\_elem\_message\_t* \*element\_message, uint32\_t ticks\_to\_wait)

Get current event message of touch element instance.

This function will receive the touch element message (handle, event type, etc ...) from te\_event\_give(). It will block until a touch element event or a timeout occurs.

**Parameters**

- **element\_message** **-[out]** Touch element event message structure
- **ticks\_to\_wait** **-[in]** Number of FreeRTOS ticks to block for waiting event

**Returns**

- ESP\_OK: Successfully received touch element event
- ESP\_ERR\_INVALID\_STATE: Touch element library is not initialized
- ESP\_ERR\_INVALID\_ARG: element\_message is null
- ESP\_ERR\_TIMEOUT: Timed out waiting for event

*esp\_err\_t* **touch\_element\_waterproof\_install** (const *touch\_elem\_waterproof\_config\_t* \*waterproof\_config)

Touch element waterproof initialization.

This function enables the hardware waterproof, then touch element system uses Shield-Sensor and Guard-Sensor to mitigate the influence of water-drop and water-stream.

---

**Note:** If the waterproof function is used, Shield-Sensor can not be disabled and it will use channel 14 as it's internal channel. Hence, the user can not use channel 14 for another propose. And the Guard-Sensor is not

---

necessary since it is optional.

---

**Note:** Shield-Sensor: It always uses channel 14 as the shield channel, so user must connect the channel 14 and Shield-Layer in PCB since it will generate a synchronous signal automatically

---

**Note:** Guard-Sensor: This function is optional. If used, the user must connect the guard channel and Guard-Ring in PCB. Any channels user wants to protect should be added into Guard-Ring in PCB.

---

**Parameters** `waterproof_config` **–[in]** Waterproof configuration

**Returns**

- `ESP_OK`: Successfully initialized
- `ESP_ERR_INVALID_STATE`: Touch element library is not initialized
- `ESP_ERR_INVALID_ARG`: `waterproof_config` is null or invalid Guard-Sensor channel
- `ESP_ERR_NO_MEM`: Insufficient memory

void `touch_element_waterproof_uninstall` (void)

Release resources allocated using `touch_element_waterproof_install()`

*esp\_err\_t* `touch_element_waterproof_add` (*touch\_elem\_handle\_t* element\_handle)

Add a masked handle to protect while Guard-Sensor has been triggered.

This function will add an application handle (button, slider, etc…) as a masked handle. While Guard-Sensor has been triggered, waterproof function will start working and lock the application internal state. While the influence of water is reduced, the application will be unlock and reset into IDLE state.

---

**Note:** The waterproof protection logic must follow the real circuit in PCB, it means that all of the channels inside the input handle must be inside the Guard-Ring in real circuit.

---

**Parameters** `element_handle` **–[in]** Touch element instance handle

**Returns**

- `ESP_OK`: Successfully added a masked handle
- `ESP_ERR_INVALID_STATE`: Waterproof is not initialized
- `ESP_ERR_INVALID_ARG`: `element_handle` is null

*esp\_err\_t* `touch_element_waterproof_remove` (*touch\_elem\_handle\_t* element\_handle)

Remove a masked handle to protect.

This function will remove an application handle from masked handle table.

**Parameters** `element_handle` **–[in]** Touch element instance handle

**Returns**

- `ESP_OK`: Successfully removed a masked handle
- `ESP_ERR_INVALID_STATE`: Waterproof is not initialized
- `ESP_ERR_INVALID_ARG`: `element_handle` is null
- `ESP_ERR_NOT_FOUND`: Failed to search `element_handle` from waterproof mask\_handle list

## Structures

struct `touch_elem_sw_config_t`

Touch element software configuration.

### Public Members

float **waterproof\_threshold\_divider**  
Waterproof guard channel threshold divider.

uint8\_t **processing\_period**  
Processing period(ms)

uint8\_t **intr\_message\_size**  
Interrupt message queue size.

uint8\_t **event\_message\_size**  
Event message queue size.

struct **touch\_elem\_hw\_config\_t**  
Touch element hardware configuration.

### Public Members

*touch\_high\_volt\_t* **upper\_voltage**  
Touch sensor channel upper charge voltage.

*touch\_volt\_atten\_t* **voltage\_attenuation**  
Touch sensor channel upper charge voltage attenuation (Diff voltage is upper - attenuation - lower)

*touch\_low\_volt\_t* **lower\_voltage**  
Touch sensor channel lower charge voltage.

*touch\_pad\_conn\_type\_t* **suspend\_channel\_polarity**  
Suspend channel polarity (High Impedance State or GND)

*touch\_pad\_denoise\_grade\_t* **denoise\_level**  
Internal de-noise level.

*touch\_pad\_denoise\_cap\_t* **denoise\_equivalent\_cap**  
Internal de-noise channel (Touch channel 0) equivalent capacitance.

*touch\_smooth\_mode\_t* **smooth\_filter\_mode**  
Smooth value filter mode (This only apply to touch\_pad\_filter\_read\_smooth())

*touch\_filter\_mode\_t* **benchmark\_filter\_mode**  
Benchmark filter mode.

uint16\_t **sample\_count**  
The count of sample in each measurement of touch sensor.

uint16\_t **sleep\_cycle**  
The cycle (RTC slow clock) of sleep.

uint8\_t **benchmark\_debounce\_count**

Benchmark debounce count.

uint8\_t **benchmark\_calibration\_threshold**

Benchmark calibration threshold.

uint8\_t **benchmark\_jitter\_step**

Benchmark jitter filter step (This only works at while benchmark filter mode is jitter filter)

struct **touch\_elem\_global\_config\_t**

Touch element global configuration passed to touch\_element\_install.

### Public Members

*touch\_elem\_hw\_config\_t* **hardware**

Hardware configuration.

*touch\_elem\_sw\_config\_t* **software**

Software configuration.

struct **touch\_elem\_waterproof\_config\_t**

Touch element waterproof configuration passed to touch\_element\_waterproof\_install.

### Public Members

*touch\_pad\_t* **guard\_channel**

Waterproof Guard-Sensor channel number (index)

float **guard\_sensitivity**

Waterproof Guard-Sensor sensitivity.

struct **touch\_elem\_message\_t**

Touch element event message type from touch\_element\_message\_receive()

### Public Members

*touch\_elem\_handle\_t* **handle**

Touch element handle.

*touch\_elem\_type\_t* **element\_type**

Touch element type.

void \***arg**

User input argument.

uint8\_t **child\_msg[8]**

Encoded message.

### Macros

**TOUCH\_ELEM\_GLOBAL\_DEFAULT\_CONFIG** ()

**TOUCH\_ELEM\_EVENT\_NONE**

None event.

**TOUCH\_ELEM\_EVENT\_ON\_PRESS**

On Press event.

**TOUCH\_ELEM\_EVENT\_ON\_RELEASE**

On Release event.

**TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS**

On LongPress event.

**TOUCH\_ELEM\_EVENT\_ON\_CALCULATION**

On Calculation event.

**TOUCH\_WATERPROOF\_GUARD\_NOUSE**

Waterproof no use guard sensor.

### Type Definitions

typedef void \***touch\_elem\_handle\_t**

Touch element handle type.

typedef uint32\_t **touch\_elem\_event\_t**

Touch element event type.

### Enumerations

enum **touch\_elem\_type\_t**

Touch element handle type.

*Values:*

enumerator **TOUCH\_ELEM\_TYPE\_BUTTON**

Touch element button.

enumerator **TOUCH\_ELEM\_TYPE\_SLIDER**

Touch element slider.

enumerator **TOUCH\_ELEM\_TYPE\_MATRIX**

Touch element matrix button.

enum **touch\_elem\_dispatch\_t**

Touch element event dispatch methods (event queue/callback)

*Values:*

enumerator **TOUCH\_ELEM\_DISP\_EVENT**

Event queue dispatch.

enumerator **TOUCH\_ELEM\_DISP\_CALLBACK**

Callback dispatch.

enumerator **TOUCH\_ELEM\_DISP\_MAX**

## API Reference - Touch Button

### Header File

- [components/touch\\_element/include/touch\\_element/touch\\_button.h](#)

### Functions

*esp\_err\_t* **touch\_button\_install** (const *touch\_button\_global\_config\_t* \*global\_config)

Touch Button initialize.

This function initializes touch button global and acts on all touch button instances.

**Parameters** **global\_config** –[in] Button object initialization configuration

#### Returns

- ESP\_OK: Successfully initialized touch button
- ESP\_ERR\_INVALID\_STATE: Touch element library was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_init is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

void **touch\_button\_uninstall** (void)

Release resources allocated using touch\_button\_install()

*esp\_err\_t* **touch\_button\_create** (const *touch\_button\_config\_t* \*button\_config, *touch\_button\_handle\_t* \*button\_handle)

Create a new touch button instance.

---

**Note:** The sensitivity has to be explored in experiments, Sensitivity = (Raw(touch) - Raw(release)) / Raw(release) \* 100%

---

#### Parameters

- **button\_config** –[in] Button configuration
- **button\_handle** –[out] Button handle

#### Returns

- ESP\_OK: Successfully create touch button
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL

*esp\_err\_t* **touch\_button\_delete** (*touch\_button\_handle\_t* button\_handle)

Release resources allocated using touch\_button\_create()

**Parameters** **button\_handle** –[in] Button handle

#### Returns

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a button handle

*esp\_err\_t* **touch\_button\_subscribe\_event** (*touch\_button\_handle\_t* button\_handle, uint32\_t event\_mask, void \*arg)

Touch button subscribes event.

This function uses event mask to subscribe to touch button events, once one of the subscribed events occurs, the event message could be retrieved by calling `touch_element_message_receive()` or input callback routine.

---

**Note:** Touch button only support three kind of event masks, they are `TOUCH_ELEM_EVENT_ON_PRESS`, `TOUCH_ELEM_EVENT_ON_RELEASE`, `TOUCH_ELEM_EVENT_ON_LONGPRESS`. You can use those event masks in any combination to achieve the desired effect.

---

#### Parameters

- **button\_handle** –[in] Button handle
- **event\_mask** –[in] Button subscription event mask
- **arg** –[in] User input argument

#### Returns

- `ESP_OK`: Successfully subscribed touch button event
- `ESP_ERR_INVALID_STATE`: Touch button driver was not initialized
- `ESP_ERR_INVALID_ARG`: button\_handle is null or event is not supported

*esp\_err\_t* **touch\_button\_set\_dispatch\_method** (*touch\_button\_handle\_t* button\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

#### Parameters

- **button\_handle** –[in] Button handle
- **dispatch\_method** –[in] Dispatch method (By callback/event)

#### Returns

- `ESP_OK`: Successfully set dispatch method
- `ESP_ERR_INVALID_STATE`: Touch button driver was not initialized
- `ESP_ERR_INVALID_ARG`: button\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_button\_set\_callback** (*touch\_button\_handle\_t* button\_handle, *touch\_button\_callback\_t* button\_callback)

Touch button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

---

**Note:** Button message will be passed from the callback function and it will be destroyed when the callback function return.

---

<p><b>Warning:</b> Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling <code>vTaskDelay()</code>.</p>
--

#### Parameters

- **button\_handle** –[in] Button handle
- **button\_callback** –[in] User input callback

#### Returns

- `ESP_OK`: Successfully set callback
- `ESP_ERR_INVALID_STATE`: Touch button driver was not initialized
- `ESP_ERR_INVALID_ARG`: button\_handle or button\_callback is null

*esp\_err\_t* **touch\_button\_set\_longpress** (*touch\_button\_handle\_t* button\_handle, uint32\_t threshold\_time)

Touch button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

#### Parameters

- **button\_handle** –[in] Button handle
- **threshold\_time** –[in] Threshold time (ms) of long press event occur

#### Returns

- ESP\_OK: Successfully set the threshold time of long press event
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null or time (ms) is not larger than 0

const *touch\_button\_message\_t* \***touch\_button\_get\_message** (const *touch\_elem\_message\_t* \*element\_message)

Touch button get message.

This function decodes the element message from touch\_element\_message\_receive() and return a button message pointer.

**Parameters** **element\_message** –[in] element message

**Returns** Touch button message pointer

## Structures

struct **touch\_button\_global\_config\_t**

Button initialization configuration passed to touch\_button\_install.

### Public Members

float **threshold\_divider**

Button channel threshold divider.

uint32\_t **default\_lp\_time**

Button default LongPress event time (ms)

struct **touch\_button\_config\_t**

Button configuration (for new instance) passed to touch\_button\_create()

### Public Members

*touch\_pad\_t* **channel\_num**

Button channel number (index)

float **channel\_sens**

Button channel sensitivity.

struct **touch\_button\_message\_t**

Button message type.

## Public Members

*touch\_button\_event\_t* **event**

Button event.

## Macros

**TOUCH\_BUTTON\_GLOBAL\_DEFAULT\_CONFIG** ()

## Type Definitions

typedef *touch\_elem\_handle\_t* **touch\_button\_handle\_t**

Button handle.

typedef void (\***touch\_button\_callback\_t**)(*touch\_button\_handle\_t*, *touch\_button\_message\_t*\*, void\*)

Button callback type.

## Enumerations

enum **touch\_button\_event\_t**

Button event type.

*Values:*

enumerator **TOUCH\_BUTTON\_EVT\_ON\_PRESS**

Button Press event.

enumerator **TOUCH\_BUTTON\_EVT\_ON\_RELEASE**

Button Release event.

enumerator **TOUCH\_BUTTON\_EVT\_ON\_LONGPRESS**

Button LongPress event.

enumerator **TOUCH\_BUTTON\_EVT\_MAX**

## API Reference - Touch Slider

### Header File

- [components/touch\\_element/include/touch\\_element/touch\\_slider.h](#)

### Functions

*esp\_err\_t* **touch\_slider\_install** (const *touch\_slider\_global\_config\_t* \*global\_config)

Touch slider initialize.

This function initializes touch slider object and acts on all touch slider instances.

**Parameters** **global\_config** –[in] Touch slider global initialization configuration

**Returns**

- **ESP\_OK**: Successfully initialized touch slider
- **ESP\_ERR\_INVALID\_STATE**: Touch element library was not initialized
- **ESP\_ERR\_INVALID\_ARG**: slider\_init is NULL
- **ESP\_ERR\_NO\_MEM**: Insufficient memory

void **touch\_slider\_uninstall** (void)

Release resources allocated using touch\_slider\_install()

*esp\_err\_t* **touch\_slider\_create** (const *touch\_slider\_config\_t* \*slider\_config, *touch\_slider\_handle\_t* \*slider\_handle)

Create a new touch slider instance.

---

**Note:** The index of Channel array and sensitivity array must be one-one correspondence

---

#### Parameters

- **slider\_config** –[in] Slider configuration
- **slider\_handle** –[out] Slider handle

#### Returns

- ESP\_OK: Successfully create touch slider
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **touch\_slider\_delete** (*touch\_slider\_handle\_t* slider\_handle)

Release resources allocated using touch\_slider\_create.

**Parameters** **slider\_handle** –[in] Slider handle

#### Returns

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a slider handle

*esp\_err\_t* **touch\_slider\_subscribe\_event** (*touch\_slider\_handle\_t* slider\_handle, uint32\_t event\_mask, void \*arg)

Touch slider subscribes event.

This function uses event mask to subscribe to touch slider events, once one of the subscribed events occurs, the event message could be retrieved by calling touch\_element\_message\_receive() or input callback routine.

---

**Note:** Touch slider only support three kind of event masks, they are TOUCH\_ELEM\_EVENT\_ON\_PRESS, TOUCH\_ELEM\_EVENT\_ON\_RELEASE. You can use those event masks in any combination to achieve the desired effect.

---

#### Parameters

- **slider\_handle** –[in] Slider handle
- **event\_mask** –[in] Slider subscription event mask
- **arg** –[in] User input argument

#### Returns

- ESP\_OK: Successfully subscribed touch slider event
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null or event is not supported

*esp\_err\_t* **touch\_slider\_set\_dispatch\_method** (*touch\_slider\_handle\_t* slider\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch slider set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

#### Parameters

- **slider\_handle** –[in] Slider handle
- **dispatch\_method** –[in] Dispatch method (By callback/event)

**Returns**

- ESP\_OK: Successfully set dispatch method
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_slider\_set\_callback** (*touch\_slider\_handle\_t* slider\_handle, *touch\_slider\_callback\_t* slider\_callback)

Touch slider set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

---

**Note:** Slider message will be passed from the callback function and it will be destroyed when the callback function return.

---

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

**Parameters**

- **slider\_handle** –[in] Slider handle
- **slider\_callback** –[in] User input callback

**Returns**

- ESP\_OK: Successfully set callback
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle or slider\_callback is null

const *touch\_slider\_message\_t* \***touch\_slider\_get\_message** (const *touch\_elem\_message\_t* \*element\_message)

Touch slider get message.

This function decodes the element message from touch\_element\_message\_receive() and return a slider message pointer.

**Parameters** **element\_message** –[in] element message

**Returns** Touch slider message pointer

**Structures**

struct **touch\_slider\_global\_config\_t**

Slider initialization configuration passed to touch\_slider\_install.

**Public Members**

float **quantify\_lower\_threshold**

Slider signal quantification threshold.

float **threshold\_divider**

Slider channel threshold divider.

uint16\_t **filter\_reset\_time**

Slider position filter reset time (Unit is esp\_timer callback tick)

uint16\_t **benchmark\_update\_time**

Slider benchmark update time (Unit is esp\_timer callback tick)

uint8\_t **position\_filter\_size**

Moving window filter buffer size.

uint8\_t **position\_filter\_factor**

One-order IIR filter factor.

uint8\_t **calculate\_channel\_count**

The number of channels which will take part in calculation.

struct **touch\_slider\_config\_t**

Slider configuration (for new instance) passed to touch\_slider\_create()

### Public Members

const *touch\_pad\_t* \***channel\_array**

Slider channel array.

const float \***sensitivity\_array**

Slider channel sensitivity array.

uint8\_t **channel\_num**

The number of slider channels.

uint8\_t **position\_range**

The right region of touch slider position range, [0, position\_range (less than or equal to 255)].

struct **touch\_slider\_message\_t**

Slider message type.

### Public Members

*touch\_slider\_event\_t* **event**

Slider event.

*touch\_slider\_position\_t* **position**

Slider position.

### Macros

**TOUCH\_SLIDER\_GLOBAL\_DEFAULT\_CONFIG** ()

### Type Definitions

typedef uint32\_t **touch\_slider\_position\_t**

Slider position data type.

typedef *touch\_elem\_handle\_t* **touch\_slider\_handle\_t**

Slider instance handle.

typedef void (\***touch\_slider\_callback\_t**)(*touch\_slider\_handle\_t*, *touch\_slider\_message\_t\**, void\*)

Slider callback type.

### Enumerations

enum **touch\_slider\_event\_t**

Slider event type.

*Values:*

enumerator **TOUCH\_SLIDER\_EVT\_ON\_PRESS**

Slider on Press event.

enumerator **TOUCH\_SLIDER\_EVT\_ON\_RELEASE**

Slider on Release event.

enumerator **TOUCH\_SLIDER\_EVT\_ON\_CALCULATION**

Slider on Calculation event.

enumerator **TOUCH\_SLIDER\_EVT\_MAX**

### API Reference - Touch Matrix

#### Header File

- [components/touch\\_element/include/touch\\_element/touch\\_matrix.h](#)

#### Functions

*esp\_err\_t* **touch\_matrix\_install** (const *touch\_matrix\_global\_config\_t* \*global\_config)

Touch matrix button initialize.

This function initializes touch matrix button object and acts on all touch matrix button instances.

**Parameters** **global\_config** –[in] Touch matrix global initialization configuration

**Returns**

- ESP\_OK: Successfully initialized touch matrix button
- ESP\_ERR\_INVALID\_STATE: Touch element library was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_init is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

void **touch\_matrix\_uninstall** (void)

Release resources allocated using touch\_matrix\_install()

*esp\_err\_t* **touch\_matrix\_create** (const *touch\_matrix\_config\_t* \*matrix\_config, *touch\_matrix\_handle\_t* \*matrix\_handle)

Create a new touch matrix button instance.

---

**Note:** Channel array and sensitivity array must be one-one correspondence in those array

---

---

**Note:** Touch matrix button does not support Multi-Touch now

---

**Parameters**

- **matrix\_config** –[in] Matrix button configuration
- **matrix\_handle** –[out] Matrix button handle

**Returns**

- ESP\_OK: Successfully create touch matrix button
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **touch\_matrix\_delete** (*touch\_matrix\_handle\_t* matrix\_handle)

Release resources allocated using touch\_matrix\_create()

**Parameters** **matrix\_handle** –[in] Matrix handle

**Returns**

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a matrix handle

*esp\_err\_t* **touch\_matrix\_subscribe\_event** (*touch\_matrix\_handle\_t* matrix\_handle, uint32\_t event\_mask, void \*arg)

Touch matrix button subscribes event.

This function uses event mask to subscribe to touch matrix events, once one of the subscribed events occurs, the event message could be retrieved by calling touch\_element\_message\_receive() or input callback routine.

---

**Note:** Touch matrix button only support three kind of event masks, they are TOUCH\_ELEM\_EVENT\_ON\_PRESS, TOUCH\_ELEM\_EVENT\_ON\_RELEASE, TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS. You can use those event masks in any combination to achieve the desired effect.

---

**Parameters**

- **matrix\_handle** –[in] Matrix handle
- **event\_mask** –[in] Matrix subscription event mask
- **arg** –[in] User input argument

**Returns**

- ESP\_OK: Successfully subscribed touch matrix event
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or event is not supported

*esp\_err\_t* **touch\_matrix\_set\_dispatch\_method** (*touch\_matrix\_handle\_t* matrix\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch matrix button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

**Parameters**

- **matrix\_handle** –[in] Matrix button handle
- **dispatch\_method** –[in] Dispatch method (By callback/event)

**Returns**

- ESP\_OK: Successfully set dispatch method
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_matrix\_set\_callback** (*touch\_matrix\_handle\_t* matrix\_handle, *touch\_matrix\_callback\_t* matrix\_callback)

Touch matrix button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

**Note:** Matrix message will be passed from the callback function and it will be destroyed when the callback function return.

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling `vTaskDelay()`.

#### Parameters

- **matrix\_handle** –[in] Matrix button handle
- **matrix\_callback** –[in] User input callback

#### Returns

- ESP\_OK: Successfully set callback
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle or matrix\_callback is null

`esp_err_t touch_matrix_set_longpress` (`touch_matrix_handle_t` matrix\_handle, `uint32_t` threshold\_time)

Touch matrix button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a matrix button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

#### Parameters

- **matrix\_handle** –[in] Matrix button handle
- **threshold\_time** –[in] Threshold time (ms) of long press event occur

#### Returns

- ESP\_OK: Successfully set the time of long press event
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or time (ms) is 0

`const touch_matrix_message_t *touch_matrix_get_message` (`const touch_elem_message_t` \*element\_message)

Touch matrix get message.

This function decodes the element message from `touch_element_message_receive()` and return a matrix message pointer.

**Parameters** `element_message` –[in] element message

**Returns** Touch matrix message pointer

## Structures

struct `touch_matrix_global_config_t`

Matrix button initialization configuration passed to `touch_matrix_install`.

## Public Members

float `threshold_divider`

Matrix button channel threshold divider.

`uint32_t` `default_lp_time`

Matrix button default LongPress event time (ms)

struct **touch\_matrix\_config\_t**

Matrix button configuration (for new instance) passed to touch\_matrix\_create()

### Public Members

const *touch\_pad\_t* \***x\_channel\_array**

Matrix button x-axis channels array.

const *touch\_pad\_t* \***y\_channel\_array**

Matrix button y-axis channels array.

const float \***x\_sensitivity\_array**

Matrix button x-axis channels sensitivity array.

const float \***y\_sensitivity\_array**

Matrix button y-axis channels sensitivity array.

uint8\_t **x\_channel\_num**

The number of channels in x-axis.

uint8\_t **y\_channel\_num**

The number of channels in y-axis.

struct **touch\_matrix\_position\_t**

Matrix button position data type.

### Public Members

uint8\_t **x\_axis**

Matrix button x axis position.

uint8\_t **y\_axis**

Matrix button y axis position.

uint8\_t **index**

Matrix button position index.

struct **touch\_matrix\_message\_t**

Matrix message type.

### Public Members

*touch\_matrix\_event\_t* **event**

Matrix event.

*touch\_matrix\_position\_t* **position**

Matrix position.

## Macros

`TOUCH_MATRIX_GLOBAL_DEFAULT_CONFIG()`

## Type Definitions

typedef *touch\_lem\_handle\_t* `touch_matrix_handle_t`

Matrix button instance handle.

typedef void (\*`touch_matrix_callback_t`)(*touch\_matrix\_handle\_t*, *touch\_matrix\_message\_t*\*, void\*)

Matrix button callback type.

## Enumerations

enum `touch_matrix_event_t`

Matrix button event type.

*Values:*

enumerator `TOUCH_MATRIX_EVT_ON_PRESS`

Matrix button Press event.

enumerator `TOUCH_MATRIX_EVT_ON_RELEASE`

## 2.5.25 Two-Wire Automotive Interface (TWAI)

### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S2's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

### Sections

- *Two-Wire Automotive Interface (TWAI)*
  - *Overview*
  - *TWAI Protocol Summary*
  - *Signals Lines and Transceiver*
  - *Driver Configuration*
  - *Driver Operation*

- [Examples](#)
- [API Reference](#)

## TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

## Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX**, **RX**, **BUS-OFF**, and **CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-S2's GPIO pads.

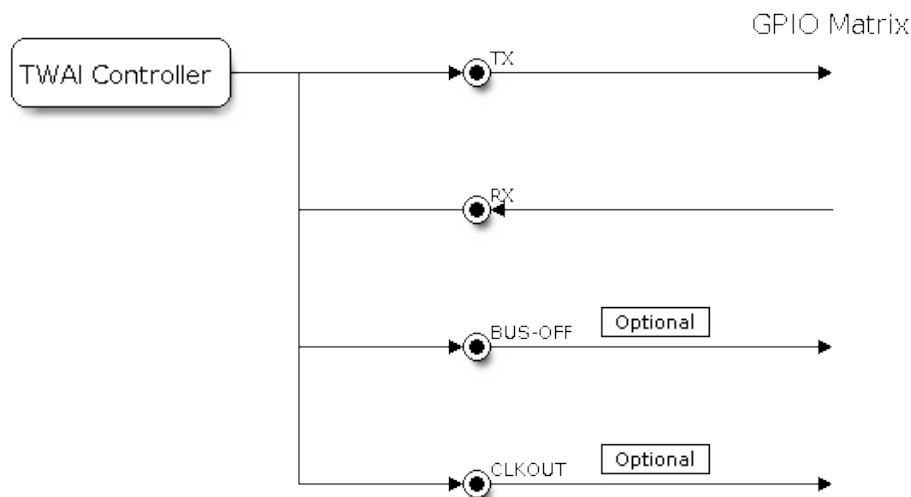

Fig. 24: Signal lines of the TWAI controller

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock (APB Clock).

---

**Note:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

## Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 6: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**Note:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI\_ALERT\_BELOW\_ERR\_WARN is raised when both TEC and REC return back to values below **96**.

**Note:** When enabling alerts, the TWAI\_ALERT\_AND\_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI\_ALERT\_AND\_LOG if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

**Note:** The TWAI\_ALERT\_ALL and TWAI\_ALERT\_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-S2, the `brp` can be **any even number from 2 to 32768**.

Fig. 25: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`
- `TWAI_TIMING_CONFIG_1KBITS()`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 26: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 27: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

## Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 28: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"

...
```

(continues on next page)

(continued from previous page)

```

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

```

(continues on next page)

(continued from previous page)

```

}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The TWAI Network example demonstrates communication between two ESP32-S2s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- [components/hal/include/hal/twai\\_types.h](#)

### Structures

struct **twai\_message\_t**

Structure to store a TWAI message.

---

**Note:** The flags member is deprecated

---

### Public Members

uint32\_t **extd**

Extended Frame Format (29bit ID)

uint32\_t **rtr**

Message is a Remote Frame

uint32\_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32\_t **reserved**

Reserved bits

uint32\_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32\_t **identifier**

11 or 29 bit identifier

uint8\_t **data\_length\_code**

Data length code

uint8\_t **data**[TWAI\_FRAME\_MAX\_DLC]

Data bytes (not relevant in RTR frame)

struct **twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

### Public Members

uint32\_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8\_t **tseg\_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8\_t **tseg\_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8\_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple\_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai\_filter\_config\_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

**Note:** Macro initializers are available for this structure

---

### Public Members

uint32\_t **acceptance\_code**

32-bit acceptance code

uint32\_t **acceptance\_mask**

32-bit acceptance mask

bool **single\_filter**

Use Single Filter Mode (see documentation)

### Macros

**TWAI\_EXTD\_ID\_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

**Enumerations**enum **twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

enumerator **TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- [components/driver/include/driver/twai.h](#)

**Functions**

*esp\_err\_t twai\_driver\_install* (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

---

**Note:** Macro initializers are available for the configuration structures (see documentation)

---

---

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

---

**Parameters**

- **g\_config** –[in] General configuration structure
- **t\_config** –[in] Timing configuration structure
- **f\_config** –[in] Filter configuration structure

**Returns**

- **ESP\_OK**: Successfully installed TWAI driver
- **ESP\_ERR\_INVALID\_ARG**: Arguments are invalid
- **ESP\_ERR\_NO\_MEM**: Insufficient memory
- **ESP\_ERR\_INVALID\_STATE**: Driver is already installed

*esp\_err\_t* **twai\_driver\_uninstall** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t* **twai\_start** (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t* **twai\_stop** (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t* **twai\_transmit** (const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

---

**Note:** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

---

---

**Note:** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

---

**Parameters**

- **message** –[in] Message to transmit
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block on the TX queue

**Returns**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_receive* (*twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Parameters**

- **message** –[out] Received message
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block on RX queue

**Returns**

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts* (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

---

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

---

**Parameters**

- **alerts** –[out] Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** –[in] Number of FreeRTOS ticks to block for alert

**Returns**

- ESP\_OK: Alerts read
- ESP\_ERR\_TIMEOUT: Timed out waiting for alerts
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts* (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**

- **alerts\_enabled** –[in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** –[out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

---

**Note:** The BUS\_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

---

**Returns**

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_get\_status\_info** (*twai\_status\_info\_t* \*status\_info)

Get current status information of the TWAI driver.

**Parameters** *status\_info* –[out] Status information

**Returns**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_clear\_transmit\_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

---

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t* **twai\_clear\_receive\_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

---

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

**Structures**

struct **twai\_general\_config\_t**

Structure for general configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

### Public Members

#### *twai\_mode\_t* mode

Mode of TWAI controller

#### *gpio\_num\_t* tx\_io

Transmit GPIO number

#### *gpio\_num\_t* rx\_io

Receive GPIO number

#### *gpio\_num\_t* clkout\_io

CLKOUT GPIO number (optional, set to -1 if unused)

#### *gpio\_num\_t* bus\_off\_io

Bus off indicator GPIO number (optional, set to -1 if unused)

#### uint32\_t tx\_queue\_len

Number of messages TX queue can hold (set to 0 to disable TX Queue)

#### uint32\_t rx\_queue\_len

Number of messages RX queue can hold

#### uint32\_t alerts\_enabled

Bit field of alerts to enable (see documentation)

#### uint32\_t clkout\_divider

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

#### int intr\_flags

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

#### struct twai\_status\_info\_t

Structure to store status information of TWAI driver.

### Public Members

#### *twai\_state\_t* state

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

#### uint32\_t msgs\_to\_tx

Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**

Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**

Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**

Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**

Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overrun\_count**

Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**

Number of instances arbitration was lost

uint32\_t **bus\_error\_count**

Number of instances a bus error has occurred

## Macros

**TWAI\_IO\_UNUSED**

Marks GPIO as unused in TWAI configuration

## Enumerations

enum **twai\_state\_t**

TWAI driver states.

*Values:*

enumerator **TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

## 2.5.26 Universal Asynchronous Receiver/Transmitter (UART)

### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S2 chip has two UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

### Functional Overview

The following overview describes how to establish communication between an ESP32-S2 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-S2's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 7: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-S2 Technical Reference Manual > UART Controller*

(UART) > *UART Interrupts and UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

## Overview of RS485 specific communication options

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-S2 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S2's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is

(continued from previous page)

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32-S2 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## Functions

*esp\_err\_t* **uart\_driver\_install** (*uart\_port\_t* uart\_num, int rx\_buffer\_size, int tx\_buffer\_size, int queue\_size, *QueueHandle\_t* \*uart\_queue, int intr\_alloc\_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**Note:** Rx\_buffer\_size should be greater than UART\_FIFO\_LEN. Tx\_buffer\_size should be either zero or greater than UART\_FIFO\_LEN.

---

### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **rx\_buffer\_size** –UART RX ring buffer size.
- **tx\_buffer\_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** –UART event queue size/depth.
- **uart\_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

bool **uart\_is\_driver\_installed** (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- true driver is installed
- false driver is not installed

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** –UART data bits

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

- **data\_bit** –Pointer to accept value of UART data bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** –UART stop bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** –Pointer to accept value of UART stop bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** –the enum of uart parity configuration

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** –Pointer to accept value of UART parity mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the UART.

**Parameters**

- **sclk** –Clock source
- **out\_freq\_hz** –[out] Output of frequency, in Hz

**Returns**

- ESP\_ERR\_INVALID\_ARG: if the clock source is not supported
- otherwise ESP\_OK

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** –UART baud rate.

**Returns**

- ESP\_FAIL Parameter error

- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

#### Returns

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** –Hardware flow control mode
- **rx\_thresh** –Threshold of Hardware RX flow control (0 ~ UART\_FIFO\_LEN). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

#### Parameters

- **uart\_num** –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **enable** –switch on or off
- **rx\_thresh\_xon** –low water mark
- **rx\_thresh\_xoff** –high water mark

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** –Option for different flow control mode.

#### Returns

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** –Bit mask of the interrupt status to be cleared.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** –Bit mask of the enable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** –Bit mask of the disable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** –UART port number

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** –UART TX pin GPIO number.
- **rx\_io\_num** –UART RX pin GPIO number.
- **rts\_io\_num** –UART RTS pin GPIO number.
- **cts\_io\_num** –UART CTS pin GPIO number.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* `uart_set_rts` (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**Note:** UART must be configured with hardware flow control disabled.

---

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* `uart_set_dtr` (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* `uart_set_tx_idle_num` (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

#### Parameters

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **idle\_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

#### Returns

- ESP\_OK Success

- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** –UART parameter settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** –UART interrupt settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** –Timeout, count in RTOS ticks

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**Note:** This function should only be used when UART TX buffer is not enabled.

---

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** –data buffer address

- **size** –data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** –data buffer address
- **size** –data length to send
- **brk\_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks\_to\_wait** –sTimeout, count in RTOS ticks

**Returns**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**Note:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** –Pointer of size\_t to accept cached data length

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**Parameters**

- **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** –Pointer of size\_t to accept the free space size

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters** **uart\_num** –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**

- **uart\_num** –UART port number.
- **pattern\_chr** –character of the pattern.
- **chr\_num** –number of the character, 8bit value.
- **chr\_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application' s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

- `uart_num` –UART port number, the max port number is (UART\_NUM\_MAX -1).
- `queue_length` –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

`esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

---

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**Parameters**

- `uart_num` –Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- `mode` –UART UART mode to set

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **uart\_set\_rx\_full\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold value for RX fifo full.

---

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**Parameters**

- **uart\_num** –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **threshold** –Threshold value above which RX fifo full interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

**Parameters**

- **uart\_num** –UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **threshold** –Threshold value below which TX fifo empty interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

**Parameters**

- **uart\_num** –Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout\_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If tout\_thresh == 0, the TOUT feature is disabled.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart\_write\_bytes()).

**Parameters**

- **uart\_num** –Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** –Pointer to variable of type bool to return collision flag.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select `UART_SCLK_REF_TICK` or `UART_SCLK_XTAL` as UART clock source in [uart\\_config\\_t::source\\_clk](#).

---

**Note:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

---

#### Parameters

- `uart_num` –UART number, the max port number is (`UART_NUM_MAX -1`).
- `wakeup_threshold` –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

*esp\_err\_t* `uart_get_wakeup_threshold` (*uart\_port\_t* `uart_num`, int \*`out_wakeup_threshold`)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### Parameters

- `uart_num` –UART number, the max port number is (`UART_NUM_MAX -1`).
- `out_wakeup_threshold` –[`out`] output, set to the current value of wakeup threshold for the given UART.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `out_wakeup_threshold` is NULL

*esp\_err\_t* `uart_wait_tx_idle_polling` (*uart\_port\_t* `uart_num`)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

**Parameters** `uart_num` –UART number

*esp\_err\_t* `uart_set_loop_back` (*uart\_port\_t* `uart_num`, bool `loop_back_en`)

Configure TX signal loop back to RX module, just for the test usage.

•

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

**Parameters**

- **uart\_num** –UART number
- **loop\_back\_en** –Set ture to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* uart\_num, bool always\_rx\_timeout\_en)

Configure behavior of UART RX timeout interrupt.

When always\_rx\_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- **uart\_num** –UART number
- **always\_rx\_timeout\_en** –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

struct **uart\_event\_t**

Event structure used in UART event queue.

**Public Members**

*uart\_event\_type\_t* **type**

UART event type

size\_t **size**

UART data size for `UART_DATA` event

bool **timeout\_flag**

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

## Macros

**UART\_NUM\_0**

UART port 0

**UART\_NUM\_1**

UART port 1

**UART\_NUM\_MAX**

UART port max

**UART\_PIN\_NO\_CHANGE**

**UART\_FIFO\_LEN**

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

## Type Definitions

typedef *intr\_handle\_t* **uart\_isr\_handle\_t**

## Enumerations

enum **uart\_event\_type\_t**

UART event types used in the ring buffer.

*Values:*

enumerator **UART\_DATA**

UART data event

enumerator **UART\_BREAK**

UART break event

enumerator **UART\_BUFFER\_FULL**

UART RX buffer full event

enumerator **UART\_FIFO\_OVF**

UART FIFO overflow event

enumerator **UART\_FRAME\_ERR**

UART RX frame error event

enumerator **UART\_PARITY\_ERR**

UART RX parity event

enumerator **UART\_DATA\_BREAK**

UART TX data and break event

enumerator **UART\_PATTERN\_DET**

UART pattern detected

enumerator **UART\_WAKEUP**

UART wakeup event

enumerator **UART\_EVENT\_MAX**

UART event max index

### Header File

- [components/hal/include/hal/uart\\_types.h](#)

### Structures

struct **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

#### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

#### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

struct **uart\_config\_t**

UART configuration parameters for uart\_param\_config function.

### Public Members

int **baud\_rate**

UART baud rate

*uart\_word\_length\_t* **data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

### Type Definitions

typedef int **uart\_port\_t**

UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

### Enumerations

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

## 2.5.27 USB Device Driver

### Overview

The driver allows you to use ESP32-S2 chips to develop USB devices on a top of TinyUSB stack. TinyUSB is integrated with ESP-IDF to provide USB features of the framework. Using this driver the chip works as simple or composite device supporting several USB devices simultaneously.

TinyUSB stack is distributed via [IDF Component Registry](#).

Our USB-OTG implementation is limited to 6 USB endpoints (5 IN/OUT endpoints and 1 IN endpoint) - find more information in [technical reference manual](#).

## Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output streams through USB Serial Device
- Other USB classes (MIDI, MSC, HID...) support directly via TinyUSB
- VBUS monitoring for self-powered devices

## Hardware USB Connection

- Any board with the ESP32-S2 chip with USB connectors or with exposed USB's D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g. with do-it-yourself cable from any USB connection cable).

On ESP32-S2, connect GPIO 20 and 19 to D+/D- respectively:

Self-powered devices must also connect VBUS through voltage divider or comparator, more details in [Self-Powered Device](#) subchapter.

## Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Encapsulated driver's task servicing the TinyUSB

## Configuration

Via Menuconfig options you can specify:

- Several of descriptor's parameters (see: Descriptors Configuration below)
- USB Serial low-level Configuration
- The verbosity of the TinyUSB's log
- Disable the TinyUSB main task (for the custom implementation)

**Descriptors Configuration** The driver's descriptors are provided by `tinyusb_config_t` structure's `device_descriptor`, `configuration_descriptor` and `string_descriptor` members. Therefore, you should initialize `tinyusb_config_t` with your desired descriptors before calling `tinyusb_driver_install()` to install the driver.

However, the driver also provides default descriptors. You can install the driver with default device and string descriptors by setting the `device_descriptor` and `string_descriptor` members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. To lower your development effort we also provide default configuration descriptor for CDC and MSC class, as these classes rarely require custom configuration. The driver's default device descriptor is specified using `Menuconfig`, where the following fields should be configured:

- PID
- VID
- `bcdDevice`
- Manufacturer
- Product name
- Name of CDC device if it is On
- Serial number

If you want to use your own descriptors with extended modification, you can define them during the driver installation process.

### Install Driver

To initialize the driver, users should call `tinyusb_driver_install()`. The driver's configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g. `const tinyusb_config_t tusb_cfg = { 0 };`) or partially (as shown below). For any member that is initialized to `0` or `NULL`, the driver will use its default configuration values for that member (see example below)

```
const tinyusb_config_t partial_init = {
    .device_descriptor = NULL, // Use default device descriptor specified in
    ↪Menuconfig
    .string_descriptor = NULL, // Use default string descriptors specified in
    ↪Menuconfig
    .external_phy = false, // Use internal USB PHY
    .configuration_descriptor = NULL, // Use default configuration descriptor
    ↪according to settings in Menuconfig
};
```

### Self-Powered Device

USB specification mandates self-powered devices to monitor voltage level on USB's VBUS signal. As opposed to bus-powered devices, a self-powered device can be fully functional even without USB connection. The self-powered device detects connection and disconnection events by monitoring the VBUS voltage level. VBUS is considered valid if it rises above 4.75V and invalid if it falls below 4.35V.

No ESP32-S2 pin is 5V tolerant, so you must connect the VBUS to ESP32-S2 via a comparator with voltage thresholds as described above, or use a simple resistor voltage divider that will output  $(0.75 \times V_{dd})$  if VBUS is 4.4V (see figure below). In both cases, voltage on the sensing pin must be logic low within 3ms after the device is unplugged from USB host.

To use this feature, in `tinyusb_config_t` you must set `self_powered` to `true` and `vbus_monitor_io` to GPIO number that will be used for VBUS monitoring.

Fig. 29: Simple voltage divider for VBUS monitoring

### USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device can be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```
const tinyusb_config_cdcacm_t acm_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&acm_cfg);
```

To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

**USB Serial Console** The driver allows to redirect all standard application streams (`stdin`, `stdout`, `stderr`) to the USB Serial Device and return them to UART using `esp_tusb_init_console()/esp_tusb_deinit_console()` functions.

### Application Examples

The table below describes the code examples available in the directory [peripherals/usb/](#).

Code Example	Description

## 2.5.28 USB Host

The document provides information regarding the USB Host Library. This document is split into the following sections:

### Sections

- *USB Host*
  - *Overview*
  - *Architecture*
  - *Usage*
  - *Examples*
  - *API Reference*

### Overview

The USB Host Library (hereinafter referred to as the Host Library) is the lowest public facing API layer of the ESP-IDF USB Host Stack. In most cases, applications that require USB Host functionality will not need to interface with the Host Library directly. Instead, most applications will use the API provided by a host class driver that is implemented on top of the Host Library.

However, users may want to use the Host Library directly for some of (but not limited to) the following reasons:

- The user needs to implement a custom host class driver such as a vendor specific class driver
- The user has a requirement for a lower level of abstraction due to resource/latency requirements

**Features & Limitations** The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices
- Supports all four transfer types (Control, Bulk, Interrupt, and Isochronous)
- Allows multiple class drivers to run simultaneously (i.e., multiple clients of the Host Library)
- A single device can be used by multiple clients simultaneously (e.g., composite devices)
- The Host Library itself (and the underlying Host Stack) does not internally instantiate any OS tasks. The number of tasks are entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is (the number of host class drivers running + 1).

Currently, the Host Library (and the underlying Host Stack) has the following limitations:

- Only supports a single device, but the Host Library's API is designed for multiple device support.
- Only supports Asynchronous transfers
- Transfer timeouts are not supported yet

### Architecture

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

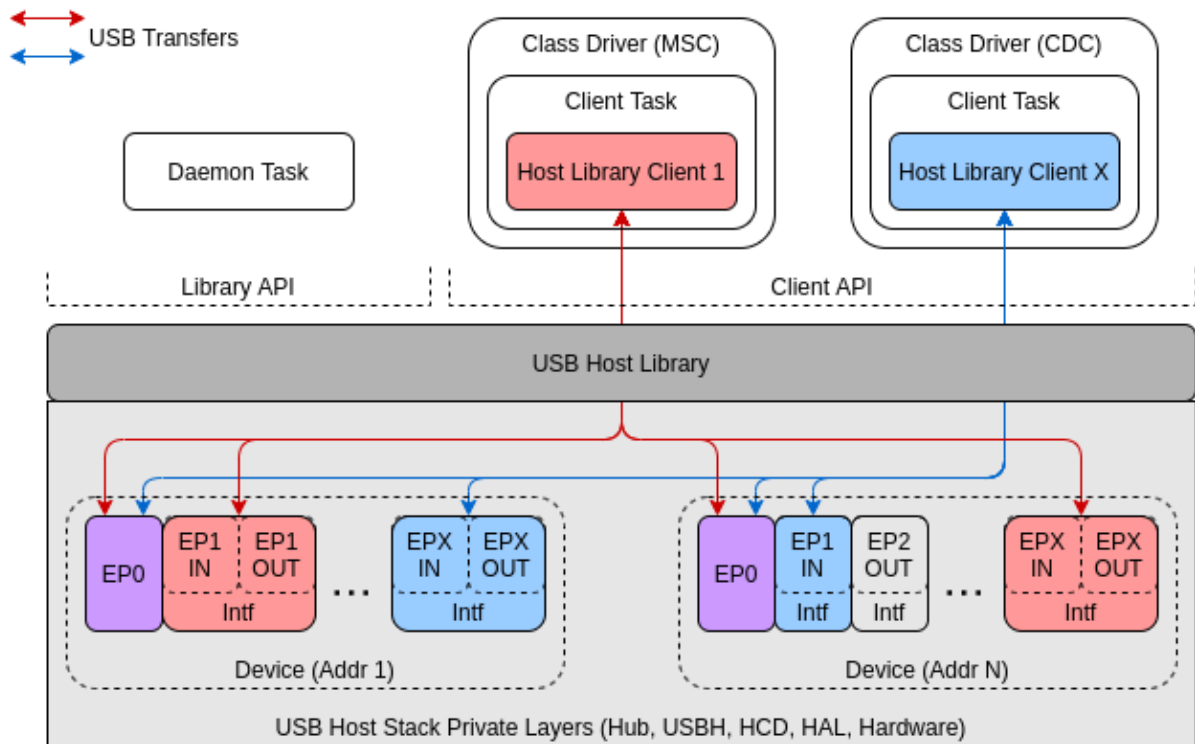

Fig. 30: Diagram of the key entities involved in USB Host functionality

- The **Host Library**
- **Clients** of the Host Library
- **Devices**
- Host Library **Daemon Task**

**Host Library** The Host Library is the a lowest public facing layer of the USB Host Stack. Any other IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library's API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client (e.g., device enumeration). Usually, the library API is called by a Host Library Daemon Task.

**Clients** A client of the Host Library is a software component (such as a host class driver or user component) that uses the Host Library to communicate with a USB device. Generally each client has a one-to-one relation with a task, meaning that for a particular client, all of its Client API calls should be done from the context of the same task.

By organizing the software components that use the Host Library's into clients, the Host Library can delegate the handling of all client events (i.e., the events specific to that client) to the client's task. In other words, each client task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

**Daemon Task** Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events (i.e., events that are not specific to a client) that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients

- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task (usually the Host Library Daemon Task) to handle all of the library events.

**Devices** The Host Library hides the details of device handling (such as connection, memory allocation, and enumeration) from the clients. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is automatically configured to use the first configuration found (i.e., the first configuration descriptor returned on a Get Configuration Descriptor request). For most standard devices, the first configuration will have a `bConfigurationValue` of 1.

It is possible for a two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device's default endpoint (EPO), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device's address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints in the claimed interface. The client's task is responsible for handling its own processing and events.

## Usage

The Host Library (and the underlying Host Stack) will not create any tasks. All tasks (i.e., the client tasks and the Daemon Task) will need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that will handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be the largely centered around the invocation of these event handler functions.

## Host Library & Daemon Task

**Basic Usage** The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the daemon task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(PORTMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...
        }
    }
    ...
}
```

(continues on next page)

(continued from previous page)

```

}
...
}

```

**Note:** See the [peripherals/usb/host/usb\\_host\\_lib](#) example for a full implementation of the Daemon Task

Fig. 31: Graph of Typical USB Host Library Lifecycle

**Lifecycle** The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves...

- two registered clients (Client 1 and Client 2)
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference the graph above, the typical lifecycle involves the following key stages.

1. **The Host Library is installed by calling `usb_host_install()`.**
  - Installation must be done before any other Host Library API is called.
  - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) will depend on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.
2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`.**
  - This is typically called from the client task (where the client task waits for a signal from the Daemon Task).
  - This can be called elsewhere if necessary as long it is called after `usb_host_install()`.
3. **Device 1 connects and is then enumerated.**
  - Each registered client (in this case Client 1 and Client 2) are notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
  - Client 1 opens Device 1 and begins communication with it.
4. **Similarly Device 2 connects and is enumerated.**
  - Client 1 and 2 are notified of a new device (via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event).
  - Client 2 opens Device 2 and begins communication with it.
5. **Device 1 suddenly disconnects.**
  - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
  - Client 2 is not notified as it has not opened Device 1.
6. **Client 1 completes its clean up and deregisters by calling `usb_host_client_deregister()`.**
  - This is typically called from the client task before the task exits.
  - This can be called elsewhere if necessary as long as Client 1 has already completed its clean up.
7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**

- The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
- Device 2 is still allocated (i.e., not freed) as it is still connected albeit not currently opened by any client.

#### 8. The Daemon Task decides to cleanup as there are no more clients.

- The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
  - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
  - If `usb_host_device_free_all()` was unable to free all devices (e.g., because the device is still opened by a client), the function will return `ESP_ERR_NOT_FINISHED`.
  - The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.
9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

## Clients & Class Driver

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client's events. This function should be called repeatedly, typically from the client's task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling
- The function's primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` which delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` which indicates that a particular USB transfer previously submitted by the client has completed.

**Note:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV    0x01
#define CLASS_DRIVER_ACTION_TRANSFER    0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV   0x03

struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};
```

(continues on next page)

(continued from previous page)

```

};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void_
↳*arg)
{
    //This is function is called from within usb_host_client_handle_events(). Don
↳'t block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control_
↳*)arg;
    switch (event_msg->event) {

↳>status, transfer->actual_num_bytes);
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
}

void client_task(void *arg)
{
    ... //Wait until Host Library is installed
    //Initialize class driver objects
    struct class_driver_control class_driver_obj = {0};
    //Register the client
    usb_host_client_config_t client_config = {
        .is_synchronous = false,
        .max_num_event_msg = 5,
        .async = {
            .client_event_callback = client_event_cb,
            .callback_arg = &class_driver_obj,
        }
    };
    usb_host_client_register(&client_config, &class_driver_obj.client_hdl);
    //Allocate a USB transfer
    usb_transfer_t *transfer;
    usb_host_transfer_alloc(1024, 0, &transfer);

    //Event handling loop
    bool exit = false;
    while (!exit) {
        //Call the client event handler function
        usb_host_client_handle_events(class_driver_obj.client_hdl, portMAX_DELAY);
        //Execute pending class driver actions
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
            //Open the device and claim interface 1

```

(continues on next page)

(continued from previous page)

```

        usb_host_device_open(class_driver_obj.client_hdl, class_driver_obj.dev_
↔addr, &class_driver_obj.dev_hdl);
        usb_host_interface_claim(class_driver_obj.client_hdl, class_driver_obj.
↔dev_hdl, 1, 0);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
        //Send an OUT transfer to EP1
        memset(transfer->data_buffer, 0xAA, 1024);
        transfer->num_bytes = 1024;
        transfer->device_handle = class_driver_obj.dev_hdl;
        transfer->bEndpointAddress = 0x01;
        transfer->callback = transfer_cb;
        transfer->context = (void *)&class_driver_obj;
        usb_host_transfer_submit(transfer);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
        //Release the interface and close the device
        usb_host_interface_release(class_driver_obj.client_hdl, class_driver_
↔obj.dev_hdl, 1);
        usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.
↔dev_hdl);
        exit = true;
    }
    ... //Handle any other actions required by the class driver
}

//Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... //Delete the task and any other signal Daemon Task if required
}

```

**Note:** An actual host class driver will likely supported many more features, thus will have a much more complex state machine. A host class driver will likely also need to:

- Be able to open multiple devices
- Parse an opened device's descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device
- Handle various errors

**Lifecycle** The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources (e.g., allocating transfers using `usb_host_transfer_alloc()`).
3. For each new device that the class driver needs to communicate with:
  - a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
  - b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from the client event callback.
  - c. Open the device via `usb_host_device_open()`.
  - d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
  - e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected (as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event):

- a. Stop any previously submitted transfers to the device's endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
  - b. Release all previously claimed interfaces via `usb_host_interface_release()`.
  - c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
  7. Delete the client task. Signal the Daemon Task if necessary.

## Examples

**Host Library Examples** The `peripherals/usb/host/usb_host_lib` demonstrates basic usage of the USB Host Library's API to implement a pseudo class driver.

**Class Driver Examples** The USB Host Stack provides a number examples that implement host class drivers using the Host Library's API.

## CDC-ACM

- A host class driver for the Communication Device Class (Abstract Control Model) is deployed to [IDF component registry](#).
- The `peripherals/usb/host/cdc/cdc_acm_host` example uses the CDC-ACM host driver component to communicate with CDC-ACM devices
- The `peripherals/usb/host/cdc/cdc_acm_vcp` example shows how can you extend the CDC-ACM host driver to interface Virtual COM Port devices.
- The CDC-ACM driver is also used in [esp\\_modem examples](#), where it is used for communication with cellular modems.

## MSC

- A host class driver for the Mass Storage Class (Bulk-Only Transport) is deployed to [IDF component registry](#). You can find its example in `peripherals/usb/host/msc`.

## API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all of USB Host Library headers will also be included.

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification (i.e., descriptors and standard requests).

## Header File

- `components/usb/include/usb/usb_host.h`

## Functions

`esp_err_t usb_host_install` (const `usb_host_config_t` \*config)

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

---

**Note:** If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

---

**Parameters** `config` –[in] USB Host Library configuration

**Returns** `esp_err_t`

*esp\_err\_t* **usb\_host\_uninstall** (void)

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

---

**Note:** If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

---

**Returns** `esp_err_t`

*esp\_err\_t* **usb\_host\_lib\_handle\_events** (TickType\_t timeout\_ticks, uint32\_t \*event\_flags\_ret)

Handle USB Host Library events.

- This function handles all of the USB Host Library's processing and should be called repeatedly in a loop
- Check `event_flags_ret` to see if any flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

---

**Note:** This function can block

---

**Parameters**

- `timeout_ticks` –[in] Timeout in ticks to wait for an event to occur
- `event_flags_ret` –[out] Event flags that indicate what USB Host Library event occurred.

**Returns** `esp_err_t`

*esp\_err\_t* **usb\_host\_lib\_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

**Returns** `esp_err_t`

*esp\_err\_t* **usb\_host\_lib\_info** (*usb\_host\_lib\_info\_t* \*info\_ret)

Get current information about the USB Host Library.

**Parameters** `info_ret` –[out] USB Host Library Information

**Returns** `esp_err_t`

*esp\_err\_t* **usb\_host\_client\_register** (const *usb\_host\_client\_config\_t* \*client\_config,  
*usb\_host\_client\_handle\_t* \*client\_hdl\_ret)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

**Parameters**

- **client\_config** –[in] Client configuration
- **client\_hdl\_ret** –[out] Client handle

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_client\_deregister** (*usb\_host\_client\_handle\_t* client\_hdl)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

**Parameters** **client\_hdl** –[in] Client handle

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_client\_handle\_events** (*usb\_host\_client\_handle\_t* client\_hdl, TickType\_t  
timeout\_ticks)

USB Host Library client processing function.

- This function handles all of a client's processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** –[in] Client handle
- **timeout\_ticks** –[in] Timeout in ticks to wait for an event to occur

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_client\_unblock** (*usb\_host\_client\_handle\_t* client\_hdl)

Unblock a client.

- This function simply unblocks a client if it is blocked on the `usb_host_client_handle_events()` function.
- This function is useful when need to unblock a client in order to deregister it.

**Parameters** **client\_hdl** –[in] Client handle

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_device\_open** (*usb\_host\_client\_handle\_t* client\_hdl, uint8\_t dev\_addr,  
*usb\_device\_handle\_t* \*dev\_hdl\_ret)

Open a device.

- This function allows a client to open a device

- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

**Parameters**

- **client\_hdl** –[in] Client handle
- **dev\_addr** –[in] Device' s address
- **dev\_hdl\_ret** –[out] Device' s handle

**Returns** esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_close** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle

**Returns** esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_free\_all** (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.
- Wait for the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` flag to be set by `usb_host_lib_handle_events()` in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

**Returns**

- `ESP_ERR_NOT_FINISHED`: There are one or more devices that still need to be freed. Wait for `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event
- `ESP_OK`: All devices already freed (i.e., there were no devices)
- Other: Error

*esp\_err\_t* **usb\_host\_device\_addr\_list\_fill** (int list\_len, uint8\_t \*dev\_addr\_list, int \*num\_dev\_ret)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in `usb_host_device_open()`
- If there are more devices than the list\_len, this function will only fill up to list\_len number of devices.

**Parameters**

- **list\_len** –[in] Length of the empty list
- **dev\_addr\_list** –[inout] Empty list to be filled
- **num\_dev\_ret** –[out] Number of devices

**Returns** esp\_err\_t

*esp\_err\_t* **usb\_host\_device\_info** (*usb\_device\_handle\_t* dev\_hdl, *usb\_device\_info\_t* \*dev\_info)

Get device' s information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

---

**Note:** This function can block

---

**Parameters**

- **dev\_hdl** –[in] Device handle
- **dev\_info** –[out] Device information

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_get\_device\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_device\_desc\_t* \*\*device\_desc)

Get device' s device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

**Note:** No control transfer is sent. The device' s descriptor is cached on enumeration

---

**Parameters**

- **dev\_hdl** –[in] Device handle
- **device\_desc** –[out] Device descriptor

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_get\_active\_config\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_config\_desc\_t* \*\*config\_desc)

Get device' s active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device' s active configuration descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

**Note:** This function can block

---

---

**Note:** No control transfer is sent. A device' s active configuration descriptor is cached on enumeration

---

**Parameters**

- **dev\_hdl** –[in] Device handle
- **config\_desc** –[out] Configuration descriptor

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_interface\_claim** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber, uint8\_t bAlternateSetting)

Function for a client to claim a device's interface.

- A client must claim a device's interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

---

**Note:** This function can block

---

#### Parameters

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle
- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Interface alternate setting number

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_interface\_release** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device's interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

---

**Note:** This function can block

---

#### Parameters

- **client\_hdl** –[in] Client handle
- **dev\_hdl** –[in] Device handle
- **bInterfaceNumber** –[in] Interface number

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_endpoint\_halt** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

---

**Note:** This function can block

---

#### Parameters

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

**Returns** *esp\_err\_t*

*esp\_err\_t* **usb\_host\_endpoint\_flush** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will caused an queued up transfers to be canceled

---

**Note:** This function can block

---

**Parameters**

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

**Returns** `esp_err_t`

`esp_err_t` **usb\_host\_endpoint\_clear** (`usb_device_handle_t` dev\_hdl, `uint8_t` bEndpointAddress)

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

---

**Note:** This function can block

---

**Parameters**

- **dev\_hdl** –Device handle
- **bEndpointAddress** –Endpoint address

**Returns** `esp_err_t`

`esp_err_t` **usb\_host\_transfer\_alloc** (`size_t` data\_buffer\_size, `int` num\_isoc\_packets, `usb_transfer_t` \*\*transfer)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

**Parameters**

- **data\_buffer\_size** –[in] Size of the transfer' s data buffer
- **num\_isoc\_packets** –[in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- **transfer** –[out] Transfer object

**Returns** `esp_err_t`

`esp_err_t` **usb\_host\_transfer\_free** (`usb_transfer_t` \*transfer)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return `ESP_OK`

**Parameters** **transfer** –[in] Transfer object

**Returns** esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_submit** (*usb\_transfer\_t* \*transfer)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

**Parameters** **transfer** –[in] Initialized transfer object

**Returns** esp\_err\_t

*esp\_err\_t* **usb\_host\_transfer\_submit\_control** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_transfer\_t* \*transfer)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer's data buffer should contain the control transfer setup packet
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

**Parameters**

- **client\_hdl** –[in] Client handle
- **transfer** –[in] Initialized transfer object

**Returns** esp\_err\_t

## Structures

struct **usb\_host\_client\_event\_msg\_t**

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

---

**Note:** The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

---

## Public Members

*usb\_host\_client\_event\_t* **event**

Type of event

uint8\_t **address**

New device's address

```
struct usb_host_client_event_msg_t::[anonymous]::[anonymous] new_dev
```

New device info

```
usb_device_handle_t dev_hdl
```

The handle of the device that was gone

```
struct usb_host_client_event_msg_t::[anonymous]::[anonymous] dev_gone
```

Gone device info

```
struct usb_host_lib_info_t
```

Current information about the USB Host Library obtained via `usb_host_lib_info()`

### Public Members

```
int num_devices
```

Current number of connected (and enumerated) devices

```
int num_clients
```

Current number of registered clients

```
struct usb_host_config_t
```

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

### Public Members

```
bool skip_phy_setup
```

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

```
int intr_flags
```

Interrupt flags for the underlying ISR used by the USB Host stack

```
struct usb_host_client_config_t
```

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

### Public Members

```
bool is_synchronous
```

Whether the client is asynchronous or synchronous or not. Set to false for now.

```
int max_num_event_msg
```

Maximum number of event messages that can be stored (e.g., 3)

*usb\_host\_client\_event\_cb\_t* **client\_event\_callback**

Client's event callback function

void \***callback\_arg**

Event callback function argument

struct *usb\_host\_client\_config\_t*::[anonymous]::[anonymous] **async**

Async callback config

## Macros

**USB\_HOST\_LIB\_EVENT\_FLAGS\_NO\_CLIENTS**

All clients have been deregistered from the USB Host Library

**USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE**

The USB Host Library has freed all devices

## Type Definitions

typedef struct *usb\_host\_client\_handle\_s* \***usb\_host\_client\_handle\_t**

Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using `usb_host_client_register()`

---

**Note:** Asynchronous API

---

typedef void (\***usb\_host\_client\_event\_cb\_t**)(const *usb\_host\_client\_event\_msg\_t* \*event\_msg, void \*arg)

Client event callback.

- Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
- The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

## Enumerations

enum **usb\_host\_client\_event\_t**

The type event in a client event message.

*Values:*

enumerator **USB\_HOST\_CLIENT\_EVENT\_NEW\_DEV**

A new device has been enumerated and added to the USB Host Library

enumerator **USB\_HOST\_CLIENT\_EVENT\_DEV\_GONE**

A device opened by the client is now gone

## Header File

- [components/usb/include/usb/usb\\_helpers.h](#)

**Functions**

const *usb\_standard\_desc\_t* \***usb\_parse\_next\_descriptor** (const *usb\_standard\_desc\_t* \*cur\_desc, uint16\_t wTotalLength, int \*offset)

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

**Parameters**

- **cur\_desc** –[in] Current descriptor
- **wTotalLength** –[in] Total length of the configuration descriptor
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** *usb\_standard\_desc\_t*\* Next descriptor, NULL if end of configuration descriptor reached

const *usb\_standard\_desc\_t* \***usb\_parse\_next\_descriptor\_of\_type** (const *usb\_standard\_desc\_t* \*cur\_desc, uint16\_t wTotalLength, uint8\_t bDescriptorType, int \*offset)

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

**Parameters**

- **cur\_desc** –[in] Current descriptor
- **wTotalLength** –[in] Total length of the configuration descriptor
- **bDescriptorType** –[in] Type of the next descriptor to get
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** *usb\_standard\_desc\_t*\* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

int **usb\_parse\_interface\_number\_of\_alternate** (const *usb\_config\_desc\_t* \*config\_desc, uint8\_t bInterfaceNumber)

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

**Parameters**

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** –[in] Interface number

**Returns** int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

const *usb\_intf\_desc\_t* \***usb\_parse\_interface\_descriptor** (const *usb\_config\_desc\_t* \*config\_desc, uint8\_t bInterfaceNumber, uint8\_t bAlternateSetting, int \*offset)

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting)

Given a full configuration descriptor, get a particular interface descriptor.

---

**Note:** To get the number of alternate settings for a particular bInterfaceNumber, call `usb_parse_interface_number_of_alternate()`

---

**Parameters**

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor

- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Alternate setting number
- **offset** –[out] Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

**Returns** const usb\_intf\_desc\_t\* Pointer to interface descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index (const usb_intf_desc_t *intf_desc,
                                                           int index, uint16_t wTotalLength,
                                                           int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

---

**Note:** If bNumEndpoints is 0, it means the interface uses the default endpoint only

---

#### Parameters

- **intf\_desc** –[in] Pointer to the start of an interface descriptor
- **index** –[in] Endpoint index
- **wTotalLength** –[in] Total length of the containing configuration descriptor
- **offset** –[inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

**Returns** const usb\_ep\_desc\_t\* Pointer to endpoint descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const usb_config_desc_t
                                                             *config_desc, uint8_t
                                                             bInterfaceNumber, uint8_t
                                                             bAlternateSetting, uint8_t
                                                             bEndpointAddress, int
                                                             *offset)
```

Get an endpoint descriptor based on an endpoint's address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

#### Parameters

- **config\_desc** –[in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** –[in] Interface number
- **bAlternateSetting** –[in] Alternate setting number
- **bEndpointAddress** –[in] Endpoint address
- **offset** –[out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

**Returns** const usb\_ep\_desc\_t\* Pointer to endpoint descriptor, NULL if not found.

```
void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)
```

Print device descriptor.

**Parameters** devc\_desc –Device descriptor

```
void usb_print_config_descriptor (const usb_config_desc_t *cfg_desc, print_class_descriptor_cb
                                  class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class\_specific\_cb if it is provided

**Parameters**

- **cfg\_desc** – Configuration descriptor
- **class\_specific\_cb** – Class specific descriptor callback. Can be NULL

void **usb\_print\_string\_descriptor** (const *usb\_str\_desc\_t* \*str\_desc)

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

**Parameters** **str\_desc** – String descriptor

static inline int **usb\_round\_up\_to\_mps** (int num\_bytes, int mps)

Round up to an integer multiple of endpoint's MPS.

This is a convenience function to round up a size/length to an endpoint's MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS <= 0, this function will return 0
- If num\_bytes <= 0, this function will return 0

**Parameters**

- **num\_bytes** –[in] Number of bytes
- **mps** –[in] MPS

**Returns** int Round up integer multiple of MPS

**Type Definitions**

typedef void (\***print\_class\_descriptor\_cb**)(const *usb\_standard\_desc\_t*\*)

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

**Header File**

- [components/usb/include/usb/usb\\_types\\_stack.h](#)

**Structures**

struct **usb\_device\_info\_t**

Basic information of an enumerated device.

**Public Members**

*usb\_speed\_t* **speed**

Device's speed

uint8\_t **dev\_addr**

Device's address

uint8\_t **bMaxPacketSize0**

The maximum packet size of the device's default endpoint

uint8\_t **bConfigurationValue**

Device's current configuration number

const *usb\_str\_desc\_t* \***str\_desc\_manufacturer**

Pointer to Manufacturer string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_product**

Pointer to Product string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_serial\_num**

Pointer to Serial Number string descriptor (can be NULL)

struct **usb\_isoc\_packet\_desc\_t**

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint's specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

### Public Members

int **num\_bytes**

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int **actual\_num\_bytes**

Actual number of bytes transmitted/received in the packet

*usb\_transfer\_status\_t* **status**

Status of the packet

struct **usb\_transfer\_s**

USB transfer structure.

### Public Members

uint8\_t \*const **data\_buffer**

Pointer to data buffer

const size\_t **data\_buffer\_size**

Size of the data buffer in bytes

int **num\_bytes**

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num\_bytes should be an integer multiple of MPS.

int **actual\_num\_bytes**

Actual number of bytes transferred

uint32\_t **flags**

Transfer flags

*usb\_device\_handle\_t* **device\_handle**

Device handle

uint8\_t **bEndpointAddress**

Endpoint Address

*usb\_transfer\_status\_t* **status**

Status of the transfer

uint32\_t **timeout\_ms**

Timeout (in milliseconds) of the packet (currently not supported yet)

*usb\_transfer\_cb\_t* **callback**

Transfer callback

void \***context**

Context variable for transfer to associate transfer with something

const int **num\_isoc\_packets**

Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

*usb\_isoc\_packet\_desc\_t* **isoc\_packet\_desc[]**

Descriptors for each Isochronous packet

## Macros

### **USB\_TRANSFER\_FLAG\_ZERO\_PACK**

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer's length (i.e., transfer.num\_bytes) is a multiple of the endpoint's MPS

Otherwise, this flag has no effect.

Users should check whether their target device's class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

---

**Note:** See USB2.0 specification 5.7.3 and 5.8.3 for more details

---

---

**Note:** IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk

OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

---

### Type Definitions

```
typedef struct usb_device_handle_s *usb_device_handle_t
```

Handle of a USB Device connected to a USB Host.

```
typedef struct usb_transfer_s usb_transfer_t
```

USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint's MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- Control: This structure represents a single control transfer. This first 8 bytes of the data\_buffer must be filled with the setup packet (see *usb\_setup\_packet\_t*). The num\_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- Interrupt: Represents an interrupt transfer. If num\_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint's specified interval.
- Isochronous: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc\_packet\_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB's overall status and the status of each packet descriptor will be updated, and the actual\_num\_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

---

**Note:** For Bulk/Control/Interrupt IN transfers, the num\_bytes must be a integer multiple of the endpoint's MPS

---

---

**Note:** This structure should be allocated via usb\_host\_transfer\_alloc()

---

---

**Note:** Once the transfer has been submitted, users should not modify the structure until the transfer has completed

---

```
typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)
```

USB transfer completion callback.

### Enumerations

```
enum usb_speed_t
```

USB Standard Speeds.

*Values:*

```
enumerator USB_SPEED_LOW
```

USB Low Speed (1.5 Mbit/s)

enumerator **USB\_SPEED\_FULL**

USB Full Speed (12 Mbit/s)

enum **usb\_transfer\_type\_t**

The type of USB transfer.

---

**Note:** The enum values need to match the bmAttributes field of an EP descriptor

---

*Values:*

enumerator **USB\_TRANSFER\_TYPE\_CTRL**

enumerator **USB\_TRANSFER\_TYPE\_ISOCHRONOUS**

enumerator **USB\_TRANSFER\_TYPE\_BULK**

enumerator **USB\_TRANSFER\_TYPE\_INTR**

enum **usb\_transfer\_status\_t**

The status of a particular transfer.

*Values:*

enumerator **USB\_TRANSFER\_STATUS\_COMPLETED**

The transfer was successful (but may be short)

enumerator **USB\_TRANSFER\_STATUS\_ERROR**

The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator **USB\_TRANSFER\_STATUS\_TIMED\_OUT**

The transfer failed due to a time out

enumerator **USB\_TRANSFER\_STATUS\_CANCELED**

The transfer was canceled

enumerator **USB\_TRANSFER\_STATUS\_STALL**

The transfer was stalled

enumerator **USB\_TRANSFER\_STATUS\_OVERFLOW**

The transfer as more data was sent than was requested

enumerator **USB\_TRANSFER\_STATUS\_SKIPPED**

ISOC packets only. The packet was skipped due to system latency or bus overload

enumerator **USB\_TRANSFER\_STATUS\_NO\_DEVICE**

The transfer failed because the target device is gone

### Header File

- [components/usb/include/usb/usb\\_types\\_ch9.h](#)

## Unions

union **usb\_setup\_packet\_t**

*#include* <usb\_types\_ch9.h> Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

### Public Members

uint8\_t **bmRequestType**

Characteristics of request

uint8\_t **bRequest**

Specific request

uint16\_t **wValue**

Word-sized field that varies according to request

uint16\_t **wIndex**

Word-sized field that varies according to request; typically used to pass an index or offset

uint16\_t **wLength**

Number of bytes to transfer if there is a data stage

struct *usb\_setup\_packet\_t*::[anonymous] [**anonymous**]

uint8\_t **val**[USB\_SETUP\_PACKET\_SIZE]

Descriptor value

union **usb\_standard\_desc\_t**

*#include* <usb\_types\_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

Descriptor Type

struct *usb\_standard\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

uint8\_t **val**[USB\_STANDARD\_DESC\_SIZE]

Descriptor value

union **usb\_device\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

### Public Members

**uint8\_t bLength**

Size of the descriptor in bytes

**uint8\_t bDescriptorType**

DEVICE Descriptor Type

**uint16\_t bcdUSB**

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

**uint8\_t bDeviceClass**

Class code (assigned by the USB-IF)

**uint8\_t bDeviceSubClass**

Subclass code (assigned by the USB-IF)

**uint8\_t bDeviceProtocol**

Protocol code (assigned by the USB-IF)

**uint8\_t bMaxPacketSize0**

Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

**uint16\_t idVendor**

Vendor ID (assigned by the USB-IF)

**uint16\_t idProduct**

Product ID (assigned by the manufacturer)

**uint16\_t bcdDevice**

Device release number in binary-coded decimal

**uint8\_t iManufacturer**

Index of string descriptor describing manufacturer

**uint8\_t iProduct**

Index of string descriptor describing product

**uint8\_t iSerialNumber**

Index of string descriptor describing the device' s serial number

**uint8\_t bNumConfigurations**

Number of possible configurations

struct *usb\_device\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

uint8\_t **val**[USB\_DEVICE\_DESC\_SIZE]

Descriptor value

union **usb\_config\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details

---

**Note:** The full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

CONFIGURATION Descriptor Type

uint16\_t **wTotalLength**

Total length of data returned for this configuration

uint8\_t **bNumInterfaces**

Number of interfaces supported by this configuration

uint8\_t **bConfigurationValue**

Value to use as an argument to the SetConfiguration() request to select this configuration

uint8\_t **iConfiguration**

Index of string descriptor describing this configuration

uint8\_t **bmAttributes**

Configuration characteristics

uint8\_t **bMaxPower**

Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

struct *usb\_config\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

uint8\_t **val**[USB\_CONFIG\_DESC\_SIZE]

Descriptor value

union **usb\_iad\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface association descriptor.

### Public Members

`uint8_t bLength`

Size of the descriptor in bytes

`uint8_t bDescriptorType`

INTERFACE ASSOCIATION Descriptor Type

`uint8_t bFirstInterface`

Interface number of the first interface that is associated with this function

`uint8_t bInterfaceCount`

Number of contiguous interfaces that are associated with this function

`uint8_t bFunctionClass`

Class code (assigned by USB-IF)

`uint8_t bFunctionSubClass`

Subclass code (assigned by USB-IF)

`uint8_t bFunctionProtocol`

Protocol code (assigned by USB-IF)

`uint8_t iFunction`

Index of string descriptor describing this function

struct `usb_iad_desc_t`::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

`uint8_t val[USB_IAD_DESC_SIZE]`

Descriptor value

union **usb\_intf\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

### Public Members

`uint8_t bLength`

Size of the descriptor in bytes

`uint8_t bDescriptorType`

INTERFACE Descriptor Type

`uint8_t bInterfaceNumber`

Number of this interface.

**uint8\_t bAlternateSetting**

Value used to select this alternate setting for the interface identified in the prior field

**uint8\_t bNumEndpoints**

Number of endpoints used by this interface (excluding endpoint zero).

**uint8\_t bInterfaceClass**

Class code (assigned by the USB-IF)

**uint8\_t bInterfaceSubClass**

Subclass code (assigned by the USB-IF)

**uint8\_t bInterfaceProtocol**

Protocol code (assigned by the USB)

**uint8\_t iInterface**

Index of string descriptor describing this interface

**struct *usb\_intf\_desc\_t*::[anonymous] USB\_DESC\_ATTR**

USB descriptor attributes

**uint8\_t val[USB\_INTF\_DESC\_SIZE]**

Descriptor value

**union *usb\_ep\_desc\_t***

*#include <usb\_types\_ch9.h>* Structure representing a USB endpoint descriptor.

See Table 9-13 of USB2.0 specification for more details

**Public Members****uint8\_t bLength**

Size of the descriptor in bytes

**uint8\_t bDescriptorType**

ENDPOINT Descriptor Type

**uint8\_t bEndpointAddress**

The address of the endpoint on the USB device described by this descriptor

**uint8\_t bmAttributes**

This field describes the endpoint's attributes when it is configured using the bConfigurationValue.

**uint16\_t wMaxPacketSize**

Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

**uint8\_t bInterval**

Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

```
struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR
```

USB descriptor attributes

```
uint8_t val[USB_EP_DESC_SIZE]
```

Descriptor value

```
union usb_str_desc_t
```

*#include <usb\_types\_ch9.h>* Structure representing a USB string descriptor.

### Public Members

```
uint8_t bLength
```

Size of the descriptor in bytes

```
uint8_t bDescriptorType
```

STRING Descriptor Type

```
uint16_t wData[]
```

UTF-16LE encoded

```
struct usb_str_desc_t::[anonymous] USB_DESC_ATTR
```

USB descriptor attributes

```
uint8_t val[USB_STR_DESC_SIZE]
```

Descriptor value

### Macros

```
USB_DESC_ATTR
```

```
USB_B_DESCRIPTOR_TYPE_DEVICE
```

Descriptor types from USB2.0 specification table 9.5.

USB_B_DESCRIPTOR_TYPE_INTERFACE_POWER
```

**USB\_B\_DESCRIPTOR\_TYPE\_OTG**

Descriptor types from USB 2.0 ECN.

**USB\_B\_DESCRIPTOR\_TYPE\_DEBUG**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE\_ASSOCIATION**

**USB\_B\_DESCRIPTOR\_TYPE\_SECURITY**

Descriptor types from Wireless USB spec.

**USB\_B\_DESCRIPTOR\_TYPE\_KEY**

**USB\_B\_DESCRIPTOR\_TYPE\_ENCRYPTION\_TYPE**

**USB\_B\_DESCRIPTOR\_TYPE\_BOS**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE\_CAPABILITY**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRELESS\_ENDPOINT\_COMP**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRE\_ADAPTER**

**USB\_B\_DESCRIPTOR\_TYPE\_RPIPE**

**USB\_B\_DESCRIPTOR\_TYPE\_CS\_RADIO\_CONTROL**

**USB\_B\_DESCRIPTOR\_TYPE\_PIPE\_USAGE**

Descriptor types from UAS specification.

**USB\_SETUP\_PACKET\_SIZE**

Size of a USB control transfer setup packet in bytes.

**USB\_BM\_REQUEST\_TYPE\_DIR\_OUT**

Bit masks belonging to the bmRequestType field of a setup packet.

**USB\_BM\_REQUEST\_TYPE\_DIR\_IN**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_STANDARD**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_CLASS**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_VENDOR**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_RESERVED**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_MASK**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_DEVICE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_INTERFACE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_ENDPOINT**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_OTHER**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_MASK**

**USB\_B\_REQUEST\_GET\_STATUS**

Bit masks belonging to the bRequest field of a setup packet.

**USB\_B\_REQUEST\_CLEAR\_FEATURE**

**USB\_B\_REQUEST\_SET\_FEATURE**

**USB\_B\_REQUEST\_SET\_ADDRESS**

**USB\_B\_REQUEST\_GET\_DESCRIPTOR**

**USB\_B\_REQUEST\_SET\_DESCRIPTOR**

**USB\_B\_REQUEST\_GET\_CONFIGURATION**

**USB\_B\_REQUEST\_SET\_CONFIGURATION**

**USB\_B\_REQUEST\_GET\_INTERFACE**

**USB\_B\_REQUEST\_SET\_INTERFACE**

**USB\_B\_REQUEST\_SYNCH\_FRAME**

**USB\_W\_VALUE\_DT\_DEVICE**

Bit masks belonging to the wValue field of a setup packet.

**USB\_W\_VALUE\_DT\_CONFIG**

**USB\_W\_VALUE\_DT\_STRING**

**USB\_W\_VALUE\_DT\_INTERFACE**

**USB\_W\_VALUE\_DT\_ENDPOINT**

**USB\_W\_VALUE\_DT\_DEVICE\_QUALIFIER**

**USB\_W\_VALUE\_DT\_OTHER\_SPEED\_CONFIG**

**USB\_W\_VALUE\_DT\_INTERFACE\_POWER**

**USB\_SETUP\_PACKET\_INIT\_SET\_ADDR** (setup\_pkt\_ptr, addr)

Initializer for a SET\_ADDRESS request.

Sets the address of a connected device

**USB\_SETUP\_PACKET\_INIT\_GET\_DEVICE\_DESC** (setup\_pkt\_ptr)

Initializer for a request to get a device's device descriptor.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG** (setup\_pkt\_ptr)

Initializer for a request to get a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG\_DESC** (setup\_pkt\_ptr, desc\_index, desc\_len)

Initializer for a request to get one of the device's current configuration descriptor.

- desc\_index indicates the configuration's index number
- Number of bytes of the configuration descriptor to get

**USB\_SETUP\_PACKET\_INIT\_SET\_CONFIG** (setup\_pkt\_ptr, config\_num)

Initializer for a request to set a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_SET\_INTERFACE** (setup\_pkt\_ptr, intf\_num, alt\_setting\_num)

Initializer for a request to set an interface's alternate setting.

**USB\_SETUP\_PACKET\_INIT\_GET\_STR\_DESC** (setup\_pkt\_ptr, string\_index, lang\_id, desc\_len)

Initializer for a request to get a string descriptor.

**USB\_STANDARD\_DESC\_SIZE**

Size of dummy USB standard descriptor.

**USB\_DEVICE\_DESC\_SIZE**

Size of a USB device descriptor in bytes.

**USB\_CLASS\_PER\_INTERFACE**

Possible base class values of the bDeviceClass field of a USB device descriptor.

**USB\_CLASS\_AUDIO**

**USB\_CLASS\_COMM**

**USB\_CLASS\_HID**

**USB\_CLASS\_PHYSICAL**

**USB\_CLASS\_STILL\_IMAGE**

**USB\_CLASS\_PRINTER**

**USB\_CLASS\_MASS\_STORAGE**

**USB\_CLASS\_HUB**

**USB\_CLASS\_CDC\_DATA**

**USB\_CLASS\_CSCID**

**USB\_CLASS\_CONTENT\_SEC**

**USB\_CLASS\_VIDEO**

**USB\_CLASS\_WIRELESS\_CONTROLLER**

**USB\_CLASS\_PERSONAL\_HEALTHCARE**

**USB\_CLASS\_AUDIO\_VIDEO**

**USB\_CLASS\_BILLBOARD**

**USB\_CLASS\_USB\_TYPE\_C\_BRIDGE**

**USB\_CLASS\_MISC**

**USB\_CLASS\_APP\_SPEC**

**USB\_CLASS\_VENDOR\_SPEC**

**USB\_SUBCLASS\_VENDOR\_SPEC**

Vendor specific subclass code.

**USB\_CONFIG\_DESC\_SIZE**

Size of a short USB configuration descriptor in bytes.

---

**Note:** The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

**USB\_BM\_ATTRIBUTES\_ONE**

Bit masks belonging to the bmAttributes field of a configuration descriptor.

Must be set

**USB\_BM\_ATTRIBUTES\_SELFPOWER**

Self powered

**USB\_BM\_ATTRIBUTES\_WAKEUP**

Can wake-up

**USB\_BM\_ATTRIBUTES\_BATTERY**

Battery powered

**USB\_IAD\_DESC\_SIZE**

Size of a USB interface association descriptor in bytes.

**USB\_INTF\_DESC\_SIZE**

Size of a USB interface descriptor in bytes.

**USB\_EP\_DESC\_SIZE**

Size of a USB endpoint descriptor in bytes.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_NUM\_MASK**

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_DIR\_MASK**

**USB\_BM\_ATTRIBUTES\_XFERTYPE\_MASK**

Bit masks belonging to the bmAttributes field of an endpoint descriptor.

**USB\_BM\_ATTRIBUTES\_XFER\_CONTROL**

**USB\_BM\_ATTRIBUTES\_XFER\_ISOC**

**USB\_BM\_ATTRIBUTES\_XFER\_BULK**

**USB\_BM\_ATTRIBUTES\_XFER\_INT**

**USB\_BM\_ATTRIBUTES\_SYNCNCTYPE\_MASK**

**USB\_BM\_ATTRIBUTES\_SYNC\_NONE**

**USB\_BM\_ATTRIBUTES\_SYNC\_ASYNC**

**USB\_BM\_ATTRIBUTES\_SYNC\_ADAPTIVE**

**USB\_BM\_ATTRIBUTES\_SYNC\_SYNC**

**USB\_BM\_ATTRIBUTES\_USAGETYPE\_MASK**

**USB\_BM\_ATTRIBUTES\_USAGE\_DATA**

**USB\_BM\_ATTRIBUTES\_USAGE\_FEEDBACK**

**USB\_BM\_ATTRIBUTES\_USAGE\_IMPLICIT\_FB**

**USB\_EP\_DESC\_GET\_XFERTYPE** (desc\_ptr)

Macro helpers to get information about an endpoint from its descriptor.

**USB\_EP\_DESC\_GET\_EP\_NUM** (desc\_ptr)**USB\_EP\_DESC\_GET\_EP\_DIR** (desc\_ptr)**USB\_EP\_DESC\_GET\_MPS** (desc\_ptr)**USB\_STR\_DESC\_SIZE**

Size of a short USB string descriptor in bytes.

**Enumerations**enum **usb\_device\_state\_t**

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

---

**Note:** The `USB_DEVICE_STATE_NOT_ATTACHED` is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

---

*Values:*enumerator **USB\_DEVICE\_STATE\_NOT\_ATTACHED**

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

enumerator **USB\_DEVICE\_STATE\_ATTACHED**

Device is attached to the USB, but is not powered.

enumerator **USB\_DEVICE\_STATE\_POWERED**

Device is attached to the USB and powered, but has not been reset.

enumerator **USB\_DEVICE\_STATE\_DEFAULT**

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

enumerator **USB\_DEVICE\_STATE\_ADDRESS**

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

enumerator **USB\_DEVICE\_STATE\_CONFIGURED**

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

enumerator **USB\_DEVICE\_STATE\_SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device's function.

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.6 Project Configuration

### 2.6.1 Introduction

ESP-IDF uses `kconfiglib` which is a Python-based extension to the `Kconfig` system which provides a compile-time project configuration mechanism. `Kconfig` is based around options of several types: integer, string, boolean. `Kconfig` files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see `Kconfig` and `kconfiglib` extentions.

### 2.6.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sd-kconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

### 2.6.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for `git`). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see *Custom `sdkconfig` defaults*.

### 2.6.4 `Kconfig` Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

#### Format checker

`tools/ci/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example,

indentations will be corrected if there isn't some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

## 2.6.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. *Deprecated options and their replacements* are automatically generated by `confgen.py`.

## 2.6.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from `Kconfig` files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

### `CONFIG_APP_BUILD_TYPE`

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main th
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

#### Available options:

- Default (binary application + 2nd stage bootloader) (`APP_BUILD_TYPE_APP_2NDBOOT`)
- ELF file, loadable into RAM (EXPERIMENTAL)) (`APP_BUILD_TYPE_ELF_RAM`)

## CONFIG\_APP\_REPRODUCIBLE\_BUILD

Enable reproducible build

*Found in:* [Build type](#)

If enabled, all date, time, and path information would be eliminated. A `.gdbinit` file would be create automatically. (or will be append if you have one already)

#### Default value:

- No (disabled)

## CONFIG\_APP\_NO\_BLOBS

No Binary Blobs

*Found in:* [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

#### Default value:

- No (disabled)

## Bootloader config

Contains:

- [CONFIG\\_BOOTLOADER\\_LOG\\_LEVEL](#)
- [CONFIG\\_BOOTLOADER\\_COMPILER\\_OPTIMIZATION](#)
- [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_REGION\\_PROTECTION\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)
- [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)
- [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)
- [CONFIG\\_BOOTLOADER\\_HOLD\\_TIME\\_GPIO](#)
- [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)
- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_ALWAYS](#)
- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_ON\\_POWER\\_ON](#)

- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_IN\\_DEEP\\_SLEEP](#)
- [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_VDDSDIO\\_BOOST](#)

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

*Found in: [Bootloader config](#)*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

### Available options:

- Size (-Os) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

### Available options:

- No output (BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

## CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

### Available options:

- 1.8V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

## CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

**CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET**

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**

- from 0 to 44 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

**CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL**

Factory reset GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Pin level for factory reset, can be triggered on low or high.

**Available options:**

- Reset on GPIO low (BOOTLOADER\_FACTORY\_RESET\_PIN\_LOW)
- Reset on GPIO high (BOOTLOADER\_FACTORY\_RESET\_PIN\_HIGH)

**CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy\_init, …” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**

- “nvs” if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_APP\_TEST

GPIO triggers boot from test app partition

*Found in: [Bootloader config](#)*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST

Number of the GPIO input to boot TEST partition

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

**Default value:**

- 18 if [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

### CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL

App test GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)*

Pin level for app test, can be triggered on low or high.

**Available options:**

- Enter test app on GPIO low (BOOTLOADER\_APP\_TEST\_PIN\_LOW)
- Enter test app on GPIO high (BOOTLOADER\_APP\_TEST\_PIN\_HIGH)

### CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO

Hold time of GPIO for reset/test mode (seconds)

*Found in: [Bootloader config](#)*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#) || [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

*Found in: [Bootloader config](#)*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

*Found in: [Bootloader config](#)*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK clock source. After changing a frequency slow\_clk a time of WDT needs to re-set for new frequency. slow\_clk depends on RTC\_CLK\_SRC (INTERNAL\_RC or EXTERNAL\_CRYSTAL).

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE

Allows RTC watchdog disable in user code

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc\_wdt in the app's own code. If this option is not set (default), then rtc\_wdt will be disabled by ESP-IDF before calling the app\_main() function.

Use function rtc\_wdt\_feed() for resetting counter of rtc\_wdt. Use function rtc\_wdt\_disable() for disabling rtc\_wdt.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

*Found in: [Bootloader config](#)*

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see *BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD* option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

### CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

**Default value:**

- 16 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

### CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE

Emulate operations with efuse secure version(only test)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: *emul\_efuse, data, efuse, , 0x2000*.

This option enables: *EFUSE\_VIRTUAL* and *EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH*.

**Default value:**

- No (disabled) if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP

Skip image validation when exiting deep sleep

*Found in: [Bootloader config](#)*

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if (`CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE`) || `CONFIG_SECURE_BOOT`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS

Skip image validation always (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC

Reserve RTC FAST memory for custom purposes

Found in: *Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO\_CPU.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE

Size in bytes for custom purposes

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (*rtc\_retain\_mem\_t*) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

### CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

Found in: *Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON' T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

**Default value:**

- Yes (enabled)

### Security features

Contains:

- *CONFIG\_SECURE\_BOOT\_INSECURE*
- *CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME*
- *CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT*
- *CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP*
- *CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE*
- *CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE*
- *CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*
- *CONFIG\_SECURE\_BOOT*
- *CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING*
- *Potentially insecure options*
- *CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT*
- *CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY*
- *CONFIG\_SECURE\_BOOTLOADER\_MODE*
- *CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*
- *CONFIG\_SECURE\_UART\_ROM\_DL\_MODE*
- *CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT*

## CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

## CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
  - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
  - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
  - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

**Available options:**

- ECDSA (SECURE\_SIGNED\_APPS\_ECDSA\_SCHEME)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (SECURE\_SIGNED\_APPS\_RSA\_SCHEME)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (SECURE\_SIGNED\_APPS\_ECDSA\_V2\_SCHEME)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

## CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

**Available options:**

- Using ECC curve NISTP192 (SECURE\_BOOT\_ECDSA\_KEY\_LEN\_192\_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE\_BOOT\_ECDSA\_KEY\_LEN\_256\_BITS)

## CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`

## **CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

## **CONFIG\_SECURE\_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

## **CONFIG\_SECURE\_BOOT\_VERSION**

Select secure boot version

*Found in: Security features > CONFIG\_SECURE\_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

**Available options:**

- Enable Secure Boot version 1 (`SECURE_BOOT_V1_ENABLED`)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`SECURE_BOOT_V2_ENABLED`)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

### **CONFIG\_SECURE\_BOOTLOADER\_MODE**

Secure bootloader mode

*Found in: [Security features](#)*

#### **Available options:**

- One-time flash (`SECURE_BOOTLOADER_ONE_TIME_FLASH`)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (`SECURE_BOOTLOADER_REFLASHABLE`)  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.  
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.  
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### **CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES**

Sign binaries during build

*Found in: [Security features](#)*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

#### **Default value:**

- “secure\_boot\_signing\_key.pem” if [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)

## CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

## CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

### Available options:

- No encoding (256 bit key) (`SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

## CONFIG\_SECURE\_BOOT\_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

### **CONFIG\_SECURE\_FLASH\_ENC\_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in:* [Security features](#)

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read [Flash Encryption](#) before enabling.

**Default value:**

- No (disabled)

### **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE**

Size of generated AES-XTS key

*Found in:* [Security features](#) > `CONFIG_SECURE_FLASH_ENC_ENABLED`

Size of generated AES-XTS key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**

- AES-128 key derived from 128 bits (SHA256(128 bits)) (`SECURE_FLASH_ENCRYPTION_AES128_DERIVED`)
- AES-128 (256-bit key) (`SECURE_FLASH_ENCRYPTION_AES128`)
- AES-256 (512-bit key) (`SECURE_FLASH_ENCRYPTION_AES256`)

### **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE**

Enable usage mode

*Found in:* [Security features](#) > `CONFIG_SECURE_FLASH_ENC_ENABLED`

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

**Available options:**

- Development (NOT SECURE) (`SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`)
- Release (`SECURE_FLASH_ENCRYPTION_MODE_RELEASE`)

### **Potentially insecure options** Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`

- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_CACHE](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_UNUSED\\_DIGEST\\_SLOTS](#)
- [CONFIG\\_SECURE\\_FLASH\\_REQUIRE\\_ALREADY\\_ENABLED](#)

### CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG

Allow JTAG Debugging

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

#### Default value:

- No (disabled) if [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#) || [SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

### CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION

Allow app partition length not 64KB aligned

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS

Allow additional read protecting of efuses

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a `BLOCK` is read-protected, the application will read all zeros from that block

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

### CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS

Leave unused digest slots available (not revoke)

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC

Leave UART bootloader encryption enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE

Leave UART bootloader flash cache enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED

Require flash encryption to be already enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: [Security features](#)*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

## CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

Found in: *Security features*

**Available options:**

- UART ROM download mode (Permanently disabled (recommended)) (`SECURE_DISABLE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`SECURE_ENABLE_SECURE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`  
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (`SECURE_INSECURE_ALLOW_DL_MODE`)  
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

## Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

### CONFIG\_APP\_COMPILE\_TIME\_DATE

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

**Default value:**

- Yes (enabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR

Exclude PROJECT\_VER from firmware image

*Found in: Application manager*

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR

Exclude PROJECT\_NAME from firmware image

*Found in: Application manager*

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER

Project version

*Found in: Application manager > CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

### CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 16

### Boot ROM Behavior

Contains:

- [CONFIG\\_BOOT\\_ROM\\_LOG\\_SCHEME](#)

### CONFIG\_BOOT\_ROM\_LOG\_SCHEME

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

**Available options:**

- Always Log (BOOT\_ROM\_LOG\_ALWAYS\_ON)  
Always print ROM logs, this is the default behavior.
- Permanently disable logging (BOOT\_ROM\_LOG\_ALWAYS\_OFF)  
Don't print ROM logs.
- Log on GPIO High (BOOT\_ROM\_LOG\_ON\_GPIO\_HIGH)  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (BOOT\_ROM\_LOG\_ON\_GPIO\_LOW)  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

### Serial flasher config

Contains:

- [CONFIG\\_ESPTOOLPY\\_AFTER](#)
- [CONFIG\\_ESPTOOLPY\\_BEFORE](#)
- [CONFIG\\_ESPTOOLPY\\_HEADER\\_FLASHSIZE\\_UPDATE](#)
- [CONFIG\\_ESPTOOLPY\\_NO\\_STUB](#)
- [CONFIG\\_ESPTOOLPY\\_FLASH\\_SAMPLE\\_MODE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHSIZE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHMODE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHFREQ](#)

### CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

**Default value:**

- No (disabled)

**CONFIG\_ESPTOOLPY\_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

**Available options:**

- QIO (ESPTOOLPY\_FLASHMODE\_QIO)
- QOUT (ESPTOOLPY\_FLASHMODE\_QOUT)
- DIO (ESPTOOLPY\_FLASHMODE\_DIO)
- DOUT (ESPTOOLPY\_FLASHMODE\_DOUT)
- OPI (ESPTOOLPY\_FLASHMODE\_OPI)

**CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

**Available options:**

- STR Mode (ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_STR)
- DTR Mode (ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_DTR)

**CONFIG\_ESPTOOLPY\_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

**Available options:**

- 120 MHz (ESPTOOLPY\_FLASHFREQ\_120M)
- 80 MHz (ESPTOOLPY\_FLASHFREQ\_80M)
- 60 MHz (ESPTOOLPY\_FLASHFREQ\_60M)
- 48 MHz (ESPTOOLPY\_FLASHFREQ\_48M)
- 40 MHz (ESPTOOLPY\_FLASHFREQ\_40M)
- 30 MHz (ESPTOOLPY\_FLASHFREQ\_30M)
- 26 MHz (ESPTOOLPY\_FLASHFREQ\_26M)
- 24 MHz (ESPTOOLPY\_FLASHFREQ\_24M)
- 20 MHz (ESPTOOLPY\_FLASHFREQ\_20M)
- 15 MHz (ESPTOOLPY\_FLASHFREQ\_15M)

**CONFIG\_ESPTOOLPY\_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

**Available options:**

- 1 MB (ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (ESPTOOLPY\_FLASHSIZE\_16MB)

- 32 MB (ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (ESPTOOLPY\_FLASHSIZE\_128MB)

### CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

**Default value:**

- No (disabled)

### CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY\_BEFORE\_RESET)
- No reset (ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (ESPTOOLPY\_AFTER\_NORESET)

### Partition Table

Contains:

- [CONFIG\\_PARTITION\\_TABLE\\_CUSTOM\\_FILENAME](#)
- [CONFIG\\_PARTITION\\_TABLE\\_MD5](#)
- [CONFIG\\_PARTITION\\_TABLE\\_OFFSET](#)
- [CONFIG\\_PARTITION\\_TABLE\\_TYPE](#)

## CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

### Available options:

- Single factory app, no OTA (PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota.csv
- Custom partition table CSV (PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project.  
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)  
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_encr\_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)  
This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large\_encr\_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)  
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota\_encr\_nvs.csv

## CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “partitions.csv”

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- “0x8000”

### CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled)

### Compiler options

Contains:

- [\*CONFIG\\_COMPILER\\_OPTIMIZATION\\_ASSERTION\\_LEVEL\*](#)
- [\*CONFIG\\_COMPILER\\_FLOAT\\_LIB\\_FROM\*](#)
- [\*CONFIG\\_COMPILER\\_OPTIMIZATION\\_CHECKS\\_SILENT\*](#)
- [\*CONFIG\\_COMPILER\\_DUMP\\_RTL\\_FILES\*](#)
- [\*CONFIG\\_COMPILER\\_WARN\\_WRITE\\_STRINGS\*](#)
- [\*CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\*](#)
- [\*CONFIG\\_COMPILER\\_CXX\\_RTTI\*](#)
- [\*CONFIG\\_COMPILER\\_OPTIMIZATION\*](#)
- [\*CONFIG\\_COMPILER\\_HIDE\\_PATHS\\_MACROS\*](#)
- [\*CONFIG\\_COMPILER\\_STACK\\_CHECK\\_MODE\*](#)

### CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.

- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER\_COMPILER\_OPTIMIZATION setting.

**Available options:**

- Debug (-Og) (COMPILER\_OPTIMIZATION\_DEFAULT)
- Optimize for size (-Os) (COMPILER\_OPTIMIZATION\_SIZE)
- Optimize for performance (-O2) (COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

**Available options:**

- Enabled (COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

## CONFIG\_COMPILER\_FLOAT\_LIB\_FROM

Compiler float lib source

*Found in: [Compiler options](#)*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast” , but it has a few exceptions from IEEE 754 compliance.

**Available options:**

- libgcc (COMPILER\_FLOAT\_LIB\_FROM\_GCCLIB)
- librvfp (COMPILER\_FLOAT\_LIB\_FROM\_RVFPLIB)

## CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in `ESP_RETURN_ON_*` and `ESP_EXIT_ON_*` macros

Found in: *Compiler options*

If enabled, the error messages will be discarded in following check macros: -  
`ESP_RETURN_ON_ERROR` - `ESP_EXIT_ON_ERROR` - `ESP_RETURN_ON_FALSE` -  
`ESP_EXIT_ON_FALSE`

**Default value:**

- No (disabled)

## **CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS**

Replace ESP-IDF and project paths in binaries

Found in: *Compiler options*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

**Default value:**

- Yes (enabled)

## **CONFIG\_COMPILER\_CXX\_EXCEPTIONS**

Enable C++ exceptions

Found in: *Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [\*CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE\*](#)

## **CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE**

Emergency Pool Size

Found in: *Compiler options* > [\*CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\*](#)

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [\*CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\*](#)

### CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**

- None (COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (COMPILER\_STACK\_CHECK\_MODE\_ALL)

### CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable `-Wwrite-strings` warning flag

*Found in: [Compiler options](#)*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### Component config

Contains:

- *ADC and ADC Calibration*
- *Application Level Tracing*
- *Bluetooth*
- *Common ESP-related*
- *Core dump*
- *Driver Configurations*
- *eFuse Bit Manager*
- *CONFIG\_BLE\_MESH*
- *ESP HTTP client*
- *ESP HTTPS OTA*
- *ESP HTTPS server*
- *ESP NETIF Adapter*
- *ESP PSRAM*
- *ESP Ringbuf*
- *ESP System Settings*
- *ESP-MQTT Configurations*
- *ESP-TLS*
- *Ethernet*
- *Event Loop Library*
- *FAT Filesystem support*
- *FreeRTOS*
- *GDB Stub*
- *Hardware Abstraction Layer (HAL) and Low Level (LL)*
- *Hardware Settings*
- *Heap memory debugging*
- *High resolution timer (esp\_timer)*
- *HTTP Server*
- *IPC (Inter-Processor Call)*
- *LCD and Touch Panel*
- *Log output*
- *LWIP*
- *mbedTLS*
- *Newlib*
- *NVS*
- *OpenThread*
- *PHY*
- *Power Management*
- *Protocomm*
- *PThreads*
- *SoC Settings*
- *SPI Flash driver*
- *SPIFFS Configuration*
- *Supplicant*
- *TCP Transport*
- *Ultra Low Power (ULP) Co-processor*
- *Unity unit testing library*
- *USB-OTG*
- *Virtual file system*
- *Wear Levelling*
- *Wi-Fi*
- *Wi-Fi Provisioning Manager*

**Application Level Tracing** Contains:

- `CONFIG_APPTRACE_DESTINATION1`
- `CONFIG_APPTRACE_DESTINATION2`
- *FreeRTOS System View Tracing*
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_APPTRACE_UART_BAUDRATE`
- `CONFIG_APPTRACE_UART_RX_GPIO`
- `CONFIG_APPTRACE_UART_RX_BUFF_SIZE`
- `CONFIG_APPTRACE_UART_TASK_PRIO`
- `CONFIG_APPTRACE_UART_TX_MSG_SIZE`
- `CONFIG_APPTRACE_UART_TX_GPIO`
- `CONFIG_APPTRACE_UART_TX_BUFF_SIZE`

**CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (`APPTRACE_DEST_JTAG`)
- None (`APPTRACE_DEST_NONE`)

**CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

**Available options:**

- UART0 (`APPTRACE_DEST_UART0`)
- UART1 (`APPTRACE_DEST_UART1`)
- UART2 (`APPTRACE_DEST_UART2`)
- USB\_CDC (`APPTRACE_DEST_USB_CDC`)
- None (`APPTRACE_DEST_UART_NONE`)

**CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

**CONFIG\_APPTRACE\_UART\_RX\_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

### CONFIG\_APPTRACE\_UART\_BAUDRATE

UART baud rate

*Found in: [Component config](#) > [Application Level Tracing](#)*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

### CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

### CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

### CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

### CONFIG\_APPTRACE\_UART\_TASK\_PRIO

UART Task Priority

*Found in: [Component config](#) > [Application Level Tracing](#)*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

### CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

**CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX**

Size of the pending data buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- [CONFIG\\_APPTRACE\\_SV\\_CPU](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_TO\\_SCHED\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_MAX\\_TASKS](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_IDLE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_CREATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_TERMINATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_OVERFLOW\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_BUF\\_WAIT\\_TMO](#)

**CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG\_APPTRACE\_SV\_DEST**

SystemView destination

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView will transfer data through defined interface.

**Available options:**

- Data destination JTAG (APPTRACE\_SV\_DEST\_JTAG)  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE\_SV\_DEST\_UART)  
Send SEGGER SystemView events through UART interface.

**CONFIG\_APPTRACE\_SV\_CPU**

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**

- CPU0 (APPTRACE\_SV\_DEST\_CPU\_0)  
Send SEGGER SystemView events for Pro CPU.
- CPU1 (APPTRACE\_SV\_DEST\_CPU\_1)  
Send SEGGER SystemView events for App CPU.

**CONFIG\_APPTRACE\_SV\_TS\_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**

- CPU cycle counter (CCOUNT) (APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- General Purpose Timer (Timer Group) (APPTRACE\_SV\_TS\_SOURCE\_GPTIMER)
- esp\_timer high resolution timer (APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

**CONFIG\_APPTRACE\_SV\_MAX\_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

**CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “ISR Enter” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “ISR Exit” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “ISR to Scheduler” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “Task Start Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “Task Stop Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “Task Start Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “Task Stop Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables “Task Create” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables “Task Terminate” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables “System Idle” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables “Timer Enter” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables “Timer Exit” event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**Bluetooth** Contains:

- *Bluedroid Options*
- *CONFIG\_BT\_ENABLED*
- *Controller Options*
- *NimBLE Options*

### **CONFIG\_BT\_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

### **CONFIG\_BT\_HOST**

Host

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- **Bluedroid - Dual-mode (BT\_BLUEDROID\_ENABLED)**  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (BT\_NIMBLE\_ENABLED)**  
This option is recommended for BLE only usecases to save on memory
- **Disabled (BT\_CONTROLLER\_ONLY)**  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth controller stack

### Available options:

- **Enabled (BT\_CONTROLLER\_ENABLED)**  
This option is recommended for Bluetooth controller usecases
- **Disabled (BT\_CONTROLLER\_DISABLED)**  
This option is recommended for Bluetooth Host only usecases

## Bluedroid Options

 Contains:

- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*
- *CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BLE\_ENABLED*
- *BT\_DEBUG\_LOG\_LEVEL*
- *CONFIG\_BT\_ACL\_CONNECTIONS*
- *CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST*
- *CONFIG\_BT\_STACK\_NO\_LOG*
- *CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*
- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT*
- *CONFIG\_BT\_BLE\_RPA\_SUPPORTED*
- *CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY*

## CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

### Default value:

- 3072 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

## CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BT\_BLUEDROID\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (BT\_BLUEDROID\_PINNED\_TO\_CORE\_1)

**CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select btu task stack size

**Default value:**

- 4096 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG**

Bluedroid memory debug

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluedroid memory debug

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**CONFIG\_BT\_GATTS\_ENABLE**

Include GATT server module(GATTS)

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#)*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_BLE\\_ENABLED](#) && BT\_BLUEDROID\_ENABLED

**CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_GATTS\\_ENABLE](#) && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 8 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 100 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

**Available options:**

- GATTS manually send service change indication (BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MANUAL)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (BT\_GATTS\_SEND\_SERVICE\_CHANGE\_AUTO)  
Let Bluedroid handle the service change indication internally

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 7 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if *CONFIG\_BT\_BLE\_SMP\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### BT DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL*

### CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT\_DEBUG\_LOG\_LEVEL*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT\_LOG\_HCI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HCI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)

- VERBOSE (BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

**Available options:**

- NONE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

**Available options:**

- NONE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

**Available options:**

- NONE (BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)

- ERROR (BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

**Available options:**

- NONE (BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

**Available options:**

- NONE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

**Available options:**

- NONE (BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

**Available options:**

- NONE (BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL**

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

**Available options:**

- NONE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL**

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

**Available options:**

- NONE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL**

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

**Available options:**

- NONE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)

- DEBUG (BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

**Available options:**

- NONE (BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

**Available options:**

- NONE (BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

**Available options:**

- NONE (BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

**Available options:**

- NONE (BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

**Available options:**

- NONE (BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

**Available options:**

- NONE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 4 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && [CONFIG\\_BT\\_BLE\\_ENABLED](#) && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT

Timeout of BLE connection establishment

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP\_GATTC\_OPEN\_EVT or ESP\_GATTS\_OPEN\_EVT is triggered.

**Range:**

- from 1 to 60 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 30 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 32 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && SOC\_BLE\_DEVICE\_PRIVACY\_SUPPORTED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**

- Yes (enabled) if BT\_BLUEDROID\_ENABLED && SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_BLUEDROID\_ENABLED

**NimBLE Options** Contains:

- [CONFIG\\_BT\\_NIMBLE\\_SVC\\_GAP\\_DEVICE\\_NAME](#)
- [CONFIG\\_BT\\_NIMBLE\\_HS\\_STOP\\_TIMEOUT\\_MS](#)
- [CONFIG\\_BT\\_NIMBLE\\_WHITELIST\\_SIZE](#)

- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

### **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

#### **Available options:**

- Internal memory (`BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)  
Allows to use IRAM memory region as 8bit accessible region.  
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BT\_NIMBLE\_LOG\_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config → Log output → Default log verbosity” .

**Available options:**

- No logs (BT\_NIMBLE\_LOG\_LEVEL\_NONE)
- Error logs (BT\_NIMBLE\_LOG\_LEVEL\_ERROR)
- Warning logs (BT\_NIMBLE\_LOG\_LEVEL\_WARNING)
- Info logs (BT\_NIMBLE\_LOG\_LEVEL\_INFO)
- Debug logs (BT\_NIMBLE\_LOG\_LEVEL\_DEBUG)

### CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 9 if SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_BONDS

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_CCCDS

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE

The CPU core on which NimBLE host will run

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**

- Core 0 (PRO CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_NIMBLE\_HOST\_TASK\_STACK\_SIZE

NimBLE Host task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL

Enable BLE Central role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enables central role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL

Enable BLE Peripheral role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable peripheral role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER

Enable BLE Broadcaster role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enables broadcaster role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enables observer role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_NVS\_PERSIST**

Persist the BLE Bonding keys in NVS

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE**

Enable BLE SM feature

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_ENCRYPTION](#)
- [CONFIG\\_BT\\_NIMBLE\\_SM\\_LEGACY](#)
- [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)

**CONFIG\_BT\_NIMBLE\_SM\_LEGACY**

Security manager legacy pairing

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SM\_SC**

Security manager secure connections (4.2)

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS**

Use predefined public-private key pair

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) > [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_SM_SC` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION

Enable LE encryption

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

Enable encryption connection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options`

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME

BLE GAP default device name

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options`

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- “nimble” if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN

Maximum length of BLE device name in octets

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options`

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU

Preferred MTU size in octets

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options`

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### Memory Settings Contains:

- [CONFIG\\_BT\\_NIMBLE\\_ACL\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_ACL\\_BUF\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_HCI\\_EVT\\_BUF\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_HCI\\_EVT\\_HI\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_HCI\\_EVT\\_LO\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_1\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_1\\_BLOCK\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_2\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_2\\_BLOCK\\_SIZE](#)

## CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_NIMBLE\_ENABLED
- 12 if SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_NIMBLE\_ENABLED

## CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_SIZE

MSYS\_1 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 1

**Default value:**

- 128 if SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_NIMBLE\_ENABLED
- 256 if SOC\_ESP\_NIMBLE\_CONTROLLER && BT\_NIMBLE\_ENABLED

## CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_COUNT

MSYS\_2 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory count

**Default value:**

- 24 if BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_SIZE

MSYS\_2 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 2

**Default value:**

- 320 if BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_COUNT

ACL Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

The number of ACL data buffers.

**Default value:**

- 24 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_SIZE

ACL Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_BUF\_SIZE

HCI Event Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED
- 70 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_HI\_BUF\_COUNT

High Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_LO\_BUF\_COUNT

Low Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_GATT\_MAX\_PROCS

Maximum number of GATT client procedures

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Maximum number of GATT client procedures that can be executed.

**Default value:**

- 4 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL

Enable Host Flow control

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable Host Flow control

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL

Host Flow control interval

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control interval in msec

**Default value:**

- 1000 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH

Host Flow control threshold

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT

Host Flow control on disconnect

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT**

RPA timeout in seconds

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**

- from 1 to 41400 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**Default value:**

- 900 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH**

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/./esp32/api-guides/esp-ble-mesh/ble-mesh-index``

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROXY**

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROV**

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH\_PROV* && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH\_PROV* && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH* && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_FRIEND

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_CRYPTO\_STACK\_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT**

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT**

Maximum number connection reattempts

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 7 if `BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `BT_NIMBLE_ENABLED`

**Default value:**

- 3 if `BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT**

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && (`SOC_BLE_50_SUPPORTED` || `BT_CONTROLLER_ENABLED`) && `BT_NIMBLE_ENABLED`

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_2M\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_CODED\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)
- [CONFIG\\_BT\\_NIMBLE\\_BLE\\_POWER\\_CONTROL](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_SYNC](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_2M\_PHY**

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY**

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_EXT\_ADV

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transer Sync Events

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#)

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 0 to 8 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_BLE\_POWER\_CONTROL**

Enable support for BLE Power Control

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to enable the Power Control feature

**CONFIG\_BT\_NIMBLE\_COEX\_PHY\_CODED\_TX\_RX\_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**

- Force Enable ([BT\\_NIMBLE\\_COEX\\_PHY\\_CODED\\_TX\\_RX\\_TLIM\\_EN](#))  
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable ([BT\\_NIMBLE\\_COEX\\_PHY\\_CODED\\_TX\\_RX\\_TLIM\\_DIS](#))  
Disable the limitation on max tx/rx time for Coded-PHY connection

**CONFIG\_BT\_NIMBLE\_WHITELIST\_SIZE**

BLE white list size

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

**Range:**

- from 1 to 15 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 12 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_TEST\_THROUGHPUT\_TEST**

Throughput Test Mode enable

*Found in: Component config > Bluetooth > NimBLE Options*

Enable the throughput test mode

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED

**CONFIG\_BT\_NIMBLE\_BLE\_GATT\_BLOB\_TRANSFER**

Blob transfer

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT needs to be increased according to the need.

**Controller Options****CONFIG\_BLE\_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*

- *CONFIG\_BLE\_MESH\_PROV*
- *CONFIG\_BLE\_MESH\_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_NO\_LOG*
- *CONFIG\_BLE\_MESH\_IVU\_DIVIDER*
- *CONFIG\_BLE\_MESH\_FAST\_PROV*
- *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*
- *CONFIG\_BLE\_MESH\_CRPL*
- *CONFIG\_BLE\_MESH\_RX\_SDU\_MAX*
- *CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT*
- *CONFIG\_BLE\_MESH\_LABEL\_COUNT*
- *CONFIG\_BLE\_MESH\_SUBNET\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MAX*
- *CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE*
- *CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE*
- *CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT*
- *CONFIG\_BLE\_MESH\_PB\_GATT*
- *CONFIG\_BLE\_MESH\_PB\_ADV*
- *CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI*
- *CONFIG\_BLE\_MESH\_RELAY*
- *CONFIG\_BLE\_MESH\_SETTINGS*
- *CONFIG\_BLE\_MESH\_DEINIT*
- *CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN*
- *Support for BLE Mesh Client/Server models*
- *Support for BLE Mesh Foundation models*
- *CONFIG\_BLE\_MESH\_NODE*
- *CONFIG\_BLE\_MESH\_PROVISIONER*
- *CONFIG\_BLE\_MESH\_FRIEND*
- *CONFIG\_BLE\_MESH\_LOW\_POWER*
- *CONFIG\_BLE\_MESH\_HCI\_5\_0*
- *CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST*
- *CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT*

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data” .

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

### Available options:

- Internal DRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL)
- External SPIRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL)
- Default alloc mode (BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE\_MESH\_MEM\_ALLOC\_MODE\_IRAM\_8BIT)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

### Default value:

- No (disabled) if ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

### Available options:

- External SPIRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_EXTERNAL)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_IRAM\_8BIT)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

### CONFIG\_BLE\_MESH\_DEINIT

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### BLE Mesh and BLE coexistence support

 Contains:

- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN*
- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support > CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

### CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

### CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB

Support receiving Heartbeat messages

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#)

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE

Maximum number of filter entries for receiving Heartbeat messages

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) > [CONFIG\\_BLE\\_MESH\\_PROVISIONER\\_RECV\\_HB](#)

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if [CONFIG\\_BLE\\_MESH\\_PROVISIONER\\_RECV\\_HB](#) && [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 3 if [CONFIG\\_BLE\\_MESH\\_PROVISIONER\\_RECV\\_HB](#) && [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PROV

BLE Mesh Provisioning support

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#)

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE\_MESH\_FAST\_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT

Node Identity advertising timeout

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE

Maximum number of filter entries per Proxy Client

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#)*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 4 if [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT

BLE Mesh GATT Proxy Client

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE

How often the sequence number gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PARTITION\_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- “ble\_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUBNET\_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_CRPL

Maximum capacity of the replay protection list

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE

Network message cache size

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT

Number of advertising buffers

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of advertising buffers available. The transport layer reserves ADV\_BUF\_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to

happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI**

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: `Component config` > `CONFIG_BLE_MESH`*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RX\_SDU\_MAX

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG\_BLE\_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if *CONFIG\_BLE\_MESH*

**Default value:**

- 384 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TX\_SEG\_MAX

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG\_BLE\_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (*BLE\_MESH\_ADV\_BUF\_COUNT*) as there are outgoing segments.

**Range:**

- from 2 to 32 if *CONFIG\_BLE\_MESH*

**Default value:**

- 32 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RELAY

Relay support

*Found in: Component config > CONFIG\_BLE\_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_NODE* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_RELAY* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT

Number of advertising buffers for relay packets

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_RELAY* > *CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF*

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if *CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF* && *CONFIG\_BLE\_MESH\_RELAY* && *CONFIG\_BLE\_MESH*

**Default value:**

- 60 if *CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF* && *CONFIG\_BLE\_MESH\_RELAY* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

### CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_LOW\_POWER* > *CONFIG\_BLE\_MESH\_LPN\_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT**

Retry timeout for Friend requests

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR**

RSSIFactor, used in Friend Offer Delay calculation

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives  $N = 2$ , and value 7 gives  $N = 128$ .

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY**

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NO\_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG\_BLE\_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH* && *CONFIG\_BLE\_MESH*

### BLE Mesh STACK DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL*

### CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL

BLE\_MESH\_STACK

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**

- NONE (BLE\_MESH\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_TRACE\_LEVEL\_VERBOSE)

### BLE Mesh NET BUF DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL*

### CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL

BLE\_MESH\_NET\_BUF

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**

- NONE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT

Timeout(ms) for client message response

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

**Default value:**

- 4000 if *CONFIG\_BLE\_MESH*

### Support for BLE Mesh Foundation models

 Contains:

- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*

### **CONFIG\_BLE\_MESH\_CFG\_CLI**

Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

### **CONFIG\_BLE\_MESH\_HEALTH\_CLI**

Health Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

### **CONFIG\_BLE\_MESH\_HEALTH\_SRV**

Health Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Client/Server models** Contains:

- *CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_SERVER*
- *CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHTING\_SERVER*
- *CONFIG\_BLE\_MESH\_SCENE\_CLI*
- *CONFIG\_BLE\_MESH\_SCHEDULER\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_CLI*

### **CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Default Transition Time Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Power OnOff Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Power Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Battery Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light LC Client model.

### CONFIG\_BLE\_MESH\_GENERIC\_SERVER

Generic server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SENSOR\_SERVER

Sensor server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER

Time and Scenes server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LIGHTING\_SERVER

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

**BLE Mesh specific test option** Contains:

- *CONFIG\_BLE\_MESH\_DEBUG*
- *CONFIG\_BLE\_MESH\_SHELL*
- *CONFIG\_BLE\_MESH\_BQB\_TEST*
- *CONFIG\_BLE\_MESH\_SELF\_TEST*
- *CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK*
- *CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST*

### CONFIG\_BLE\_MESH\_SELF\_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BQB\_TEST

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enter mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH\_SELF\_TEST* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_SELF\_TEST* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Foundation Models debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ADV**

Advertising debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable advertising debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER**

Low Power debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Low Power debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_FRIEND**

Friend debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Friend debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROXY**

Proxy debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Proxy protocol debug logs for the BLE Mesh functionality.

### **Driver Configurations** Contains:

- *GPIO Configuration*
- *GPTimer Configuration*
- *I2S Configuration*
- *Legacy ADC Configuration*
- *MCPWM Configuration*
- *PCNT Configuration*
- *RMT Configuration*
- *Sigma Delta Modulator Configuration*
- *SPI Configuration*
- *Temperature sensor Configuration*
- *TWAI Configuration*
- *UART Configuration*

### **Legacy ADC Configuration** Contains:

- *CONFIG\_ADC\_DISABLE\_DAC*
- *Legacy ADC Calibration Configuration*
- *CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN*

### CONFIG\_ADC\_DISABLE\_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled)

### CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### Legacy ADC Calibration Configuration

 Contains:

- [CONFIG\\_ADC\\_CALI\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp\_adc\_cal.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### SPI Configuration

 Contains:

- [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM](#)

### CONFIG\_SPI\_MASTER\_IN\_IRAM

Place transmitting functions of SPI master into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM

Place SPI master ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP\_INTR\_FLAG\_IRAM when initializing the driver.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_SLAVE\_IN\_IRAM

Place transmitting functions of SPI slave into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there' s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM

Place SPI slave ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP\_INTR\_FLAG\_IRAM when initializing the driver.

**Default value:**

- Yes (enabled)

### TWAI Configuration

 Contains:

- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_LISTEN\\_ONLY\\_DOM](#)
- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

### CONFIG\_TWAI\_ISR\_IN\_IRAM

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP\_INTR\_FLAG\_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI\_ALERT\_AND\_LOG flag) will have no effect.

**Default value:**

- No (disabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_LISTEN\_ONLY\_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**

- Yes (enabled)

**Temperature sensor Configuration** Contains:

- [CONFIG\\_TEMP\\_SENSOR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_TEMP\_SENSOR\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp\_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG\_TEMP\_SENSOR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**UART Configuration** Contains:

- [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#)

**CONFIG\_UART\_ISR\_IN\_IRAM**

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [UART Configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**

- No (disabled) if [CONFIG\\_RINGBUF\\_PLACE\\_ISR\\_FUNCTIONS\\_INTO\\_FLASH](#)

**GPIO Configuration** Contains:

- [CONFIG\\_GPIO\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### **CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM**

Place GPIO control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

Place GPIO control functions (like `intr_disable/set_level`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**Sigma Delta Modulator Configuration** Contains:

- [CONFIG\\_SDM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_SDM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_SDM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM**

Place SDM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_SDM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**GPTimer Configuration** Contains:

- [CONFIG\\_GPTIMER\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GPTIMER\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GPTIMER\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM**

Place GPTimer control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE**

GPTimer ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### **CONFIG\_GPTIMER\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_GPTIMER\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**PCNT Configuration** Contains:

- [CONFIG\\_PCNT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PCNT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_PCNT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_PCNT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM

Place PCNT control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_ISR\_IRAM\_SAFE

PCNT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**RMT Configuration** Contains:

- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_RMT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_RMT\_ISR\_IRAM\_SAFE

RMT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_RMT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG\_RMT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**MCPWM Configuration** Contains:

- [CONFIG\\_MCPWM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_MCPWM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_MCPWM\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_MCPWM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_MCPWM\_ISR\_IRAM\_SAFE**

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**CONFIG\_MCPWM\_CTRL\_FUNC\_IN\_IRAM**

Place MCPWM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Place MCPWM control functions (like set\_compare\_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

### CONFIG\_MCPWM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

### CONFIG\_MCPWM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**I2S Configuration** Contains:

- [CONFIG\\_I2S\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2S\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_I2S\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_I2S\_ISR\_IRAM\_SAFE

I2S ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_I2S\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

### CONFIG\_I2S\_ENABLE\_DEBUG\_LOG

Enable I2S debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_CUSTOM\_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “main/esp\_efuse\_custom\_table.csv” if [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### **CONFIG\_EFUSE\_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**

- No (disabled)

### **CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the *efuse* partition. partition.csv: “efuse\_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

**ESP-TLS** Contains:

- [CONFIG\\_ESP\\_TLS\\_INSECURE](#)
- [CONFIG\\_ESP\\_TLS\\_LIBRARY\\_CHOOSE](#)
- [CONFIG\\_ESP\\_TLS\\_CLIENT\\_SESSION\\_TICKETS](#)
- [CONFIG\\_ESP\\_DEBUG\\_WOLFSSL](#)
- [CONFIG\\_ESP\\_TLS\\_SERVER](#)

- [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#)
- [CONFIG\\_ESP\\_WOLFSSL\\_SMALL\\_CERT\\_VERIFY](#)
- [CONFIG\\_ESP\\_TLS\\_USE\\_DS\\_PERIPHERAL](#)

### **CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in:* [Component config](#) > [ESP-TLS](#)

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS ([ESP\\_TLS\\_USING\\_MBEDTLS](#))
- wolfSSL (License info in wolfSSL directory README) ([ESP\\_TLS\\_USING\\_WOLFSSL](#))

### **CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL**

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS**

Enable client session tickets

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077.

### **CONFIG\_ESP\_TLS\_SERVER**

Enable ESP-TLS Server

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### **CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS**

Enable server session tickets

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Enable session ticket support as specified in RFC5077

### **CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT**

Server session ticket timeout in seconds

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`

**CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK**

Certificate selection hook

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

**CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL**

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

**CONFIG\_ESP\_TLS\_PSK\_VERIFICATION**

Enable PSK verification

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG\_ESP\_TLS\_INSECURE**

Allow potentially insecure options

*Found in: [Component config](#) > [ESP-TLS](#)*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_INSECURE](#)*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `cert_bundle_attach`, `use_global_ca_store` etc.). **WARNING** : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

*Found in: [Component config](#) > [ESP-TLS](#)*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust up to the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if ESP\_TLS\_USING\_WOLFSSL

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable detailed debug prints for wolfSSL SSL library.

### ADC and ADC Calibration

 Contains:

- [ADC Calibration Configurations](#)
- [CONFIG\\_ADC\\_CONTINUOUS\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ADC\\_DISABLE\\_DAC\\_OUTPUT](#)
- [CONFIG\\_ADC\\_ONESHOT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM

Place ISR version ADC oneshot mode read function into IRAM

*Found in: [Component config](#) > [ADC and ADC Calibration](#)*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE

ADC continuous mode driver ISR IRAM-Safe

*Found in: [Component config](#) > [ADC and ADC Calibration](#)*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**

- No (disabled)

### ADC Calibration Configurations

### CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT

Disable DAC when ADC2 is in use

*Found in: [Component config](#) > [ADC and ADC Calibration](#)*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled)

**Common ESP-related** Contains:

- [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#)

**CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP**

Enable lookup of error code strings

*Found in: [Component config](#) > [Common ESP-related](#)*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_TRANSMIT\\_MUTEX](#)
- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

**CONFIG\_ETH\_USE\_SPI\_ETHERNET**

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_KSZ8851SNL](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

**CONFIG\_ETH\_SPI\_ETHERNET\_DM9051**

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG\_ETH\_SPI\_ETHERNET\_W5500**

Use W5500 (MAC RAW)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_TX\\_BUFFER\\_NUM](#)

### CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 4 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 1 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### CONFIG\_ETH\_TRANSMIT\_MUTEX

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### **CONFIG\_ESP\_EVENT\_LOOP\_PROFILING**

Enable event loop profiling

*Found in: [Component config](#) > [Event Loop Library](#)*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR**

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR**

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

### **CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

### **CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32 if [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_DIGEST\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS**

Enable https

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH**

Enable HTTP Basic Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH**

Enable HTTP Digest Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

**HTTP Server** Contains:

- [CONFIG\\_HTTPD\\_QUEUE\\_WORK\\_BLOCKING](#)
- [CONFIG\\_HTTPD\\_PURGE\\_BUF\\_LEN](#)
- [CONFIG\\_HTTPD\\_LOG\\_PURGE\\_DATA](#)
- [CONFIG\\_HTTPD\\_MAX\\_REQ\\_HDR\\_LEN](#)
- [CONFIG\\_HTTPD\\_MAX\\_URI\\_LEN](#)
- [CONFIG\\_HTTPD\\_ERR\\_RESP\\_NO\\_DELAY](#)
- [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#)

### **CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN**

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_MAX\_URI\_LEN

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

### CONFIG\_HTTPD\_PURGE\_BUF\_LEN

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

## CONFIG\_HTTPD\_QUEUE\_WORK\_BLOCKING

httpd\_queue\_work as blocking API

Found in: *Component config > HTTP Server*

This makes httpd\_queue\_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to *LWIP\_UDP\_RECVMBOX\_SIZE* to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

## ESP HTTPS OTA Contains:

- *CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP*
- *CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB*

## CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB

Provide decryption callback

Found in: *Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

### Default value:

- No (disabled)

## CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

### Default value:

- No (disabled)

## ESP HTTPS server Contains:

- *CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE*

## CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE

Enable ESP\_HTTPS\_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

## Hardware Settings Contains:

- *Chip revision*
- *ESP\_SLEEP\_WORKAROUND*
- *GDMA Configuration*
- *MAC Config*
- *Main XTAL Config*
- *Peripheral Control*
- *RTC Clock Config*
- *Sleep Config*

**Chip revision** Contains:

- [CONFIG\\_ESP32S2\\_REV\\_MIN](#)

### CONFIG\_ESP32S2\_REV\_MIN

Minimum Supported ESP32-S2 Revision

*Found in:* [Component config](#) > [Hardware Settings](#) > [Chip revision](#)

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) (ESP32S2\_REV\_MIN\_0)
- Rev v1.0 (ECO1) (ESP32S2\_REV\_MIN\_1)

**MAC Config** Contains:

- [CONFIG\\_ESP32S2\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)

### CONFIG\_ESP32S2\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in:* [Component config](#) > [Hardware Settings](#) > [MAC Config](#)

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is Two, all interfaces (WiFi station, WiFi softap) receive a universally administered MAC address. They are generated sequentially by adding 0, and 1 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is one, only WiFi station receives a universally administered MAC address. It's generated by adding 0 to the base MAC address. The WiFi softap receives local MAC addresses. It's derived from the universal WiFi station MAC addresses. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 1 or 2 per device.)

**Available options:**

- One (ESP32S2\_UNIVERSAL\_MAC\_ADDRESSES\_ONE)
- Two (ESP32S2\_UNIVERSAL\_MAC\_ADDRESSES\_TWO)

**Sleep Config** Contains:

- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_RESET\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_POWER\\_DOWN\\_FLASH](#)
- [CONFIG\\_ESP\\_SLEEP\\_MSPI\\_NEED\\_ALL\\_IO\\_PU](#)
- [CONFIG\\_ESP\\_SLEEP\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)

### CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH

Power down flash in light sleep when there is no SPIRAM

*Found in:* [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set

ESP\_PD\_DOMAIN\_VDDSDIO to ESP\_PD\_OPTION\_OFF. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

**Default value:**

- No (disabled) if `CONFIG_SPIRAM`

### CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND

Pull-up Flash CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

**Default value:**

- Yes (enabled) if `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH`

### CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND

Pull-up PSRAM CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM`

### CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU

Pull-up all SPI pins in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

### CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND

light sleep GPIO reset workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

esp32c2, esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only

- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

## ESP\_SLEEP\_WORKAROUND

**RTC Clock Config** Contains:

- [CONFIG\\_RTC\\_XTAL\\_CAL\\_RETRY](#)
- [CONFIG\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_RTC\\_CLK\\_SRC](#)

## CONFIG\_RTC\_CLK\_SRC

RTC clock source

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Choose which clock is used as RTC clock source.

- **“Internal 90kHz oscillator” option provides lowest deep sleep current** consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **“External 32kHz crystal” provides better frequency stability, at the** expense of slightly higher (1uA) deep sleep current consumption.
- **“External 32kHz oscillator” allows using 32kHz clock generated by an** external circuit. In this case, external clock signal must be connected to 32K\_XP pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be  $0.1 < V_{cm} < 0.5V_{amp}$ , where  $V_{amp}$  is the signal amplitude.
- **“Internal 8MHz oscillator divided by 256” option results in higher** deep sleep current (by 5uA) but has better frequency stability than the internal 90kHz oscillator. It does not require external components.

**Available options:**

- Internal 90kHz RC oscillator (RTC\_CLK\_SRC\_INT\_RC)
- External 32kHz crystal (RTC\_CLK\_SRC\_EXT\_CRYST)
- External 32kHz oscillator at 32K\_XN pin (RTC\_CLK\_SRC\_EXT\_OSC)
- Internal 8MHz oscillator, divided by 256 (~32kHz) (RTC\_CLK\_SRC\_INT\_8MD256)

## CONFIG\_RTC\_CLK\_CAL\_CYCLES

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 90000 Hz if internal RC oscillator is used as clock source. For this use value 1024.

- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 125000

**Default value:**

- 3000 if `RTC_CLK_SRC_EXT_CRYSTAL` || `RTC_CLK_SRC_EXT_OSC` || `RTC_CLK_SRC_INT_8MD256`
- 576

### CONFIG\_RTC\_XTAL\_CAL\_RETRY

Number of attempts to repeat 32k XTAL calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

**Default value:**

- 3 if `RTC_CLK_SRC_EXT_CRYSTAL`

**Peripheral Control** Contains:

- [CONFIG\\_PERIPH\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_PERIPH\_CTRL\_FUNC\_IN\_IRAM

Place peripheral control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Peripheral Control](#)*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**GDMA Configuration** Contains:

- [CONFIG\\_GDMA\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GDMA\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM

Place GDMA control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if `SOC_GDMA_SUPPORTED`

## CONFIG\_GDMA\_ISR\_IRAM\_SAFE

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_GDMA\_SUPPORTED

**Main XTAL Config** Contains:

- [CONFIG\\_XTAL\\_FREQ\\_SEL](#)

## CONFIG\_XTAL\_FREQ\_SEL

Main XTAL frequency

*Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL\_FREQ\_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHz as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL\_FREQ\_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

**Available options:**

- 24 MHz (XTAL\_FREQ\_24)
- 26 MHz (XTAL\_FREQ\_26)
- 32 MHz (XTAL\_FREQ\_32)
- 40 MHz (XTAL\_FREQ\_40)
- Autodetect (XTAL\_FREQ\_AUTO)

**LCD and Touch Panel** Contains:

- [LCD Peripheral Configuration](#)

**LCD Peripheral Configuration** Contains:

- [CONFIG\\_LCD\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE](#)
- [CONFIG\\_LCD\\_RGB\\_RESTART\\_IN\\_VSYNC](#)
- [CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE](#)

## CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE

LCD panel io format buffer size

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

### CONFIG\_LCD\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### CONFIG\_LCD\_RGB\_RESTART\_IN\_VSYNC

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### ESP NETIF Adapter

 Contains:

- [CONFIG\\_ESP\\_NETIF\\_BRIDGE\\_EN](#)
- [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)
- [CONFIG\\_ESP\\_NETIF\\_IP\\_LOST\\_TIMER\\_INTERVAL](#)
- [CONFIG\\_ESP\\_NETIF\\_USE\\_TCPIP\\_STACK\\_LIB](#)
- [CONFIG\\_ESP\\_NETIF\\_RECEIVE\\_REPORT\\_ERRORS](#)

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

## CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

### Available options:

- LwIP (ESP\_NETIF\_TCPIP\_LWIP)  
LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

## CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS

Use esp\_err\_t to report errors from esp\_netif\_receive

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Enable if esp\_netif\_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

### Default value:

- No (disabled)

## CONFIG\_ESP\_NETIF\_L2\_TAP

Enable netif L2 TAP support

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

## CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FDS

Maximum number of opened L2 TAP File descriptors

*Found in: [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)*

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

### Range:

- from 1 to 10 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### Default value:

- 5 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

## CONFIG\_ESP\_NETIF\_L2\_TAP\_RX\_QUEUE\_SIZE

Size of L2 TAP Rx queue

*Found in: [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

### Range:

- from 1 to 100 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### Default value:

- 20 if `CONFIG_ESP_NETIF_L2_TAP`

### **CONFIG\_ESP\_NETIF\_BRIDGE\_EN**

Enable LwIP IEEE 802.1D bridge

*Found in: Component config > ESP NETIF Adapter*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (`LWIP_NUM_NETIF_CLIENT_DATA`) option needs to be properly configured to be LwIP bridge available!

**Default value:**

- No (disabled)

**PHY** Contains:

- `CONFIG_ESP_PHY_CALIBRATION_MODE`
- `CONFIG_ESP_PHY_ENABLE_USB`
- `CONFIG_ESP_PHY_IMPROVE_RX_11B`
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

### **CONFIG\_ESP\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE**

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- `CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID`

- [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

### CONFIG\_ESP\_PHY\_DEFAULT\_INIT\_IF\_INVALID

Reset default PHY init data if invalid

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n' .

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

Support multiple PHY init data bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED

Support embedded multiple phy init data bin to app bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, multiple phy init data bin will embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR

Terminate operation when PHY init data error

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER

Max WiFi TX power (dBm)

*Found in: [Component config](#) > [PHY](#)*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

### CONFIG\_ESP\_PHY\_REDUCE\_TX\_POWER

Reduce PHY TX power when brownout reset

*Found in: [Component config](#) > [PHY](#)*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_ENABLE\_USB

Enable USB when phy init

*Found in: [Component config](#) > [PHY](#)*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_CALIBRATION\_MODE

Calibration mode

*Found in: [Component config](#) > [PHY](#)*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

**Available options:**

- Calibration partial (ESP\_PHY\_RF\_CAL\_PARTIAL)
- Calibration none (ESP\_PHY\_RF\_CAL\_NONE)
- Calibration full (ESP\_PHY\_RF\_CAL\_FULL)

### CONFIG\_ESP\_PHY\_IMPROVE\_RX\_11B

Improve Wi-Fi receive 11b pkts

*Found in: [Component config](#) > [PHY](#)*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**

- No (disabled) if SOC\_PHY\_IMPROVE\_RX\_11B

**Power Management** Contains:

- [CONFIG\\_PM\\_SLP\\_DISABLE\\_GPIO](#)
- [CONFIG\\_PM\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_PM\\_RTOS\\_IDLE\\_OPT](#)
- [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_SMP](#)

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to `DEFAULT_CPU_FREQ_MHZ` setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using `esp_pm_configure` function.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, `esp_pm_*` functions will keep track of the amount of time each of the power management locks has been held, and `esp_pm_dump_locks` function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to `pm_trace.c` file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 260B of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. **Warning:** If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

**ESP PSRAM** Contains:

- [CONFIG\\_SPIRAM](#)

### CONFIG\_SPIRAM

Support for external, SPI-connected RAM

*Found in: [Component config](#) > [ESP PSRAM](#)*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**

- No (disabled)

**SPI RAM config** Contains:

- [CONFIG\\_SPIRAM\\_ALLOW\\_BSS\\_SEG\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_ALLOW\\_STACK\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_FETCH\\_INSTRUCTIONS](#)
- [CONFIG\\_SPIRAM\\_RODATA](#)
- [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_ALWAYSINTERNAL](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_RESERVE\\_INTERNAL](#)
- [CONFIG\\_SPIRAM\\_MEMTEST](#)
- [CONFIG\\_SPIRAM\\_SPEED](#)
- [CONFIG\\_SPIRAM\\_USE](#)

- [CONFIG\\_SPIRAM\\_TRY\\_ALLOCATE\\_WIFI\\_LWIP](#)
- [CONFIG\\_SPIRAM\\_TYPE](#)

### CONFIG\_SPIRAM\_TYPE

Type of SPI RAM chip in use

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

**Available options:**

- Auto-detect (SPIRAM\_TYPE\_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM\_TYPE\_ESPPSRAM16)
- ESP-PSRAM32 (SPIRAM\_TYPE\_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM\_TYPE\_ESPPSRAM64)

### CONFIG\_SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY

Allow external memory as an argument to xTaskCreateStatic

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Accessing memory in SPIRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from SPIRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the cache is disabled.

**Default value:**

- Yes (enabled) if [CONFIG\\_SPIRAM](#)

### CONFIG\_SPIRAM\_FETCH\_INSTRUCTIONS

Cache fetch instructions from SPI RAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If enabled, instruction in flash will be copied into SPIRAM. If SPIRAM\_RODATA also enabled, you can run the instruction when erasing or programming the flash.

**Default value:**

- No (disabled) if [CONFIG\\_SPIRAM](#)

### CONFIG\_SPIRAM\_RODATA

Cache load read only data from SPI RAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If enabled, rodata in flash will be copied into SPIRAM. If SPIRAM\_FETCH\_INSTRUCTIONS also enabled, you can run the instruction when erasing or programming the flash.

**Default value:**

- No (disabled) if [CONFIG\\_SPIRAM](#)

### CONFIG\_SPIRAM\_SPEED

Set RAM clock speed

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Select the speed for the SPI RAM chip.

**Available options:**

- 80MHz clock speed (SPIRAM\_SPEED\_80M)
- 40Mhz clock speed (SPIRAM\_SPEED\_40M)

- 26Mhz clock speed (SPIRAM\_SPEED\_26M)
- 20Mhz clock speed (SPIRAM\_SPEED\_20M)

### CONFIG\_SPIRAM\_BOOT\_INIT

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you'll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**Default value:**

- Yes (enabled) if *CONFIG\_SPIRAM*

### CONFIG\_SPIRAM\_IGNORE\_NOTFOUND

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > CONFIG\_SPIRAM\_BOOT\_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**Default value:**

- No (disabled) if *CONFIG\_SPIRAM\_BOOT\_INIT* && *CONFIG\_SPIRAM\_ALLOW\_BSS\_SEG\_EXTERNAL\_MEMORY* && *CONFIG\_SPIRAM*

### CONFIG\_SPIRAM\_USE

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU's memory map, by integrating it in the heap as 'special' memory needing `heap_caps_malloc` to allocate, or by fully integrating it making `malloc()` also able to return SPI RAM pointers.

**Available options:**

- Integrate RAM into memory map (SPIRAM\_USE\_MEMMAP)
- Make RAM allocatable using `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)` (SPIRAM\_USE\_CAPS\_ALLOC)
- Make RAM allocatable using `malloc()` as well (SPIRAM\_USE\_MALLOC)

### CONFIG\_SPIRAM\_MEMTEST

Run memory test on SPI RAM initialization

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**Default value:**

- Yes (enabled) if *CONFIG\_SPIRAM\_BOOT\_INIT* && *CONFIG\_SPIRAM*

### CONFIG\_SPIRAM\_MALLOC\_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

**Range:**

- from 0 to 131072 if SPIRAM\_USE\_MALLOC && CONFIG\_SPIRAM

**Default value:**

- 16384 if SPIRAM\_USE\_MALLOC && CONFIG\_SPIRAM

### CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**Default value:**

- No (disabled) if (SPIRAM\_USE\_CAPS\_ALLOC || SPIRAM\_USE\_MALLOC) && CONFIG\_SPIRAM

### CONFIG\_SPIRAM\_MALLOC\_RESERVE\_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**

- from 0 to 262144 if SPIRAM\_USE\_MALLOC && CONFIG\_SPIRAM

**Default value:**

- 32768 if SPIRAM\_USE\_MALLOC && CONFIG\_SPIRAM

### CONFIG\_SPIRAM\_ALLOW\_BSS\_SEG\_EXTERNAL\_MEMORY

Allow .bss segment placed in external memory

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

If enabled, variables with EXT\_RAM\_BSS\_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of *lwip*, *net80211*, *pp*, *bt* libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme *extram\_bss*.

Note that the variables placed in SPIRAM using EXT\_RAM\_BSS\_ATTR will be zero initialized.

**Default value:**

- No (disabled) if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**ESP Ringbuf** Contains:

- `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

**CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH**

Place non-ISR ringbuf functions into flash

Found in: *Component config* > *ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

**CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH**

Place ISR ringbuf functions into flash

Found in: *Component config* > *ESP Ringbuf* > `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

Place ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**

- No (disabled) if `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

**ESP System Settings** Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- *Brownout Detector*
- *Cache config*
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_TASK_WDT_EN`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP32S2_KEEP_USB_ALIVE`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- *Memory*
- *Memory protection*
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`

- *Trace memory*
- *CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE*
- *CONFIG\_ESP\_CONSOLE\_UART\_NUM*
- *CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO*
- *CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO*

### **CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

**Available options:**

- 40 MHz (ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_40)
- 80 MHz (ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_80)
- 160 MHz (ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_160)
- 240 MHz (ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_240)

**Cache config** Contains:

- *CONFIG\_ESP32S2\_DATA\_CACHE\_LINE\_SIZE*
- *CONFIG\_ESP32S2\_DATA\_CACHE\_SIZE*
- *CONFIG\_ESP32S2\_DATA\_CACHE\_WRAP*
- *CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_WRAP*
- *CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_LINE\_SIZE*
- *CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_SIZE*

### **CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_SIZE**

Instruction cache size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache size to be set on application startup. If you use 8KB instruction cache rather than 16KB instruction cache, then the other 8KB will be added to the heap.

**Available options:**

- 8KB (ESP32S2\_INSTRUCTION\_CACHE\_8KB)
- 16KB (ESP32S2\_INSTRUCTION\_CACHE\_16KB)

### **CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_LINE\_SIZE**

Instruction cache line size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache line size to be set on application startup.

**Available options:**

- 16 Bytes (ESP32S2\_INSTRUCTION\_CACHE\_LINE\_16B)
- 32 Bytes (ESP32S2\_INSTRUCTION\_CACHE\_LINE\_32B)

### **CONFIG\_ESP32S2\_DATA\_CACHE\_SIZE**

Data cache size

*Found in: Component config > ESP System Settings > Cache config*

Data cache size to be set on application startup. If you use 0KB data cache, the other 16KB will be added to the heap. If you use 8KB data cache rather than 16KB data cache, the other 8KB will be added to the heap.

**Available options:**

- 0KB (ESP32S2\_DATA\_CACHE\_0KB)
- 8KB (ESP32S2\_DATA\_CACHE\_8KB)
- 16KB (ESP32S2\_DATA\_CACHE\_16KB)

**CONFIG\_ESP32S2\_DATA\_CACHE\_LINE\_SIZE**

Data cache line size

*Found in: Component config > ESP System Settings > Cache config*

Data cache line size to be set on application startup.

**Available options:**

- 16 Bytes (ESP32S2\_DATA\_CACHE\_LINE\_16B)
- 32 Bytes (ESP32S2\_DATA\_CACHE\_LINE\_32B)

**CONFIG\_ESP32S2\_INSTRUCTION\_CACHE\_WRAP**

Enable instruction cache wrap

*Found in: Component config > ESP System Settings > Cache config*

If enabled, instruction cache will use wrap mode to read spi flash (maybe spiram). The wrap length equals to INSTRUCTION\_CACHE\_LINE\_SIZE. However, it depends on complex conditions.

**Default value:**

- No (disabled)

**CONFIG\_ESP32S2\_DATA\_CACHE\_WRAP**

Enable data cache wrap

*Found in: Component config > ESP System Settings > Cache config*

If enabled, data cache will use wrap mode to read spiram (maybe spi flash). The wrap length equals to DATA\_CACHE\_LINE\_SIZE. However, it depends on complex conditions.

**Default value:**

- No (disabled)

**Memory** Contains:

- [CONFIG\\_ESP32S2\\_RTCDATA\\_IN\\_FAST\\_MEM](#)
- [CONFIG\\_ESP32S2\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

**CONFIG\_ESP32S2\_RTCDATA\_IN\_FAST\_MEM**

Place RTC\_DATA\_ATTR and RTC\_RODATA\_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP System Settings > Memory*

This option allows to place .rtc\_data and .rtc\_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs.

**Default value:**

- No (disabled)

### CONFIG\_ESP32S2\_USE\_FIXED\_STATIC\_RAM\_SIZE

Use fixed static RAM size

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory](#)*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0\_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0\_0 region, where its length is set with ESP32S2\_FIXED\_STATIC\_RAM\_SIZE

**Default value:**

- No (disabled)

### CONFIG\_ESP32S2\_FIXED\_STATIC\_RAM\_SIZE

Fixed Static RAM size

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory](#) > [CONFIG\\_ESP32S2\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)*

RAM size dedicated for static variables (.data & .bss sections). This value is less than the chips total memory, as not all of it can be used for this purpose. E.g. parts are used by the software bootloader, and will only be available as heap memory after app startup.

**Range:**

- from 0 to 0x34000 if [CONFIG\\_ESP32S2\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

**Default value:**

- “0x10000” if [CONFIG\\_ESP32S2\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

**Trace memory** Contains:

- [CONFIG\\_ESP32S2\\_TRAX](#)

### CONFIG\_ESP32S2\_TRAX

Use TRAX tracing feature

*Found in: [Component config](#) > [ESP System Settings](#) > [Trace memory](#)*

The ESP32S2 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_SYSTEM\_PANIC

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

**Available options:**

- Print registers and halt (ESP\_SYSTEM\_PANIC\_PRINT\_HALT)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP\_SYSTEM\_PANIC\_PRINT\_REBOOT)  
Outputs the relevant registers over the serial port and immediately reset the processor.

- Silent reboot (`ESP_SYSTEM_PANIC_SILENT_REBOOT`)  
Just resets the processor without outputting anything
- GDBStub on panic (`ESP_SYSTEM_PANIC_GDBSTUB`)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (`ESP_SYSTEM_GDBSTUB_RUNTIME`)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime.

### **CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for `RTC_SLOW_CLK` calibration” (about 3000).

### **CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: [Component config](#) > [ESP System Settings](#)*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**

- Yes (enabled)

**Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_PMP\\_IDRAM\\_SPLIT](#)
- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT**

Enable IRAM/DRAM split protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if `SOC_CPU_IDRAM_SPLIT_USING_PMP`

## CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK

Lock memory protection settings

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE

System event queue size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event queue size in different application.

**Default value:**

- 32

## CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE

Event loop task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

## CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE

Main task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the “main task” stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

### CONFIG\_ESP\_MAIN\_TASK\_AFFINITY

Main task core affinity

Found in: *Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

**Available options:**

- CPU0 (ESP\_MAIN\_TASK\_AFFINITY\_CPU0)
- CPU1 (ESP\_MAIN\_TASK\_AFFINITY\_CPU1)
- No affinity (ESP\_MAIN\_TASK\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE

Minimal allowed size for shared stack

Found in: *Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

### CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

Found in: *Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**

- Default: UART0 (ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (ESP\_CONSOLE\_UART\_CUSTOM)
- None (ESP\_CONSOLE\_NONE)

### CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

Found in: *Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

**Available options:**

- UART0 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)

- UART1 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

### CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 43 if ESP\_CONSOLE\_UART\_CUSTOM

### CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 44 if ESP\_CONSOLE\_UART\_CUSTOM

### CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: [Component config](#) > [ESP System Settings](#)*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 4000000 if [CONFIG\\_PM\\_ENABLE](#)
- from 1200 to 1000000 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 115200

### CONFIG\_ESP\_CONSOLE\_USB\_CDC\_RX\_BUF\_SIZE

Size of USB CDC RX buffer

*Found in: [Component config](#) > [ESP System Settings](#)*

Set the size of USB CDC RX buffer. Increase the buffer size if your application is often receiving data over USB CDC.

**Range:**

- from 4 to 16384 if ESP\_CONSOLE\_USB\_CDC

**Default value:**

- 64 if ESP\_CONSOLE\_USB\_CDC

### CONFIG\_ESP\_CONSOLE\_USB\_CDC\_SUPPORT\_ETC\_PRINTF

Enable esp\_rom\_printf / ESP\_EARLY\_LOG via USB CDC

*Found in: [Component config](#) > [ESP System Settings](#)*

If enabled, esp\_rom\_printf and ESP\_EARLY\_LOG output will also be sent over USB CDC. Disabling this option saves about 1kB of RAM.

**Default value:**

- No (disabled) if ESP\_CONSOLE\_USB\_CDC

### CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300

### CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_EN

Enable Task Watchdog Timer

*Found in:* [Component config](#) > [ESP System Settings](#)

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_INIT

Initialize Task Watchdog Timer on startup

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S

Task Watchdog timeout period (seconds)

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0

Watch CPU0 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_TASK\_WDT\_EN > CONFIG\_ESP\_TASK\_WDT\_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_XT\_WDT

Initialize XTAL32K watchdog timer on startup

*Found in: Component config > ESP System Settings*

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

### CONFIG\_ESP\_XT\_WDT\_TIMEOUT

XTAL32K watchdog timeout period

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if *CONFIG\_ESP\_XT\_WDT*

**Default value:**

- 200 if *CONFIG\_ESP\_XT\_WDT*

### CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_XT\_WDT*

### CONFIG\_ESP\_PANIC\_HANDLER\_IRAM

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE

OpenOCD debug stubs

*Found in: [Component config](#) > [ESP System Settings](#)*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**

- “COMPILER\_OPTIMIZATION\_LEVEL\_DEBUG” if `ESP32_TRAX` && `CONFIG_ESP32S2_TRAX` && `ESP32S3_TRAX`

### CONFIG\_ESP\_DEBUG\_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: [Component config](#) > [ESP System Settings](#)*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: [Component config](#) > [ESP System Settings](#)*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**

- Level 5 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_5`)  
Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_4`)  
Using level 4 interrupt for Interrupt Watchdog and other system checks.

**Brownout Detector** Contains:

- [CONFIG\\_ESP\\_BROWNOUT\\_DET](#)

### CONFIG\_ESP\_BROWNOUT\_DET

Hardware brownout detect & reset

*Found in: [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#)*

The ESP32-S2 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL

Brownout voltage level

*Found in:* [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#) > [CONFIG\\_ESP\\_BROWNOUT\\_DET](#)

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP3-S2 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

### Available options:

- 2.44V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_7)
- 2.56V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_6)
- 2.67V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_5)
- 2.84V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_4)
- 2.98V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_3)
- 3.19V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_2)
- 3.30V (ESP\_BROWNOUT\_DET\_LVL\_SEL\_1)

## CONFIG\_ESP32S2\_KEEP\_USB\_ALIVE

Keep USB peripheral enabled at start up

*Found in:* [Component config](#) > [ESP System Settings](#)

During the application initialization process, all the peripherals except UARTs and timers are reset. Enable this option to keep USB peripheral enabled. This option is automatically enabled if “USB CDC” console is selected.

### Default value:

- Yes (enabled) if ESP\_CONSOLE\_USB\_CDC

**IPC (Inter-Processor Call)** Contains:

- [CONFIG\\_ESP\\_IPC\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_IPC\\_USES\\_CALLERS\\_PRIORITY](#)

## CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE

Inter-Processor Call (IPC) task stack size

*Found in:* [Component config](#) > [IPC \(Inter-Processor Call\)](#)

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

### Range:

- from 512 to 65536

### Default value:

- 1024

## CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY

IPC runs at caller's priority

*Found in:* [Component config](#) > [IPC \(Inter-Processor Call\)](#)

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX\_PRIORITIES - 1) priority.

**Default value:**

- Yes (enabled)

**High resolution timer (esp\_timer)** Contains:

- [CONFIG\\_ESP\\_TIMER\\_PROFILING](#)
- [CONFIG\\_ESP\\_TIMER\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_TIMER\\_INTERRUPT\\_LEVEL](#)
- [CONFIG\\_ESP\\_TIMER\\_SUPPORTS\\_ISR\\_DISPATCH\\_METHOD](#)

### CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE

High-resolution timer task stack size

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Configure the stack size of “timer\_task” task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

### CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL

Interrupt level

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 1

**Default value:**

- 1

### CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD

Support ISR dispatch method

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Allows using `ESP_TIMER_ISR` dispatch method (`ESP_TIMER_TASK` dispatch method is also available). - `ESP_TIMER_TASK` - Timer callbacks are dispatched from a high-priority `esp_timer` task. - `ESP_TIMER_ISR` - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi** Contains:

- `CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA`
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE`
- `CONFIG_ESP_WIFI_WPS_PASSPHRASE`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_ESPNOV_MAX_ENCRYPT_NUM`
- `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`
- `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE`
- `CONFIG_ESP32_WIFI_TX_BUFFER`
- `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- `CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_CSI_ENABLED`
- `CONFIG_ESP_WIFI_EXTERNAL_COEXIST_ENABLE`
- `CONFIG_ESP_WIFI_FTM_ENABLE`
- `CONFIG_ESP_WIFI_GCMP_SUPPORT`
- `CONFIG_ESP_WIFI_GMAC_SUPPORT`
- `CONFIG_ESP32_WIFI_IRAM_OPT`
- `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP32_WIFI_NVS_ENABLED`
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
- `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
- `CONFIG_ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`

**CONFIG\_ESP32\_WIFI\_SW\_COEXIST\_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in:* `Component config` > `Wi-Fi`

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM**

Max number of WiFi static RX buffers

*Found in:* `Component config` > `Wi-Fi`

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 25

**Default value:**

- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

## CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM

Max number of WiFi dynamic RX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

## CONFIG\_ESP32\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**

- Static (`ESP32_WIFI_STATIC_TX_BUFFER`)
- Dynamic (`ESP32_WIFI_DYNAMIC_TX_BUFFER`)

### CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if `ESP32_WIFI_STATIC_TX_BUFFER`

**Default value:**

- 16 if `ESP32_WIFI_STATIC_TX_BUFFER`

### CONFIG\_ESP32\_WIFI\_CACHE\_TX\_BUFFER\_NUM

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**

- from 16 to 128 if `CONFIG_SPIRAM`

**Default value:**

- 32 if `CONFIG_SPIRAM`

### CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### CONFIG\_ESP32\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable CSI(Channel State Information) feature. CSI takes about `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

**CONFIG\_ESP32\_WIFI\_AMPDU\_TX\_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_TX\_BA\_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG\_ESP32\_WIFI\_AMPDU\_TX\_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 32

**Default value:**

- 6

**CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN**

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 32

**Default value:**

- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`

**CONFIG\_ESP32\_WIFI\_AMSDU\_TX\_ENABLED**

WiFi AMSDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if [CONFIG\\_SPIRAM](#)

**CONFIG\_ESP32\_WIFI\_NVS\_ENABLED**

WiFi NVS flash

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_TASK\_CORE\_ID**

WiFi Task Core ID

*Found in: [Component config](#) > [Wi-Fi](#)*

Pinned WiFi task to core 0 or core 1.

**Available options:**

- Core 0 (ESP32\_WIFI\_TASK\_PINNED\_TO\_CORE\_0)
- Core 1 (ESP32\_WIFI\_TASK\_PINNED\_TO\_CORE\_1)

**CONFIG\_ESP32\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN**

Max length of WiFi SoftAP Beacon

*Found in: [Component config](#) > [Wi-Fi](#)*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP32\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP32\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_RX\_IRAM\_OPT

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_ENABLE\_WPA3\_SAE

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP' s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_ENABLE\_WPA3\_OWE\_STA

Enable OWE STA

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish OWE connection with eligible AP' s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT

WiFi SLP IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32\_WIFI\_IRAM\_OPT and ESP32\_WIFI\_RX\_IRAM\_OPT, or this one. If already enabled ESP32\_WIFI\_IRAM\_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32\_WIFI\_RX\_IRAM\_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME

Minimum active time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 50 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME

Maximum keep alive time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

### CONFIG\_ESP\_WIFI\_FTM\_ENABLE

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

### CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT

FTM Responder support

Found in: *Component config* > *Wi-Fi* > *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

### CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE

Power Management for station at disconnected

Found in: *Component config* > *Wi-Fi*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_EXTERNAL\_COEXIST\_ENABLE

WiFi External Coexistence

Found in: *Component config* > *Wi-Fi*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

**Default value:**

- No (disabled) if *CONFIG\_BT\_ENABLED* || *NIMBLE\_ENABLED*

### CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

Found in: *Component config* > *Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

### CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: *Component config* > *Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT

WiFi SoftAP Support

Found in: *Component config* > *Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT

Wifi sleep optimize when beacon lost

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

**Default value:**

- 3 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

**Default value:**

- 2 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

**Default value:**

- 2 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_BEACON\\_LOST\\_OPT](#)

### CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM

Maximum espnow encrypt peers number

*Found in: [Component config](#) > [Wi-Fi](#)*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number.

When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 17

**Default value:**

- 7

### CONFIG\_ESP\_WIFI\_WPS\_PASSPHRASE

Get WPA2 passphrase in WPS config

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**

- No (disabled)

**Core dump** Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_LOGS](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)

### CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

*Found in: [Component config](#) > [Core dump](#)*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition\_table directory.

**Available options:**

- Flash (ESP\_COREDUMP\_ENABLE\_TO\_FLASH)
- UART (ESP\_COREDUMP\_ENABLE\_TO\_UART)
- None (ESP\_COREDUMP\_ENABLE\_TO\_NONE)

### CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

*Found in:* [Component config](#) > [Core dump](#)

Select the data format for core dump.

**Available options:**

- Binary format (ESP\_COREDUMP\_DATA\_FORMAT\_BIN)
- ELF format (ESP\_COREDUMP\_DATA\_FORMAT\_ELF)

### CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in:* [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

**Available options:**

- Use CRC32 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_SHA256)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in:* [Component config](#) > [Core dump](#)

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if ESP\_COREDUMP\_ENABLE\_TO\_FLASH

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in:* [Component config](#) > [Core dump](#)

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in:* [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in:* [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if ESP\_COREDUMP\_ENABLE\_TO\_UART

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in: [Component config](#) > [Core dump](#)*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

### CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: [Component config](#) > [Core dump](#)*

**Available options:**

- Decode and show summary (info\_corefile) (ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (ESP\_COREDUMP\_DECODE\_DISABLE)

### FAT Filesystem support

 Contains:

- [CONFIG\\_FATFS\\_API\\_ENCODING](#)
- [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)
- [CONFIG\\_FATFS\\_CHOOSE\\_TYPE](#)
- [CONFIG\\_FATFS\\_LONG\\_FILENAMES](#)
- [CONFIG\\_FATFS\\_MAX\\_LFN](#)
- [CONFIG\\_FATFS\\_FS\\_LOCK](#)
- [CONFIG\\_FATFS\\_VOLUME\\_COUNT](#)
- [CONFIG\\_FATFS\\_CHOOSE\\_CODEPAGE](#)
- [CONFIG\\_FATFS\\_ALLOC\\_PREFER\\_EXTRAM](#)
- [CONFIG\\_FATFS\\_SECTOR\\_SIZE](#)
- [CONFIG\\_FATFS\\_SECTORS\\_PER\\_CLUSTER](#)
- [CONFIG\\_FATFS\\_TIMEOUT\\_MS](#)
- [CONFIG\\_FATFS\\_PER\\_FILE\\_CACHE](#)

### CONFIG\_FATFS\_VOLUME\_COUNT

Number of volumes

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

### CONFIG\_FATFS\_SECTOR\_SIZE

Sector size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Specify the size of the sector in bytes for FATFS partition generator.

**Available options:**

- 512 (FATFS\_SECTOR\_512)
- 1024 (FATFS\_SECTOR\_1024)
- 2048 (FATFS\_SECTOR\_2048)
- 4096 (FATFS\_SECTOR\_4096)

## CONFIG\_FATFS\_SECTORS\_PER\_CLUSTER

Sectors per cluster

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This value specifies how many sectors there are in one cluster.

### Available options:

- 1 (FATFS\_SECTORS\_PER\_CLUSTER\_1)
- 2 (FATFS\_SECTORS\_PER\_CLUSTER\_2)
- 4 (FATFS\_SECTORS\_PER\_CLUSTER\_4)
- 8 (FATFS\_SECTORS\_PER\_CLUSTER\_8)
- 16 (FATFS\_SECTORS\_PER\_CLUSTER\_16)
- 32 (FATFS\_SECTORS\_PER\_CLUSTER\_32)
- 64 (FATFS\_SECTORS\_PER\_CLUSTER\_64)
- 128 (FATFS\_SECTORS\_PER\_CLUSTER\_128)

## CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

*Found in: [Component config](#) > [FAT Filesystem support](#)*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

### Available options:

- Dynamic (all code pages supported) (FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (FATFS\_CODEPAGE\_437)
- Arabic (CP720) (FATFS\_CODEPAGE\_720)
- Greek (CP737) (FATFS\_CODEPAGE\_737)
- KBL (CP771) (FATFS\_CODEPAGE\_771)
- Baltic (CP775) (FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (FATFS\_CODEPAGE\_855)
- Turkish (CP857) (FATFS\_CODEPAGE\_857)
- Portugese (CP860) (FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (FATFS\_CODEPAGE\_863)
- Arabic (CP864) (FATFS\_CODEPAGE\_864)
- Nordic (CP865) (FATFS\_CODEPAGE\_865)
- Russian (CP866) (FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (FATFS\_CODEPAGE\_932)
- Simplified Chinese (DBCS) (CP936) (FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (FATFS\_CODEPAGE\_950)

## CONFIG\_FATFS\_CHOOSE\_TYPE

FAT type

*Found in: [Component config](#) > [FAT Filesystem support](#)*

If user specifies automatic detection of the FAT type, the FATFS generator will determine the type by the size.

### Available options:

- Select a suitable FATFS type automatically. (FATFS\_AUTO\_TYPE)
- FAT12 (FATFS\_FAT12)
- FAT16 (FATFS\_FAT16)

### CONFIG\_FATFS\_LONG\_FILENAMES

Long filename support

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap (Currently not supported by FATFS partition generator).

**Available options:**

- No long filenames (FATFS\_LFN\_NONE)
- Long filename buffer in heap (FATFS\_LFN\_HEAP)
- Long filename buffer on stack (FATFS\_LFN\_STACK)

### CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

**Range:**

- from 12 to 255

**Default value:**

- 255

### CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**

- API uses ANSI/OEM encoding (FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-8 encoding (FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC` || `SPIRAM_USE_MALLOC`

### CONFIG\_FATFS\_USE\_FASTSEEK

Enable fast seek algorithm when using `lseek` function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

## CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)

## FreeRTOS Contains:

- [Kernel](#)
- [Port](#)

## Kernel Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_STACKOVERFLOW](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_BACKWARD\\_COMPATIBILITY](#)
- [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)
- [CONFIG\\_FREERTOS\\_MAX\\_TASK\\_NAME\\_LEN](#)
- [CONFIG\\_FREERTOS\\_IDLE\\_TASK\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_THREAD\\_LOCAL\\_STORAGE\\_POINTERS](#)
- [CONFIG\\_FREERTOS\\_QUEUE\\_REGISTRY\\_SIZE](#)
- [CONFIG\\_FREERTOS\\_HZ](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_QUEUE\\_LENGTH](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_PRIORITY](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_STACK\\_DEPTH](#)
- [CONFIG\\_FREERTOS\\_USE\\_IDLE\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_OPTIMIZED\\_SCHEDULER](#)
- [CONFIG\\_FREERTOS\\_USE\\_TICK\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)
- [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)
- [CONFIG\\_FREERTOS\\_UNICORE](#)
- [CONFIG\\_FREERTOS\\_SMP](#)
- [CONFIG\\_FREERTOS\\_USE\\_MINIMAL\\_IDLE\\_HOOK](#)

## CONFIG\_FREERTOS\_SMP

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: <https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp>

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_UNICORE

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_HZ

configTICK\_RATE\_HZ

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK\_RATE\_HZ documentation for more details).

**Range:**

- from 1 to 1000

**Default value:**

- 100

### CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER

configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables port specific task selection method. This option can will speed up the search of ready tasks when scheduling (see configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION documentation for more details).

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW

configCHECK\_FOR\_STACK\_OVERFLOW

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables FreeRTOS to check for stack overflows (see configCHECK\_FOR\_STACK\_OVERFLOW documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

**Available options:**

- No checking (FREERTOS\_CHECK\_STACKOVERFLOW\_NONE)  
Do not check for stack overflows (configCHECK\_FOR\_STACK\_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK\_FOR\_STACK\_OVERFLOW = 1)
- Check using canary bytes (Method 2) (FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK\_FOR\_STACK\_OVERFLOW = 2)

## CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the number of thread local storage pointers in each task (see configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

## CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

configMINIMAL\_STACK\_SIZE (Idle task stack size)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the idle task stack size in bytes (see configMINIMAL\_STACK\_SIZE documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

**Range:**

- from 768 to 32768

**Default value:**

- 1536

## CONFIG\_FREERTOS\_USE\_IDLE\_HOOK

configUSE\_IDLE\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationIdleHook( void ) ;`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_MINIMAL\_IDLE\_HOOK

Use FreeRTOS minimal idle hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the minimal idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationMinimalIdleHook ( void );`
- `vApplicationMinimalIdleHook ()` is called from FreeRTOS minimal idle task(s)

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_SMP`

### **CONFIG\_FREERTOS\_USE\_TICK\_HOOK**

`configUSE_TICK_HOOK`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationTickHook ( void );`
- `vApplicationTickHook ()` is called from FreeRTOS' s tick handling function `xTaskIncrementTick ()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN**

`configMAX_TASK_NAME_LEN`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

**Range:**

- from 1 to 256

**Default value:**

- 16

### **CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY**

`configENABLE_BACKWARD_COMPATIBILITY`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see `configENABLE_BACKWARD_COMPATIBILITY` documentation for more details).

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY**

`configTIMER_TASK_PRIORITY`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task' s priority (see `configTIMER_TASK_PRIORITY` documentation for more details).

**Range:**

- from 1 to 25

**Default value:**

- 1

**CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH**

configTIMER\_TASK\_STACK\_DEPTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's stack size (see configTIMER\_TASK\_STACK\_DEPTH documentation for more details).

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

**CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH**

configTIMER\_QUEUE\_LENGTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's command queue length (see configTIMER\_QUEUE\_LENGTH documentation for more details).

**Range:**

- from 5 to 20

**Default value:**

- 10

**CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE**

configQUEUE\_REGISTRY\_SIZE

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the queue registry (see configQUEUE\_REGISTRY\_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**

- from 0 to 20

**Default value:**

- 0

**CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY**

configUSE\_TRACE\_FACILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE\_TRACE\_FACILITY documentation for more details).

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

configUSE\_STATS\_FORMATTING\_FUNCTIONS

*Found in: Component config > FreeRTOS > Kernel > CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY*

Set configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS to 1 to include the `vTaskList()` and `vTaskGetRunTimeStats()` functions in the build (see configUSE\_STATS\_FORMATTING\_FUNCTIONS documentation for more details).

**Default value:**

- No (disabled) if *CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY*

## CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY > CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**

- No (disabled) if *CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS*

## CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

configGENERATE\_RUN\_TIME\_STATS

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see configGENERATE\_RUN\_TIME\_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS\_RUN\_TIME\_STATS\_CLK.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE

configUSE\_TICKLESS\_IDLE

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip\_unhandled\_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if *CONFIG\_PM\_ENABLE*

## CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP

configEXPECTED\_IDLE\_TIME\_BEFORE\_SLEEP

Found in: *Component config > FreeRTOS > Kernel > CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

### Range:

- from 2 to 4294967295 if *CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE*

### Default value:

- 3 if *CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE*

**Port** Contains:

- *CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER*
- *CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK*
- *CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE*
- *CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK*
- *CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP*
- *CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT*
- *CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS*
- *CONFIG\_FREERTOS\_ASSERT\_ON\_UNTESTED\_FUNCTION*
- *CONFIG\_FREERTOS\_ISR\_STACKSIZE*
- *CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH*
- *CONFIG\_FREERTOS\_PLACE\_SNAPSHOT\_FUNS\_INTO\_FLASH*
- *CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE*
- *CONFIG\_FREERTOS\_CORETIMER*
- *CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER*

## CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER

Wrap task functions

Found in: *Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

### Default value:

- Yes (enabled)

## CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK

Enable stack overflow debug watchpoint

Found in: *Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS

Enable thread local storage pointers deletion callbacks

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**

- Yes (enabled) if `CONFIG_FREERTOS_SMP` && `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS > 0`

## CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP

Enable static task clean up hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_SMP`

## CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_ISR\_STACKSIZE

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if `ESP_COREDUMP_DATA_FORMAT_ELF`
- from 1536 to 32768

**Default value:**

- 2096 if `ESP_COREDUMP_DATA_FORMAT_ELF`

- 1536

### CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_CORETIMER

Tick timer source (Xtensa Only)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS\_CORETIMER\_0)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS\_CORETIMER\_1)  
Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS\_CORETIMER\_SYSTIMER\_LVL1)  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS\_CORETIMER\_SYSTIMER\_LVL3)  
Select this to use systimer with the 3 interrupt priority.

### CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**

- Use ESP TIMER for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER)  
ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK)  
CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_PLACE\_SNAPSHOT\_FUNS\_INTO\_FLASH

Place task snapshot functions into flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled, the functions related to snapshots, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT` && `CONFIG_ESP_PANIC_HANDLER_IRAM`

### CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE

Tests compliance with Vanilla FreeRTOS `port*_CRITICAL` calls

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, context of `port*_CRITICAL` calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling `port*_CRITICAL` from ISR context would cause assert failure

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_ASSERT\_ON\_UNTESTED\_FUNCTION

Halt when an SMP-untested function is called

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an `assert()`.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT

Enable task snapshot functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled, the functions related to snapshots, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, are compiled and linked. Task snapshots are used by Task Watchdog (TWDT), GDB Stub and Core dump.

**Default value:**

- Yes (enabled)

**Hardware Abstraction Layer (HAL) and Low Level (LL)** Contains:

- [CONFIG\\_HAL\\_DEFAULT\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_HAL\\_LOG\\_LEVEL](#)
- [CONFIG\\_HAL\\_SYSTIMER\\_USE\\_ROM\\_IMPL](#)
- [CONFIG\\_HAL\\_WDT\\_USE\\_ROM\\_IMPL](#)

**CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL**

Default HAL assertion level

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**

- Same as system assertion level (HAL\_ASSERTION\_EQUALS\_SYSTEM)
- Disabled (HAL\_ASSERTION\_DISABLE)
- Silent (HAL\_ASSERTION\_SILENT)
- Enabled (HAL\_ASSERTION\_ENABLE)

**CONFIG\_HAL\_LOG\_LEVEL**

HAL layer log verbosity

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Specify how much output to see in HAL logs.

**Available options:**

- No output (HAL\_LOG\_LEVEL\_NONE)
- Error (HAL\_LOG\_LEVEL\_ERROR)
- Warning (HAL\_LOG\_LEVEL\_WARN)
- Info (HAL\_LOG\_LEVEL\_INFO)
- Debug (HAL\_LOG\_LEVEL\_DEBUG)
- Verbose (HAL\_LOG\_LEVEL\_VERBOSE)

**CONFIG\_HAL\_SYSTIMER\_USE\_ROM\_IMPL**

Use ROM implementation of SysTimer HAL driver

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_SYSTIMER

**CONFIG\_HAL\_WDT\_USE\_ROM\_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_WDT

**Heap memory debugging** Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)
- [CONFIG\\_HEAP\\_TLSF\\_USE\\_ROM\\_IMPL](#)

**CONFIG\_HEAP\_CORRUPTION\_DETECTION**

Heap corruption detection

*Found in:* [Component config](#) > [Heap memory debugging](#)

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**

- Basic (no poisoning) (HEAP\_POISONING\_DISABLED)
- Light impact (HEAP\_POISONING\_LIGHT)
- Comprehensive (HEAP\_POISONING\_COMPREHENSIVE)

**CONFIG\_HEAP\_TRACING\_DEST**

Heap tracing

*Found in:* [Component config](#) > [Heap memory debugging](#)

Enables the heap tracing API defined in esp\_heap\_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**

- Disabled (HEAP\_TRACING\_OFF)
- Standalone (HEAP\_TRACING\_STANDALONE)
- Host-based (HEAP\_TRACING\_TOHOST)

**CONFIG\_HEAP\_TRACING\_STACK\_DEPTH**

Heap tracing stack depth

*Found in:* [Component config](#) > [Heap memory debugging](#)

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

### CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL

Use ROM implementation of heap tlsf library

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HEAP\_TLSF

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#)
- [CONFIG\\_LOG\\_COLORS](#)

### CONFIG\_LOG\_DEFAULT\_LEVEL

Default log verbosity

*Found in: [Component config](#) > [Log output](#)*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**

- No output (`LOG_DEFAULT_LEVEL_NONE`)
- Error (`LOG_DEFAULT_LEVEL_ERROR`)
- Warning (`LOG_DEFAULT_LEVEL_WARN`)
- Info (`LOG_DEFAULT_LEVEL_INFO`)
- Debug (`LOG_DEFAULT_LEVEL_DEBUG`)
- Verbose (`LOG_DEFAULT_LEVEL_VERBOSE`)

## CONFIG\_LOG\_MAXIMUM\_LEVEL

Maximum log verbosity

*Found in: [Component config](#) > [Log output](#)*

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

### Available options:

- Same as default (LOG\_MAXIMUM\_EQUALS\_DEFAULT)
- Error (LOG\_MAXIMUM\_LEVEL\_ERROR)
- Warning (LOG\_MAXIMUM\_LEVEL\_WARN)
- Info (LOG\_MAXIMUM\_LEVEL\_INFO)
- Debug (LOG\_MAXIMUM\_LEVEL\_DEBUG)
- Verbose (LOG\_MAXIMUM\_LEVEL\_VERBOSE)

## CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

*Found in: [Component config](#) > [Log output](#)*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

### Default value:

- Yes (enabled)

## CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

*Found in: [Component config](#) > [Log output](#)*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip's RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

### Available options:

- Milliseconds Since Boot (LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- [CONFIG\\_LWIP\\_CHECK\\_THREAD\\_SAFETY](#)
- [Checksums](#)
- [CONFIG\\_LWIP\\_DHCP\\_COARSE\\_TIMER\\_SECS](#)

- *DHCP server*

- *CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE*
- *UDP*
- *CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS*

### CONFIG\_LWIP\_LOCAL\_HOSTNAME

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- “espressif”

### CONFIG\_LWIP\_NETIF\_API

Enable usage of standard POSIX APIs in LWIP

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking, Creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See `LOCK_TCPIP_CORE()` and `UNLOCK_TCPIP_CORE()`.

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY

Checks that lwip API runs in expected context

*Found in: [Component config](#) > [LWIP](#)*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as `gethostbyname` support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TIMERS\_ONDEMAND

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Do not use this option, use VFS\_SUPPORT\_SELECT instead.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1, l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP4\_FRAG

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP6\_FRAG

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_GARP\_TMR\_INTERVAL

GARP timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_GRATUITOUS\\_ARP](#)*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

### CONFIG\_LWIP\_ESP\_MLDV6\_REPORT

Send mldv6 report periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL

mldv6 report timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_MLDV6\\_REPORT](#)*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**

- 40

### CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE

TCPIP task receive mail box size

*Found in: [Component config](#) > [LWIP](#)*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 64 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

### CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK

DHCP: Perform ARP check on any offered address

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID

DHCP: Disable Use of vendor class identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP

DHCP: Restore last IP obtained from DHCP server

Found in: *Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN

DHCP total option length

Found in: *Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68
- 108

### CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA

Number of clients store data in netif

Found in: *Component config > LWIP*

Number of clients that may store data in client\_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

### CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS

DHCP coarse timer interval(s)

Found in: *Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- *CONFIG\_LWIP\_DHCPS*

### CONFIG\_LWIP\_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

### CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM

Maximum number of stations

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it' s address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

### CONFIG\_LWIP\_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_AUTOIP\\_TRIES](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_MAX\\_CONFLICTS](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_RATE\\_LIMIT\\_INTERVAL](#)

### CONFIG\_LWIP\_AUTOIP\_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 2 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS

Max IP conflicts before rate limiting

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 9 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL

Rate limited interval (seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 20 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_IPV6

Enable IPv6

*Found in: [Component config](#) > [LWIP](#)*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6\_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

**CONFIG\_LWIP\_IPV6\_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS**

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: [Component config](#) > [LWIP](#)*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

**CONFIG\_LWIP\_IPV6\_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: [Component config](#) > [LWIP](#)*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

**CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK**

Enable status callback for network interfaces

*Found in: [Component config](#) > [LWIP](#)*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

## CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

*Found in:* [Component config > LWIP](#)

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_LWIP\\_LOOPBACK\\_MAX\\_PBUFS](#)

## CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

*Found in:* [Component config > LWIP > CONFIG\\_LWIP\\_NETIF\\_LOOPBACK](#)

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- [CONFIG\\_LWIP\\_TCP\\_WND\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_SND\\_BUF\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_RTO\\_TIME](#)
- [CONFIG\\_LWIP\\_MAX\\_ACTIVE\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_FIN\\_WAIT\\_TIMEOUT](#)
- [CONFIG\\_LWIP\\_MAX\\_LISTENING\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_MAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_SYNMAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_MSL](#)
- [CONFIG\\_LWIP\\_TCP\\_MSS](#)
- [CONFIG\\_LWIP\\_TCP\\_OVERSIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)
- [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- [CONFIG\\_LWIP\\_TCP\\_HIGH\\_SPEED\\_RETRANSMISSION](#)
- [CONFIG\\_LWIP\\_TCP\\_TMR\\_INTERVAL](#)

## CONFIG\_LWIP\_MAX\_ACTIVE\_TCP

Maximum active TCP Connections

*Found in:* [Component config > LWIP > TCP](#)

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_TCP\_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 6
- 12

### CONFIG\_LWIP\_TCP\_MSS

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_mSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

### CONFIG\_LWIP\_TCP\_TMR\_INTERVAL

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

### CONFIG\_LWIP\_TCP\_MSL

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

### CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

### CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 65535 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5744

**CONFIG\_LWIP\_TCP\_WND\_DEFAULT**

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 65535 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5744

**CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE**

Default TCP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCP_RECVMBOX_SIZE` multiples the maximum TCP socket number. In other words, the bigger `LWIP_TCP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 6

**CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ**

Queue incoming out-of-order segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_SACK\_OUT

Support sending selective acknowledgements

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**

- MSS (LWIP\_TCP\_OVERSIZE\_MSS)
- 25% MSS (LWIP\_TCP\_OVERSIZE\_QUARTER\_MSS)
- Disabled (LWIP\_TCP\_OVERSIZE\_DISABLE)

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if [CONFIG\\_SPIRAM\\_TRY\\_ALLOCATE\\_WIFI\\_LWIP](#)

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 3000

- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_UDP\_PCBS**

Maximum active UDP control blocks

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE**

Default UDP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `UDP_RECVMBOX_SIZE` packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is `UDP_RECVMBOX_SIZE` multiplies the maximum UDP socket number. In other words, the bigger `UDP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP**

Enable LWIP IP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

*Found in: [Component config](#) > [LWIP](#)*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**

- No affinity (LWIP\_TCPIP\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU0)
- CPU1 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU1)

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP stack. Now only PPP over serial is possible.

PPP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPv6 support for PPP connections (IPv6CP)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in: [Component config](#) > [LWIP](#)*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS

Max number of entries in IPv6 neighbor cache

*Found in: [Component config](#) > [LWIP](#)*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT

Enable Notify Phase Callback

*Found in: [Component config](#) > [LWIP](#)*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_PAP\_SUPPORT

Enable PAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_ENABLE\_LCP\_ECHO

Enable LCP ECHO

*Found in: [Component config](#) > [LWIP](#)*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### **CONFIG\_LWIP\_PPP\_DEBUG\_ON**

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### **CONFIG\_LWIP\_SLIP\_SUPPORT**

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_LWIP\_SLIP\_DEBUG\_ON*

### **CONFIG\_LWIP\_SLIP\_DEBUG\_ON**

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG\_LWIP\_SLIP\_SUPPORT*

Enable SLIP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_SLIP\_SUPPORT*

**ICMP** Contains:

- *CONFIG\_LWIP\_ICMP*
- *CONFIG\_LWIP\_BROADCAST\_PING*
- *CONFIG\_LWIP\_MULTICAST\_PING*

### **CONFIG\_LWIP\_ICMP**

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MULTICAST\_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_BROADCAST\_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### LWIP RAW API

 Contains:

- [CONFIG\\_LWIP\\_MAX\\_RAW\\_PCBS](#)

### CONFIG\_LWIP\_MAX\_RAW\_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### SNTP

 Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_MAX\_SERVERS

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS

Maximum number of NTP servers aquired via DHCP

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)*

Set maximum number of NTP servers aquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers” , any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY

Request interval to update time (ms)

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

### CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS

Maximum number of bridge ports

*Found in: [Component config](#) > [LWIP](#)*

Set maximum number of ports a bridge can consists of.

**Range:**

- from 1 to 63

**Default value:**

- 7

### CONFIG\_LWIP\_ESP\_LWIP\_ASSERT

Enable LWIP ASSERT checks

*Found in: [Component config](#) > [LWIP](#)*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**

- Yes (enabled) if `COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_ND6\\_GET\\_GW](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_INPUT](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

### **CONFIG\_LWIP\_HOOK\_TCP\_ISN**

TCP ISN Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_iss*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

**Available options:**

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_IP6\_ROUTE**

IPv6 route Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW**

IPv6 get gateway Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE**

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_NONE)
- Default (weak) implementation (LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_DEFAULT)
- Custom implementation (LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_CUSTOM)

## CONFIG\_LWIP\_HOOK\_IP6\_INPUT

IPv6 packet input

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (LWIP\_HOOK\_IP6\_INPUT\_NONE)
- Default (weak) implementation (LWIP\_HOOK\_IP6\_INPUT\_DEFAULT)
- Custom implementation (LWIP\_HOOK\_IP6\_INPUT\_CUSTOM)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_API\\_LIB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FDB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FW\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_STATE\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DNS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ETHARP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NETIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_PBUF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SNTP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SOCKETS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_TCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DEBUG\\_ESP\\_LOG](#)

## CONFIG\_LWIP\_DEBUG\_ESP\_LOG

Route LWIP debugs through ESP\_LOG interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)*

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_NETIF\_DEBUG**

Enable netif debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_ICMP*

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_DNS\_DEBUG**

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_DEBUG**

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG**

Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG**

Enable bridge forwarding debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**mbedTLS** Contains:

- *CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG\_MBEDTLS\_CHACHA20\_C*
- *CONFIG\_MBEDTLS\_DHM\_C*
- *CONFIG\_MBEDTLS\_ECP\_C*
- *CONFIG\_MBEDTLS\_ECDH\_C*
- *CONFIG\_MBEDTLS\_ECJPAKE\_C*
- *CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED*
- *CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED*
- *CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED*

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- *Symmetric Ciphers*
- *TLS Key Exchange Methods*
- `CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN`
- `CONFIG_MBEDTLS_TLS_MODE`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

## **CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default `malloc()` behavior in ESP-IDF
- Custom allocation mode, by overwriting `calloc()/free()` using `mbedtls_platform_set_calloc_free()` function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

### **Available options:**

- Internal memory (`MBEDTLS_INTERNAL_MEM_ALLOC`)
- External SPIRAM (`MBEDTLS_EXTERNAL_MEM_ALLOC`)
- Default alloc mode (`MBEDTLS_DEFAULT_MEM_ALLOC`)
- Custom alloc mode (`MBEDTLS_CUSTOM_MEM_ALLOC`)

- Internal IRAM (MBEDTLS\_IRAM\_8BIT\_MEM\_ALLOC)  
Allows to use IRAM memory region as 8bit accessible region.  
TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN

TLS maximum message content length

*Found in: [Component config](#) > [mbedtls](#)*

Maximum TLS message length (in bytes) supported by mbedtls.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max\_fragment\_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS\_ERR\_SSL\_INVALID\_RECORD (-0x7200).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN

Asymmetric in/out fragment length

*Found in: [Component config](#) > [mbedtls](#)*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN

TLS maximum incoming fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

**CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER**

Using dynamic TX/RX buffer

*Found in: [Component config](#) > [mbedtls](#)*

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedtls also allocate TX and RX buffer with the default value of “MBEDTLS\_SSL\_OUT\_CONTENT\_LEN” or “MBEDTLS\_SSL\_IN\_CONTENT\_LEN” , so to save more heap, users can set the options to be an appropriate value.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#) && [CONFIG\\_MBEDTLS\\_SSL\\_VARIABLE\\_BUFFER\\_LENGTH](#)

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA**

Free private key and DHM data after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT**

Free SSL CA certificate after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

**CONFIG\_MBEDTLS\_DEBUG**

Enable mbedtls debugging

*Found in: [Component config](#) > [mbedtls](#)*

Enable mbedtls debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp\_debug.h” and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedtls debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedTLS debugging level

*Found in: [Component config](#) > [mbedTLS](#) > [CONFIG\\_MBEDTLS\\_DEBUG](#)*

Set mbedTLS debugging level

### Available options:

- Warning (MBEDTLS\_DEBUG\_LEVEL\_WARN)
- Info (MBEDTLS\_DEBUG\_LEVEL\_INFO)
- Debug (MBEDTLS\_DEBUG\_LEVEL\_DEBUG)
- Verbose (MBEDTLS\_DEBUG\_LEVEL\_VERBOSE)

### **mbedTLS v3.x related** Contains:

- [DTLS-based configurations](#)
- [CONFIG\\_MBEDTLS\\_PKCS7\\_C](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_CONTEXT\\_SERIALIZATION](#)
- [CONFIG\\_MBEDTLS\\_X509\\_TRUSTED\\_CERT\\_CALLBACK](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_KEEP\\_PEER\\_CERTIFICATE](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)
- [CONFIG\\_MBEDTLS\\_ECDH\\_LEGACY\\_CONTEXT](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_VARIABLE\\_BUFFER\\_LENGTH](#)

## CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3

Support TLS 1.3 protocol

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v3.x related](#)*

### Default value:

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_KEEP\\_PEER\\_CERTIFICATE](#) && [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### **TLS 1.3 related configurations** Contains:

- [CONFIG\\_MBEDTLS\\_SSL\\_TLS1\\_3\\_KEXM\\_EPHEMERAL](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_TLS1\\_3\\_COMPATIBILITY\\_MODE](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_TLS1\\_3\\_KEXM\\_PSK\\_EPHEMERAL](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_TLS1\\_3\\_KEXM\\_PSK](#)

## CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE

TLS 1.3 middlebox compatibility mode

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)*

### Default value:

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

## CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK

TLS 1.3 PSK key exchange mode

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)*

### Default value:

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH

Variable SSL buffer length

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT

Use a backward compatible ECDH context (Experimental)

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Use the legacy ECDH context format. Define this option only if you enable [MBEDTLS\\_ECP\\_RESTARTABLE](#) or if you want to access ECDH context fields directly.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECDH\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_RESTARTABLE](#)

### CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See [mbedtls](#) documentation for required API and more details.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

**Default value:**

- Yes (enabled) if `MBEDTLS_DYNAMIC_FREE_PEER_CERT`

**CONFIG\_MBEDTLS\_PKCS7\_C**

Enable PKCS #7

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**

- Yes (enabled)

**DTLS-based configurations** Contains:

- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_SRTP](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID**

Support for the DTLS Connection ID extension

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [DTLS-based configurations](#)*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

**CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#) && [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

**Default value:**

- 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#) && [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

### CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY

Record plaintext padding (for DTLS 1.2)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 16 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

### CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use\_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE**

Default certificate bundle options

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Available options:**

- Use the full default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_CMN)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_NONE)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE**

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH**

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

**CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS**

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

**CONFIG\_MBEDTLS\_ECP\_RESTARTABLE**

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in: [Component config](#) > [mbedtls](#)*

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_AES\_USE\_INTERRUPT

Use interrupt for long AES operations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HARDWARE\_GCM

Enable partially hardware accelerated GCM

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS\_HARDWARE\_GCM is disabled and MBEDTLS\_HARDWARE\_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HARDWARE\_MPI

Enable hardware MPI (bignum) acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_MPI\_USE\_INTERRUPT

Use interrupt for MPI exp-mod operations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)*

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HARDWARE\_SHA

Enable hardware SHA acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_HARDWARE\_ECC

Enable hardware ECC acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedtls

**Default value:**

- Yes (enabled) if SOC\_ECC\_SUPPORTED

### CONFIG\_MBEDTLS\_ECC\_OTHER\_CURVES\_SOFT\_FALLBACK

Fallback to software implementation for curves not supported in hardware

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)

### CONFIG\_MBEDTLS\_ROM\_MD5

Use MD5 implementation in ROM

*Found in: [Component config](#) > [mbedtls](#)*

Use ROM MD5 in mbedtls.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PLATFORM\_TIME\_ALT

Enable mbedtls time support: platform-specific

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enabling this config will provide users with a function “mbedtls\_platform\_set\_time()” that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the

current system time then verification will fail with code `MBEDTLS_X509_BADCERT_FUTURE` or `MBEDTLS_X509_BADCERT_EXPIRED`.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SHA512\_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable `MBEDTLS_SHA512_C` adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_TLS\_MODE**

TLS Protocol Role

*Found in: [Component config](#) > [mbedtls](#)*

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

- Server & Client (`MBEDTLS_TLS_SERVER_AND_CLIENT`)
- Server (`MBEDTLS_TLS_SERVER_ONLY`)
- Client (`MBEDTLS_TLS_CLIENT_ONLY`)
- None (`MBEDTLS_TLS_DISABLED`)

### **TLS Key Exchange Methods**   Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)*

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in:* [Component config > mbedTLS](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in:* [Component config > mbedTLS](#)

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1

Support GM/T SSL 1.1 protocol

*Found in:* [Component config > mbedTLS](#)

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS**

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_ALPN**

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS**

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS**

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **Symmetric Ciphers** Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

### CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_XTEA\_C

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CCM\_C

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_GCM\_C

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_NIST\_KW\_C

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RIPEMD160\_C

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### CONFIG\_MBEDTLS\_PEM\_PARSE\_C

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PEM\_WRITE\_C

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DHM\_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: [Component config](#) > [mbedtls](#)*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in:* [Component config](#) > [mbedtls](#)

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in:* [Component config](#) > [mbedtls](#)

Enable support for SECP192R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in:* [Component config](#) > [mbedtls](#)

Enable support for SECP224R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in:* [Component config](#) > [mbedtls](#)

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in:* [Component config](#) > [mbedtls](#)

Enable support for SECP384R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP521R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP224K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config > mbedtls](#)*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: [Component config > mbedtls](#)*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: [Component config > mbedtls](#)*

Enable support for CURVE25519 Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST ‘modulo p’ optimisations

*Found in: [Component config > mbedtls](#)*

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_FIXED\_POINT\_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: [Component config > mbedtls](#)*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in:* [Component config > mbedTLS](#)

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHA20\_C**

Chacha20 stream cipher

*Found in:* [Component config > mbedTLS](#)

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHAPOLY\_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_CHACHA20_C` && `CONFIG_MBEDTLS_POLY1305_C`

**CONFIG\_MBEDTLS\_HKDF\_C**

HKDF algorithm (RFC 5869)

*Found in:* [Component config > mbedTLS](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_THREADING\_C**

Enable the threading abstraction layer

*Found in:* [Component config > mbedTLS](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_THREADING\_ALT**

Enable threading alternate implementation

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_THREADING_C`

### **CONFIG\_MBEDTLS\_THREADING\_PTHREAD**

Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_THREADING\_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_THREADING_C`

### **CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI**

Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than `SOC_RSA_MAX_BIT_LEN`. If this is not active then the ESP will be unable to process keys greater than `SOC_RSA_MAX_BIT_LEN`.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SECURITY\_RISKS**

Show configurations with potential security risks

*Found in: Component config > mbedTLS*

**Default value:**

- No (disabled)

Contains:

- `CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT`

### **CONFIG\_MBEDTLS\_ALLOW\_UNSUPPORTED\_CRITICAL\_EXT**

X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_SECURITY\_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SECURITY_RISKS`

**ESP-MQTT Configurations** Contains:

- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_SSL`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

### CONFIG\_MQTT\_PROTOCOL\_311

Enable MQTT protocol 3.1.1

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_PROTOCOL\_5

Enable MQTT protocol 5.0

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TRANSPORT\_SSL

Enable MQTT over SSL

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE

Enable MQTT over Websocket Secure

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)*

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL

Use Incremental Message Id

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket port

**Default value:**

- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task stack size

**Default value:**

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### **CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

### **CONFIG\_MQTT\_TASK\_CORE\_SELECTION**

Core to use ?

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED*

#### **Available options:**

- Core 0 (MQTT\_USE\_CORE\_0)
- Core 1 (MQTT\_USE\_CORE\_1)

### **CONFIG\_MQTT\_CUSTOM\_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

#### **Default value:**

- No (disabled)

### **CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

#### **Default value:**

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

### **CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline ( ' n' , LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB\_STDOUT\_LINE\_ENDING\_CRLF)
- LF (NEWLIB\_STDOUT\_LINE\_ENDING\_LF)
- CR (NEWLIB\_STDOUT\_LINE\_ENDING\_CR)

## CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING

Line ending for UART input

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring which input sequence on UART produces a newline ( ' n ' , LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB\_STDIN\_LINE\_ENDING\_CRLF)
- LF (NEWLIB\_STDIN\_LINE\_ENDING\_LF)
- CR (NEWLIB\_STDIN\_LINE\_ENDING\_CR)

## CONFIG\_NEWLIB\_NANO\_FORMAT

Enable 'nano' formatting options for printf/scanf family

*Found in: [Component config](#) > [Newlib](#)*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for 'enable-newlib-nano-formatted-io' : <https://sourceware.org/newlib/README>

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

## CONFIG\_NEWLIB\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: [Component config](#) > [Newlib](#)*

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used,** timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.

- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC\_STORE registers are** used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (NEWLIB\_TIME\_SYSCALL\_USE\_RTC\_HRT)
- RTC (NEWLIB\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (NEWLIB\_TIME\_SYSCALL\_USE\_HRT)
- None (NEWLIB\_TIME\_SYSCALL\_USE\_NONE)

**NVS** Contains:

- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

**CONFIG\_NVS\_ENCRYPTION**

Enable NVS encryption

*Found in: [Component config](#) > [NVS](#)*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED](#)

**CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: [Component config](#) > [NVS](#)*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**CONFIG\_NVS\_ASSERT\_ERROR\_CHECK**

Use assertions for error checking

*Found in: [Component config](#) > [NVS](#)*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

**OpenThread** Contains:

- [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_ENABLED

OpenThread

*Found in:* [Component config](#) > [OpenThread](#)

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DYNAMIC

Enable dynamic log level control

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL

OpenThread log verbosity

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select OpenThread log level.

**Available options:**

- No logs (OPENTHREAD\_LOG\_LEVEL\_NONE)
- Error logs (OPENTHREAD\_LOG\_LEVEL\_CRIT)
- Warning logs (OPENTHREAD\_LOG\_LEVEL\_WARN)
- Notice logs (OPENTHREAD\_LOG\_LEVEL\_NOTE)
- Info logs (OPENTHREAD\_LOG\_LEVEL\_INFO)
- Debug logs (OPENTHREAD\_LOG\_LEVEL\_DEBUG)

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Configure how OpenThread connects to the 15.4 radio

**Available options:**

- Native 15.4 radio (OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD\_RADIO\_SPINEL\_UART)
